- It is not known how this drug could affect a fetus. If you are pregnant or would like to become pregnant while on this drug, consult your health care provider.
- You may experience these side effects: Headache (consult with your health care provider; medication may be available to help); nausea, diarrhea (frequent small meals may help).
- Report pain or trouble swallowing, chest pain, very bad heartburn, or heartburn that does not get better.

ibrutumomab

See Appendix U, *Less commonly used drugs*.

ibuprofen

(eye *byoo'* proe fen)

Advil, Advil Liqui-Gels, Advil Migraine, Advil Pediatric Drops, Apo-Ibuprofen (CAN), Apo-Ibuprofen Prescription (CAN), Caldolor, Children's Advil, Children's Motrin, Genpril, Ibutab, Infants' Motrin, Junior Strength Advil, Junior Strength Motrin, Menadol, Midol, Midol Maximum Strength Cramp Formula, Motrin, Motrin IB, Motrin Migraine Pain, Neoprofen, PediaCare Fever, Pediatric Advil Drops

PREGNANCY CATEGORY B

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Analgesic (nonopioid)

NSAID

Propionic acid derivative

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of

action are not known. Inhibits both cyclooxygenase (COX) 1 and 2. Ibuprofen is slightly more selective for COX-1.

Indications

- Relief of signs and symptoms of rheumatoid arthritis and osteoarthritis
- Relief of mild to moderate pain
- Treatment of primary dysmenorrhea
- Prevention and treatment of migraine headache
- Fever reduction
- Unlabeled uses: Prevention of adverse reactions with DTP vaccine in patients at risk for seizures

Contraindications and cautions

- Contraindicated with allergy to ibuprofen, salicylates, or other NSAIDs (more common in patients with rhinitis, asthma, chronic urticaria, nasal polyps).

 **Black box warning** Contraindicated for treatment of perioperative pain after coronary artery bypass graft.

- Use cautiously with CV dysfunction, hypertension, peptic ulceration, GI bleeding, pregnancy, lactation, impaired hepatic or renal function.

Available forms

Tablets—100, 200, 400, 600, 800 mg; chewable tablets—50, 100 mg; capsules—200 mg; suspension—100 mg/2.5 mL, 100 mg/5 mL; oral drops—40 mg/mL; injection—10 mg/mL, 100 mg/mL

Dosages

Adults

Do not exceed 3,200 mg/day.

- *Mild to moderate pain*: 400 mg every 4–6 hr PO.
- *Migraine*: 400 mg PO at onset of headache.
- *Osteoarthritis or rheumatoid arthritis*: 1,200–3,200 mg/day PO (300 mg qid or 400, 600, 800 mg tid or qid; individualize dosage. Therapeutic response may occur in a few days, but often takes 2 wk).
- *Primary dysmenorrhea*: 400 mg every 4 hr PO.

- **IV use:** 400–800 mg IV over 30 min every 6 hr for pain; 400 mg IV over 30 min for fever, can be followed by 400 mg every 4–6 hr or 100–200 mg every 4 hr to control fever.
- **OTC use:** 200–400 mg every 4–6 hr PO while symptoms persist; do not exceed 1,200 mg/day. Do not take for more than 10 days for pain or 3 days for fever, unless so directed by health care provider.

Pediatric patients

Give dose every 6–8 hr according to weight (shown below) but no more than qid.

Weight (kg)	Dose (mg)
5–7	50
8–10	75
11–15	100
16–21	150
22–26	200
27–31	250
32–43	300

- **Juvenile arthritis:** 30–50 mg/kg/day PO in three to four divided doses; 20 mg/kg/day for milder disease.
- **Fever (6 mo–12 yr):** 5–10 mg/kg PO every 6–8 hr; do not exceed 40 mg/kg/day.

Oral drops

5–8 kg (12–17 lb) or age 6–11 months:
1.25 mL (50 mg)

9–11 kg (18–23 lb) or age 12–23 months:
1.875 mL (75 mg)

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1–2 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 1.8–2.5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute to a concentration of 4 mg/mL or less using 0.9% sodium chloride, 5% dextrose, or lactated Ringer's. Solution should be particulate matter–free and not discolored. Diluted solution is stable for up to 24 hr at room temperature.

Infusion: Infuse over no less than 30 min.

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **CV:** Hypertension, palpitations, arrhythmia, heart failure
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence, **GI bleeding**
- **GU:** Dysuria, renal impairment, menorrhagia
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

Interactions

★ **Drug-drug** • Increased toxic effects of lithium with ibuprofen • Decreased diuretic effect with loop diuretics—bumetanide, furosemide, ethacrynic acid • Potential decrease in antihypertensive effect of beta-adrenergic blocking drugs and ACE inhibitors • Increased risk of gastric ulceration with bisphosphonates • Increased risk of bleeding with anticoagulants

★ **Drug-alternative therapy** • Increased risk of bleeding with concurrent use of ginkgo biloba

Nursing considerations

Assessment

- **History:** Allergy to ibuprofen, salicylates or other NSAIDs; CV dysfunction, hypertension; peptic ulceration, GI bleeding; impaired hepatic or renal function; pregnancy; lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, ophthalmologic evaluation, audiometric evaluation, peripheral sensation; P, BP, edema; R, adventitious sounds; liver evaluation, bowel sounds; CBC, clotting times, urinalysis, LFTs, renal function tests, serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk of CV event, GI bleeding; monitor accordingly.

- Ensure that patient is well hydrated if using IV form.
- Administer drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.
- Discontinue drug if eye changes, symptoms of hepatic impairment, or renal impairment occur.

⊗ **Warning** Institute emergency procedures if overdose occurs: Gastric lavage, induction of emesis, and supportive therapy.

Teaching points

- Use drug only as suggested; avoid overdose. Take the drug with food or after meals if GI upset occurs. Do not exceed the prescribed dosage.
- Avoid over-the-counter drugs. Many of these drugs contain similar medication, and serious overdose can occur.
- You may experience these side effects: Nausea, GI upset, dyspepsia (take drug with food); diarrhea or constipation; drowsiness, dizziness, vertigo, insomnia (use caution when driving or operating dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black or tarry stools.

DANGEROUS DRUG

ibutilide fumarate
(eye *byu'* ti lyed *foo'* mah rate)

Convert

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic (predominantly class III)

Therapeutic actions

Prolongs cardiac action potential, increases atrial and ventricular refractoriness; produces mild slowing of sinus rate and AV conduction; delays repolarization by activating inward

current rather than blocking outward current.

Indications

- Rapid conversion of atrial fibrillation or flutter of recent onset to sinus rhythm; most effective in arrhythmias of less than 90 days' duration

Contraindications and cautions

- Contraindicated with hypersensitivity to ibutilide; second- or third-degree AV heart block, prolonged QTc intervals.
- Use cautiously with ventricular arrhythmias, pregnancy, lactation, renal and hepatic impairment.

Available forms

Solution—0.1 mg/mL

Dosages

Adults weighing 60 kg or more

1 vial (1 mg) infused IV over 10 min; may be repeated after 10 min if arrhythmia is not terminated.

Adults weighing less than 60 kg

0.1 mL/kg (0.01 mg/kg) infused IV over 10 min; may be repeated after 10 min if arrhythmia is not terminated.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	10 min

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta, may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: May be diluted in 50 mL of diluent, 0.9% sodium chloride, or 5% dextrose injection; one 10-mL vial added to 50 mL of diluent yields a concentration of 0.017 mg/mL; may also be infused undiluted; diluted solution is stable for 24 hr at room temperature or for 48 hr refrigerated.

Infusion: Infuse slowly over 10 min.

Compatibilities: Compatible with 5% dextrose injection, 0.9% sodium chloride injection.

Incompatibilities: Do not mix in solution with any other drugs.

Adverse effects

- **CNS:** Headache, light-headedness, dizziness, tingling in arms, numbness
- **CV: Ventricular arrhythmias,** hypotension, hypertension, tachycardia
- **GI:** *Nausea*

Interactions

★ **Drug drug** • Increased risk of serious to life-threatening arrhythmias with disopyramide, quinidine, procainamide, amiodarone, sotalol; do not give together • Increased risk of proarrhythmias with phenothiazines, TCAs, antihistamines • Use cautiously with digoxin because ibutilide may mask digoxin cardiotoxicity

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to ibutilide; second- or third-degree AV heart block, time of onset of atrial arrhythmia; prolonged QTc intervals; pregnancy, lactation; ventricular arrhythmias
- **Physical:** Orientation; BP, P, auscultation, ECG; R, adventitious sounds

Interventions

- Determine time of onset of arrhythmia and potential benefit before beginning therapy. Conversion is more likely in patients with arrhythmias of short (fewer than 90 days') duration.
- ⊗ **Warning** Ensure that patient is adequately anticoagulated, generally for at least 2 wk, if atrial fibrillation lasts more than 2–3 days.
- Monitor ECG continually during and for at least 4 hr after administration. Be alert for possible arrhythmias, including PVCs, sinus tachycardia, sinus bradycardia, and varying degrees of block at time of conversion.

⊗ **Black box warning** Keep emergency equipment readily available during and for at least 4 hr after administration; can cause po-

tentially life-threatening arrhythmias. Use caution when selecting patients for this drug treatment.

- Provide appointments for continued follow-up care, including ECG monitoring; tendency to revert to atrial arrhythmia after conversion increases with length of time patient was in abnormal rhythm.

Teaching points

- This drug can only be given by intravenous infusion. You will need electrocardiographic monitoring during and for 4 hours after administration.
- Arrange for follow-up medical evaluation, including electrocardiography, which is important to monitor the effect of the drug on your heart.
- You may experience these side effects: Rapid or irregular heartbeat (usually passes shortly), headache.
- Report chest pain, difficulty breathing, numbness, or tingling.

DANGEROUS DRUG

▷ **idarubicin hydrochloride**
(*eye da roo' bi sin*)

Idamycin PFS

PREGNANCY CATEGORY D

Drug classes

Antibiotic (anthracycline)

Antineoplastic

Therapeutic actions

Cytotoxic: Binds to DNA and inhibits DNA synthesis in susceptible cells.

Indications

- In combination with other approved anti-leukemic drugs for the treatment of AML in adults
- Orphan drug uses: Acute nonlymphocytic leukemia and ALL in pediatric patients

Contraindications and cautions

- Contraindicated with allergy to idarubicin, other anthracycline antibiotics; myelosup-

pression; cardiac disease; pregnancy; lactation.

- Use cautiously with impaired hepatic or renal function.

Available forms

Injection—1 mg/mL

Dosages

Adults

- **Induction therapy in adults with AML:** 12 mg/m² daily for 3 days by slow IV injection (10–15 min) in combination with cytarabine. Cytarabine may be administered as 100 mg/m² daily given by continuous infusion for 7 days or as a 25-mg/m² IV bolus followed by 200 mg/m² daily for 5 days by continuous infusion. A second course may be administered when toxicity has subsided, if needed, at a 25% dose reduction.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

Reduce dosage by 25%. Do not administer if bilirubin level exceeds 5 mg/dL.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	Minutes

Metabolism: Hepatic; T_{1/2}: 22 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Use extreme caution when preparing drug. Using goggles and gloves is recommended as drug can cause severe skin reactions. If skin is accidentally exposed to idarubicin, wash with soap and water; use standard irrigation techniques if eyes are contaminated. Store solution in the refrigerator and protect from light.

Infusion: Administer slowly (over 10–15 min) into tubing of a freely running IV infusion of sodium chloride injection or 5% dextrose injection. Attach the tubing to a butterfly needle inserted into a large vein; avoid veins

over joints or in extremities with poor perfusion.

Incompatibilities: ⊗ **Warning** Do not mix idarubicin with other drugs, especially heparin (a precipitate forms, and the IV solution must not be used) and any alkaline solution.

Adverse effects

- **CV: Cardiac toxicity,** heart failure, phlebosclerosis
- **Dermatologic:** *Complete but reversible alopecia*, hyperpigmentation of nailbeds and dermal creases, facial flushing
- **GI:** *Nausea, vomiting, mucositis*, anorexia, diarrhea, abdominal cramping
- **Hematologic: Myelosuppression,** hyperuricemia due to cell lysis
- **Hypersensitivity:** Fever, chills, urticaria, **anaphylaxis**
- **Local:** Severe local cellulitis, vesication and tissue necrosis if extravasation occurs
- **Other:** Carcinogenesis, infertility, infection, headache

Nursing considerations

Assessment

- **History:** Allergy to idarubicin, other anthracycline antibiotics; myelosuppression; cardiac disease; impaired hepatic or renal function; pregnancy; lactation
- **Physical:** T; skin color, lesions; weight; hair; nailbeds; local injection site; cardiac auscultation, peripheral perfusion, pulses, ECG; R, adventitious sounds; liver evaluation, mucous membranes; CBC, LFTs, renal function tests, uric acid levels

Interventions

⊗ **Black box warning** Do not give IM or subcutaneously because severe local reaction and tissue necrosis occur. Give IV only.

⊗ **Black box warning** Be aware that patient is at risk for myocardial toxicity; monitor accordingly.

⊗ **Warning** Monitor injection site for extravasation; ask about burning or stinging. If extravasation occurs, discontinue infusion immediately, and restart in another vein. For local subcutaneous extravasation, local infiltration with corticosteroid may be ordered; flood area with normal saline, and apply cold

compress to area. If ulceration begins, arrange consultation with plastic surgeon.

⊗ **Black box warning** Monitor the patient's response to therapy frequently at beginning of therapy: Serum uric acid level, CBC, cardiac output (listen for S_3), liver function tests, changes in uric acid levels may require a decrease in the dose; consult physician.

- Ensure adequate hydration to prevent hyperuricemia.
- Ensure that patient is not pregnant; explain the importance of avoiding pregnancy.

Teaching points

- Prepare a calendar for days to return for drug therapy. Drug can only be given IV.
- This drug should not be used during pregnancy; using barrier contraceptives is advised.
- Have regular medical follow-up care, including blood tests to monitor the drug's effects.
- You may experience these side effects: Rash, skin lesions, loss of hair, changes in nails (obtain a wig before hair loss occurs; skin care may help); loss of appetite, nausea, mouth sores (perform frequent mouth care, frequent small meals may help; maintain good nutrition; consult a dietitian; an antiemetic may be ordered); red urine (transient).
- Report difficulty breathing, sudden weight gain, swelling, burning or pain at injection site, unusual bleeding or bruising; chest pain.

▷ idursulfase

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ ifosfamide

(eye *foss'* fa mide)

Ivex

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic
Nitrogen mustard

Therapeutic actions

Cytotoxic: Exact mechanism of action is not known, although metabolite of ifosfamide alkylates DNA, interferes with the replication of susceptible cells; immunosuppressive: Lymphocytes are especially sensitive to drug effects.

Indications

- In combination with other approved neoplastic drugs for third-line chemotherapy of germ cell testicular cancer; prophylactically with mesna to prevent hemorrhagic cystitis
- Orphan drug uses: Third-line chemotherapy in the treatment of bone sarcomas, soft-tissue sarcomas
- Unlabeled uses: Possible effectiveness in the treatment of lung, breast, ovarian, pancreatic and gastric cancer; sarcomas; acute leukemias; malignant lymphomas; bladder and cervical cancer

Contraindications and cautions

- Contraindicated with allergy to ifosfamide, hematopoietic depression, pregnancy, lactation.
- Use cautiously with impaired hepatic or renal function.

Available forms

Powder for injection—1, 3 g

Dosages

Adults

Administer IV at a dose of 1.2 g/m² per day for 5 consecutive days. Treatment is repeated every 3 wk or after recovery from hematologic toxicity. For prevention of bladder toxicity, give more than 2 L of fluid per day IV or PO. Also use mesna IV to prevent hemorrhagic cystitis.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Data not available on appropriate dosage. Reduced dosage is advisable; use caution.

Pharmacokinetics

Route	Onset
IV	Rapid

Metabolism: Hepatic; $T_{1/2}$: 15 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add sterile water for injection or bacteriostatic water for injection to the vial, and shake gently. Use 20 mL diluent with 1-g vial, giving a final concentration of 50 mg/mL, or use 60-mL diluent with 3-g vial, giving a final concentration of 50 mg/mL. Solutions may be further diluted to achieve concentrations of 0.6–20 mg/mL in 5% dextrose injection, 0.9% sodium chloride injection, lactated Ringer's injection, and sterile water for injection. Solution is stable for at least 1 wk at room temperature or 6 wk if refrigerated. Dilutions not prepared with bacteriostatic water for injection should be refrigerated and used within 6 hr.

Infusion: Administer as a slow IV infusion lasting a minimum of 30 min.

Adverse effects

- **CNS:** *Somnolence, confusion, hallucinations*, coma, depressive psychosis, dizziness, seizures
- **Dermatologic:** *Alopecia*, darkening of skin and fingernails
- **GI:** *Anorexia, nausea, vomiting*, diarrhea, stomatitis
- **GU:** *Hemorrhagic cystitis*, bladder fibrosis, *hematuria* to **potentially fatal hemorrhagic cystitis**, increased urine uric acid levels, gonadal suppression
- **Hematologic:** *Leukopenia*, thrombocytopenia, anemia (rare), increased serum uric acid levels
- **Other:** Immunosuppression, secondary neoplasia, hepatic impairment, infection

Interactions

* **Drug-food** • Decreased metabolism and risk of toxic effects if taken with grapefruit juice; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to ifosfamide, hematopoietic depression, impaired hepatic or renal function, pregnancy, lactation

- **Physical:** Reflexes, affect; skin lesions, hair; urinary output, renal function; LFTs, renal function tests, CBC, Hct

Interventions

⊗ **Black box warning** Arrange for blood tests to evaluate hematopoietic function before beginning therapy and weekly during therapy; serious hemorrhagic toxicities have occurred.

⊗ **Black box warning** Arrange for extensive hydration consisting of at least 2 L of oral or IV fluid per day to prevent bladder toxicity.

⊗ **Black box warning** Arrange to administer a protector, such as mesna, to prevent hemorrhagic cystitis.

- Counsel male patients not to father a child during or immediately after therapy; infant cardiac and limb abnormalities have occurred. Counsel female patients not to become pregnant while using this drug; severe birth defects have occurred.

Teaching points

- This drug can only be given IV.
- Have frequent blood tests to monitor your response to this drug. All appointments for follow-up care should be kept.
- Avoid grapefruit juice while using this drug.
- Men or women should use birth control while using drug and for a time afterwards; this drug can cause severe birth defects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (take drug with food, eat frequent small meals); maintain your fluid intake and nutrition (drink at least 10–12 glasses of fluid each day); darkening of the skin and fingernails, loss of hair (obtain a wig or arrange for some other head covering before hair loss occurs; keep head covered in extreme temperatures).
- Report unusual bleeding or bruising, fever, chills, sore throat, cough, shortness of breath, blood in the urine, painful urination, unusual lumps or masses, flank, stomach or joint pain, sores in mouth or on lips, yellow discoloration of skin or eyes.

iloperidone (il ob pair' ib dohn)

Fanapt

PREGNANCY CATEGORY C

Drug classes

Atypical antipsychotic
Benzisoxazole derivative

Therapeutic actions

Mechanism of action not fully understood; blocks dopamine and serotonin receptors in the brain, depresses the reticular activating system; suppresses many of the negative aspects of schizophrenia, including blunted affect, social withdrawal, lack of motivation, anger.

Indications

- Acute treatment of schizophrenia in adults. Consider first using drugs that do not prolong QT interval. Consider need to slowly titrate drug, prolonging time until therapeutic effect is seen; faster-acting drugs may be more appropriate.

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, pregnancy, lactation.
- Use cautiously with prolonged QT interval, history of seizures, diabetes, suicidal ideation.

Available forms

Tablets—1, 2, 4, 6, 8, 10, 12 mg

Dosages

Adults

Target dose: 12–24 mg/day PO. Titrate based on orthostatic hypotension tolerance—initially, 1 mg PO bid; then 2, 4, 6, 8, 10, and 12 mg PO bid on days 2, 3, 4, 5, 6, and 7, respectively.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 18–23 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Dizziness, somnolence*, extrapyramidal disorders, tremor, lethargy, blurred vision, altered thinking
- **CV:** Orthostatic hypotension, hypotension, tachycardia, prolonged QT interval
- **GI:** *Nausea*, diarrhea, dry mouth, abdominal discomfort
- **GU:** Priapism, ejaculation failure
- **Respiratory:** URI, nasal pharyngitis
- **Other:** Fatigue, lethargy, bone marrow suppression, **neuroleptic malignant syndrome**, hyperglycemia, weight gain, gynecomastia, galactorrhea

Interactions

- *** Drug-drug** • Increased risk of serious cardiac arrhythmias if taken with other drugs that prolong QT interval; avoid this combination. If combination must be used, monitor patient carefully • Possible increased serum levels and toxicity if combined with ketoconazole, fluoxetine, itraconazole, paroxetine; iloperidone dosage should be halved if these drug combinations are used • Risk of increased effectiveness of antihypertensives if used with iloperidone; monitor patient closely and adjust antihypertensive dosage as needed • Risk of increased CNS effects if combined with centrally acting drugs or alcohol; use caution if this combination is used
- *** Drug-alternative therapy** • Possible increased toxicity if combined with St. John's wort

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug; prolonged QT interval, history of seizures, diabetes, suicidal ideation, pregnancy, lactation
- **Physical:** Orientation, affect, reflexes; BP, P; abdominal exam; liver evaluation; ECG, LFTs, CBC

Interventions

 **Black box warning** There is an increased risk of death if used in elderly patients

with dementia-related psychosis. Do not use for these patients; not approved for this use.

- Obtain baseline ECG to rule out prolonged QT interval; monitor patient periodically throughout therapy.
- Titrate drug over first week to decrease effect of orthostatic hypotension.
- Monitor patient regularly for signs and symptoms of increased blood glucose level.
- Advise patient who is nursing to select another method of feeding the baby.
- Monitor patient for signs and symptoms of neuroleptic malignant syndrome (high temperature, muscle rigidity, altered mental status, high or low blood pressure, diaphoresis, tachycardia); discontinue drug and support patient if these occur. Carefully consider reintroduction of drug because recurrence is likely.
- Provide safety measures as needed if patient develops extrapyramidal effects or orthostatic hypotension.
- Because of the risk of suicidal ideation with treatment, limit amount of drug dispensed to the smallest effective amount to decrease chances of overdose.
- Continue other measures used to deal with schizophrenia.

Teaching points

- Take this drug once a day, exactly as prescribed. Carefully follow directions for increasing the dosage over the first week.
- If you miss a dose, take the next dose as soon as you remember. Do not take more than the prescribed amount each day.
- Avoid alcohol while taking this drug. Tell your health care provider about other drugs, over-the-counter drugs, or herbal therapies that you are using because serious drug interactions are possible.
- If you are diabetic, monitor your blood glucose level very carefully and adjust treatment as ordered.
- It is not known how this drug affects a fetus. If you become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for serious adverse effects on an infant, you should

use another method of feeding the baby while you are taking this drug.

- This drug may cause your blood pressure to fall when you stand up; this is called *orthostatic hypotension*. Use care when standing or changing positions. Orthostatic hypotension is most likely to occur when starting the drug and when changing dosage.
- You may experience these side effects: Dizziness, changes in motor performance and impaired thinking (do not drive a car or engage in activities that require alertness if these effects occur); nausea, dry mouth (small, frequent meals may help; sucking sugarless lozenges may also be helpful).
- Report fever accompanied by sweating, changes in mental status, muscle rigidity; heart palpitations, feeling faint, loss of consciousness, thoughts of suicide.

iloprost

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

imatinib mesylate (*eh mat' eh nib mess' ah late*)

Gleevec ORIG

PREGNANCY CATEGORY D

Drug classes

Antineoplastic

Protein tyrosine kinase inhibitor

Therapeutic actions

A protein tyrosine kinase inhibitor that selectively inhibits the Bcr-Abl tyrosine kinase created by the Philadelphia chromosome abnormality in CML; this inhibits proliferation and induces apoptosis in the Bcr-Abl positive cell lines as well as fresh leukemic cells, leading to an inhibition of tumor growth in CML patients in blast crisis.

Indications

- Treatment of patients with Philadelphia-chromosome–positive CML in blast crisis,

accelerated phase or in chronic phase after failure with interferon-alfa therapy

- Treatment of patients with Kit (CD117) positive unresectable or metastatic malignant GI stromal tumors (GISTs)
- Treatment of adults with relapsed or refractory Philadelphia-chromosome-positive ALL
- Treatment of aggressive systemic mastocytosis (ASM)
- Treatment of adults with unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP)
- Treatment of adults with myelodysplastic/myeloproliferative diseases (MDS/MPD)
- Treatment of hypereosinophilic syndrome and chronic eosinophilic leukemia (HES/CEL) in adults
- Treatment of pediatric patients with Philadelphia chromosome positive CML in chronic phase, whose disease recurred after stem cell transplant or who are resistant to interferon alfa therapy

■ **NEW INDICATION:** Unlabeled uses: Rectal administration of twice-daily doses

Contraindications and cautions

- Contraindicated with allergy to imatinib or any of its components, pregnancy, lactation.
- Use cautiously with hepatic or renal impairment; bone marrow suppression; cardiac disease, risk factors for heart failure.

Available forms

Tablets —100, 400 mg

Dosages

Dosage should be adjusted based on bone marrow function and liver toxicity.

When used with CYP3A4 inducers, increase imatinib dosage by 50% and carefully monitor patient. For dosages of 800 mg or more, use 400 mg tablets to avoid increase in iron.

Adults

- *Chronic phase CML:* 400 mg/day PO as a once-a-day dose; increase to 600 mg/day may be considered if response is not satisfactory and patient can tolerate the drug.
- *Accelerated phase or blast crisis CML:* 600 mg/day PO as a single dose; increase to 400 mg PO bid may be considered if response is not satisfactory and patient can tolerate the drug.
- *ALL:* 600 mg/day PO.

- *ASM:* 400 mg/day PO.
- *DFSP:* 800 mg/day PO.
- *HES/CEL:* 400 mg/day PO.
- *MDS/MPD:* 400 mg/day PO.
- *GIST:* 400 or 800 mg/day PO.

Pediatric patients older than 2 yr

Newly diagnosed CML: 340 mg/m² PO; maximum dose 600 mg/day.
Chronic phase CML: 260 mg/m²/day PO given as one dose, or divided and given morning and evening.

Patients with hepatic impairment

Severe impairment, decrease dosage by 25%.

Patients with renal impairment

For creatinine clearance of 20–39 mL/min, reduce starting dose by 50%; increase as tolerated. Doses of 400 mg not recommended. For creatinine clearance of 40–59 mL/min, doses of 600 mg not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Hepatic; T_{1/2}: 14–17 hr

Distribution: Crosses placenta; may enter breast milk; 95% protein-bound

Excretion: Feces, urine

Adverse effects

- **CNS:** Malaise, insomnia, *headache*, dizziness
- **CV: Severe heart failure, left ventricular dysfunction**
- **GI:** Abdominal pain, *vomiting, nausea, diarrhea*, dyspepsia, anorexia, constipation, hepatotoxicity, GI irritation
- **Hematologic:** *Neutropenia, thrombocytopenia*
- **Respiratory:** Pulmonary edema, pneumonia, URI, cough
- **Other:** Myalgia, fever, *rash, sudden weight gain, fluid retention*, night sweats, joint pain, muscle cramps, fatigue, hemorrhage, pruritus, rigors, hemorrhage

Interactions

* **Drug-drug** ⊗ **Warning** Increased serum levels of simvastatin, cyclosporine, or pimozide when combined with imatinib; avoid these combinations if possible.

• Risk of increased imatinib effects with ketoconazole, itraconazole, azithromycin, or clarithromycin; use caution if this combination is used • Risk of decreased imatinib effects if combined with dexamethasone, phenytoin, carbamazepine, rifampin, or phenobarbital; use caution if this combination is required • Increased risk of bleeding with warfarin; if anticoagulation is needed, use of a heparin is recommended • Increased clearance of levothyroxine; monitor thyroid function if this combination is used

* **Drug-food** • Increased risk of toxic effects with grapefruit juice; avoid this combination

* **Drug-alternative therapy** • Decreased effectiveness of imatinib if taken with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to imatinib or any of its components, pregnancy, lactation, hepatic or renal impairment
- **Physical:** T, body weight, P, BP, R, adventitious sounds, CBC with differential, LFTs, Hgb, Hct, cardiac function

Interventions

- Administer once a day with a meal and a large glass of water. Pediatric patients may have the dose divided and given half in the morning and half in the evening.
- If patient cannot swallow tablets, they may be dispersed in a glass of water or apple juice and given immediately. Use 50 mL for 10-mg tablet and 200 mL for 400-mg tablet. Do not cut or crush tablet.
- Provide frequent small meals if GI upset occurs.
- Arrange for nutritional consult if nausea and vomiting are persistent.
- Provide analgesics if headache or muscle pain is a problem.
- Advise women of child-bearing age to use a barrier form of contraception while taking this drug.
- Increase imatinib dose by at least 50% when administering with a potent CYP3A4 inducer such as rifampin or phenytoin.

⊗ **Warning** Monitor CBC before and periodically during therapy; arrange for dosage adjustment as indicated if bone marrow suppression occurs.

⊗ **Warning** Monitor patient for fluid retention and edema; severe cases may require dosage reduction or discontinuation of drug.

- Arrange for appropriate consultation to help patient cope with the high cost of drug.

Teaching points

- This drug should be taken once a day as a single dose, with a meal and a large glass of water. Do not crush tablet. If tablet is crushed, avoid contact with skin and mucous membranes. If contact occurs, flush area immediately with water. Children may split the dose in two, taking half in the morning and half in the evening.
- This drug has been linked to serious fetal abnormalities; women of childbearing age who are taking this drug should use a barrier contraceptive.
- Avoid infection while taking this drug; avoid crowded areas or people with known infections.
- Do not use any alternative therapy, including St. John's wort, while you are in this treatment program; it may decrease the effectiveness of the drug.
- Do not drink grapefruit juice while taking this drug.
- You will need regular blood tests to monitor the effects of this drug on your blood.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals or suck on sugarless lozenges or chewing gum); headache, muscle cramps, pain (use of an analgesic may help; consult your health care provider); fluid retention and sudden weight gain (monitor daily weights and report sudden increases or difficulty breathing).
- Report fever, chills, unusual bleeding or bruising, difficulty breathing, yellowing of your skin or eyes, any signs of infection, sudden weight gain, severe swelling.

▷ imipramine (im ip' ra meen)

imipramine hydrochloride

Tofranil

imipramine pamoate

Tofranil-PM

PREGNANCY CATEGORY C

Drug class

TCA (tertiary amine)

Therapeutic actions

Mechanism of action unknown; the TCAs are structurally related to the phenothiazine antipsychotic drugs (eg, chlorpromazine), but unlike the phenothiazines, TCAs inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; sedative; the relation of these effects to clinical efficacy is unknown.

Indications

- Relief of symptoms of depression (endogenous depression most responsive); sedative effects of tertiary amine TCAs may be helpful in patients whose depression is associated with anxiety and sleep disturbance
- Enuresis in children 6 yr and older
- Unlabeled use: Control of chronic pain (eg, intractable pain of cancer, peripheral neuropathies, postherpetic neuralgia, tic douloureux, central pain syndromes), migraine prophylaxis

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug or to tartrazine (in preparations marketed as *Tofranil*, *Tofranil-PM*; patients with aspirin allergy are commonly allergic to tartrazine); concomitant therapy with an MAOI; EST with coadministration of TCAs; recent MI; myelography within previous 24 hr or scheduled within 48 hr; pregnancy.
- Use cautiously with preexisting CV disorders; seizure disorders (TCAs lower the seizure

threshold); hyperthyroidism; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis with TCA therapy; manic-depressive patients may shift to hypomanic or manic phase); elective surgery; lactation; history of suicide attempts; use with alcohol.

Available forms

Tablets (imipramine hydrochloride, imipramine pamoate)—10, 25, 50 mg; capsules (imipramine pamoate)—75, 100, 125, 150 mg

Dosages

Adults

- **Depression:** Hospitalized patients—Initially, 100–150 mg/day PO in divided doses. Gradually increase to 200 mg/day as required. If no response after 2 wk, increase to 250–300 mg/day. Total daily dosage may be given at bedtime. Outpatients—Initially, 75 mg/day PO, increasing to 150 mg/day. Dosages more than 200 mg/day not recommended. Total daily dosage may be given at bedtime. Maintenance dose is 50–150 mg/day.
- **Chronic pain:** 50–200 mg/day PO.

Adolescent and geriatric patients

- **Depression:** 30–40 mg/day PO; doses greater than 100 mg/day generally are not needed.

Pediatric patients 6 yr and older

- Imipramine pamoate capsules should not be used in children because of potential for overdose. Capsules can be used in adults if daily dosage is 75 mg or higher.
- **Childhood enuresis:** Initially, 25 mg/day 1 hr before bedtime. If response is not satisfactory after 1 wk, increase to 50 mg nightly in children younger than 12 yr, 75 mg nightly in children older than 12 yr. Doses or more than 75 mg/day do not have greater efficacy but are more likely to increase side effects. Do not exceed 2.5 mg/kg per day. Early-night bedwetters may be more effectively treated with earlier and divided dosage (25 mg midafternoon, repeated at bedtime). Institute drug-free period after successful therapy, gradually tapering dosage.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 8–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects**Adult use**

- **CNS:** *Sedation and anticholinergic effects*, dry mouth, blurred vision, disturbance of accommodation for near vision, mydriasis, increased IOP; *confusion, disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, *seizures*, dysarthria, tinnitus, altered EEG, suicidal ideation
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure, CVA
- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels, inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis
- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling in men; breast enlargement, menstrual irregularity and galactorrhea in women; increased or decreased libido; impotence
- **Hematologic:** **Bone marrow depression**, including agranulocytosis; eosinophilia, purpura, thrombocytopenia, leukopenia

- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, facial, tongue), drug fever
- **Withdrawal:** Abrupt discontinuation of prolonged therapy—nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight gain or loss; sweating (paradoxical effect in a drug with prominent anticholinergic effects), alopecia, lacrimation, hyperthermia, flushing, chills

Pediatric use for enuresis

- **CNS:** *Nervousness, sleep disorders, tiredness*, seizures, anxiety, emotional instability, syncope, collapse
- **CV:** ECG changes of unknown significance when given in doses of 5 mg/kg/day
- **GI:** Constipation, *mild GI disturbances*
- **Other:** Adverse reactions reported with adult use

Interactions

- **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine, or ranitidine • Increased serum levels and risk of bleeding with oral anticoagulants • Altered response, including arrhythmias and hypertension, with sympathomimetics • Risk of severe hypertension with clonidine • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths when MAOIs are given with TCAs • Decreased hypotensive activity of guanethidine with imipramine

Note: MAOIs and TCAs have been used successfully in some patients resistant to therapy with single drugs; however, the combination can cause serious and potentially fatal adverse effects.

- **Drug-alternative therapy** • Plasma imipramine levels may be reduced with *St. John's wort*

Nursing considerations**Assessment**

- **History:** Hypersensitivity to any tricyclic drug or to tartrazine; concomitant therapy with an MAOI; EST with coadministration of TCAs; recent MI; myelography within previous 24 hr or scheduled within 48 hr; pre-existing CV disorders; seizure disorders;

hyperthyroidism; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; impaired hepatic, renal function; psychiatric patients; elective surgery; pregnancy; lactation

- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, auscultation, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

- Obtain baseline ECG to monitor cardiac arrhythmias.

⊗ **Black box warning** Limit drug access for depressed and potentially suicidal patients; increased risk of suicidality especially in children, adolescents, and young adults; monitor patients accordingly.

- Give IM only when oral therapy is impossible. Do not give IV.
- Give major portion of dose at bedtime if drowsiness, severe anticholinergic effects occur (note that elderly may not tolerate single-daily-dose therapy).

⊗ **Warning** Reduce dosage if minor side effects develop; discontinue if serious side effects occur.

- Arrange for CBC if fever, sore throat, or other sign of infection develops during therapy.

Teaching points

- Take drug exactly as prescribed. Do not stop taking drug abruptly or without consulting your health care provider; clinical effects may take 4–6 weeks to be seen.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or wear protective garments.
- Use of barrier contraceptives is recommended. If nursing, choose another method to feed the baby.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; safety measures may need to be taken if severe; avoid driving or performing tasks that require alertness); nausea, vomiting, constipation, loss of appetite (eat frequent small meals; frequent mouth care

may help); dry mouth (sucking sugarless candies may help); disorientation, difficulty concentrating, emotional changes; changes in sexual function, impotence, changes in libido.

- Report dry mouth, difficulty in urination, excessive sedation, fever, chills, sore throat, palpitations, suicidal thoughts.

⚠ DANGEROUS DRUG

▶ **inamrinone lactate**
(in am' ri none)

PREGNANCY CATEGORY C

Drug classes

Cardiotonic
Inotropic

Therapeutic actions

Increases force of contraction of ventricles (positive inotropic effect); causes vasodilation by a direct relaxant effect on vascular smooth muscle.

Indications

- Heart failure: Short-term management of patients who have not responded to cardiac glycosides, diuretics, or vasodilators.

Contraindications and cautions

- Contraindicated with allergy to inamrinone or bisulfites.
- Use cautiously with severe aortic or pulmonic valvular disease, acute MI, decreased fluid volume, pregnancy, lactation.

Available forms

Injection—5 mg/mL

Dosages

Adults

- **Initial dose:** 0.75 mg/kg IV bolus, given over 2–3 min. A supplemental IV bolus of 0.75 mg/kg may be given after 30 min if needed.
- **Maintenance infusion:** 5–10 mcg/kg/min. Do not exceed a total of 10 mg/kg/day.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	10 min	2 hr

Metabolism: Hepatic; $T_{1/2}$: 3.6–5.8 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Give as supplied or dilute in normal or one-half normal saline solution to a concentration of 1–3 mg/mL. Use diluted solution within 24 hr. Protect ampules from exposure to light.

Infusion: Administer IV bolus slowly over 2–3 min. Maintenance infusion should not exceed 5–10 mcg/kg/min. Monitor doses; do not exceed a daily dose of 10 mg/kg.

Incompatibilities: Do not mix directly with dextrose-containing solutions; may be injected into a Y-connector or into tubing when a dextrose solution is running; precipitates can form.

Y-site incompatibilities: Do not mix with furosemide, sodium bicarbonate. Do not inject with furosemide.

Adverse effects

- **CV:** *Arrhythmias*, hypotension
- **GI:** Nausea, vomiting, abdominal pain, anorexia, hepatotoxicity
- **Hematologic:** *Thrombocytopenia*
- **Hypersensitivity:** Pericarditis, pleuritis, ascites, vasculitis
- **Other:** Fever, chest pain, burning at injection site

■ Nursing considerations**CLINICAL ALERT!**

Name confusion had occurred between amiodarone when drug name was amrinone; although inamrinone is a new name, confusion may still occur.

Assessment

- **History:** Allergy to inamrinone or bisulfites, severe aortic or pulmonic valvular dis-

ease, acute MI, decreased fluid volume, lactation, pregnancy

- **Physical:** Weight, orientation, P, BP, cardiac auscultation, peripheral pulses, peripheral perfusion; R, adventitious sounds; bowel sounds, liver evaluation; urinary output; serum electrolyte levels, platelet count, liver enzymes

Interventions

- Protect drug vial from light.
- Monitor BP and pulse, and reduce dose if marked decreases occur.
- Monitor input and output and electrolyte levels; record daily weight.
- ⊗ **Warning** Monitor platelet counts if patient is on prolonged therapy. Consider reducing dosage if platelet levels fall to less than 150,000/mm³.

Teaching points

- You will need to have your blood pressure and pulse monitored frequently.
- You may experience increased voiding while using this drug.
- Report pain at IV injection site, dizziness, weakness, fatigue, numbness or tingling.

▽ incobotulinumtoxinA

See Appendix U, *Less commonly used drugs*.

▽ indapamide

(in *dap'* a *mide*)

Apo-Indapamide (CAN),
Gen-Indapamide (CAN),
PMS-Indapamide (CAN)

PREGNANCY CATEGORY B

Drug class

Thiazide-like diuretic (indoline)

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, increasing excretion of sodium, chloride, and water by the kidney; may decrease peripheral resistance.

Indications

- Edema associated with heart failure
- Hypertension, as sole therapy or in combination with other antihypertensives
- Unlabeled use: Diabetes insipidus, especially nephrogenic diabetes insipidus

Contraindications and cautions

- Contraindicated with allergy to thiazides, sulfonamides; hepatic coma or precoma, anuria.
- Use cautiously with fluid or electrolyte imbalance; renal disease (risk of azotemia); liver disease (may precipitate hepatic coma); gout (risk of precipitation of attack); SLE; glucose tolerance abnormalities, diabetes mellitus; hyperparathyroidism; bipolar disorder (aggravated by hypercalcemia); pregnancy; lactation.

Available forms

Tablets—1.25, 2.5 mg

Dosages

Adults

- **Edema:** 2.5 mg/day PO as single dose in the morning. May be increased to 5 mg/day if response is not satisfactory after 1 wk.
- **Hypertension:** 1.25 mg/day PO. May be increased up to 2.5 mg/day if response is not satisfactory after 4 wk. May increase to a maximum of 5 mg/day or consider adding another antihypertensive. If combination antihypertensive therapy is needed, reduce the dosage of other drugs by 50%, then adjust according to patient's response.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–2 hr	2 hr	36 hr

Metabolism: Hepatic; $T_{1/2}$: 14 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, vertigo*, paresthesias, weakness, headache, drowsiness, fatigue, anxiety, nervousness

- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain
- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis, hives
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation, jaundice, hepatitis, pancreatitis, dyspepsia*
- **GU:** *Polyuria, nocturia*, impotence, decreased libido
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia
- **Other:** Hypokalemia, muscle cramps and muscle spasms, fever, gouty attacks, flushing, weight loss, rhinorrhea, infection, pain, back pain

Interactions

- *** Drug-drug** • Consider risk of interactions seen with all thiazides • Increased thiazide effects if taken with diazoxide • Decreased absorption with cholestyramine, colestipol • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Decreased effectiveness of antidiabetics
- *** Drug-lab test** • Decreased protein-bound iodine levels without clinical signs of thyroid disturbance

Nursing considerations

Assessment

- **History:** Allergy to thiazides, sulfonamides; fluid or electrolyte imbalance; renal or liver disease; gout; SLE; glucose tolerance abnormalities, diabetes mellitus; hyperparathyroidism; manic-depressive disorders; lactation, pregnancy
- **Physical:** Skin color, lesions, edema; orientation, reflexes, muscle strength; pulses, baseline ECG, BP, orthostatic BP, perfusion; R, pattern, adventitious sounds; liver evaluation, bowel sounds, urinary output patterns; CBC, serum electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

- Give with food or milk if GI upset occurs.
- Mark calendars or provide other reminders for outpatients on alternate-day or 3–5 days/wk therapy.

- Give early in the day so increased urination will not disturb sleep.
- Measure and record regular weight to monitor fluid changes.

Teaching points

- Record intermittent therapy on a calendar, or use prepared, dated envelopes. Take the drug early in the day so increased urination will not disturb sleep. The drug may be taken with food or meals if GI upset occurs.
- Weigh yourself on a regular basis, at the same time of the day and in the same clothing; record the weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes; hazardous activities, like driving a car; and alcohol, which can intensify these problems); sensitivity to sunlight (use sunglasses, wear protective clothing, or use a sunscreen); decrease in sexual function; increased thirst (sucking on sugarless lozenges, frequent mouth care may help).
- Report weight change of more than 3 pounds in 1 day, swelling in ankles or fingers, unusual bleeding or bruising, dizziness, trembling, numbness, fatigue, muscle weakness or cramps.

indinavir sulfate (in *din'* ab ver)

Crixivan

PREGNANCY CATEGORY C

Drug classes

Antiretroviral
Antiviral
Protease inhibitor

Therapeutic actions

Antiviral activity; inhibits HIV protease activity, leading to production of immature, non-infective HIV particles.

Indications

- Treatment of HIV infection in adults; used in combination with other drugs

Contraindications and cautions

- Contraindicated with allergy to component of indinavir.
- Use cautiously with pregnancy, hepatic or renal impairment, lactation.

Available forms

Capsules—100, 200, 333, 400 mg

Dosages

Adults

800 mg PO every 8 hr. With delavirdine, 600 mg PO every 8 hr with delavirdine 400 mg tid; with didanosine, administer more than 1 hr apart on an empty stomach; with itraconazole, 600 mg PO every 8 hr with itraconazole 200 mg bid; with ketoconazole, 600 mg PO every 8 hr; with rifabutin, 1,000 mg (three 333-mg capsules) PO every 8 hr, reduce rifabutin by 50%.

Pediatric patients

Safety and efficacy not established in children younger than 12 yr.

Patients with hepatic impairment

600 mg PO every 8 hr with mild to moderate hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.8 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk; 60% bound to human plasma proteins

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness, insomnia, somnolence
- **CV:** Palpitations
- **Dermatologic:** Acne, dry skin, contact dermatitis, rash, body odor
- **GI:** *Nausea, vomiting, diarrhea*, anorexia, dry mouth, acid regurgitation, *hyperbilirubinemia*, abdominal pain, increased appetite
- **GU:** Dysuria, hematuria, nocturia, pyelonephritis, nephrolithiasis, urolithiasis
- **Respiratory:** Cough, dyspnea, sinusitis

- **Other:** Hypothermia, chills, back pain, flank pain, flulike symptoms, appetite increase, fever, back pain, fatigue, taste perversion

Interactions

• **Drug-drug** ⊗ **Warning** Potentially large increase in serum concentration of triazolam, midazolam, pimozide and ergot derivatives with indinavir; potential for serious arrhythmias, seizure, and fatal reactions; do not administer indinavir with any of these drugs.

• Azole antifungals, delavirdine, nelfinavir, ritonavir, interleukins may increase indinavir concentrations and cause toxicity • Decreased effectiveness with didanosine; give these two drugs 1 hr apart on empty stomach to decrease effects of interaction • Significant decrease in serum levels with nevirapine—avoid this combination; if combination is necessary, increase indinavir to 1,000 mg every 8 hr with nevirapine 200 mg bid; carefully monitor effectiveness of indinavir if starting or stopping nevirapine • Decreased indinavir concentrations with efavirenz, carbamazepine, phenobarbital, phenytoin, rifabutin, venlafaxine • Indinavir may cause increased concentrations of fentanyl, rifamycin, benzodiazepines, ritonavir, and sildenafil

• **Drug-food** • Absorption is decreased by presence of food and grapefruit juice; give on empty stomach with full glass of water

• **Drug-alternative therapy** • Decreased effectiveness if combined with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to indinavir, hepatic or renal impairment, pregnancy, lactation
- **Physical:** T; orientation, reflexes; BP, P, peripheral perfusion; R, adventitious sounds; bowel sounds; urinary output; skin color, perfusion; LFTs, renal function tests

Interventions

- Capsules should be protected from moisture; store in container provided and keep desiccant in bottle. Give drug every 8 hr around the clock.
- Give on an empty stomach, 1 hr before or 2 hr after meal with a full glass of water. If

GI upset is severe, give with a light meal; avoid grapefruit juice and foods high in calories, fat, or protein.

⊗ **Warning** Carefully screen drug history to avoid potentially dangerous drug interactions.

- Monitor patient to maintain hydration; if nephrolithiasis occurs, therapy will need to be interrupted or stopped.

Teaching points

- Take this drug on an empty stomach, 1 hour before or 2 hours after a meal, with a full glass of water. If GI upset is severe, take with a light meal; avoid grapefruit juice and foods high in calories, fat, or protein.
- Avoid St. John's wort while taking this drug.
- Store the capsules in the original container and leave the desiccant in the bottle. These capsules are very sensitive to moisture.
- Take the full course of therapy as prescribed; do not take double doses if one is missed; do not change dosage without consulting your health care provider. Take drug every 8 hours around the clock.
- Drink 1.5 liters or more of water per day to ensure adequate hydration.
- This drug does not cure HIV infection; long-term effects are not yet known; continue to take precautions as the risk of transmission is not reduced by this drug.
- Do not take any other prescription or over-the-counter drugs without consulting your health care provider; this drug interacts with many other drugs and serious problems can occur.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, abdominal pain, headache, dizziness, insomnia.
- Report severe diarrhea, severe nausea, personality changes, changes in color of urine or stool, flank pain, fever or chills.

▷ indomethacin

(in *mdoe eth'* a *sin*)

indomethacin

Indocid P.D.A. (CAN), Indocin, Indocin-SR

indomethacin sodium trihydrate

Apo-Indomethacin (CAN), Indocin I.V.

PREGNANCY CATEGORY B

PREGNANCY CATEGORY D
(THIRD TRIMESTER)**Drug class**

NSAID

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known. Inhibits both cyclooxygenase (COX) 1 and 2. Indomethacin is mainly COX-1 selective.

Indications

- Oral, topical, suppositories: Relief of signs and symptoms of moderate to severe rheumatoid arthritis and moderate to severe osteoarthritis, moderate to severe ankylosing spondylitis, acute painful shoulder (bursitis, tendinitis), acute gouty arthritis (*not* SR form)
- Parenteral use: Closure of hemodynamically significant patent ductus arteriosus in premature infants weighing 500–1,750 g, if 48 hr of usual medical management is not effective
- Unlabeled uses for oral form: Pharmacologic closure of persistent patent ductus arteriosus in premature infants; juvenile rheumatoid arthritis; prevention of premature labor
- Unlabeled use of topical eye drops: Cystoid macular edema
- Unlabeled uses: To reduce incidence of patent ductus arteriosus in patients at risk for the condition.

Contraindications and cautions**Oral and rectal**

- Contraindicated with allergy to indomethacin, salicylates, or other NSAIDs; history of

proctitis or rectal bleeding (suppositories); pregnancy in the third trimester, lactation, labor; pain associated with coronary artery bypass graft surgery.

- Use cautiously with CV dysfunction, hypertension, peptic ulceration, GI bleeding, impaired renal or hepatic function, pregnancy.

IV

- Contraindicated with proven or suspected infection; bleeding, thrombocytopenia, coagulation defects; necrotizing enterocolitis; neonates with significant renal impairment, congenital heart disease when patency of ductus arteriosus is needed for blood flow.
- Use cautiously with renal impairment.

Available forms

Capsules—25, 50 mg; SR capsules—75 mg; oral suspension—25 mg/5 mL; suppositories—50 mg; powder for injection—1 mg

Dosages**Adults**

- *Osteoarthritis or rheumatoid arthritis, ankylosing spondylitis*: 25 mg PO bid or tid. If tolerated, increase dose by 25- or 50-mg increments if needed up to total daily dose of 150–200 mg/day PO. SR dose may be used.
- *Acute painful shoulder*: 75–150 mg/day PO, in three or four divided doses. Discontinue drug after inflammation is controlled, usually 7–14 days. SR dose may be used.
- *Acute gouty arthritis*: 50 mg PO, tid until pain is tolerable, then rapidly decrease dose until no longer needed, usually within 3–5 days. Do not use SR dose. In those who have persistent night pain or morning stiffness, a total daily dose of 100 mg may be given at bedtime. Do not exceed 200 mg.

Pediatric patients

Safety and efficacy not established. When special circumstances warrant use in children older than 2 yr, initial dose is 2 mg/kg/day in divided doses PO. Do not exceed 4 mg/kg/day or 150–200 mg/day, whichever is less.

IV

Three IV doses given at 12- to 24-hr intervals.

Age	1st Dose	2nd Dose	3rd Dose
Younger than 48 hr	0.2 mg/kg	0.1 mg/kg	0.1 mg/kg
2–7 days	0.2 mg/kg	0.2 mg/kg	0.2 mg/kg
Older than 7 days	0.2 mg/kg	0.25 mg/kg	0.25 mg/kg

If marked anuria or oliguria occurs, do not give additional doses. If ductus reopens, repeat course of therapy at 12- to 24-hr intervals.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1–2 hr	4–6 hr
IV	Immediate	Unknown	15–30 min

Metabolism: Hepatic; $T_{1/2}$: 4.5–6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute solution with 1–2 mL of 0.9% sodium chloride injection or water for injection; diluents should be preservative free. If 1 mL of diluent is used, concentration is 0.1 mg/0.1 mL. If 2 mL of diluent is used, concentration is 0.05 mg/0.1 mL. Discard any unused portion of the solution; prepare fresh solution before each dose.

Infusion: Inject reconstituted solution IV over 20–30 min; further dilution is not recommended.

Adverse effects

Oral, suppositories

- **CNS:** Headache, dizziness, somnolence, insomnia, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **CV: Thrombotic events, MI, CVA**
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** Nausea, dyspepsia, GI pain, diarrhea, vomiting, constipation, flatulence, **GI bleed**
- **GU:** Dysuria, renal impairment
- **Hematologic: Bleeding ulcer,** platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia

- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

IV preparation

- **GI: GI bleeding,** vomiting, abdominal distention, transient ileus
- **GU:** Renal impairment
- **Hematologic:** Increased bleeding problems, including intracranial bleed, **DIC**, hyponatremia, hyperkalemia, hypoglycemia, fluid retention
- **Respiratory:** Apnea, exacerbation of pulmonary infection, **pulmonary hemorrhage**
- **Other:** Retrolental fibroplasia, local irritation with extravasation

Interactions

- **Drug-drug** • Increased toxic effects of lithium • Decreased diuretic effect with loop diuretics: Bumetanide, furosemide, ethacrynic acid • Potential decrease in antihypertensive effect of beta-adrenergic blocking drugs, ACE inhibitors, and ARBs • Increased risk of gastric ulceration with bisphosphonates • Increased risk of bleeding with anticoagulants
- Indomethacin may potentiate potassium-sparing properties of potassium-sparing diuretics
- **Drug-lab test** • False-negative results in dexamethasone suppression test

Nursing considerations

Assessment

- **History:** Oral and rectal preparations: Allergy to indomethacin, salicylates, or other NSAIDs; CV dysfunction, hypertension, recent history of coronary artery bypass surgery; peptic ulceration, GI bleeding; history of proctitis or rectal bleeding; impaired hepatic or renal function; pregnancy; labor and delivery. IV preparations: Proven or suspected infection; bleeding, thrombocytopenia, coagulation defects; necrotizing enterocolitis; renal impairment; local irritation if extravasation occurs
- **Physical:** Skin color, lesions; T; orientation, reflexes, ophthalmologic evaluation, audiometric evaluation, peripheral sensation; P, BP, edema; R, adventitious sounds; liver evaluation, bowel sounds; CBC, clotting

times, urinalysis, LFTs, renal function tests, serum electrolytes, stool guaiac

Interventions

Oral and rectal preparations

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly. Adverse reactions are dose-related; use lowest effective dose.

- Do not give SR tablets for gouty arthritis.
- Give drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** Discontinue drug if eye changes or symptoms of hepatic or renal impairment occur.

⊗ **Warning** For overdose, use emergency procedures—gastric lavage, induction of emesis, support.

⊗ **Warning** Test renal function between doses. If severe renal impairment is noted, do not give the next dose.

Teaching points

- Parents of infants receiving IV therapy for patent ductus arteriosus will need support and encouragement and an explanation of the drug's action; this is best incorporated into the teaching about the disease.
- Use the drug only as suggested; avoid overdose. Take with food or after meals if GI upset occurs. Do not exceed the prescribed dosage. Do not use with over-the-counter analgesics; serious toxicity can occur.
- You may experience these side effects: Nausea, GI upset, dyspepsia (take drug with food); diarrhea or constipation; drowsiness, dizziness, vertigo, insomnia (use caution if driving or operating dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black tarry stools.

▷ infliximab

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ insulin

(in' su lin)

Insulin injection: Humulin R, Novolin Toronto (CAN), Novolin R

Insulin injection concentrate: Humulin R Regular U-500

Insulin lispro: Humalog

Isophane insulin suspension (NPH): Humulin N, Novolinge (CAN), Novolin NPH (CAN), Novolin N

Insulin aspart: NovoLog

Insulin detemir: Levemir

Insulin glargine: Lantus

Insulin glulisine: Apidra, Apidra SoloSTAR

Combination insulins:

Humalog 50/50, Humalog 75/25, Humulin 70/30, Novolin 70/30, Novolinge 10/90, 20/80, 30/70, 40/60, 50/50 (CAN), NovoLog 70/30

PREGNANCY CATEGORY B

PREGNANCY CATEGORY C

(INSULIN GLARGINE, INSULIN ASPART, INSULIN GLULISINE)

Drug classes

Antidiabetic
Hormone

Therapeutic actions

Insulin is a hormone secreted by beta cells of the pancreas that, by receptor-mediated effects, promotes the storage of the body's fuels, facilitating the transport of metabolites and ions (potassium) through cell membranes and stimulating the synthesis of glycogen from glucose, of fats from lipids, and proteins from amino acids.

Indications

- Treatment of type 1 diabetes mellitus
- Treatment of type 2 diabetes mellitus that cannot be controlled by diet or oral drugs
- Regular insulin injection: Treatment of severe ketoacidosis or diabetic coma
- Treatment of hyperkalemia with infusion of glucose to produce a shift of potassium into the cells
- Highly purified and human insulins promoted for short courses of therapy (surgery, intercurrent disease), newly diagnosed patients, patients with poor metabolic control, and patients with gestational diabetes
- Insulin injection concentrated: Treatment of diabetic patients with marked insulin resistance (requiring more than 200 units/day)
- Glargine (*Lantus*): Treatment of adult patients with type 2 diabetes mellitus who require basal insulin control of hyperglycemia
- Treatment of adults and children 6 yr and older who require basal insulin control
- Detemir (*Levemir*): Treatment of adults with diabetes who require basal insulin for the control of hyperglycemia
- Aspart (*NovoLog*): To maintain glycemic control in children 4–18 yr using a continuous subcutaneous infusion pump

Contraindications and cautions

- Contraindicated with allergy to pork products (varies with preparations; human insulin not contraindicated with pork allergy); during episodes of hypoglycemia.
- Use cautiously with pregnancy (keep patients under close supervision; rigid control is desired; following delivery, requirements may drop for 24–72 hr, rising to normal levels during next 6 wk); lactation (monitor mother carefully; insulin requirements may decrease during lactation).

Available forms

Injection—100 units/mL, 500 units/mL (concentrated); prefilled cartridges and pens—100 units/mL

Dosages

Adults and pediatric patients

General guidelines, 0.5–1 unit/kg/day. The number and size of daily doses, times of administration, and type of insulin preparation

are determined after close medical scrutiny of the patient's blood and urine glucose, diet, exercise, and intercurrent infections and other stresses. Usually given subcutaneously. Regular insulin and insulin glulisine may be given IV in diabetic coma or ketoacidosis. Insulin injection concentrated may be given subcutaneously or IM but do not administer IV.

Adults with type 2 diabetes mellitus requiring basal insulin control

10 units/day subcutaneously, given at the same time each day. Range, 2–100 units/day (*Lantus*) or 0.1–0.2 units/kg subcutaneously in the evening or 10 units once or twice a day (*Levemir*).

Pharmacokinetics

Type	Onset	Peak	Duration
Regular	30–60 min	2–3 hr	6–12 hr
NPH	1–1.5 hr	4–12 hr	24 hr
Lente	1–2.5 hr	7–15 hr	24 hr
Ultralente	4–8 hr	10–30 hr	> 36 hr
Lispro	< 15 min	30–90 min	2–5 hr
Aspart	10–20 min	1–3 hr	3–5 hr
Detemir	Slow	3–6 hr	6–11 hr
Glargine	60 min	None	24 hr
Glulisine	2–5 min	30–90 min	2 hr
Combination insulins	30–60 min, then 1–2 hr	2–4 hr, then 6–12 hr	6–8 hr, then 18–24 hr

Metabolism: Cellular; $T_{1/2}$: Varies with preparation

Distribution: Crosses placenta; does not enter breast milk

Excretion: Unknown

IV FACTS

Preparation: May be mixed with standard IV solutions; use of plastic tubing or bag will change the amount of insulin delivered.

Infusion: Use of a monitored delivery system is suggested. Rate should be determined by patient response and glucose levels.

Incompatibilities: Do not add to aminophylline, amobarbital, chlorothiazide, cytarabine, dobutamine, methylprednisolone, pentobarbital, phenobarbital, phenytoin, secobarbital, sodium bicarbonate, thiopental.

Adverse effects

- **Hypersensitivity:** Rash, **anaphylaxis or angioedema**
- **Local:** Allergy—local reactions at injection site—redness, swelling, itching; usually resolves in a few days to a few weeks; a change in type or species source of insulin may be tried; lipodystrophy; pruritus
- **Metabolic:** Hypoglycemia; ketoacidosis
- **Respiratory:** Decline in pulmonary function (inhaled insulin)

Interactions

- * **Drug-drug** • Increased hypoglycemic effects of insulin with MAOIs, beta blockers, salicylates, or alcohol • Delayed recovery from hypoglycemic episodes and masked signs and symptoms of hypoglycemia if taken with beta-adrenergic blocking drugs • Decreased effectiveness of insulin with corticosteroids, diuretics, atypical antipsychotics
- * **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

■ Nursing considerations

Assessment

- **History:** Allergy to pork products; pregnancy; lactation
- **Physical:** Skin color, lesions; eyeball turgor; orientation, reflexes, peripheral sensation; P, BP; R, adventitious sounds; urinalysis, blood glucose

Interventions

- Ensure uniform dispersion of insulin suspensions by rolling the vial gently between hands; avoid vigorous shaking.
- Give maintenance doses subcutaneously, rotating injection sites regularly to decrease incidence of lipodystrophy; give regular insulin IV or IM in severe ketoacidosis or diabetic coma.
- Monitor patients receiving insulin IV carefully; plastic IV infusion sets have been reported to remove 20%–80% of the insulin; dosage delivered to the patient will vary.
- Do not give insulin injection concentrated IV; severe anaphylactic reactions can occur.

- Use caution when mixing two types of insulin; always draw the regular insulin into the syringe first; if mixing with insulin lispro, draw the lispro first; use mixtures of regular and NPH or regular and Lente insulins within 5–15 min of combining them; *Lantus* (insulin glargine) and *Levemir* (insulin detemir) cannot be mixed in solution with any other drug, including other insulins.

⊗ **Warning** Double-check, or have a colleague check, the dosage drawn up for pediatric patients, for patients receiving concentrated insulin injection, or patients receiving very small doses; even small errors in dosage can cause serious problems.

- Carefully monitor patients being switched from one type of insulin to another; dosage adjustments are often needed. Human insulins often require smaller doses than beef or pork insulin; monitor cautiously if patients are switched; lispro insulin is given 15 min before a meal. *Levemir* is given in the evening.
- Store insulin in a cool place away from direct sunlight. Refrigeration is preferred. Do not freeze insulin. Insulin prefilled in glass or plastic syringes is stable for 1 wk refrigerated; this is a safe way of ensuring proper dosage for patients with limited vision or who have problems with drawing up insulin.
- Monitor serum glucose levels frequently to determine effectiveness of drug and dosage. Patients can learn to adjust insulin dosage on a sliding scale based on test results.
- Monitor insulin needs during times of trauma or severe stress; dosage adjustments may be needed.

⊗ **Warning** Keep life-support equipment and glucose readily available to deal with ketoacidosis or hypoglycemic reactions.

Teaching points

- Use the same type and brand of syringe; use the same type and brand of insulin to avoid dosage errors. Arrange for proper disposal of syringes.
- Do not change the order of mixing insulins. Rotate injection sites regularly (keep a chart of sites used) to prevent breakdown at injection sites.

- Dosage may vary with activities, stress, or diet. Monitor blood glucose levels, and consult your health care provider if problems arise.
- Store drug in the refrigerator or in a cool place out of direct sunlight; do not freeze insulin.
- If refrigeration is not possible, drug is stable at controlled room temperature and out of direct sunlight for up to 1 month.
- Wear a medical alert tag stating that you have diabetes and are taking insulin so that emergency medical personnel will take proper care of you.
- Avoid alcohol; serious reactions can occur.
- Report fever, sore throat, vomiting, hypoglycemic or hyperglycemic reactions, rash.
- Adjunct to surgical treatment of malignant melanoma in patients older than 18 yr who are free of disease, but at high risk of recurrence with 56 days of surgery
- Treatment of chronic hepatitis C in patients 18 yr and older
- Treatment of chronic hepatitis B in patients 1 yr and older
- Follicular lymphoma, as initial treatment of clinically aggressive follicular non-Hodgkin's lymphoma with other chemotherapy in patient 18 yr and older
- Orphan drug uses: CML, metastatic renal cell carcinoma, ovarian carcinoma, invasive carcinoma of cervix, primary malignant brain tumors, laryngeal papillomatosis, carcinoma in situ of urinary bladder, chronic delta hepatitis, acute hepatitis B

DANGEROUS DRUG

interferon alfa-2b
(IFN- α -2, rIFN- α -2,
a-2-interferon)

(*in ter feer' on*)

Intron-A

PREGNANCY CATEGORY C

Drug classes

Antineoplastic
 Immunomodulator
 Interferon

Therapeutic actions

Inhibits growth of tumor cells; mechanism of action is not clearly understood; prevents the replication of tumor cells and enhances host immune response. Interferons are produced by human leukocytes in response to viral infections and other stimuli. Interferon alfa-2b is produced by recombinant DNA technology using *Escherichia coli*.

Indications

- Hairy cell leukemia in patients 18 yr and older
- Intralesional treatment of condylomata acuminata in patients 18 yr and older
- AIDS-related Kaposi's sarcoma in patients 18 yr and older

Contraindications and cautions

- Contraindicated with allergy to interferon-alfa or any components of the product, severe hepatic impairment.
- Use cautiously with cardiac disease, pulmonary disease, diabetes mellitus prone to ketoacidosis, coagulation disorders, bone marrow depression, pregnancy, neuropsychiatric disorders, autoimmune diseases, lactation.

Available forms

Powder for injection—10, 18, 50 million international units/vial; solution for injection—18, 25 million international units/vial; injection—3, 5, 10 million international units/dose (in multidose pens)

Dosages

Adults

- *Hairy cell leukemia*: 2 million international units/m² subcutaneously or IM three times/wk for up to 6 mo. Continue for several months, depending on clinical and hematologic response. Patient with platelet count less than 50,000/mm³ should not receive IM injection.
- *Condylomata acuminata*: 1 million international units/lesion three times/wk for 3 wk intralesionally. Maximum response occurs 4–8 wk after initiation of therapy. Up to five lesions can be treated at one time. May repeat course at 12–16 wk.

- *Chronic hepatitis C*: 3 million international units subcutaneously or IM, three times/wk for 18–24 mo.
- *AIDS-related Kaposi's sarcoma*: 30 million international units/m² three times/wk subcutaneously or IM. Maintain dosage until disease progresses rapidly or severe intolerance occurs. Do not use the multidose pens or multidose vials due to inappropriate concentration.
- *Chronic hepatitis B*: 30–35 million international units/wk subcutaneously or IM either as 5 million international units daily or 10 million international units three times/wk for 16 wk.
- *Follicular lymphoma*: 5 million international units subcutaneously, three times/wk for 18 mo with other chemotherapy. Adjust dosage based on blood counts.
- *Malignant melanoma*: 20 million international units/m² IV on 5 consecutive days/wk for 4 wk; maintenance, 10 million international units/m² IV three times/wk for 48 wk.

Pediatric patients

- *Chronic hepatitis B*: 3 million international units/m² subcutaneously three times/wk for the first wk, then increase to 6 million international units/m² subcutaneously three times/wk for a total of 16–24 wk (maximum dose, 10 million international units, three times/wk). Adjust dosage based on blood counts.

Pharmacokinetics

Route	Onset	Peak
IM, Subcut.	Rapid	3–12 hr
IV	Rapid	End of infusion

Metabolism: Renal; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Powder for injection is not indicated for pediatric patients because diluent contains benzyl alcohol.

Preparation: Inject diluent (bacteriostatic water for injection) into vial using chart provided by manufacturer; agitate gently, with-

draw with sterile syringe, inject into 100 mL of normal saline.

Infusion: Administer each dose slowly over 20 min.

Adverse effects

- **CNS:** *Dizziness, confusion*, paresthesias, numbness, lethargy, decreased mental status, depression, visual disturbances, sleep disturbances, nervousness
- **CV:** Hypotension, edema, hypertension, chest pain, arrhythmias, palpitations
- **Dermatologic:** *Rash*, dryness or inflammation of the oropharynx, *dry skin, pruritus*, partial alopecia
- **GI:** *Anorexia, nausea*, diarrhea, vomiting, change in taste
- **GU:** Impaired fertility in women, transient impotence
- **Hematologic:** Leukopenia, neutropenia, thrombocytopenia, anemia, decreased Hgb; increased levels of AST, LDH, alkaline phosphatase, bilirubin, uric acid, serum creatinine, BUN, blood sugar, serum phosphorus, neutralizing antibodies; hypocalcemia
- **Other:** *Flulike symptoms*, weight loss, diaphoresis, arthralgia

Nursing considerations

Assessment

- **History:** Allergy to interferon-alfa or product components, cardiac or pulmonary disease, diabetes mellitus prone to ketoacidosis, coagulation disorders, bone marrow depression, pregnancy, lactation
- **Physical:** Weight; T; skin color, lesions; orientation, reflexes; P, BP, edema, ECG; liver evaluation; CBC, blood glucose, LFTs, renal function tests, urinalysis

Interventions

- Obtain laboratory tests (CBC, differential, granulocytes and hairy cells, bone marrow and hairy cells, LFTs) before therapy and monthly during therapy.
- Prepare solution as follows (see manufacturer's guidelines for specific indications and dilutions):

Vial Strength (Million International Units)	Final Amount of Diluent (mL)	Concentration (Million International Units/mL)
3	1	3
5	1	5
10	2	5
25	5	5
10	1	10
50	1	50

- Use bacteriostatic water for injection as diluent. Agitate gently. After reconstitution, stable for 1 mo if refrigerated.
- Administer IM or subcutaneously.
- ⊗ **Black box warning** Monitor for severe reactions, including hypersensitivity reactions and neuropsychiatric, autoimmune, ischemic, and infectious disorders; notify physician immediately; dosage reduction or discontinuation may be necessary; risk of serious to life-threatening reactions.
- Ensure that patient is well hydrated, especially during initiation of treatment.

Teaching points

- Prepare a calendar to check off as drug is given. You and a significant other should learn proper subcutaneous or IM injection technique for outpatient use. Do not change brands of interferon without consulting your health care provider. Arrange for proper disposal of syringes and needles.
- Arrange for regular blood tests to monitor the drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, frequent small meals may help; maintain good nutrition; a dietitian may be able to help; an antiemetic also may be ordered); fatigue, confusion, dizziness, numbness, visual disturbances, depression (use special precautions to avoid injury; avoid driving or using dangerous machinery); flulike symptoms (take drug at bedtime; ensure rest periods for yourself; a medication may be ordered for fever).
- Report fever, chills, sore throat, unusual bleeding or bruising, chest pain, palpitations, dizziness, changes in mental status.

interferon alfacon-1

See Appendix U, *Less commonly used drugs*.

interferon alfa-n3

See Appendix U, *Less commonly used drugs*.

interferon beta-1a (in *ter* 'feer' on)

Avonex, Rebif

PREGNANCY CATEGORY C

Drug classes

Immunomodulator
Interferon
MS drug

Therapeutic actions

Interferons are produced by human leukocytes in response to viral infections and other stimuli; interferon beta-1a blocks replication of viruses and stimulates the host immunoregulatory activities. It is produced by Chinese hamster ovary cells.

Indications

- MS—treatment of relapsing forms of MS to slow accumulation of physical disability and decrease frequency of clinical exacerbations

Contraindications and cautions

- Contraindicated with allergy to beta interferon, human albumin, or any components of product, lactation.
- Use cautiously with chronic progressive MS, suicidal tendencies or mental disorders, cardiac disease, seizures, pregnancy.

Available forms

Powder for injection—33 mcg (*Avonex*), pre-filled syringe—30 mcg/0.5 mL (*Avonex*); injection—8.8 mcg/0.2 mL, 22 mcg/0.5 mL, 44 mcg/0.5 mL (*Rebif*)

Dosages

Adults

30 mcg IM once per week (*Avonex*)—22 or 44 mcg subcutaneously 3 times per week

(*Rebif*)—start with 8.8 mcg 3 times per week and titrate up over 5 wk to full dose of 22–44 mcg.

Pediatric patients

Safety and efficacy not established in patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	12 hr	48 hr	4 days

Metabolism: Hepatic and renal; $T_{1/2}$: 10 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, confusion*, paresthesias, numbness, lethargy, decreased mental status, depression, visual disturbances, sleep disturbances, nervousness, asthenia
- **CV:** Hypotension, edema, hypertension, chest pain, arrhythmias, palpitations
- **Dermatologic:** *Photosensitivity*, rash, alopecia, sweating
- **GI:** *Anorexia, nausea*, diarrhea, vomiting, change in taste
- **GU:** Impairment of fertility in women, transient impotence
- **Hematologic:** Leukopenia, neutropenia, thrombocytopenia, anemia, decreased Hgb; increased levels of AST, LDH, alkaline phosphatase, bilirubin, uric acid, serum creatinine, BUN, blood sugar, serum phosphorus, neutralizing antibodies; hypocalcemia
- **Other:** *Flulike symptoms*, weight loss, diaphoresis, arthralgia, injection site reaction

■ Nursing considerations

Assessment

- **History:** Allergy to beta interferon or any component of product, mental disorders, suicidal tendencies, cardiac disease, seizures, depression, pregnancy, lactation
- **Physical:** Weight; T; skin color; lesions; orientation, reflexes; P, BP, edema, ECG; liver evaluation; CBC, blood glucose, LFTs, renal function tests, urinalysis

Interventions

- Arrange for laboratory tests—CBC, differential, granulocytes and hairy cells and bone marrow hairy cells, and liver function tests—before and monthly during therapy.
- Reconstitute with 1.1 mL of diluent and swirl gently to dissolve; use within 6 hr (*Avonex*).
- Ensure that patient is well hydrated, especially during initiation of treatment.
- Ensure regular follow-up and treatment of MS; this drug is not a cure.
- If flulike symptoms occur, arrange for supportive treatment—rest, acetaminophen for fever and headache, environmental control.
- Carefully monitor patients with any history of mental disorders or suicidal tendencies.
- Counsel female patients to use birth control while using this drug. Drug should not be used in pregnancy.

Teaching points

- *Avonex* needs to be taken weekly. If you or a significant other can give an IM injection: Store vial in refrigerator, reconstitute with 1.1 milliliters of diluent and swirl gently, use within 6 hours. Do not give in the same site each week.
- *Rebif* needs to be given three times per week subcutaneously, preferably at the same time of day and on the same days of the week. Store in refrigerator, reconstitute with solution provided, and discard any solution remaining in the syringe. Rotate injection sites.
- Keep a chart of injection sites to prevent overuse of one area. Arrange for proper disposal of needles and syringes.
- Have regular treatment and follow-up of MS; this drug is not a cure.
- You may experience these side effects: Loss of appetite, nausea, vomiting (use frequent mouth care; eat frequent small meals; maintain good nutrition if possible—dietitian may be able to help; antiemetics may be ordered); fatigue, confusion, dizziness, numbness, visual disturbances, depression (use caution to avoid injury; avoid driving or using dangerous machinery); impotence (usually transient); sensitivity to sunlight (use a sunscreen, wear protective clothing if exposure to sun cannot be prevented).

- Report fever, chills, sore throat, unusual bleeding or bruising, chest pain, palpitations, dizziness, changes in mental status.

interferon beta-1b (rIFN-B)

(*in ter feer' on*)

Betaseron, Extavia

PREGNANCY CATEGORY C

Drug classes

Immune modulator

Interferon

MS drug

Therapeutic actions

Interferons are produced by human leukocytes in response to viral infections and other stimuli; interferon beta-1b block replication of viruses and stimulate the host immunoregulatory activities. Interferon beta-1b is produced by recombinant DNA technology using *Escherichia coli*.

Indications

- Reduce the frequency of clinical exacerbations in relapsing, remitting MS

Contraindications and cautions

- Contraindicated with allergy to beta interferon, human albumin, or product components; lactation.
- Use cautiously with chronic progressive MS, suicidal tendencies, mental disorders, pregnancy.

Available forms

Powder for injection—0.3 mg

Dosages

Adults

0.25 mg subcutaneously every other day; discontinue use if disease is unremitting for more than 6 mo. Initially, 0.0625 mg subcutaneously every other day, weeks 1–2; then 0.125 mg subcutaneously every other day, weeks 3–4; 0.1875 mg subcutaneously every other day, weeks 5–6; target 0.25 mg subcutaneously every other day by week 7.

Pediatric patients

Safety and efficacy not established in patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	1–8 hr

Metabolism: Hepatic and renal; $T_{1/2}$: 8 min–4.3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, confusion*, paresthesias, numbness, lethargy, decreased mental status, depression, visual disturbances, sleep disturbances, nervousness
- **CV:** Hypotension, edema, hypertension, chest pain, arrhythmias, palpitations
- **Dermatologic:** *Photosensitivity*, rash, alopecia, sweating
- **GI:** *Anorexia, nausea*, diarrhea, vomiting, change in taste, abdominal pain
- **GU:** Impairment of fertility in women, transient impotence, metrorrhagia
- **Hematologic:** Leukopenia, neutropenia, thrombocytopenia, anemia, decreased Hgb; increased levels of AST, LDH, alkaline phosphatase, bilirubin, uric acid, serum creatinine, BUN, blood sugar, serum phosphorus, neutralizing antibodies; hypocalcemia
- **Other:** *Flulike symptoms*, weight loss, diaphoresis, arthralgia, injection site reaction

Nursing considerations

Assessment

- **History:** Allergy to interferon beta or any components of the product, mental disorders, suicidal tendencies, pregnancy, lactation
- **Physical:** Weight; T; skin color, lesions; orientation, reflexes; P; BP, edema, ECG; liver evaluation; CBC, blood glucose, LFTs, renal function tests, urinalysis

Interventions

- Obtain laboratory tests (CBC, differential, granulocytes and hairy cells, bone marrow hairy cells, and liver function tests) before therapy and monthly during therapy.

⊗ **Warning** Monitor for severe reactions; notify physician immediately; you may need to reduce dosage or discontinue drug.

- Reconstitute by using a sterile syringe and needle to inject 1.2 mL supplied diluent into vial; gently swirl vial to dissolve drug completely; do not shake. Discard if any particulate matter or discoloration has occurred. After reconstitution, vial contains 0.25 mg/mL solution. Withdraw 1 mL of reconstituted solution with a sterile syringe fitted with a 27-gauge needle. Inject subcutaneously into arms, abdomen, hips, or thighs. Vial is for single use only. Discard any unused portions. Drug is stable at room temperature before reconstitution. Refrigerate reconstituted solution and use within 3 hr.
- Ensure that patient is well hydrated, especially during initiation of treatment.
- Ensure regular follow-up and treatment of MS; this drug is not a cure.

⊗ **Warning** Carefully monitor patients with any mental disorders or suicidal tendencies.

- Counsel female patients to use birth control. Drug should not be used in pregnancy.

Teaching points

- Reconstitute by using a sterile syringe and needle to inject 1.2 milliliters supplied diluent into vial; gently swirl the vial to dissolve the drug completely; do not shake. Discard if any particulate matter or discoloration has occurred. After reconstitution, vial contains 0.25 mg/mL solution. Withdraw 1 milliliter of reconstituted solution with a sterile syringe fitted with a 27-gauge needle. Inject subcutaneously into arms, abdomen, hips, or thighs. Vial is for single use only. Discard any unused portions. Drug is stable at room temperature before reconstitution. Refrigerate reconstituted solution and use within 3 hours.
- Keep a chart of injection sites to prevent overuse of one area. Arrange for proper disposal of needles and syringes.
- Have regular treatment and follow-up of MS; this drug is not a cure.
- Using barrier contraceptives is advised; the drug should not be used during pregnancy.

- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, frequent small meals may help; maintain good nutrition; a dietitian may be able to help; an antiemetic also may be ordered); fatigue, confusion, dizziness, numbness, visual disturbances, depression (use special precautions to avoid injury; avoid driving or using dangerous machinery); impotence (transient and reversible); sensitivity to the sun (use sunscreen and wear protective clothing if exposed to sun).
- Report fever, chills, sore throat, unusual bleeding or bruising, chest pain, palpitations, dizziness, changes in mental status, thoughts of suicide.

interferon gamma-1b

(*in ter feer' on*)

Actimmune

PREGNANCY CATEGORY C

Drug classes

Immunomodulator

Interferon

Therapeutic actions

Interferons are produced by human leukocytes in response to viral infections and other stimuli; interferon gamma-1b block has potent phagocyte-activating effects; acts as an interleukin; produced by *Escherichia coli* bacteria.

Indications

- For reducing the frequency and severity of serious infections associated with chronic granulomatous disease
- For delaying time to disease progression in patients with severe, malignant osteopetrosis
- Orphan drug use: Renal cell carcinoma

Contraindications and cautions

- Contraindicated with allergy to interferon gamma, *E. coli*, or product components; lactation.

- Use cautiously with seizure disorders, compromised CNS function, cardiac disease, myelosuppression, pregnancy.

Available forms

Injection—100 mcg/0.5 mL (2 million international units)

Dosages

Adults

50 mcg/m² (1 million international units/m²) subcutaneously three times/wk in patients who have a body surface area greater than 0.5 m²; 1.5 mcg/kg per dose in patients who have a body surface area less than or equal to 0.5 m² subcutaneously three times/wk. Reduce dose by 50% or hold therapy for severe reactions.

Pediatric patients

Safety and efficacy not established in patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	7 hr

Metabolism: Hepatic and renal; T_{1/2}: 2.9–5.9 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, confusion*, paresthesias, headache, numbness, lethargy, decreased mental status, depression, visual disturbances, sleep disturbances, nervousness
- **CV:** Hypotension, edema, hypertension, chest pain, arrhythmias, palpitations
- **GI:** *Anorexia, nausea*, diarrhea, vomiting, change in taste, pancreatitis
- **Other:** *Flulike symptoms*, weight loss, diaphoresis, arthralgia, injection site reaction, fever, rash, chills, fatigue, myalgia

■ Nursing considerations

Assessment

- **History:** Allergy to interferon gamma, *E. coli*, or product components; pregnancy, lactation, seizure disorders, compromised CNS function, cardiac disease, myelosuppression

- **Physical:** Weight; T; skin color, lesions; orientation, reflexes; P; BP, edema, ECG; liver evaluation; CBC, blood glucose, LFTs, renal function tests, urinalysis

Interventions

- Obtain laboratory tests (CBC, differential, granulocytes and hairy cells, bone marrow and hairy cells, and liver function tests) before therapy and monthly during therapy.
- ⊗ **Warning** Monitor for severe reactions and notify physician immediately; dosage may need to be reduced or drug discontinued.
- Store in refrigerator; each vial is for one use only, discard after that time. Discard any vial that has been unrefrigerated for 12 hr.
- Give drug at bedtime if flulike symptoms become a problem.
- Advise women of childbearing age to use barrier contraceptives; drug should not be used during pregnancy.

Teaching points

- Store in refrigerator; each vial is for one use only; discard after that time. Discard vial that has been unrefrigerated for 12 hours. You and a significant other should learn the proper technique for subcutaneous injections. Product does not contain a preservative.
- Keep a chart of injection sites to prevent overuse of one area. Arrange for proper disposal of needles and syringes.
- Using barrier contraceptives is advised; this drug should not be used in pregnancy.
- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, frequent small meals may help; maintain good nutrition; a dietitian may be able to help; an antiemetic also may be ordered); fatigue, confusion, dizziness, numbness, visual disturbances, depression (use special precautions to avoid injury; avoid driving or using dangerous machinery); flulike symptoms (fever, chills, aches, pains; rest, take acetaminophen for fever and headache; take drug at bedtime).
- Report fever, chills, sore throat, unusual bleeding or bruising, chest pain, palpitations, dizziness, changes in mental status.

iodine thyroid products

(eye' ob dine)

Lugol's Solution, Strong Iodine Solution, Thyro-Block, ThyroShield

PREGNANCY CATEGORY D

Drug class

Thyroid suppressant

Therapeutic actions

Inhibits synthesis of the active thyroid hormones T₃ and T₄ and inhibits the release of these hormones into circulation.

Indications

- **Hyperthyroidism:** Adjunctive therapy with antithyroid drugs in preparation for thyroidectomy, treatment of thyrotoxic crisis, or neonatal thyrotoxicosis
- **Thyroid blocking in a radiation emergency**
- **Unlabeled uses:** Potassium iodide has been effective with Sweet's syndrome, treatment of lymphocutaneous sporotrichosis in combination with a potent topical steroid

Contraindications and cautions

- Contraindicated with allergy to iodides.
- Use cautiously with pulmonary edema, pulmonary TB (sodium iodide); pregnancy; lactation.

Available forms

Solution—5% iodine, 10% potassium iodide; tablets—130 mg potassium iodide; ThyroShield solution—65 mg/mL. *Note:* Potassium iodide tablets and drops are available only to state and federal agencies.

Dosages

Adults and pediatric patients older than 1 yr

- *RDA:* 150 mcg PO.
- *Preparation for thyroidectomy:* 2–6 drops strong iodine solution tid PO for 10 days before surgery.
- *Thyroid blocking in a radiation emergency used as directed by state or local*

health authorities: 1 tablet (130 mg potassium iodide) PO or 6 drops (21 mg potassium iodide/drop) added to one-half glass of liquid per day for 10 days.

- *ThyroShield:* As directed by local public health authorities; don't give more than 1 dose per 24 hr.

For adults and children older than 12 yr and weighing more than 68 kg: 2 mL per 24 hr.

For pediatric patients 12–18 yr weighing less than 68 kg and patients 3–12 yr: 1 mL per 24 hr.

For pediatric patients 1 mo–3 yr: 0.5 mL per 24 hr.

For infants to 1 mo: 0.25 mL per 24 hr.

Pediatric patients younger than 1 yr

- *Thyroid blocking in a radiation emergency:* One-half of a crushed tablet or 3 drops in a small amount of liquid per day for 10 days.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	24 hr	10–15 days	6 wk

Metabolism: Hepatic; T_{1/2}: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **Dermatologic:** *Rash*
- **Endocrine:** Hypothyroidism, hyperthyroidism, goiter
- **GI:** *Swelling of the salivary glands, iodism* (metallic taste, burning mouth and throat, sore teeth and gums, head cold symptoms, stomach upset, diarrhea)
- **Hypersensitivity:** Allergic reactions—fever, joint pains, swelling of the face or body, shortness of breath

Interactions

- **Drug-drug** • Increased risk of hypothyroidism if taken concurrently with lithium

Nursing considerations Assessment

- **History:** Allergy to iodides, pulmonary edema, pulmonary TB, lactation

- **Physical:** Skin color, lesions, edema; R, adventitious sounds; gums, mucous membranes; T₃ and T₄

Interventions

- Test skin for idiosyncrasy to iodine before giving parenteral doses.
- Dilute strong iodine solution with fruit juice or water to improve taste.
- Crush tablets for small children.

⊗ **Warning** Discontinue drug if symptoms of acute iodine toxicity occur: Vomiting, abdominal pain, diarrhea, or circulatory collapse.

Teaching points

- Drops may be diluted in fruit juice or water. Tablets may be crushed.
- Discontinue use and report fever, rash, swelling of the throat, metallic taste, sore teeth and gums, head cold symptoms, severe GI distress, enlargement of the thyroid gland.

▷ iodoquinol (diiodohydroxyquinoline)

(eye oh doe kwinn' ole)

Yodoxin

PREGNANCY CATEGORY C

Drug class

Amebicide

Therapeutic actions

Directly amebicidal by an unknown mechanism; is poorly absorbed in the GI tract and is able to exert its amebicidal action directly in the large intestine.

Indications

- Acute or chronic intestinal amebiasis

Contraindications and cautions

- Contraindicated with hepatic failure, allergy to iodine preparations or 8-hydroxyquinolines.
- Use cautiously with thyroid disease, pregnancy, lactation.

Available forms

Tablets—210, 650 mg; powder—25 g

Dosages

Adults

650 mg tid PO after meals for 20 days.

Pediatric patients

10–13.3 mg/kg/day PO, in 3 divided doses for 20 days. Maximum dose, 650 mg/dose. Do not exceed 1.95 g in 24 hr for 20 days.

Pharmacokinetics

Route	Onset
Oral	Slow

Very poorly absorbed; exerts effects locally in the intestine.

Excretion: Feces

Adverse effects

- **CNS:** Blurring of vision, weakness, fatigue, optic atrophy, peripheral neuropathy, vertigo, numbness, headache
- **Dermatologic:** Rash, pruritus, urticaria
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal cramps, pruritus ani
- **Other:** Thyroid enlargement, fever, chills

Interactions

* **Drug-lab test** • Interferes with many tests of thyroid function; interference may last up to 6 mo after drug is discontinued

■ Nursing considerations

Assessment

- **History:** Hepatic failure, allergy to iodine preparations or 8-hydroxyquinolines, thyroid disease, lactation, pregnancy
- **Physical:** Skin rashes, lesions; check reflexes, ophthalmologic examination; BP, P, R; LFTs, thyroid function tests (PBI, T₃, and T₄)

Interventions

- Administer drug after meals.
- Administer for full course of therapy.
- Maintain patient's nutrition.

Teaching points

- Take drug after meals.

- You may experience these side effects: GI upset, nausea, vomiting, diarrhea (eat frequent small meals; frequent mouth care often helps).
- Report severe GI upset, rash, blurring of vision, unusual fatigue, fever.

ipratropium bromide

(i pra troe' pee um)

Apo-Ipravent (CAN), Atrovent, Atrovent HFA, Gen-Ipratropium (CAN), ratio-Ipratropium (CAN), ratio-Ipratropium UDV (CAN)

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Antimuscarinic
Bronchodilator
Parasympatholytic

Therapeutic actions

Anticholinergic, chemically related to atropine, which blocks vagally mediated reflexes by antagonizing the action of acetylcholine. Causes bronchodilation and inhibits secretion from serous and seromucous glands lining the nasal mucosa.

Indications

- Bronchodilator for maintenance treatment of bronchospasm associated with COPD (solution, aerosol), chronic bronchitis, and emphysema
- Nasal spray: Symptomatic relief of rhinorrhea associated with perennial rhinitis, common cold, seasonal allergic rhinitis

Contraindications and cautions

- Contraindicated with hypersensitivity to atropine or its derivatives, soybean or peanut allergies (aerosol).
- Use cautiously with narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, pregnancy, lactation.

Available forms

Aerosol—17, 18 mcg/actuation; solution for inhalation—0.02%; (500 mcg/vial); nasal

spray—0.03% (21 mcg/spray), 0.06% (42 mcg/spray)

Dosages

Aerosol

Adults

The usual dosage is 2 inhalations qid. Patients may take additional inhalations as required. Do not exceed 12 inhalations/24 hr.

Solution for inhalation

Adults and pediatric patients

12 yr and older

500 mcg tid–qid via nebulizer, with doses 6–8 hr apart.

Nasal spray

Adults and pediatric patients 12 yr and older

2 sprays 0.06% per nostril tid–qid for relief with common cold.

Adults and pediatric patients 6 yr and older

2 sprays 0.03% per nostril bid–tid for rhinitis.

Adults and pediatric patients older than 5 yr

- *Rhinorrhea in seasonal allergic rhinitis:* 2 sprays 0.06% qid for 3 wk.

Pediatric patients 5–11 yr

2 sprays 0.06% per nostril tid for relief with common cold.

Pharmacokinetics

Route	Onset	Peak	Duration
Inhalation	15 min	1–2 hr	3–4 hr

Metabolism: Hepatic, T_{1/2}: 2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Unknown

Adverse effects

- **CNS:** *Nervousness, dizziness, headache, fatigue, insomnia, blurred vision*
- **GI:** *Nausea, GI distress, dry mouth*
- **Respiratory:** *Dyspnea, bronchitis, bronchospasms, URI, cough, exacerbation of symptoms, hoarseness, pharyngitis*
- **Other:** *Back pain, chest pain, allergic-type reactions, palpitations, rash*

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to atropine, soybeans, peanuts (aerosol preparation); acute bronchospasm, narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, pregnancy, lactation
- **Physical:** Skin color, lesions, texture; T; orientation, reflexes, bilateral grip strength; affect; ophthalmic examination; P, BP; R, adventitious sounds; bowel sounds, normal output; normal urinary output, prostate palpation

Interventions

- Protect solution for inhalation from light. Store unused vials in foil pouch.
- Use nebulizer mouthpiece instead of face mask to avoid blurred vision or aggravation of narrow-angle glaucoma.
- Can mix with albuterol in nebulizer for up to 1 hr.
- Ensure adequate hydration; control environment (temperature) to prevent hyperpyrexia.
- Have patient void before taking medication to avoid urinary retention.
- Teach patient proper use of inhaler.

Teaching points

- Use this drug as an inhalation product. Review the proper use of inhaler; for nasal spray, initiation of pump requires 7 actuations; if not used for 24 hours, 2 actuations will be needed before use. If not used for more than 7 days, reprime pump with 7 sprays. Protect from light; do not freeze.
- For *Atrovent HFA*, use only the supplied HFA aerosol inhalation mouthpiece.
- You may experience these side effects: Dizziness, headache, blurred vision (avoid driving or performing hazardous tasks); nausea, vomiting, GI upset (proper nutrition is important; consult with a dietitian to maintain nutrition); cough.
- Report rash, eye pain, difficulty voiding, palpitations, vision changes.

▷ irbesartan

(*er bab sar' tan*)

Avapro

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Antihypertensive
ARB

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the vascular smooth muscle and adrenal gland; this action blocks the vasoconstriction effect of the renin-angiotensin system as well as the release of aldosterone, leading to decreased BP.

Indications

- Treatment of hypertension as monotherapy or in combination with other antihypertensives
- Slowing of the progression of nephropathy in patients with hypertension and type 2 diabetes

Contraindications and cautions

- Contraindicated with hypersensitivity to irbesartan, pregnancy (use during the second or third trimester can cause injury or even death to the fetus).
- Use cautiously with hepatic or renal impairment, hypovolemia, volume or sodium depletion, lactation.

Available forms

Tablets—75, 150, 300 mg

Dosages

Adults

- *Diabetic nephropathy:* 300 mg/day PO as a single dose.
- *Hypertension:* 150 mg PO daily as one dose; adjust slowly to determine effective dose; maximum daily dose, 300 mg.

Pediatric patients 13–16 yr

150 mg/day PO; maximum dose, 300 mg.

Pediatric patients 6–12 yr

75 mg/day PO, titrate to a maximum of 150 mg/day.

Pediatric patients younger than 6 yr

Not recommended.

Volume- or salt-depleted patients

75 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 11–15 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** *Headache, dizziness*, syncope, muscle weakness, sleep disturbance
- **CV:** Hypotension, orthostatic hypotension, flushing
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea*, constipation, dry mouth, dental pain, dyspepsia
- **Respiratory:** *URI symptoms, cough*, sinus disorders
- **Other:** Cancer in preclinical studies, back pain, fever, *fatigue*, neutropenia, **angioedema**

Interactions

* **Drug-drug** • Use caution with drugs metabolized by CYP2C9; anticipated effects may be altered

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to irbesartan, pregnancy, lactation, hepatic or renal impairment, hypovolemia
- **Physical:** Skin lesions, turgor; T; reflexes, affect; BP; R, respiratory auscultation; LFTs, renal function tests

Interventions

- Administer without regard to meals.

⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy; suggest using barrier birth control while using irbesartan; fetal injury and deaths have been reported.

- Find an alternative method of feeding the baby if giving drug to a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.

⊗ **Warning** Alert surgeon and mark the patient's chart with notice that irbesartan is being taken. The blockage of the renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.

- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume (excessive perspiration, dehydration, vomiting, diarrhea); excessive hypotension can occur.

Teaching points

- Take this drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while using this drug; if you become pregnant or desire to become pregnant, consult your health care provider. If you are breast-feeding, you should find another method of feeding the baby.
- You may experience these side effects: Dizziness (more likely to occur in any situation where you may be fluid depleted [extreme heat, exertion]); avoid driving or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important; consult a dietitian); symptoms of upper respiratory tract infection, cough (do not self-medicate; consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy.

DANGEROUS DRUG**irinotecan hydrochloride***(eh rin oh' te kan)*

Camptosar

PREGNANCY CATEGORY D

Drug classes

Antineoplastic

DNA topoisomerase inhibitor

Therapeutic actions

Cytotoxic: Causes death of cells during cell division by causing damage to the DNA strand during DNA synthesis; specific to cells using topoisomerase I, DNA, and irinotecan complexes.

Indications

- First-line therapy in combination with 5-FU and leucovorin for patients with metastatic colon or rectal carcinomas
- Treatment of patients with metastatic colon or rectal cancer whose disease has recurred or progressed following 5-FU therapy
- Unlabeled uses: Cervical cancer, lung cancer, gastric cancer, CNS tumor

Contraindications and cautions

- Contraindicated with allergy to irinotecan, lactation, pregnancy.
- Use cautiously with bone marrow depression, severe diarrhea.

Available forms

Injection—20 mg/mL

Dosages**Adults**

Monitor patient for toxicity at each visit, and modify dose based on patient tolerance.

- **Single-drug use:** 125 mg/m² IV over 90 min once weekly for 4 wk, then a 2-wk rest; repeat 6-wk regimen or 350 mg/m² IV over 90 min once every 3 wk.
- **Combination drugs:** 125 mg/m² IV over 90 min, days 1, 8, 15, and 22 with leucovorin 20 mg/m² IV bolus days 1, 8, 15, and 22 and 5-FU, 500 mg/m² IV days 1, 8, 15,

and 22. Restart cycle on day 43. *Or* 180 mg/m² IV over 90 min days 1, 15, and 29 with leucovorin—200 mg/m² IV over 2 hr days 1, 2, 15, 16, 29, and 30 and 5-FU—400 mg/m² as IV bolus days 1, 2, 15, 16, 29, and 30 followed by 5-FU 600 mg/m² IV infusion over 22 hr on days 1, 2, 15, 16, 29, and 30. Restart cycle on day 43.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	1–2 hr

Metabolism: Hepatic; T_{1/2}: 6–12 hr

Distribution: Crosses placenta; may enter breast milk, binds to albumin

Excretion: Bile, urine

IV FACTS

Preparation: Dilute in 5% dextrose injection or 0.9% sodium chloride injection to final concentration of 0.12–2.8 mg/mL. Store diluted drug protected from light; use within 48 hr if refrigerated or within 24 hr if at room temperature (5% dextrose only). Store vials at room temperature, protected from light.

Infusion: Infuse total dose over 90 min.

Incompatibilities: Do not add any other drugs to solution.

Adverse effects

- **CNS:** Insomnia, dizziness, asthenia, confusion
- **Dermatologic:** Alopecia, sweating, flushing, rashes
- **GI:** Nausea, vomiting, diarrhea, constipation, stomatitis, flatulence, dyspepsia, abdominal pain, anorexia, mucositis
- **Hematologic:** Neutropenia, leukopenia, anemia, thrombocytopenia
- **Respiratory:** Dyspnea, cough, rhinitis
- **Other:** Fatigue, malaise, pain, infections, fever, cramping, weight loss, pain, infection

Interactions

★ **Drug-drug** • Irinotecan used with other antineoplastics may cause excessive diarrhea, myelosuppression, and other associated adverse reactions • Increased risk of dehydration

if patient is also on diuretics; withhold diuretics if patient has nausea and vomiting • Risk of severe toxicity with ketoconazole; combination is contraindicated

• **Drug-alternative therapy** • May decrease irinotecan plasma levels and efficacy if taken with St. John's wort; combination is contraindicated

■ Nursing considerations

Assessment

- **History:** Allergy to irinotecan, diarrhea, pregnancy, lactation, bone marrow depression
- **Physical:** T; skin lesions, color, turgor; orientation, affect, reflexes; R; abdominal examination, bowel sounds; CBC with differential

Interventions

⊗ **Black box warning** Obtain CBC before each infusion; do not give to patients with a baseline neutrophil count of less than 1,500 cells/mm²; consult with physician for reduction in dose or withholding of drug if bone marrow depression becomes evident; severe bone marrow depression can occur.

⊗ **Warning** Ensure that patient is not pregnant before beginning therapy; advise the use of barrier contraceptives.

- Monitor infusion site; if extravasation occurs, flush with sterile water and apply ice.

⊗ **Black box warning** Monitor for diarrhea; assess hydration and arrange to decrease dose if 4–6 stools/day; omit a dose if 7–9 stools/day; if 10 or more stools/day, consult a physician. Early diarrhea may be prevented or ameliorated by atropine 0.25–1 mg IV or subcutaneously; treat late diarrhea lasting more than 24 hr with loperamide; late diarrhea can be severe to life-threatening.

- Protect patient from any exposure to infection.
- Arrange for wig or other appropriate head covering when alopecia occurs.

Teaching points

- This drug can only be given by IV infusion, which will run over 90 minutes. Mark calendar with days to return for infusion. A blood test will be required before each dose.

- This drug cannot be used during pregnancy; using barrier contraceptives is suggested.
- You may experience these side effects: Increased susceptibility to infection (avoid crowded areas or people with known infections; report any injury); nausea, vomiting (eat frequent small meals; medication may be ordered); headache; loss of hair (arrange for a wig or other head covering; it is important to protect the head from extreme temperatures); diarrhea.
- Report pain at injection site, any injury or illness, fatigue, severe nausea or vomiting, increased, severe, or bloody diarrhea.

▽ iron dextran

DexFerrum, INFeD, Inufer (CAN)

PREGNANCY CATEGORY C

Drug class

Iron preparation

Therapeutic actions

Elevates the serum iron concentration and is then converted to Hgb or trapped in the reticuloendothelial cells for storage and eventual conversion to usable form of iron.

Indications

- Treatment of iron deficiency anemia only when oral administration of iron is unsatisfactory or impossible
- Unlabeled use: May be required for patients receiving epoetin therapy

Contraindications and cautions

- Contraindicated with allergy to iron dextran, anemias other than iron deficiency anemia, acute phase of infectious renal disease.
- Use cautiously with impaired hepatic function, rheumatoid arthritis, allergies, asthma, lactation, pregnancy.

Available forms

Injection—50 mg/mL

Dosages

Adults and pediatric patients

- **Iron deficiency anemia:** Administer a 0.5 mL IM or IV test dose before therapy. Base dosage on hematologic response with frequent Hgb determinations.

For patients weighing more than 15 kg:

Use the following formula:

Dose (mL) = $[0.0442 (\text{desired Hgb} - \text{observed Hgb}) \times \text{LBW}] + (0.26 \times \text{LBW})$, where Hgb = Hgb in g/dL and LBW = lean body weight.

Determine LBW as follows:

For males: LBW = 50 kg + 2.3 kg for each inch of patient's height over 5 ft.

For females: LBW = 45.5 kg + 2.3 kg for each inch of patient's height over 5 ft.

For children 5–15 kg and older than 4 mo:

Use the following formula:

Dose (mL) = $0.0442 (\text{desired Hgb} - \text{observed Hgb}) \times W + (0.26 \times W)$, where W = actual weight in kg.

- **Iron replacement for blood loss:** Determine dosage by the following formula: Replacement iron (in mg) = blood loss (in mL) \times Hct

IM

Inject only into the upper outer quadrant of the buttocks. Give test dose of 0.5 mL IM. If tolerated, do not exceed 0.5 mL (25 mg) for infants weighing less than 5 kg; 1 mL for those more than 5 to less than 10 kg; 2 mL for all others.

IV injection

Give a test dose of 0.5 mL over at least 5 min before beginning therapy. May give up to 2 mL per daily dose (100 mg). Give slowly at 50 mg/min or less, undiluted.

Pharmacokinetics

Route	Onset	Peak
IM	Slow	1–2 wk

Metabolism: $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Blood loss

IV FACTS

Preparation: *Intermittent IV:* Calculate dose from formula. Give individual doses of 2 mL

or less per day. Use single-dose ampules without preservatives. *IV infusion:* Dilute needed dose in 200–250 mL of normal saline.

Infusion: *Intermittent IV:* Give undiluted and slowly—1 mL or less/min. *IV infusion (not approved by the FDA):* Infuse over 1–2 hr after a test dose of 25 mL. Do not mix with other drugs or add to parenteral nutrition.

Adverse effects

- **CNS:** Headache, backache, dizziness, malaise, transitory paresthesias, seizures, numbness, syncope, unconsciousness
- **CV:** Hypotension, chest pain, shock, tachycardia, **cardiac arrest**, hypertension, arrhythmias
- **GI:** *Nausea, vomiting*, diarrhea, abdominal pain, altered taste
- **Hypersensitivity:** Hypersensitivity reactions, including **anaphylaxis**; dyspnea, urticaria, rash and itching, arthralgia and myalgia, fever, sweating, purpura
- **Local:** *Pain, inflammation and sterile abscesses at injection site, brown skin discoloration (IM use); lymphadenopathy, local phlebitis, peripheral vascular flushing (IV administration)*
- **Other:** *Arthritic reactivation*, fever, shivering, sweating, rash, pruritus, arthritis, iron overload, cyanosis

Interactions

• **Drug-drug** • Delayed response to iron dextran therapy in patients taking chloramphenicol

• **Drug-lab test** • Use caution when interpreting serum iron levels when done within 4 hr of iron dextran injection • Serum may be discolored to a brownish color following IV injection • Bone scans using Tc-99m diphosphonate may have abnormal areas following IM injection

Nursing considerations

Assessment

- **History:** Allergy to iron dextran, anemias other than iron deficiency anemia, impaired liver function, rheumatoid arthritis, allergies or asthma, lactation, pregnancy
- **Physical:** Skin lesions, color; T; injection site examination; range of motion, joints;

R, adventitious sounds; liver evaluation; CBC, Hgb, Hct, serum ferritin assays, LFTs

Interventions

- Verify that patient has iron deficiency anemia before treatment.
- Arrange treatment of underlying cause of iron deficiency anemia.
- Give IM injections using the Z-track technique (displace skin laterally before injection) to avoid injection into the tissue and tissue staining. Use a large-gauge needle; if patient is standing, have patient support self on leg not receiving the injection. If patient is lying down, have the injection site uppermost.

⊗ **Black box warning** Monitor patient for hypersensitivity reactions; test dose is highly recommended. Keep epinephrine readily available in case severe hypersensitivity reaction occurs.

- Monitor serum ferritin levels periodically; these correlate well with iron stores. Do not give with oral iron preparations.
- Caution patients with rheumatoid arthritis that acute exacerbation of joint pain and swelling may occur; provide appropriate comfort measures.

Teaching points

- Treatment will end if anemia is corrected.
- Have periodic blood tests during therapy to assess drug response and determine appropriate dosage.
- Do not take oral iron products or vitamins with iron added while using this drug.
- You may experience these side effects: Pain at injection site, headache, joint and muscle aches, GI upset.
- Report difficulty breathing, pain at injection site, rash, itching.

iron sucrose

See Appendix U, *Less commonly used drugs*.

isocarboxazid

See Appendix U, *Less commonly used drugs*.

isoniazid (isonicotinic acid hydrazide, INH)

(eye soe nye' a zid)

Isotamine (CAN), Nydrizid

PREGNANCY CATEGORY C

Drug class

Antituberculotic

Therapeutic actions

Bactericidal: Interferes with lipid and nucleic acid biosynthesis in actively growing tubercle bacilli.

Indications

- TB, all forms in which organisms are susceptible
- Prophylaxis in specific patients who are tuberculin reactors or household members of recently diagnosed tuberculars or who are considered to be high risk (patients with HIV, IV drug users, recent converters [5 mm or more increase on skin test within 2 yr in patients younger than 35 yr or 15 mm or more increase in patients older than 35 yr] and children younger than 4 yr with 10 mm or more induration on purified protein derivative tuberculin skin test)
- Unlabeled use of 300–400 mg/day, increased over 2 wk to 20 mg/kg/day, for improvement of severe tremor in patients with MS

Contraindications and cautions

- Contraindicated with allergy to isoniazid, isoniazid-associated hepatic injury or other severe adverse reactions to isoniazid, acute hepatic disease.
- Use cautiously with renal impairment, lactation, pregnancy.

Available forms

Tablets—100, 300 mg; syrup—50 mg/5 mL; injection—100 mg/mL

Dosages

Adults

- **Treatment of active TB:** 5 mg/kg/day (up to 300 mg) PO in a single dose, with other effective drugs or 15 mg/kg (up to 900 mg) PO two or three times per week. “First-line treatment” is considered to be 300 mg INH plus 600 mg rifampin, each given in a single daily oral dose. Consult manufacturer’s guidelines for other possible combinations.
- **Prophylaxis for TB:** 300 mg/day PO in a single dose.
- Concomitant administration of 10–50 mg/day of pyridoxine is recommended for those who are malnourished or predisposed to neuropathy (alcoholics, diabetics).

Pediatric patients

- **Treatment of active TB:** 10–15 mg/kg/day (up to 300 mg) PO in a single dose, with other effective drugs or 20–40 mg/kg (up to 900 mg/day) two or three times per week.
- **Prophylaxis for TB:** 10 mg/kg/day (up to 300 mg) PO in a single dose.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 1–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Peripheral neuropathy*, seizures, toxic encephalopathy, optic neuritis and atrophy, memory impairment, toxic psychosis
- **GI:** *Nausea, vomiting, epigastric distress*, bilirubinemia, bilirubinuria, *elevated AST*, ALT levels, jaundice, **hepatitis**
- **Hematologic:** Agranulocytosis, hemolytic or aplastic anemia, **thrombocytopenia**, eosinophilia, pyridoxine deficiency, pellagra, hyperglycemia, metabolic acidosis, hypocalcemia, hypophosphatemia due to altered vitamin D metabolism
- **Hypersensitivity:** Fever, skin eruptions, lymphadenopathy, vasculitis
- **Local:** *Local irritation at IM injection site*
- **Other:** Gynecomastia, rheumatic syndrome, SLE syndrome

Interactions

- *** Drug-drug** • Increased incidence of isoniazid-related hepatitis with alcohol and possibly if taken in high doses with rifampin
- Increased serum levels of phenytoin
- Increased effectiveness and risk of toxicity of carbamazepine
- Risk of high output renal failure in fast INH acetylators with enflurane
- Increased risk of hepatotoxicity with acetaminophen, rifampin
- *** Drug-food** • Risk of sympathetic-type reactions with tyramine-containing foods and exaggerated response (headache, palpitations, sweating, hypotension, flushing, diarrhea, itching) to histamine-containing food (fish [skipjack, tuna] sauerkraut juice, yeast extracts)

Nursing considerations

Assessment

- **History:** Allergy to isoniazid, isoniazid-associated adverse reactions; acute hepatic disease; renal impairment; lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensitivity, bilateral grip strength; ophthalmologic examination; R, adventitious sounds; liver evaluation; CBC, LFTs, renal function tests, blood glucose

Interventions

- Give on an empty stomach, 1 hr before or 2 hr after meals; may be given with food if GI upset occurs.
- Give in a single daily dose. Reserve parenteral dose for patients unable to take oral medications.
- Decrease foods containing tyramine or histamine in patient’s diet.
- Consult with physician and arrange for daily pyridoxine in diabetic, alcoholic, or malnourished patients; also for patients who develop peripheral neuritis, and those with HIV.
- **⊗ Warning** Discontinue drug, and consult with physician if signs of hypersensitivity occur.
- **⊗ Black box warning** Monitor liver enzymes monthly; risk of serious to fatal hepatitis.

Teaching points

- Take this drug in a single daily dose. Take drug on an empty stomach, 1 hour before or 2 hours after meals. If GI distress occurs, may be taken with food.
- Take this drug regularly; avoid missing doses; do not discontinue without first consulting your health care provider.
- Do not drink alcohol, or drink as little as possible. There is an increased risk of hepatitis if these two drugs are combined.
- Avoid foods containing tyramine; consult a dietitian to obtain a list of foods containing tyramine or histamine.
- Have periodic medical check-ups, including an eye examination and blood tests, to evaluate the drug effects.
- You may experience these side effects: Nausea, vomiting, epigastric distress (take drug with meals); skin rashes or lesions; numbness, tingling, loss of sensation (use caution to prevent injury or burns).
- Report weakness, fatigue, loss of appetite, nausea, vomiting, yellowing of skin or eyes, darkening of the urine, numbness or tingling in hands or feet.

⚠ DANGEROUS DRUG

isoproterenol
(eye soe proe ter' e nole)

**isoproterenol
hydrochloride**

Isuprel

PREGNANCY CATEGORY C

Drug classes

Antiasthmatic
Beta₁- and beta₂-adrenergic agonist
Bronchodilator
Sympathomimetic
Vasopressor in shock

Therapeutic actions

Effects are mediated by beta₁- and beta₂-adrenergic receptors; acts on beta₁-receptors in the heart to produce positive chronotropic and positive inotropic effects and to increase automaticity; acts on beta₂-receptors in the

bronchi to cause bronchodilation; acts on beta₂-receptors in smooth muscle in the walls of blood vessels in skeletal muscle and splanchnic beds to cause dilation (cardiac stimulation, vasodilation may be adverse effects when drug is used as bronchodilator).

Indications

- Management of bronchospasm during anesthesia; a vasopressor in shock
- Adjunct in the management of shock (hypoperfusion syndrome) and in the treatment of cardiac standstill or arrest; carotid sinus hypersensitivity; heart block; Stokes-Adams syndrome; heart failure; ventricular tachycardia and ventricular arrhythmias that require increased inotropic activity for therapy

Contraindications and cautions

- Contraindicated with hypersensitivity to isoproterenol; tachyarrhythmias, tachycardia caused by digoxin toxicity; acute angina; general anesthesia with halogenated hydrocarbons or cyclopropane (sensitize the myocardium to catecholamines); labor and delivery (may delay second stage of labor; can accelerate fetal heart beat; may cause hypoglycemia, hypokalemia, pulmonary edema in the mother, and hypoglycemia in the neonate).
- Use cautiously with unstable vasomotor system disorders, hypertension, coronary insufficiency, history of CVA, COPD patients with degenerative heart disease, diabetes mellitus, hyperthyroidism, history of seizure disorders, psychoneuroses, lactation, pregnancy.

Available forms

Injection—0.02 mg/mL (1:50,000), 0.2 mg/mL (1:5,000)

Dosages

Adults

Injection

- *Bronchospasm during anesthesia:* 0.01–0.02 mg (0.5–1 mL of diluted solution) bolus IV; repeat when necessary.
- *Shock:* 0.5–5 mcg/min; infuse IV at a rate adjusted on the basis of HR, CVP, systemic BP, and urine flow.

- **Cardiac standstill and arrhythmias:** IV injection, 0.02–0.06 mg using diluted solution. IV infusion, 5 mcg/min using diluted solution.

Pediatric patients

There are no well-controlled studies in children. The American Heart Association recommends an infusion of 0.1 mcg/kg/min as an initial dose; range, 0.1–1 mcg/kg/min.

- **Bronchospasm during anesthesia (patients 7–19 yr):** 0.05–0.17 mcg/kg/min. Maximum dose, 1.3–2.7 mcg/kg/min. Postoperative cardiac patients will need a lower dose than patients with asthma.

Geriatric patients

Patients older than 60 yr are more likely to experience side effects; use with extreme caution.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	1–2 min

Metabolism: Tissue; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute the 1:5,000 solutions for IV injection or infusion with 5% dextrose or sodium chloride injection; a convenient dilution is 1 mg isoproterenol (5 mL) in 500 mL diluent (final concentration 1:500,000 or 2 mcg/mL).

Infusion: Dosage of 5 mcg/min is provided by infusing 2.5 mL/min; adjust dosage to keep heart rate less than 110 beats per min.

Incompatibilities: Do not combine with aminophylline, barbiturates, lidocaine, sodium bicarbonate.

Adverse effects

- **CNS:** Restlessness, apprehension, anxiety, fear, CNS stimulation, hyperkinesia, insomnia, tremor, drowsiness, irritability, weakness, vertigo, headache
- **CV:** Cardiac arrhythmias, tachycardia, palpitations, anginal pain, changes in BP, paradoxical precipitation of Stokes-Adams seizures during normal sinus rhythm or transient heart block

- **GI:** Nausea, vomiting, heartburn, unusual or bad taste, swelling of the parotid glands
- **Respiratory:** Respiratory difficulties, dyspnea, pulmonary edema, coughing, bronchospasm, paradoxical airway resistance with repeated, excessive use
- **Other:** Sweating, pallor; flushing, muscle cramps, blurred vision

Interactions

• **Drug-drug** • Increased peripheral vasoconstriction if given with ergot alkaloids; if this combination is used, monitor BP and perfusion carefully • Increased BP response may occur if combined with TCAs, halogenated hydrocarbon anesthetics, oxytocic drugs; monitor patient closely and adjust dosage as needed • Possible arrhythmias with epinephrine; do not administer together

Nursing considerations Assessment

- **History:** Hypersensitivity to isoproterenol; tachyarrhythmias; general anesthesia with halogenated hydrocarbons or cyclopropane; unstable vasomotor system disorders; hypertension; CAD; history of stroke; COPD patients with degenerative heart disease; diabetes mellitus; hyperthyroidism; seizure disorders; psychoneurotic disorders; labor and delivery; lactation
- **Physical:** Weight; skin color, T, turgor; orientation, reflexes; P, BP; R, adventitious sounds; blood and urine glucose, serum electrolytes, thyroid function tests, ECG

Interventions

- Protect drug from light, and keep in original carton until use.
- Use minimal doses for minimum periods; drug tolerance can occur with prolonged use.
- ⊗ **Warning** Keep a beta-adrenergic blocker (a cardioselective beta-adrenergic blocker, such as atenolol, should be used in patients with respiratory distress) readily available in case cardiac arrhythmias occur.

Teaching points

- This drug is given IV.
- You may experience these side effects: Drowsiness, dizziness, inability to sleep (use caution);

nausea, vomiting (eat frequent small meals); anxiety; rapid heart rate.

- Report chest pain, dizziness, insomnia, weakness, tremor or irregular heart beat.

▷ isosorbide nitrates

(eye soe sor' bide)

isosorbide dinitrate

Apo-ISDN (CAN), Dilatrate SR **ONC**, Isochron **ONC**, Isordil Titradose

isosorbide mononitrate

Imdur **ONC**, ISMO, Monoket

PREGNANCY CATEGORY C

PREGNANCY CATEGORY B
(IMDUR, MONOKET)

Drug classes

Antianginal
Nitrate
Vasodilator

Therapeutic actions

Relaxes vascular smooth muscle with a resultant decrease in venous return and decrease in arterial BP, which reduces left ventricular workload and decreases myocardial oxygen consumption.

Indications

- Dinitrate: Treatment and prevention of angina pectoris
- Mononitrate: Prevention of angina pectoris; treatment of angina pectoris (*Monoket*)
- Unlabeled use (dinitrate): Used with hydralazine in black patients with advanced heart failure; acute angle-closure glaucoma in emergent situations; achalasia
- Unlabeled use (mononitrate): Used with nadolol to prevent recurrent variceal bleeding

Contraindications and cautions

- Contraindicated with allergy to nitrates, severe anemia, head trauma, cerebral hemorrhage, hypertrophic cardiomyopathy, narrow-angle glaucoma, orthostatic hypotension.
- Use cautiously with pregnancy, lactation, acute MI, heart failure.

Available forms

Dinitrate: Tablets—5, 10, 20, 30, 40 mg; ER tablets **ONC**—40 mg; SR capsules **ONC**—40 mg; SL tablets—2.5, 5 mg
Mononitrate: Tablets—10, 20 mg; ER tablets **ONC**—30, 60, 120 mg

Dosages

Adults

To avoid tolerance to drug, take short-acting products bid or tid with last dose no later than 7 PM and ER or SR products once daily or bid at 8 AM and 2 PM. This creates a nitrate-free period.

Isosorbide dinitrate

- *Angina pectoris*: Starting dose, 2.5–5 mg sublingual or 5- to 20-mg oral tablets. For maintenance, 10–40 mg every 6 hr or tid oral tablets or capsules; SR or ER, initially 40 mg, then 40–80 mg PO every 8–12 hr.
- *Acute prophylaxis*: Initial dosage, 2.5–5 mg sublingually every 2–3 hr. Give 15 min before activity that may cause angina.

Isosorbide mononitrate

- *Prevention of angina*: 20 mg PO bid given 7 hr apart. In smaller patients, start with 5 mg (one-half of 10-mg tablet) but then increase to at least 10 mg by day 2 or 3 of therapy. Give first dose when waking and second dose 7 hr later. This creates a nitrate-free period and minimizes tolerance to drug. ER tablets—30–60 mg/day PO may be increased to 120 mg/day if needed.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Oral	15–45 min	4–6 hr
Oral SR, ER	Up to 4 hr	6–8 hr
SL	2–5 min	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 5 min, then 2–5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS**: *Headache, apprehension, restlessness, weakness, vertigo, dizziness, faintness*

- **CV:** *Tachycardia, retrosternal discomfort, palpitations, hypotension, syncope, collapse, orthostatic hypotension, angina, rebound hypertension, atrial fibrillation*
- **Dermatologic:** Rash, exfoliative dermatitis, cutaneous vasodilation with flushing
- **GI:** *Nausea, vomiting, incontinence of feces, abdominal pain, diarrhea, ulcer*
- **GU:** Dysuria, impotence, urinary frequency
- **Other:** Muscle twitching, pallor, perspiration, cold sweat, arthralgia, bronchitis, thrombocytopenia

Interactions

★ **Drug-drug** • Increased systolic BP and decreased antianginal effect if taken concurrently with ergot alkaloids

★ **Drug-lab test** • False report of decreased serum cholesterol if done by the Zlatkis-Zak color reaction

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Isordil* (isosorbide) and *Plendil* (felodipine); use caution.

Assessment

- **History:** Allergy to nitrates, severe anemia, GI hypermobility, head trauma, cerebral hemorrhage, hypertrophic cardiomyopathy, pregnancy, lactation
- **Physical:** Skin color, T, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; R, adventitious sounds; liver evaluation, normal output; CBC, Hgb

Interventions

- Give sublingual preparations under the tongue or in the buccal pouch; discourage the patient from swallowing.
- Create a nitrate-free period to minimize tolerance.
- ⊗ **Warning** Give chewable tablets slowly, only 5 mg initially, because severe hypotension can occur; ensure that patient does not chew or crush SR or ER preparations.

- Give oral preparations on an empty stomach, 1 hr before or 2 hr after meals; take with meals if severe, uncontrolled headache occurs.

⊗ **Warning** Keep life-support equipment readily available if overdose occurs or cardiac condition worsens.

⊗ **Warning** Gradually reduce dose if anginal treatment is being terminated; rapid discontinuation can lead to problems of withdrawal.

Teaching points

- Place sublingual tablets under your tongue or in your cheek; do not chew, swallow, or crush the tablet. Take the isosorbide before chest pain begins, when activities or situation may precipitate an attack. Take oral isosorbide dinitrate on an empty stomach, 1 hour before or 2 hours after meals; do not chew or crush extended- or sustained-release preparations; do not take isosorbide mononitrate to relieve acute anginal episodes.
- You may experience these side effects: Dizziness, light-headedness (may be transient; use care to change positions slowly); headache (lie down in a cool environment, rest; over-the-counter preparations may not help; take drug with meals); flushing of the neck or face (reversible).
- Report blurred vision, persistent or severe headache, rash, more frequent or more severe angina attacks, fainting.

▷ isotretinoin (13-*cis*-retinoic acid, vitamin A metabolite)

(eye so *tret'* i noyn)

Amnesteem ONC, Claravis ONC,
Sotret ONC

PREGNANCY CATEGORY X

Drug classes

Acne product
Retinoid (first generation)
Vitamin metabolite

Therapeutic actions

Decreases sebaceous gland size and inhibits sebaceous gland differentiation, resulting in

a reduction in sebum secretion; inhibits follicular keratinization; exact mechanism of action is not known.

Indications

- Treatment of severe recalcitrant nodular acne unresponsive to conventional treatments
- Unlabeled uses: Treatment of cutaneous disorders of keratinization, cutaneous T-cell lymphoma and leukoplakia, psoriasis, rosacea, pityriasis rubra pilaris, keratoacanthomas

Contraindications and cautions

- Contraindicated with allergy to isotretinoin, parabens, or product component; pregnancy (has caused severe fetal malformations and spontaneous abortions); lactation.
- Use cautiously with history of severe depression, suicidal ideation, diabetes mellitus, pediatric patients with genetic predisposition to age-related osteoporosis, a history of childhood osteoporosis, osteomalacia, other diseases of bone metabolism.

Available forms

Capsules **ORIG**—10, 20, 30, 40 mg; soft gel capsules **ORIG**—10, 20, 30, 40 mg

Dosages

Adults and pediatric patients 12 yr and older

Individualize dosage based on side effects and disease response. Initial dose, 0.5–1 mg/kg/day PO; usual dosage range is 0.5–2 mg/kg/day divided into two doses for 15–20 wk. Maximum daily dose, 2 mg/kg. If a second course of therapy is needed, allow a rest period of at least 8 wk between courses. Must take with food or absorption of drug will decrease.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2.9–3.2 hr	6–20 hr

Metabolism: Hepatic; $T_{1/2}$: 10–20 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Letargy, insomnia, fatigue, headache*, pseudotumor cerebri (papilledema, headache, nausea, vomiting, visual disturbances); depression, psychoses, **suicide**, aggressive or violent behavior
- **CV:** Palpitations, tachycardia, vascular thrombotic disease
- **Dermatologic:** *Skin fragility, dry skin, pruritus, rash*, thinning of hair, peeling of palms and soles, skin infections, photosensitivity, nail brittleness, petechiae
- **EENT:** *Cheilitis, eye irritation, conjunctivitis*, corneal opacities, epistaxis
- **GI:** *Nausea, vomiting, abdominal pain*, anorexia, inflammatory bowel disease, dry mouth, gum irritation
- **GU:** *White cells in the urine, proteinuria, hematuria*
- **Hematologic:** Elevated sedimentation rate, hypertriglyceridemia, abnormal liver function tests, increased fasting serum glucose
- **Musculoskeletal:** Skeletal hyperostosis, arthralgia, bone and joint pain and stiffness
- **Respiratory:** *Epistaxis, dry nose, bronchospasms*

Interactions

- *** Drug-drug:** Increased toxicity when taken with vitamin A; avoid this combination
- Risk of increased adverse effects if combined with systemic corticosteroids, phenytoin; use caution if these combinations are used
- Risk of pseudotumor cerebri with concomitant tetracycline use

■ Nursing considerations

Assessment

- **History:** Allergy to isotretinoin, parabens, or product component; diabetes mellitus; pregnancy; lactation; history of depression
- **Physical:** Skin color, lesions, turgor, texture; joint range of motion; orientation, reflexes, affect, ophthalmologic examination; mucous membranes, bowel sounds; serum triglycerides, HDL, sedimentation rate, CBC and differential, urinalysis, pregnancy test

Interventions

⊗ **Black box warning** Ensure that patient reads and signs the consent form that comes with this drug. Place this form in the patient's permanent record.

⊗ **Black box warning** Ensure that patient is not pregnant before therapy; test for pregnancy within 2 wk of beginning therapy. Advise patient to use two forms of contraception starting 1 mo before therapy, during treatment, and for 1 mo after treatment is discontinued. Patient must sign consent form acknowledging this information; form should be kept in patient's medical record. Pharmacists must register patients in iPLEDGE program before dispensing drug. Patient may obtain no more than a 30-day supply.

- Do not give a second course of therapy within 8 wk of first course.
- Give drug with meals; do not crush capsules.
- Do not give vitamin supplements that contain vitamin A.

⊗ **Warning** Discontinue drug if signs of papilledema occur; consult with a neurologist for further care.

⊗ **Warning** Discontinue drug at any indication of severe depression or psychoses. Patient must sign informed consent concerning risk of suicide; form should be kept in patient's medical record.

- Discontinue drug if visual disturbances occur; arrange for an ophthalmologic examination.

⊗ **Warning** Discontinue drug if abdominal pain, rectal bleeding, or severe diarrhea occurs; consult with physician.

- Monitor triglycerides during therapy; if elevation occurs, institute measures to lower serum triglycerides: Reduce weight, reduce dietary fat, exercise, increase intake of insoluble fiber, decrease alcohol consumption.
- Monitor diabetic patients with frequent blood glucose determinations.
- Do not allow blood donation from patients taking isotretinoin due to the teratogenic effects of the drug.

Teaching points

- Only 1 month's prescription can be given at a time. You will need to complete a consent form before this drug is prescribed.
- Take drug with meals; do not crush capsules.

- Transient flare-ups of acne may occur at beginning of therapy.
- There is a risk of injury in pediatric patients who participate in sports that involve repetitive impact; parents should monitor activity and alert coaches.
- Use two forms of contraception 1 month before treatment, during treatment, and for 1 month after treatment is discontinued. This drug has been associated with severe birth defects and miscarriages; it is contraindicated in pregnant women. If you think that you are pregnant, consult your health care provider immediately. You must sign a consent form stating your understanding of the need for contraception.
- Do not donate blood while using this drug because of its potential effects on the fetus of a blood recipient.
- Avoid vitamin supplements containing vitamin A; serious toxic effects may occur. Limit your consumption of alcohol. You also may need to limit your intake of fats and increase exercise to limit drug effects on blood triglyceride levels.
- Avoid wax epilation and skin resurfacing during and for 6 months after therapy; scarring could occur.
- You may experience these side effects: Dizziness, lethargy, headache, visual changes (avoid driving or performing tasks that require alertness); sensitivity to the sun (avoid sunlamps, exposure to the sun; use sunscreens, protective clothing); diarrhea, abdominal pain, loss of appetite (take drug with meals); dry mouth (suck sugarless lozenges); eye irritation and redness, inability to wear contact lenses; dry skin, itching, redness, nose bleeds.
- Report headache with nausea and vomiting, severe diarrhea or rectal bleeding, visual difficulties, depression, suicidal ideation, violent or aggressive behavior.

 **isradipine**
(eyes *rad'* i *peen*)

DynaCirc, DynaCirc CR ORC

PREGNANCY CATEGORY C

Drug classes

Antihypertensive

Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; calcium is involved in the generation of the action potential in specialized automatic and conducting cells in the heart and in arterial smooth muscle and excitation-contraction coupling in cardiac muscle cells; inhibition of transmembrane calcium flow results in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, the depression of myocardial contractility, and the dilation of coronary arteries and arterioles and peripheral arterioles. These effects lead to decreased cardiac work, cardiac energy consumption, and BP.

Indications

- Management of hypertension alone or in combination with thiazide-type diuretics

Contraindications and cautions

- Contraindicated with allergy to isradipine; sick sinus syndrome, except with ventricular pacemaker; heart block (second or third degree); IHSS; cardiogenic shock.
- Use cautiously in the elderly and with hypotension, impaired hepatic or renal function (repeated doses may accumulate), pregnancy, lactation, heart failure.

Available forms

Capsules—2.5, 5 mg; CR tablets **ORC**—5, 10 mg

Dosages**Adults**

Initial dose of 2.5 mg PO bid. An antihypertensive effect is usually seen within 2–3 hr; maximal response may require 2–4 wk. Dosage may be increased in increments of 5 mg/day at 2- to 4-wk intervals. Maximum dose, 20 mg/day. CR: 5–10 mg PO daily as monotherapy or combined with thiazide diuretic.

Pediatric patients

Safety and efficacy are not established.

Geriatric patients and patients with hepatic or renal impairment

Starting dose is 5 mg/day PO for CR tablets; 2.5 mg PO bid for capsules.

Pharmacokinetics

Route	Onset	Peak
Oral	40 min	90 min
CR	NA	7–8 hr

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: Crosses placenta; enters breast milk; 95% protein-bound

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness*, vertigo, emotional depression, sleepiness, *headache*
- **CV:** *Peripheral edema*, *hypotension*, arrhythmias, bradycardia, **AV heart block**, **angina**, **MI**, **CVA** (increased risk with isradipine than with other calcium channel blockers)
- **GI:** *Nausea*, constipation, abdominal discomfort, diarrhea
- **Other:** Muscle fatigue, diaphoresis, fatigue, rash

Interactions

★ **Drug-drug** • Increased cardiac depression with beta-adrenergic blocking drugs • Increased serum levels of digoxin, carbamazepine, prazosin, and quinidine • Increased respiratory depression with atracurium, pancuronium, tubocurarine, and vecuronium • Decreased effects with calcium and rifampin • Increased isradipine levels with azole antifungals and H_2 antagonists • Risk of severe hypotension with fentanyl anesthesia; use caution

Nursing considerations**Assessment**

- **History:** Allergy to isradipine; sick sinus syndrome, heart block; IHSS; cardiogenic shock, severe heart failure; hypotension; impaired hepatic or renal function; pregnancy; lactation
- **Physical:** Skin color, edema; orientation, reflexes; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds;

liver evaluation, normal output; LFTs, renal function tests, urinalysis

Interventions

- Consider increased risk of angina, MI, and CVA with use of this drug; select patients carefully.
- ⊗ **Warning** Monitor patient carefully (BP, cardiac rhythm, and output) while drug is being adjusted to therapeutic dose.
- Monitor BP very carefully with concurrent doses of other antihypertensive drugs.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- ⊗ **Warning** Monitor patients with renal or hepatic impairment carefully for drug accumulation and adverse reactions.

Teaching points

- Swallow controlled-release tablets whole. Do not crush, chew, or divide them. The empty shell is eliminated in the stool.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (monitor lighting, noise, and temperature; medication may be ordered if severe); dizziness, sleepiness (avoid driving or operating dangerous equipment); emotional depression (should pass when the drug is stopped); constipation (measures may be taken to alleviate this problem).
- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

▶ itraconazole (eye tra kon' a zole)

Sporanox

PREGNANCY CATEGORY C

Drug class

Antifungal—triazole

Therapeutic actions

Binds to sterols in the fungal cell membrane, changing membrane permeability; fungicidal or fungistatic depending on concentration and organism.

Indications

- Parenteral and oral: Treatment of blastomycosis, histoplasmosis in immunocompromised and nonimmunocompromised patients
- Parenteral and oral: Treatment of aspergillosis in patients intolerant or refractory to amphotericin B
- Treatment of onychomycosis due to dermatophytes (capsules only)
- Parenteral and oral: Treatment of febrile neutropenic patients with suspected fungal infections
- Oral solution: Treatment of fungal, candidiasis infections of the esophagus or mouth
- Unlabeled uses: Treatment of superficial and systemic mycoses, fungal keratitis, cutaneous leishmaniasis; used as an alternative to fluconazole for HIV patients to prevent candidiasis, cryptococcosis, and coccidioidomycosis

Contraindications and cautions

- Contraindicated with hypersensitivity to itraconazole or other azoles, lactation, heart failure, history of prolonged QTc interval.
- Use cautiously with hepatic or renal impairment, arrhythmias, pregnancy.

Available forms

Capsules—100 mg; oral solution—10 mg/mL

Dosages

Adults

- *Empiric febrile neutropenia*: 200 mg PO bid until clinically significant neutropenia resolves.
- *Candidiasis*: 200 mg/day PO (oral solution only) for 1–2 wk (oro-pharyngeal); 100 mg/day for a minimum of 3 wk (esophageal); 200 mg/day in AIDS patients and neutropenic patients.
- *Blastomycosis or chronic histoplasmosis*: 200 mg/day PO for a minimum of 3 mo, may increase to a maximum of 400 mg/day.
- *Other systemic mycoses*: 100–200 mg/day PO for 3–6 mo.
- *Dermatophytoses*: 100–200 mg/day to bid for 7–28 days, determined by specific infection.
- *Fingernail onychomycosis*: 200 mg bid PO for 1 wk, followed by 3-wk rest period; repeat.

- *Toenail onychomycosis*: 200 mg/day PO for 12 wk.
- *Aspergillosis*: 200–400 mg/day PO.

Oral solution

100–200 mg (10–20 mL), rinse and hold, swallow solution daily for 1–3 wk.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Do not give to patients if creatinine clearance less than 30 mL/min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	4.6 hr	4–6 days

Metabolism: Hepatic; $T_{1/2}$: 21 hr, then 64 hr

Distribution: Crosses placenta; may enter breast milk, highly protein-bound

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **CV:** **Heart failure**
- **GI:** *Nausea, vomiting, diarrhea, abdominal pain*, anorexia, hepatic function abnormality
- **Other:** *Rash, edema*, fever, malaise

Interactions

* **Drug-drug** ☒ **Black box warning**
Potential for serious CV events, including ventricular tachycardia and death, with lovastatin, simvastatin, triazolam, midazolam, pimozide, dofetilide, and quinidine; avoid these combinations.

• Increased serum levels and therefore therapeutic and toxic effects of cyclosporine, digoxin, oral hypoglycemics, warfarin anticoagulants, phenytoin, and buspirone • Decreased serum levels with histamine-2 antagonists, antacids, proton pump inhibitors, isoniazid, phenytoin, rifampin, carbamazepine, phenobarbital, and nevirapine • Increased plasma level of itraconazole with macrolide antibiotics and protease inhibitors • Potential for prolonged sedation if combined with benzodiazepines • Increased risk of rhabdomyolysis with lovastatin

* **Drug-food** • Risk of decreased effectiveness if combined with grapefruit juice, or-

ange juice • Risk of increased effects if combined with cola beverages; avoid this combination

Nursing considerations

Assessment

- **History:** Hypersensitivity to itraconazole, hepatic impairment, lactation, heart failure, prolonged QTc interval, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; bowel sounds, BP, P, auscultation; LFTs; culture of area involved, ECG

Interventions

- Culture of infection before beginning therapy; begin treatment before laboratory results are returned.
- Screen medications to prevent serious drug interactions.
- Decrease dosage in cases of hepatic failure.
- ☒ **Black box warning** Do not administer to patients with evidence of cardiac dysfunction or heart failure; risk of severe heart failure.
- Give oral capsules with meals to facilitate absorption.
- ☒ **Warning** Monitor LFTs regularly in patients with a history of hepatic impairment; discontinue or decrease dosage at signs of increased liver toxicity.
- Discontinue drug at any sign of active liver disease—elevated enzymes, hepatitis; or signs of heart failure.

Teaching points

- Take the full course of drug therapy that has been prescribed. Therapy may need to be long term.
- Take capsules with food; take oral solution without food.
- Do not use grapefruit juice or cola beverages while taking this drug.
- Adopt hygiene measures to prevent reinfection or spread of infection.
- Have frequent follow-up visits while you are using this drug. Keep all appointments, which may include those for blood tests.
- Women of childbearing age should use contraceptives during therapy and for 1 month after therapy is stopped.

- You may experience these side effects: Nausea, vomiting, diarrhea (eat frequent small meals); headache (analgesics may be ordered); rash, itching (appropriate medication may help).
- Report unusual fatigue, anorexia, vomiting, jaundice, dark urine, pale stool, edema, difficulty breathing.

▼ ivermectin

See Appendix U, *Less commonly used drugs*.

▼ ixabepilone

See Appendix U, *Less commonly used drugs*.

▼ kanamycin sulfate

(*kan a mye' sin*)

Kantrex

PREGNANCY CATEGORY D

Drug class

Aminoglycoside antibiotic

Therapeutic actions

Bactericidal: Inhibits protein synthesis in strains of gram-negative bacteria; functional integrity of cell membrane appears to be disrupted, causing cell death.

Indications

- Infections caused by susceptible strains of *Escherichia coli*, *Proteus*, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Serratia marcescens*, *Acinetobacter*
- Treatment of severe infections due to susceptible strains of staphylococci in patients allergic to other antibiotics
- As part of a multidrug therapy for *Mycobacterium avium* complex (an infection in AIDS patients)

Contraindications and cautions

- Contraindicated with allergy to aminoglycosides; intestinal obstruction, pregnancy, lactation.
- Use cautiously with elderly or any patient with diminished hearing, decreased renal function, dehydration, neuromuscular disorders.

Available forms

Injection—500 mg, 1 g; pediatric injection—75 mg

Dosages

Adults and pediatric patients

Do not exceed 1.5 g/day.

IM

7.5 mg/kg every 12 hr or 15 mg/kg/day in equally divided doses every 6–8 hr. Usual duration is 7–10 days. Do not exceed 1.5 g per day. If no effect in 3–5 days, discontinue therapy.

IV

15 mg/kg/day divided into two or three equal doses, administered over 30–60 min.

Intraperitoneal

500 mg diluted in 20 mL sterile water instilled into the wound closure.

Aerosol

250 mg bid–qid, nebulized.

Geriatric patients or patients with renal failure

Reduce dosage, and carefully monitor serum drug levels and renal function tests. When not possible, reduce frequency of administration. Calculate dosing interval from the following: Dosing interval in hr = serum creatinine (mg/dL) × 9.

Pharmacokinetics

Route	Onset	Peak
IM, IV	Rapid	30–120 min

Metabolism: $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, feces

▼ IV FACTS

Preparation: Do not mix with other antibacterial drugs; administer separately; dilute contents of 500-mg vial with 100–200 mL of normal saline or D₅W; dilute 1 g-vial with 200–400 mL of diluent; vials may darken during storage, does not affect potency.

Infusion: Administer dose slowly over 30–60 min (especially important in children).

Incompatibilities: Do not combine with amphotericin B, chlorpheniramine, colistimethate, heparin, methohexital, or other antibacterials.

Adverse effects

- **CNS:** *Ototoxicity—tinnitus, dizziness, vertigo, deafness* (partially reversible to irreversible), confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, fever, tremor, paresthesias, muscle twitching, seizures, muscular weakness, neuromuscular blockade, apnea
- **CV:** Palpitations, hypotension, hypertension
- **GI:** *Nausea, vomiting, anorexia, diarrhea, weight loss, increased salivation, malabsorption syndrome*
- **GU:** *Nephrotoxicity* (may be irreversible)
- **Hematologic:** Leukemoid reaction, agranulocytosis, granulocytosis, leukopenia, leukocytosis, thrombocytopenia, eosinophilia, anemia, hemolytic anemia, increased or decreased reticulocyte count
- **Hepatic:** Hepatic toxicity; hepatomegaly
- **Hypersensitivity:** Purpura, rash, urticaria, exfoliative dermatitis
- **Other:** *Superinfections, pain and irritation at IM injection sites*

Interactions

* **Drug-drug** • Increased ototoxic and nephrotoxic effects with potent diuretics and other ototoxic and nephrotoxic drugs (cephalosporins, penicillins) • Increased likelihood of neuromuscular blockade if given shortly after general anesthetics, depolarizing and nondepolarizing neuromuscular junction blockers, or succinylcholine • Decreased absorption and therapeutic levels of digoxin with kanamycin and methotrexate

* **Drug-lab test** • Inactivation between aminoglycosides and beta-lactam antibiotics may result in false low-aminoglycoside readings

■ Nursing considerations**Assessment**

- **History:** Allergy to aminoglycosides; intestinal obstruction, lactation, diminished hearing, decreased renal function, dehydration, neuromuscular disorders; pregnancy
- **Physical:** Site of infection, skin color, lesions; orientation, reflexes, eighth cranial nerve function; P, BP; R, bowel sounds;

urinalysis, BUN, serum creatinine, serum electrolytes, LFTs, CBC

Interventions

- Arrange culture and sensitivity tests before beginning therapy.
- Therapeutic serum levels are peaks of 20–25 mcg/mL and troughs of less than 10 mcg/mL. Monitor with fourth dose, then weekly thereafter.

⊗ **Black box warning** Monitor length of treatment: Usual duration, 7–10 days. If clinical response does not occur within 3–5 days, stop therapy. Prolonged treatment risks increased toxicity. If drug is used longer than 10 days, monitor auditory and renal function daily.

- Give IM dosage by deep IM injection in upper outer quadrant of the gluteal muscle.
- Ensure that patient is well hydrated before and during therapy.

⊗ **Black box warning** Monitor patients receiving a total dose of more than 15 g, elderly patients, and those with preexisting tinnitus or vertigo for signs of eighth cranial nerve damage.

Teaching points

- You may experience these side effects: Ringing in the ears, headache, dizziness (reversible; use safety measures); nausea, vomiting, loss of appetite (eat frequent small meals; frequent mouth care may help).
- Report severe headache, dizziness, loss of hearing, severe diarrhea, increased urine output.

▽ ketoconazole

(*kee toe koe' na zole*)

Apo-Ketoconazole (CAN), Extina, Kuric, Nizoral A-D, Xolegel

PREGNANCY CATEGORY C

Drug class

Antifungal (Imidazole)

Therapeutic actions

Impairs the synthesis of ergosterol, the main sterol of fungal cell membranes, allowing increased permeability and leakage of cellular components and causing cell death.

Indications

- Treatment of systemic fungal infections: Candidiasis, chronic mucocutaneous candidiasis, oral thrush, candiduria, blastomycosis, coccidioidomycosis, histoplasmosis, chromomycosis, paracoccidioidomycosis
- Treatment of dermatophytosis (recalcitrant infections not responding to topical or griseofulvin therapy)
- Topical treatment of seborrheic dermatitis in patients older than 12 yr
- Cream: Tinea corporis (ringworm), tinea cruris (jock itch), and tinea pedis (athlete's foot)
- Shampoo: Reduction of scaling due to dandruff
- Orphan drug use: With cyclosporine to diminish cyclosporine-induced nephrotoxicity in organ transplant
- Unlabeled uses: Treatment of onychomycosis, pityriasis versicolor, vaginal candidiasis, tinea pedis, tinea corporis, tinea cruris, tinea capitis; CNS fungal infections at high doses (800–1,200 mg/day); advanced prostate cancer at doses of 400 mg every 8 hr; Cushing's syndrome (800–1,200 mg/day); refractory depression

Contraindications and cautions

- Contraindicated with allergy to ketoconazole; fungal meningitis; administration with terfenadine, astemizole, oral triazolam; pregnancy; lactation.
- Use cautiously with hepatic failure (increased risk of hepatocellular necrosis).

Available forms

Tablets—200 mg; shampoo—1% (OTC), 2%; topical gel—2%; cream—2%; topical foam—2%

Dosages

Adults

200 mg PO daily. Up to 400 mg/day in severe infections. Treatment period must be long enough to prevent recurrence, 1 wk–6 mo, depending on infecting organism and site.

Pediatric patients older than 2 yr

3.3–6.6 mg/kg/day PO as a single dose.

Pediatric patients younger than 2 yr

Safety and efficacy not established.

Shampoo

Moisten hair and scalp thoroughly with water; apply sufficient shampoo to produce a lather; leave on hair for 5 min. Shampoo twice a week for 4 wk with at least 3 days between shampooing. Up to 8 wk may be needed.

Topical

Patients older than 12 yr

- *Tinea pedis, tinea corporis, tinea cruris, cutaneous candidiasis*: Apply thin film of gel, foam, or cream once daily to affected areas for 2 wk; do not wash this area for 3 hr after applying. Wait 20 min before applying makeup or sunscreen. May require 6 wk of treatment.

Foam

- *Seborrheic dermatitis*: Apply foam bid for 4 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
Topical	Slow	Unknown

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** Headache, dizziness, somnolence, photophobia
- **GI:** Hepatotoxicity, *nausea, vomiting*, abdominal pain
- **GU:** Impotence, oligospermia (with very high doses)
- **Hematologic:** Thrombocytopenia, leukopenia, hemolytic anemia
- **Hypersensitivity:** Urticaria to **anaphylaxis**
- **Local:** Severe irritation, *pruritus, stinging* with topical application
- **Other:** *Pruritus*, fever, chills, gynecomastia

Interactions

- **Drug-drug** • Decreased blood levels of ketoconazole with rifampin • Increased blood levels

of cyclosporine and risk of toxicity • Increased duration of adrenal suppression with corticosteroids • Decreased absorption if taken with antacids, histamine-2 blockers, proton pump inhibitors; space these at least 2 hr apart • Potent inhibitor of CYP3A4 enzyme system. Use with drugs metabolized via this system (eg, tacrolimus, warfarin) may lead to increased plasma levels and toxicity; use is contraindicated

■ Nursing considerations

Assessment

- **History:** Allergy to ketoconazole, fungal meningitis, hepatic failure, pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes, affect; bowel sounds, LFTs; CBC and differential; culture of area involved

Interventions

- Culture fungus before therapy; begin treatment before return of laboratory results.

⊗ **Warning** Keep epinephrine readily available in case of severe anaphylaxis after first dose.

⊗ **Black box warning** Risk of serious to fatal hepatic toxicity; monitor patient closely.

- Administer oral drug with food to decrease GI upset.
- Do not administer with antacids, H₂-blockers, proton pump inhibitors; ketoconazole requires an acidic environment for absorption; if antacids are required, administer at least 2 hr apart.
- Continue administration for long-term therapy until infection is eradicated: Candidiasis, 1–2 wk; other systemic mycoses, 6 mo; chronic mucocutaneous candidiasis, often requires maintenance therapy; tinea versicolor, 2 wk of topical application.
- Stop treatment, and consult physician about diagnosis if no improvement is seen within 2 wk of topical application.
- Administer shampoo as follows: Moisten hair and scalp thoroughly with water; apply sufficient shampoo to produce a lather; gently massage for 1 min; rinse hair with warm water; repeat, leaving on hair for 3 min.
- Arrange to monitor hepatic function tests before therapy and monthly or more frequently throughout treatment.

Teaching points

- Take the full course of drug therapy. Long-term use of the drug will be needed; beneficial effects may not be seen for several weeks.
- Take oral drug with meals to decrease GI upset.
- If using shampoo, moisten hair and scalp thoroughly with water; apply sufficient shampoo to produce a lather; leave on hair for 5 minutes. Shampoo twice a week for 4 weeks with at least 3 days between shampooing.
- Apply thin layer of gel, foam, or cream to affected area for 2 weeks. Wait 20 minutes before applying makeup or sunscreen to area, and do not wash area for 3 hours.
- Use appropriate hygiene measures to prevent reinfection or spread of infection.
- Do not take antacids, histamine-2 blockers, proton pump inhibitors with this drug; if they are needed, take this drug at least 2 hours after their administration.
- You may experience these side effects: Nausea, vomiting, diarrhea (take drug with food); sedation, dizziness, confusion (avoid driving or performing tasks that require alertness); stinging, irritation (local application).
- Report rash, severe nausea, vomiting, diarrhea, fever, sore throat, unusual bleeding or bruising, yellow skin or eyes, dark urine or pale stools, severe irritation (local application).

▽ ketoprofen

(*kee toe proe' fen*)

PREGNANCY CATEGORY B
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Nonopioid analgesic
NSAID

Therapeutic actions

Anti-inflammatory and analgesic activity; inhibits prostaglandin and leukotriene synthesis and has antibradykinin and lysosomal membrane-stabilizing actions.

Indications

- Acute and long-term treatment of rheumatoid arthritis and osteoarthritis
- Relief of mild to moderate pain
- Treatment of dysmenorrhea
- Reduction of fever (OTC indication)

Contraindications and cautions

- Contraindicated with significant renal impairment, pregnancy, lactation; allergy to ketoprofen, aspirin.
- Use cautiously with impaired hearing; allergies; hepatic, CV, and GI conditions.

Available forms

Capsules—50, 75 mg; ER capsules—100, 150, 200 mg

Dosages

Adults

Do not exceed 300 mg/day, or 200 mg/day ER.

- *Rheumatoid arthritis, osteoarthritis*: Starting dose, 75 mg tid or 50 mg qid PO. Maintenance dose, 150–300 mg PO in three or four divided doses. ER, 200 mg PO daily.
- *Mild to moderate pain, primary dysmenorrhea*: 25–50 mg PO every 6–8 hr as needed.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic or renal impairment

Reduce starting dose by one-half or one-third; maximum dose, 100 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	30–60 min	0.5–2 hr
ER oral	30–60 min	6–7 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr, 5–6 hr for ER

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia, fatigue, tiredness, tinnitus, ophthalmologic effects*
- **Dermatologic:** *Rash, pruritus, sweating, dry mucous membranes*

- **GI:** *Nausea, dyspepsia, GI pain, diarrhea, vomiting, constipation, flatulence, gastric or duodenal ulcer*
- **GU:** Dysuria, **renal impairment**
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

Interactions

★ **Drug-drug** • Increased risk of nephrotoxicity with other nephrotoxins (aminoglycosides, cyclosporine, diuretics) • Increased risk of bleeding with anticoagulants (warfarin) and aspirin

■ Nursing considerations

Assessment

- **History:** Renal impairment, impaired hearing, allergies, hepatic, CV, and GI conditions, lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, BP, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures: Gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs; take only the prescribed dosage.
- Use during pregnancy is not advised; if an analgesic is needed, consult your health care provider.

- Dizziness, drowsiness can occur (avoid driving or using dangerous machinery).
- For over-the-counter use: Do not take for more than 3 days for fever or for more than 10 days for pain. If symptoms persist, contact your health care provider.
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools, easy bruising.

ketorolac tromethamine

(*kee' toe role ak*)

Acular LS, Acuvail, Sprix

PREGNANCY CATEGORY C
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Antipyretic
Nonopioid analgesic
NSAID

Therapeutic actions

Anti-inflammatory and analgesic activity; inhibits prostaglandins and leukotriene synthesis.

Indications

- Short-term management of pain (up to 5 days)
- Ophthalmic: Relief of ocular itching due to seasonal conjunctivitis and relief of postoperative inflammation and pain after cataract surgery

Contraindications and cautions

- Contraindicated with significant renal impairment, during labor and delivery, lactation; patients wearing soft contact lenses (ophthalmic); aspirin allergy; concurrent use of NSAIDs; active peptic ulcer disease, recent GI bleed or perforation, history of peptic ulcer disease or GI bleeding; hypersensitivity to ketorolac; as prophylactic analgesic before

major surgery; treatment of perioperative pain in CABG; suspected or confirmed cerebrovascular bleeding; hemorrhagic diathesis, incomplete hemostasis, high risk of bleeding; use with probenecid, pentoxifylline.

- Use cautiously with impaired hearing; allergies; hepatic, CV and GI conditions.

Available forms

Ophthalmic solution—0.4%, 0.45%, 0.5%; tablets—10 mg; injection—15, 30 mg/mL; nasal spray—15.75 mg/spray

Dosages

For short-term use only (up to 5 days). Potent NSAID with many adverse effects.

Adults

Parenteral

- *Single-dose treatment*: 60 mg IM or 30 mg IV.
- *Multiple-dose treatment*: 30 mg IM or IV every 6 hr to a maximum 120 mg/day.

Oral

- *Transfer to oral*: 20 mg PO as a first dose for patients who received 60 mg IM or 30 mg IV as a single dose or 30-mg multiple dose, followed by 10 mg every 4–6 hr; do not exceed 40 mg/24 hr.

Nasal spray

- *Patients younger than 65 yr*: 1 spray (15.75 mg) in each nostril every 6–8 hr; maximum daily dose, 126 mg.
- *Patients 65 yr and older, patients with renal impairment, and patients weighing less than 50 kg*: 1 spray in one nostril every 6–8 hr; maximum daily dose, 63 mg.

Ophthalmic

- *Itching from allergic conjunctivitis*: 1 drop qid.
- *Acular*: For cataract surgery, begin 1 drop qid 24 hr after and continue for 2 wk.
- *Acular LS*: 1 drop qid prn for burning and stinging for up to 4 days after surgery. For pain and photophobia, use for 3 days.
- *Acuvail*: 1 drop twice a day beginning 1 day before cataract surgery; continue the day of surgery and for the next 2 weeks.

Pediatric patients 2–16 yr

Use one single-dose injection—1 mg/kg IM up to a maximum of 30 mg, or 0.5 mg/kg IV up to a maximum of 15 mg.

Geriatric patients 65 yr and older, patients with renal impairment, and patients weighing less than 50 kg

Parenteral

- **Single-dose treatment:** 30 mg IM or 15 mg IV.
- **Multiple-dose treatment:** 15 mg IM or IV every 6 hr to a maximum of 60 mg/day.

Oral

- **Transfer to oral:** 10 mg PO as first dose for patients who received 30 mg IM or 15 mg IV single dose or 15 mg IM or IV multiple dose, then 10 mg PO every 4–6 hr; do not exceed 40 mg/24 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	30–60 min	6 hr
IM, IV	30 min	1–2 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 2.4–8.6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is required.

Infusion: Infuse slowly as a bolus over no less than 15 sec.

Incompatibilities: Do not mix with morphine, sulfate, meperidine, promethazine, or hydroxyzine; a precipitate will form. Protect injection from light.

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tinnitus, ophthalmologic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence, **gastric or duodenal ulcers**
- **GU:** Dysuria, **renal impairment**
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia,

aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia

- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema; anaphylactoid reactions to anaphylactic shock; local burning, stinging (ophthalmic)

Interactions

- **Drug-drug** • Increased risk of nephrotoxicity with other nephrotoxins (aminoglycosides, cyclosporine) • Increased risk of bleeding with anticoagulants (warfarin), aspirin

Nursing considerations

Assessment

- **History:** Renal impairment; impaired hearing; allergies; hepatic, CV, and GI conditions; lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema, BP; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding, renal toxicity; monitor accordingly.

⊗ **Black box warning** Do not use during labor, delivery, or while nursing; serious adverse effects to the fetus or baby are possible.

⊗ **Black box warning** May increase risk of bleeding. Do not use with high risk of bleeding or prophylactically before surgery.

⊗ **Black box warning** There is increased risk of severe hypersensitivity with known hypersensitivity to aspirin, NSAIDs. Contraindicated for use with aspirin or NSAIDs because of risk of serious cumulative NSAID effects.

⊗ **Warning** Keep emergency equipment readily available at time of initial dose, in case of severe hypersensitivity reaction.

- Protect drug vials from light.
- Administer every 6 hr to maintain serum levels and control pain.

Teaching points

- Every effort will be made to administer the drug on time to control pain; dizziness, drowsiness can occur (avoid driving or using dangerous machinery); burning and stinging on application (ophthalmic).
- Do not use ophthalmic drops with contact lenses.
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools, easy bruising.

DANGEROUS DRUG**labetalol hydrochloride***(la bet' a lol)*

Normodyne, Trandate

PREGNANCY CATEGORY C**Drug classes**Alpha- and beta-adrenergic blocker
Antihypertensive**Therapeutic actions**

Competitively blocks alpha₁- and beta₁- and beta₂-adrenergic receptors, and has some sympathomimetic activity at beta₂-receptors. Alpha- and beta-blocking actions contribute to the BP-lowering effect; beta blockade prevents the reflex tachycardia seen with most alpha-blocking drugs and decreases plasma renin activity.

Indications

- Hypertension, alone or with other oral drugs, especially diuretics
- Parenteral preparations: Severe hypertension
- Unlabeled uses: Control of BP in pheochromocytoma; clonidine withdrawal hypertension

Contraindications and cautions

- Contraindicated with sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, asthma.
- Use cautiously with diabetes or hypoglycemia (can mask cardiac signs of hypoglycemia), nonallergic bronchospasm (oral drug—IV is absolutely contraindicated), pheochromocytoma (paradoxical increases in BP have

occurred), hepatic impairment, pregnancy, lactation.

Available forms

Tablets—100, 200, 300 mg; injection—5 mg/mL.

Dosages**Adults****Oral**

Initial dose, 100 mg bid. After 2–3 days, using standing BP as indicator, adjust dosage in increments of 100 mg bid every 2–3 days. For maintenance, 200–400 mg bid. May need up to 2,400 mg/day; to improve tolerance, divide total daily dose and give tid.

Parenteral

- *Severe hypertension:* For repeated IV injection, 20 mg (0.25 mg/kg) slowly over 2 min. Individualize dosage using supine BP; additional doses of 40 or 80 mg can be given at 10-min intervals until desired BP is achieved or until a 300-mg dose has been injected. For continuous IV infusion, dilute ampule (see IV facts), infuse at a rate of up to 2 mg/min, adjust according to BP response up to 300 mg total dose. Transfer to oral therapy as soon as possible.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Generally require lower maintenance doses between 100 and 200 mg bid.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	8–12 hr
IV	Immediate	5 min	5.5 hr

Metabolism: Hepatic; T_{1/2}: 6–8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add 200 mg to 160 mL of a compatible IV fluid to make a 1 mg/mL solution; infuse at 2 mL/min, or add 200 mg (2 ampules) to 250 mg of IV fluid to make a 2 mg/3 mL solution, infuse at 3 mL/min. Compatible

IV fluids include Ringer's, lactated Ringer's, 0.9% sodium chloride, 2.5% dextrose and 0.45% sodium chloride, 5% dextrose, 5% dextrose and Ringer's, 5% dextrose and 5% lactated Ringer's, and 5% dextrose and 0.2%, 0.33%, or 0.9% sodium chloride. Stable for 24 hr in these solutions at concentrations between 1.25 and 3.75 mg/mL.

Infusion: Administer infusion at 2–3 mL/min; inject slowly over 2 min.

Incompatibilities: Do not dilute drug in 5% sodium bicarbonate injection or other alkaline solutions, including furosemide.

Y-site incompatibilities: Do not give with nafcillin.

Adverse effects

- **CNS:** *Dizziness, vertigo, fatigue*, depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** Heart failure, cardiac arrhythmias, peripheral vascular insufficiency, claudication, CVA, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis, taste alteration
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, polyuria, priapism, urinary retention
- **Respiratory:** **Bronchospasm**, *dyspnea, cough*, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis
- **Other:** *Decreased exercise tolerance*, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated liver enzymes

Interactions

• **Drug-drug** • Risk of excessive hypotension with enflurane or isoflurane • Potential for added antihypertensive effects with nitroglycerin • Additive AV block with calcium channel blockers

• **Drug-lab test** • Possible falsely elevated urinary catecholamines in lab tests using a trihydroxyindole reaction

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, asthma, pregnancy, lactation, diabetes or hypoglycemia, nonallergic bronchospasm, pheochromocytoma
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function, blood and urine glucose

Interventions

- ⊗ **Warning** Do not discontinue drug abruptly after long-term therapy. (Hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI and ventricular arrhythmias; taper drug gradually over 2 wk with monitoring.)
- Consult with physician about withdrawing the drug if the patient is to undergo surgery (withdrawal is controversial).
- Keep patient supine during parenteral therapy, and assist initial ambulation.
- Position to decrease effects of edema.
- Provide support and encouragement to deal with drug effects and disease.

Teaching points

- Take drug with meals.
- Do not stop taking drug unless instructed to do so by your health care provider.
- If you have diabetes, monitor your blood glucose carefully. This drug may mask usual symptoms of hypoglycemia.
- You may experience these side effects: Dizziness, light-headedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▽ lacosamide (lab koss' ab mide)

Vimpat

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not fully understood; inhibits voltage-sensitive sodium channels, resulting in stabilization of neuronal membranes and inhibition of repetitive neuronal firing.

Indications

- Adjunctive therapy for the treatment of partial-onset seizures in patients 17 yr and older; IV use is indicated for short-term treatment when oral administration is not feasible

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, pregnancy, lactation.
- Use cautiously with cardiac conduction problems, MI, heart failure, drugs that prolong the PR interval, suicidal ideation, hepatic dysfunction, renal impairment.

Available forms

Tablets—50, 100, 150, 200 mg; single-use vial—10 mg/mL, 200 mg/20 mL

Dosages

Adults

Initially, 50 mg PO bid; may be increased, if needed and tolerated, at weekly intervals by 100 mg/day given in two divided doses. Usual effective dosage is 200–400 mg/day PO. IV dosage is the same as oral dosage and may be used short-term if oral dosing is not feasible; transfer patient to oral form as soon as feasible.

Pediatric patients younger than 17 yr

Safety and efficacy not established.

Patients with renal impairment

Patients with severe renal impairment (CrCl \leq 30 mL/min) should receive a maximum of 300 mg/day.

Patients with hepatic impairment

Increase dosage with caution. Maximum dosage is 300 mg/day with mild to moderate hepatic impairment; not recommended for use with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–4 hr
IV	Rapid	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 13 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Solution may be given as provided or diluted in 0.9% sodium chloride injection, 5% dextrose injection, or lactated Ringer's injection. Solution should be clear; discard solution that is discolored or contains particulate matter. Discard unused portion. Stable for 24 hr at room temperature when diluted in appropriate solutions.

Infusion: Infuse slowly over 30–60 min.

Incompatibilities: Do not administer in the same line as other medications.

Adverse effects

- **CNS:** *Dizziness, ataxia, diplopia*, somnolence, tremor, *headache*, nystagmus, gait disorder, balance disorder, blurred vision, vertigo
- **CV:** Prolonged PR interval
- **GI:** *Nausea, vomiting, diarrhea*
- **Other:** Fatigue, pruritus

Interactions

★ **Drug-drug** • Increased risk of prolonged PR interval if combined with other drugs known to prolong PR interval; monitor patient closely if such a combination is needed

Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, cardiac conduction problems, MI, heart failure, use of drugs that prolong PR interval, suicidal ideation, hepatic dysfunction, renal impairment, pregnancy, lactation
- **Physical:** Orientation, affect, reflexes; BP, P, bowel sounds, LFTs, renal function tests, baseline ECG

Interventions

⊗ **Black box warning** There is an increased risk of suicidal ideation when used in children, adolescents, or young adults; monitor patient accordingly.

⊗ **Warning** Taper drug slowly when discontinuing; risk of seizures increases if drug is stopped abruptly.

- Be aware that dosage is the same for PO and IV routes. IV route should be reserved for short-term use when oral dosing is not feasible. Switch to oral route as soon as possible.
- Provide safety measures if CNS effects occur.

Teaching points

- Take this drug exactly as prescribed; be aware that the dosage may be slowly increased.
- Do not discontinue this drug abruptly. If the drug is discontinued, it will need to be slowly tapered to prevent seizures.
- You will need to have regular medical follow-up to monitor your response to this drug.
- It is not known how this drug affects a fetus; use of contraceptives is advised when you are taking this drug.
- If you are nursing a baby, you should use another method of feeding the baby while you are taking this drug because the drug could cause serious adverse effects in the baby.
- You may experience these side effects: Headache (medications may be available to help); nausea and vomiting (small, frequent meals may help; medication may be available to relieve these symptoms); dizziness, sleepiness, problems with vision and balance (avoid driving or performing tasks that require alertness or visual acuity until you know how this drug will affect you; take special precautions to avoid falls); thoughts of suicide, depression (be aware of changes in thoughts or thoughts of suicide; report changes to your health care provider immediately).
- Report thoughts of suicide, sudden changes in personality, excessive activity or thoughts of aggression, severe nausea or vomiting.

▷ lactulose (lak' tyoo lose)

Ammonia-reducing drug:

Apo-Lactulose (CAN), Cephulac, Enulose

Laxative: Chronulac, Constilac,

Constulose, Duphalac, Kristalose, PMS-Lactulose (CAN), ratio-Lactulose (CAN)

PREGNANCY CATEGORY B

Drug classes

Ammonia reduction drug

Laxative

Therapeutic actions

The drug passes unchanged into the colon where bacteria break it down to organic acids that increase the osmotic pressure in the colon and slightly acidify the colonic contents, resulting in an increase in stool water content, stool softening, laxative action. This also results in migration of blood ammonia into the colon contents with subsequent trapping and expulsion in the feces.

Indications

- Treatment of constipation
- Prevention and treatment of portal-systemic encephalopathy

Contraindications and cautions

- Contraindicated with allergy to lactulose, low-galactose diet.
- Use cautiously with diabetes, pregnancy, and lactation.

Available forms

Syrup, solution—10 g/15 mL

Dosages

Adults

Laxative

15–30 mL/day (10–20 g) PO; may be increased to 60 mL/day as needed.

Oral

- *Portal-systemic encephalopathy:* 30–45 mL (20–30 g) tid or qid. Adjust dosage every 1–2 days to produce two or three soft stools/day. 30–45 mL/hr may be used if needed. Return to standard dose as soon as possible.

Rectal

- *Portal-systemic encephalopathy:* 300 mL (20 g) lactulose mixed with 700 mL water or physiologic saline as a retention enema, retained for 30–60 min. May be repeated every

4–6 hr. Start oral drug as soon as feasible and before stopping enemas.

Pediatric patients

Laxative

Safety and efficacy not established.

Oral

- **Portal-systemic encephalopathy:** Standards not clearly established. Initial dose of 2.5–10 mL/day in divided dose for small children or 40–90 mL/day for older children is suggested. Attempt to produce two or three soft stools daily.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	20 hr	24–48 hr

Very minimal systemic absorption

Adverse effects

- **GI:** *Transient flatulence, distention, intestinal cramps, belching, diarrhea, nausea*
- **Other:** Acid–base imbalances, electrolyte imbalance

■ Nursing considerations

Assessment

- **History:** Allergy to lactulose, low-galactose diet, diabetes, lactation, pregnancy
- **Physical:** Abdominal examination, bowel sounds, serum electrolytes, serum ammonia levels

Interventions

- ⊗ **Warning** Do not freeze laxative form. Extremely dark or cloudy syrup may be unsafe; do not use.
- Give laxative syrup orally with fruit juice, water, or milk to increase palatability.
- Administer retention enema using a rectal balloon catheter. Do not use cleansing enemas containing soapsuds or other alkaline drugs that counteract the effects of lactulose.
- Do not administer other laxatives while using lactulose.
- Monitor serum ammonia levels.
- Monitor with long-term therapy for potential electrolyte and acid–base imbalances.
- Carefully monitor blood glucose levels in diabetic patients.

Teaching points

- Do not use other laxatives. The drug may be mixed in water, juice, or milk to make it more tolerable.
- For laxative use, do not use continuously for longer than 1 week unless directed by your health care provider.
- Make sure you have ready access to bathroom; bowel movements will be increased to two or three per day.
- You may experience these side effects: Abdominal fullness, flatulence, belching.
- Report diarrhea, severe belching, abdominal fullness.

▷ lamivudine (3TC)

(*lam ab vew' den*)

Epivir, Epivir-HBV

PREGNANCY CATEGORY C

Drug classes

Antiviral

Reverse transcriptase inhibitor

Therapeutic actions

Nucleoside analogue inhibitor of HIV reverse transcriptase via DNA viral chain termination and HBV polymerase.

Indications

- Treatment of HIV infection in combination with other antiretroviral drugs
- Treatment of chronic hepatitis B (*Epivir-HBV*) with active liver inflammation

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component.
- Use cautiously with compromised bone marrow function, impaired renal function, hepatic impairment, obesity, pregnancy, lactation.

Available forms

Tablets—100 (*Epivir-HBV*); 150, 300 mg (*Epivir*); oral solution—5 mg/mL (*Epivir-HBV*), 10 mg/mL (*Epivir*)

Dosages

Adults

- **Hepatitis B:** 100 mg PO daily.

Adults and patients 16 yr and older

- **HIV infection:** 150 mg PO bid or 300 mg/day PO as a single dose in combination with other antiretroviral drugs.

Pediatric patients

- **HIV infection:**

3 mo–16 yr: 4 mg/kg PO bid; up to a maximum of 150 mg bid.

or:

Patients weighing 14–21 kg: 75 mg (one-half tablet) PO bid.

Patients weighing more than 21 kg but less than 30 kg: 75 mg (one-half tablet) PO in the morning and then 150 mg (1 tablet) PO in the evening.

Patients weighing 30 kg or more: 150 mg (1 tablet) PO bid.

- **Hepatitis B:**

2–17 yr: 3 mg/kg PO daily up to a maximum of 100 mg daily.

Patients with impaired renal function

- **HIV infection:**

CrCl

CrCl (mL/min)	Dosage (PO)
50 or more	150 mg bid or 300 mg daily
30–49	150 mg daily
15–29	150 mg first dose, then 100 mg daily
5–14	150 mg first dose, then 50 mg daily
Less than 5	50 mg first dose, then 25 mg daily

- **Hepatitis B:**

CrCl

CrCl (mL/min)	Dosage (PO)
50 or more	100 mg daily
30–49	100 mg first dose, then 50 mg daily
15–29	100 mg first dose, then 25 mg daily
5–14	35 mg first dose, then 15 mg daily
Less than 5	35 mg first dose, then 10 mg daily

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Unknown; $T_{1/2}$: 5–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, insomnia, myalgia, *asthenia*, malaise, dizziness, paresthasias, somnolence
- **GI:** *Nausea*, *GI pain*, *diarrhea*, anorexia, vomiting, dyspepsia, **pancreatitis** (children), **hepatomegaly with lactic acidosis**, **steatosis**
- **Hematologic:** *Agranulocytosis*
- **Respiratory:** *Nasal signs and symptoms*, *cough*
- **Other:** Fever, rash, taste perversion

Interactions

★ **Drug-drug** • Increased levels of lamivudine taken concurrently with trimethoprim-sulfamethoxazole • Lamivudine and zalcitabine inhibit the effects of each other; avoid concurrent use

Nursing considerations

Assessment

- **History:** Life-threatening allergy to any component, compromised bone marrow function, impaired renal function, pregnancy, lactation, hepatic impairment, obesity
- **Physical:** Skin rashes, lesions, texture; T; affect, reflexes, peripheral sensation; bowel sounds, liver evaluation; renal function tests, CBC and differential

Interventions

⊗ **Black box warning** Arrange to monitor hematologic indices and liver function every 2 wk during therapy; severe hepatomegaly with steatosis, lactic acidosis has occurred.

⊗ **Black box warning** Counsel and periodically test patients receiving *Epivir-HBV*. Severe, acute exacerbations of HBV have been reported in patients with both HIV and HBV infection who stop taking lamivudine.

- Monitor children for any sign of pancreatitis and discontinue immediately if it occurs.
- Monitor patient for signs of opportunistic infections that will need to be treated appropriately.

- Administer the drug concurrently with other antiretrovirals for HIV infection.
- Offer support and encouragement to the patient to deal with the diagnosis as well as the effects of drug therapy and the high expense of treatment.

Teaching points

- Take drug as prescribed; take concurrently with other drugs prescribed for HIV treatment.
- These drugs are not a cure for AIDS, AIDS-related complex, or hepatitis B; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- Arrange for frequent blood tests during the course of treatment; results of blood counts may indicate a need to decrease dosage or discontinue the drug for a time.
- Lamivudine does not reduce the risk of transmission of HIV or hepatitis B to others by sexual contact or blood contamination—use appropriate precautions.
- Avoid pregnancy while using this drug; using barrier contraceptives is urged.
- You may experience these side effects: Nausea, loss of appetite, change in taste (eat frequent small meals); dizziness, loss of feeling (take appropriate precautions); headache, fever, muscle aches (an analgesic may help, consult your health care provider).
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty breathing, rash.

lamotrigine

(*la mo' tri geen*)

Apo-Lamotrigine (CAN), Gen-Lamotrigine (CAN), Lamictal, Lamictal ODT, Lamictal XR **ORC**, PMS-Lamotrigine (CAN), ratio-Lamotrigine (CAN)

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism not well understood; may inhibit voltage-sensitive sodium channels, stabilizing the neuronal membrane and modulating calcium-dependent presynaptic release of excitatory amino acids.

Indications

- Adjunctive therapy in the treatment of partial seizures in adults and children 2 yr and older with epilepsy
- ER form—once daily adjunctive therapy for patients 13 yr and older with partial onset seizures
- Adjunctive therapy for the treatment of Lennox-Gastaut syndrome in infants, children, and adults; primary generalized tonic-clonic seizures in adults and children 2 yr and older
- Monotherapy in adults with partial seizures that have not been controlled by other therapies
- Conversion to monotherapy in adults with partial seizures receiving treatment with a single enzyme-inducing antiepileptic drug
- Long-term maintenance of bipolar 1 disorder, to delay the occurrence of acute mood episodes in patients on standard therapy
- Unlabeled uses: Absence seizures (children), temporal lobe seizures, migraine headache, postpoliomyelitis syndrome

Contraindications and cautions

- Contraindicated with allergy to drug, lactation.
- Use cautiously with impaired hepatic, renal, or cardiac function; patients younger than 16 yr, pregnancy.

Available forms

Tablets—25, 100, 150, 200 mg; chewable tablets—2, 5, 25 mg; orally disintegrating tablets—25, 50, 100, 200 mg; ER tablets **ORC**—25, 50, 100, 200 mg

Dosages

Adults

- *Epilepsy*
Patients taking enzyme-inducing anti-epileptics (ie, carbamazepine, phenytoin, phenobarbital) and not valproic acid:

50 mg PO daily for 2 wk; then 100 mg PO daily in two divided doses for 2 wk; may increase by 100 mg/day every wk up to a maintenance dose of 300–500 mg/day in two divided doses. Patients older than 13 yr (ER tablets): wk 1–2, 50 mg/day PO; wk 3–4, 100 mg/day PO; wk 5, 200 mg/day PO; wk 6, 300 mg/day PO; wk 7, 400 mg/day PO. Range, 400–600 mg/day.

Patients taking enzyme-inducing anti-epileptics (ie, carbamazepine, phenytoin, phenobarbital) and also valproic acid: 25 mg PO every other day for 2 wk; then 25 mg PO daily for 2 wk, then may increase by 25–50 mg every 1–2 wk up to a maintenance dose of 100–400 mg/day PO in two divided doses.

Conversion of patients to lamotrigine monotherapy: Titrate as above to a target dose of 500 mg/day in two divided doses, then attempt to decrease other antiepileptic by 20% weekly.

• *Bipolar I disorder*

Patients taking valproic acid: 25 mg every other day for 2 wk; then 25 mg once daily for 2 wk. After 4 wk, dose may be doubled at weekly intervals to target of 100 mg/day.

Patients taking enzyme-inducing anti-epileptics but not valproic acid: 50 mg/day for 2 wk; then 100 mg daily in two divided doses for 2 wk. After 4 wk, dose may be increased in 100-mg increments at weekly intervals to target maintenance dosage of 400 mg/day in two divided doses.

Patients taking neither enzyme-inducing anti-epileptics nor valproic acid: 25 mg/day for 2 wk; then 50 mg daily for 2 wk. After 4 wk, dose may be doubled at weekly intervals to maintenance dosage of 200 mg/day.

Pediatric patients 2–12 yr

- *Patients taking non-enzyme-inducing anti-epileptics with valproic acid:* 0.15 mg/kg/day in one to two divided doses for 2 wk. Then 0.3 mg/kg/day in one to two divided doses, rounded down to nearest 5 mg for 2 wk. For maintenance, 1–5 mg/kg/day in one to two divided doses, to a maximum of 200 mg/day.
- *Single enzyme-inducing anti-epileptic without valproic acid:* 0.6 mg/kg/day in two divided doses for 2 wk, then 1.2 mg/kg/day in two divided doses for 2 wk. For maintenance,

5–15 mg/kg/day in two divided doses, to a maximum of 400 mg/day.

Pediatric patients older than 12 yr

- *Patients taking valproic acid:* 25 mg PO every other day for 2 wk, then 25 mg PO daily for 2 wk. For maintenance, 100–400 mg/day in one to two divided doses. *Without valproic acid:* 50 mg/day PO for 2 wk, then 100 mg/day in two divided doses for 2 wk. For maintenance, 300–500 mg/day in one to two divided doses, to a maximum of 500 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–5 hr

Metabolism: Hepatic; $T_{1/2}$: 25–33 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness*, insomnia, headache, somnolence, *ataxia*, diplopia, blurred vision
- **Dermatologic:** **Stevens-Johnson syndrome, rash, toxic epidermal necrosis with multiorgan failure**
- **GI:** *Nausea*, vomiting, abdominal pain, constipation, diarrhea

Interactions

- **Drug-drug** • Decrease in lamotrigine levels of 40%–50% with enzyme-inducing anti-epileptics—carbamazepine, phenytoin, phenobarbital, primidone • Decreased clearance of lamotrigine, requiring a lower dose, if taken with valproic acid

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Lamictal* (lamotrigine) and *Lamisil* (terbinafine); use extreme caution.

Assessment

- **History:** Lactation; impaired hepatic, renal or cardiac function; pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes; P, BP, perfusion;

bowel sounds, normal output; LFTs, renal function tests

Interventions

- Monitor renal and hepatic function before and periodically during therapy; if abnormal, reevaluate therapy.
- ⊗ **Warning** Monitor drug doses carefully when starting therapy and with each increase in dose; special care will be needed when changing the dose or frequency of any other antiepileptic.
- Ensure that extended-release tablets are not cut, crushed, or chewed.
- ⊗ **Black box warning** Monitor patient for any sign of rash; discontinue lamotrigine immediately if rash appears and be prepared with appropriate life support if needed; potential for serious or life-threatening rash.
- Administer only whole dispersible tablets.
- Administer chewable, dispersible tablets with a small amount of water or fruit juice if chewed; to disperse, add tablet to 1 tsp water, wait 1 min, swirl and administer immediately.
- Taper drug slowly over a 2-wk period when discontinuing.

Teaching points

- Take this drug exactly as prescribed. Swallow extended-release tablets whole; do not cut, crush, or chew tablets.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Wear or carry a medical ID tag to alert emergency medical personnel that you are an epileptic taking antiepileptic medication.
- If rash occurs, notify your health care provider immediately.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or performing tasks requiring alertness or visual acuity); GI upset (take drug with food or milk, eat frequent small meals); headache (medication can be ordered).
- Report yellowing of skin, abdominal pain, changes in color of urine or stools, fever, sore throat, mouth sores, unusual bleeding or bruising, rash.

lanreotide acetate

See Appendix U, *Less commonly used drugs.*

lansoprazole

(lanz ab' pray zol)

Prevacid ORAC, Prevacid IV,
Prevacid 24 Hr

PREGNANCY CATEGORY B

Drug classes

Antisecretory drug
Proton pump inhibitor

Therapeutic actions

Gastric acid-pump inhibitor: Suppresses gastric acid secretion by specific inhibition of the hydrogen–potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step of acid production.

Indications

- Short-term treatment (up to 4 wk) of active duodenal ulcer
- Short-term treatment (up to 8 wk) of gastric ulcers
- Healing of NSAID-related gastric ulcer
- Risk reduction for NSAID-related gastric ulcer
- Short-term treatment (up to 8 wk) of GERD: Severe erosive esophagitis; poorly responsive symptomatic GERD
- Long-term treatment of pathological hypersecretory conditions (eg, Zollinger-Ellison syndrome, multiple adenomas, systemic mastocytosis)
- Maintenance therapy for healing of erosive esophagitis, duodenal ulcers
- Eradication of *Helicobacter pylori* infection in patients with active or recurrent duodenal ulcers in combination with clarithromycin and amoxicillin
- Short-term treatment (up to 7 days) of all grades of erosive esophagitis when patient is unable to take oral medication (IV)
- **NEW INDICATION:** Treatment of frequent heartburn (*Prevacid 24 Hr*)

- **NEW INDICATION:** Unlabeled uses: Alternate-day dosing for management of reflux esophagitis, laryngitis

Contraindications and cautions

- Contraindicated with hypersensitivity to lansoprazole or its components.
- Use cautiously with pregnancy, lactation.
- Use cautiously because of possible increased risk of *Clostridium difficile* infection.

Available forms

DR capsules **cmc**—15, 30 mg; orally disintegrating DR tablets—15, 30 mg; DR granules for oral suspension—15, 30 mg; powder for injection—30 mg/vial

Dosages

Adults

- **Active duodenal ulcer:** 15 mg PO daily before eating for 4 wk. For maintenance, 15 mg PO daily.
- **Gastric ulcer:** 30 mg/day PO for up to 8 wk.
- **Risk reduction of gastric ulcer with NSAIDs:** 15 mg/day PO for up to 12 wk.
- **Duodenal ulcers associated with H. pylori:** 30 mg lansoprazole, 500 mg clarithromycin, 1 g amoxicillin, all given PO bid for 10–14 days; or 30 mg lansoprazole and 1 g amoxicillin PO tid for 14 days.
- **GERD:** 15 mg/day PO for up to 8 wk.
- **Erosive esophagitis or poorly responsive GERD:** 30 mg PO daily before eating for up to 8 wk. An additional 8-wk course may be helpful for patients who do not heal with 8-wk therapy.
- **Maintenance of healing of erosive esophagitis:** 15 mg/day PO.
- **Pathological hypersecretory conditions:** Individualize dosage. Initial dose is 60 mg PO daily. Doses up to 90 mg bid have been used. Administer daily doses of more than 120 mg in divided doses.
- **Short-term treatment of all grades of erosive esophagitis:** 30 mg/day IV, over 30 min for up to 7 days; switch to oral form as soon as possible for total of 8 wk treatment.
- **Heartburn:** 1 capsule *Prevacid 24 Hr* taken with a full glass of water in the morning before eating for 14 days; 14-day course can be repeated every 4 mo.

Pediatric patients 12–17 yr

Nonerosive GERD: 15 mg/day PO for up to 8 wk.

Erosive esophagitis: 30 mg/day PO for up to 8 wk.

Pediatric patients 1–11 yr

Give as oral suspension, or capsules may be opened and the granules sprinkled on soft food. Do not cut, crush, or chew granules.

Patients weighing 30 kg or less: 15 mg/day PO for up to 12 wk.

Patients weighing more than 30 kg: 30 mg/day PO for up to 12 wk.

Patients with hepatic impairment

Consider reducing dose and monitoring patient response.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.7 hr
IV	Rapid	End of transfusion

Metabolism: Hepatic; $T_{1/2}$: 2 hr, 1.3 hr (IV)

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile

IV FACTS

Preparation: Reconstitute with 5 mL sterile water for injection (resulting solution 6 mg/mL); mix gently until powder is dissolved; reconstituted solution is stable for 1 hr before dilution. Dilute in 50 mL 0.9% sodium chloride injection, lactated Ringer's, or 5% dextrose injection. Stable for 24 hr (0.9% sodium chloride, lactated Ringer's) or 12 hr (5% dextrose).

Infusion: Use in-line filter provided with product. Infuse over 30 min; flush line with appropriate dilution fluid.

Incompatibilities: Do not administer with other drugs.

Adverse effects

- **CNS:** *Headache*, dizziness, asthenia, vertigo, insomnia, anxiety, paresthesias, dream abnormalities
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin, acne
- **GI:** *Diarrhea*, *abdominal pain*, *nausea*, *vomiting*, constipation, dry mouth

- **Respiratory:** *URI symptoms*, cough, epistaxis
- **Other:** Gastric cancer in preclinical studies, back pain, fever, bone loss

Interactions

★ **Drug-drug** • Decreased serum levels if taken concurrently with sucralfate • Decreased serum levels of ketoconazole, theophylline when taken with lansoprazole

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to lansoprazole or any of its components; pregnancy; lactation
- **Physical:** Skin lesions; body T; reflexes, affect; urinary output, abdominal examination; respiratory auscultation

Interventions

• Administer before meals. Caution patient to swallow capsules whole, not to chew or crush. If patient has difficulty swallowing, open capsule and sprinkle granules on apple sauce, *Ensure*, yogurt, cottage cheese, or strained pears. For nasogastric tube, place 15- or 30-mg tablet in a syringe and draw 4 or 10 mL of water; shake gently for quick dispersal. After dispersal, inject through nasogastric tube into the stomach within 15 min. If using capsules with nasogastric tube, mix granules from capsule with 40 mL apple juice and inject through tube, flush tube with more apple juice; or granules for oral suspension can be added to 30 mL water, stir well, and have patient drink immediately. Place orally disintegrating tablet on tongue; follow with water after it dissolves.

⊗ **Warning** Arrange for further evaluation of patient after 4 wk of therapy for acute gastroesophageal reflux disorders if symptomatic improvement does not rule out gastric cancer, which did occur in preclinical studies.

- Switch to oral drug from IV as soon as patient is able to take oral drugs. Use of IV drug for more than 7 days is not approved.

Teaching points

- Take the drug before meals. Swallow the capsules whole—do not chew, open, or crush.

If you are unable to swallow capsule, open and sprinkle granules on applesauce, or use granules, which can be added to 30 milliliters water, stirred, and drunk immediately. If using orally disintegrating tablet, place on your tongue and allow to dissolve. Follow with a drink of water.

- Arrange to have regular medical follow-up care while you are taking this drug.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult with a dietitian to maintain nutrition); symptoms of upper respiratory tract infection, cough (reversible; do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report severe headache, worsening of symptoms, fever, chills.

▷ lanthanum carbonate

▷ lapatinib

See Appendix U, *Less commonly used drugs*.

▷ laronidase

See Appendix U, *Less commonly used drugs*.

▷ leflunomide

(*leh flew' no mide*)

Arava

PREGNANCY CATEGORY X

Drug classes

Antiarthritic

Pyrimidine synthesis inhibitor

Therapeutic actions

Reversibly inhibits the enzyme dihydroorotate dehydrogenase, which is active in the autoimmune process that leads to rheumatoid

arthritis; blocking this enzyme relieves the signs and symptoms of inflammation and blocks the structural damage caused by the inflammatory response to the autoimmune process.

Indications

- Treatment of active rheumatoid arthritis; to relieve symptoms and slow progression
- Improvement in physical functioning in adults with active rheumatoid arthritis

Contraindications and cautions

- Contraindicated with allergy to leflunomide, lactation, pregnancy, childbearing age when not using a reliable method of contraception, significant hepatic impairment, hepatitis B or C, severe immune deficiency.
- Use cautiously with renal or hepatic disorders.

Available forms

Tablets—10, 20, 100 mg

Dosages

Adults

Loading dose, 100 mg PO daily for 3 days; maintenance dose, 20 mg PO daily. If not well tolerated or if ALT elevates to more than two times upper level of normal, may reduce to 10 mg PO daily. If elevation of ALT is between two and three times upper limit of normal, monitor closely if continued therapy is desired; if it is three times or greater than upper limit of normal, use of cholestyramine may decrease absorption; consider discontinuation.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Do not use with serious hepatic impairment. Decrease dosage and monitor patient closely with mild to moderate hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	6–12 hr

Metabolism: Hepatic; $T_{1/2}$: 14–18 days

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, drowsiness, blurred vision, fatigue, dizziness, paresthesias
- **Dermatologic:** *Erythematous rashes*, pruritus, urticaria, *transient alopecia*
- **GI:** Nausea, vomiting, *diarrhea*, **hepatic toxicity**
- **Other:** Serious birth defects, pancytopenia, agranulocytosis, thrombocytopenia

Interactions

- *** Drug-drug** • Possible severe hepatic impairment if combined with other hepatotoxic drugs; use with caution • Decreased absorption and effectiveness if combined with charcoal, cholestyramine • Increased risk of toxicity if combined with rifampin; monitor patient closely if this combination is used

■ Nursing considerations

Assessment

- **History:** Allergy to leflunomide, childbearing age, pregnancy, lactation, hepatitis B or C, severe hepatic impairment
- **Physical:** Weight; skin lesions, color; hair; orientation, liver evaluation, abdominal examination; LFTs

Interventions

- Advise patient that this drug does not cure the disease and appropriate therapies for rheumatoid arthritis should be used.
- Arrange for patient to obtain a wig or some other suitable head covering if alopecia occurs; ensure that head is covered at extreme temperatures; loss of hair is usually reversible.
- Provide appropriate skin care; arrange for treatment of skin lesions as needed.

⊗ **Black box warning** Advise women of childbearing age of the risks associated with becoming pregnant while using this drug. Arrange for counseling for appropriate contraceptive measures while this drug is being used. If patient decides to become pregnant, a withdrawal program to rid the body of leflunomide is recommended. Cholestyramine may be used to rapidly decrease serum levels if unplanned pregnancy occurs.

⊗ **Black box warning** There is a risk of severe liver injury; check LFTs before and periodically during treatment. Drug is not

recommended for patients with preexisting liver disease or with liver enzyme levels greater than two times the upper limit of normal. Use caution with other drugs that cause liver injury.

Teaching points

- Take this drug exactly as prescribed. Note that this drug does not cure rheumatoid arthritis, and appropriate therapies to deal with the disease should be followed.
- This drug may cause birth defects or miscarriages. It is advisable to use birth control while using this drug and for 8 weeks thereafter. Consult your health care provider if you decide to become pregnant; a withdrawal program is available.
- Arrange for frequent, regular medical follow-up care, including frequent blood tests to follow the effects of the drug on your body.
- You may experience these side effects: Nausea, vomiting, diarrhea (medication may be ordered to help; eat frequent small meals); dizziness, drowsiness (these are all effects of the drug; consult with your nurse or physician if these occur; dosage adjustment may be needed; avoid driving or operating dangerous machinery if these occur); loss of hair (you may wish to obtain a wig or other suitable head covering; it is important to keep the head covered at extremes of temperature); rash (avoid exposure to the sun, use a sunscreen and protective clothing if exposed to sun).
- Report black, tarry stools; fever, chills, sore throat; unusual bleeding or bruising; cough or shortness of breath; darkened or bloody urine; abdominal, flank, or joint pain; yellow color to the skin or eyes; mouth sores.

▶ lenalidomide

See Appendix U, *Less commonly used drugs*.

▶ lepirudin

See Appendix U, *Less commonly used drugs*.

▶ letrozole (le' tro zol)

Femara

PREGNANCY CATEGORY D

Drug classes

Antiestrogen
Antineoplastic
Aromatase inhibitor

Therapeutic actions

Inhibits the conversion of androgens to estrogens by the aromatase enzyme system (in postmenopausal women, the aromatase system is the main source of estrogens); reduces estrogen levels in all tissues, including tumors.

Indications

- Treatment of advanced breast cancer in postmenopausal women as a first-line treatment and with disease progression following traditional antiestrogen therapy
- Adjuvant treatment of early, receptor-positive breast cancer in postmenopausal women
- Extended adjuvant treatment of breast cancer in postmenopausal women who have received 5 yr of tamoxifen therapy

Contraindications and cautions

- Contraindicated with allergy to letrozole, pregnancy.
- Use cautiously with hepatic impairment, lactation.

Available forms

Tablets—2.5 mg

Dosages

Adults

2.5 mg PO daily; continue until tumor progression is evident.

Patients with hepatic impairment

Reduce dose by 50% in patients with cirrhosis or severe hepatic impairment; give 2.5 mg every other day. No adjustment needed for mild to moderate impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–6 wk

Metabolism: Hepatic; $T_{1/2}$: 2 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Depression, *headache*, fatigue, somnolence, anxiety, vertigo, dizziness, insomnia
- **CV:** Thromboembolic events, CV events, cerebrovascular events
- **Dermatologic:** Alopecia, *hot flashes*, rash
- **GI:** *Nausea*, *GI upset*, elevated liver enzymes, diarrhea, vomiting, constipation, abdominal pain, dyspepsia
- **Respiratory:** Cough, dyspnea, chest wall pain
- **Other:** Peripheral edema; arthralgia, bone pain, back pain

■ Nursing considerations

Assessment

- **History:** Allergy to letrozole, hepatic impairment, pregnancy, lactation
- **Physical:** Skin lesions, color, turgor; orientation, affect, reflexes; peripheral pulses, edema; LFTs, estrogen receptor evaluation of tumor cells

Interventions

- ⊗ **Warning** Counsel patient about the need to use contraceptive measures to avoid pregnancy while taking this drug; inform patient that serious fetal harm could occur.
- Provide comfort measures to help patient deal with drug effects: Hot flashes (control environmental temperature); headache, depression (monitor light and noise); vaginal bleeding (hygiene measures).
- Discontinue drug at signs that tumor is progressing.

Teaching points

- This drug can cause serious fetal harm and must not be taken during pregnancy. Contraceptive measures should be used while you are taking this drug. If you become pregnant or decide that you would like to become

pregnant, consult your health care provider immediately.

- You may experience these side effects: Hot flashes (stay in cool temperatures); nausea, GI upset (eat frequent small meals); headache, light-headedness (use caution if driving or performing tasks that require alertness).
- Report changes in color of urine or stool, increased fatigue, rash, fever, chills, severe depression.

▷ **leucovorin calcium**
(**citrovorum factor**,
folinic acid)
(*loo koe vor' in*)

PREGNANCY CATEGORY C

Drug class

Folic acid derivative

Therapeutic actions

Active reduced form of folic acid; required for nucleoprotein synthesis and maintenance of normal hematopoiesis.

Indications

- “Leucovorin rescue”—after high-dose methotrexate therapy for various cancers
- Parenteral form: Treatment of megaloblastic anemias due to sprue, nutritional deficiency, pregnancy, and infancy when oral folic acid therapy is not feasible
- IV: With 5-FU for palliative treatment of metastatic colorectal cancer
- To decrease toxicity of methotrexate caused by decreased elimination or for inadvertent overdose of folic acid antagonists such as trimethoprim

Contraindications and cautions

- Contraindicated with allergy to leucovorin on previous exposure, pernicious anemia or other megaloblastic anemias in which vitamin B₁₂ is deficient.
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—5, 10, 15, 25 mg; injection—10 mg/mL; powder for injection—50, 100, 200, 350, 500 mg/vial

L

Dosages**Adults**

- *Rescue after methotrexate therapy:* Begin therapy within 24 hr of methotrexate dose. 10 mg/m² PO every 6 hr for 10 doses or until methotrexate level is less than 0.05 micromolar. If at 24 hr following methotrexate administration, serum creatinine is 100% greater than the pretreatment level, or based on methotrexate levels, increase the leucovorin dose to 150 mg IV every 3 hr until the serum methotrexate level is less than 1.0 micromolar; then 15 mg IV every 3 hr until methotrexate level is less than .05 micromolar.
- *Megaloblastic anemia:* Up to 1 mg/day IM may be used. Do not exceed 1 mg/day.
- *Metastatic colon cancer:* Give 200 mg/m² by slow IV injection over up to 3 min, followed by 5-FU 370 mg/m² IV or 20 mg/m² IV, followed by 5-FU 425 mg/m² IV. Repeat daily for 5 days; may be repeated at 4-wk intervals.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	2.4 hr	3–6 hr
IM	Rapid	52 min	3–6 hr
IV	Immediate	10 min	3–6 hr

Metabolism: Hepatic; T_{1/2}: 5.7 hr (oral), 6.2 hr (IV, IM)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare solution by diluting a 50-mg vial of powder with 5 mL bacteriostatic water for injection that contains benzyl alcohol and use within 7 days, or reconstitute with water for injection, and use immediately. Protect from light.

Infusion: Infuse slowly over 3–5 min; not more than 160 mg/min.

Incompatibility: Do not mix with floxuridine or 5-FU.

Y-site incompatibility: Do not inject with droperidol.

Adverse effects

- **Hypersensitivity:** Allergic reactions
- **Local:** Pain, discomfort at injection site

Interactions

• **Drug-drug** • Leucovorin increases the efficacy and potential side effects of 5-FU; adjust dosage of 5-FU and monitor.

Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between leucovorin and *Leukeran* (chlorambucil) and between folinic acid (leucovorin) and folic acid; use extreme caution.

Assessment

- **History:** Allergy to leucovorin on previous exposure, pernicious anemia or other megaloblastic anemias, lactation, pregnancy
- **Physical:** Skin lesions, color; R, adventitious sounds; CBC, Hgb, Hct, serum folate levels, serum methotrexate levels

Interventions

⊗ **Warning** Do not use benzyl alcohol solutions when giving leucovorin to premature infants; a fatal gasping syndrome has occurred.

- Begin leucovorin rescue within 24 hr of methotrexate administration. Arrange for fluid loading and urine alkalinization during this procedure to decrease methotrexate toxicity.
- Give drug orally unless intolerance to oral route develops due to nausea and vomiting from chemotherapy or clinical condition. Switch to oral drug when feasible. Doses more than 25 mg should be divided or given IV.

⊗ **Warning** Monitor patient for hypersensitivity reactions, especially if drug has been used previously. Keep supportive equipment and emergency drugs readily available in case of serious allergic response.

⊗ **Warning** Do not administer intrathecally; doing so can be fatal.

Teaching points

- Leucovorin “rescues” normal cells from the effects of methotrexate and allows them to survive.
- Leucovorin used to treat anemias or colorectal cancer must be given IV. Mark calendars with treatment days.
- Report rash, difficulty breathing, pain, or discomfort at injection site.

▶ leuprolide acetate (loo *proe'* lide)

Eligard, Lupron, Lupron Depot, Lupron Depot-PED, Lupron Depot—3 Month, Lupron Depot—4 Month, Lupron for Pediatric Use

PREGNANCY CATEGORY X

Drug class

Gonadotropin-releasing hormone (GnRH) analogue

Therapeutic actions

An LH-RH agonist that occupies pituitary gonadotropin-releasing hormone receptors and desensitizes them; inhibits gonadotropin secretion when given continuously, leading to an initial increase, then profound decrease in LH and FSH levels.

Indications

- Advanced prostatic cancer—palliation, alternative to orchiectomy or estrogen therapy
- Depot only: Endometriosis
- Central precocious puberty
- Depot only: Uterine leiomyomata
- Unlabeled uses: Treatment of breast, ovarian, and endometrial cancer; infertility; prostatic hypertrophy

Contraindications and cautions

- Contraindicated with allergy to leuprolide, pregnancy, undiagnosed vaginal bleeding, lactation.

Available forms

Injection—5 mg/mL; *Depot*—3.75, 7.5 mg; *Depot-Ped*—7.5, 11.25, 15 mg; 3-mo *Depot*—

11.25, 22.5, 45 mg; 4-mo *Depot*—30 mg, 72 mg; powder for injection—7.5 mg

Dosages

Adults

- **Advanced prostate cancer:** 1 mg/day subcutaneously; use only the syringes that come with the drug.
Depot: 7.5 mg IM monthly (every 28–33 days). Do not use needles smaller than 22 gauge.
3-mo depot: 22.5 mg IM or subcutaneously every 3 mo (84 days).
4-mo depot: 30 mg IM or subcutaneously every 4 mo.
- **6-mo depot:** 45 mg subcutaneously every 6 mo.
- **Endometriosis:** 3.75 mg as a single monthly IM injection or 11.25 mg IM every 3 mo. Continue for 6 mo.
- **Uterine leiomyomata:** 3.75 mg as a single monthly injection for 3 mo *or* 11.25 mg IM once; give with concomitant iron treatment.

Pediatric patients

- **Central precocious puberty:** 50 mcg/kg/day subcutaneously; may be titrated up by 10 mcg/kg/day increments.
Depot: 0.3 mg/kg IM monthly every 4 wk. Round to nearest depot size; minimum, 7.5 mg.

Pharmacokinetics

Route	Onset	Peak	Duration
IM depot	4 hr	Variable	1, 3, or 4 mo

Metabolism: Unknown; $T_{1/2}$: 3 hr (subcutaneous injection)

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

Adverse effects

- **CNS:** *Dizziness, headache, pain, paresthesia, blurred vision, lethargy, fatigue, insomnia, memory disorder*
- **CV:** *Peripheral edema, cardiac arrhythmias, thrombophlebitis, heart failure, MI*
- **Dermatologic:** *Rash, alopecia, itching, erythema*
- **GI:** *GI bleeding, nausea, vomiting, anorexia, sour taste, constipation*
- **GU:** *Frequency, hematuria, decrease in size of testes, increased BUN and creatinine,*

impotence, decreased libido, gynecomastia

- **Local:** Ecchymosis at injection site
- **Respiratory:** Difficulty breathing, pleural rub, worsening of pulmonary fibrosis
- **Other:** *Hot flashes, sweats*, bone pain, diabetes

■ Nursing considerations

Assessment

- **History:** Allergy to leuprolide; pregnancy, lactation
- **Physical:** Skin lesions, color, turgor, testes; injection sites; orientation, affect, reflexes, peripheral sensation; peripheral pulses, edema, P; R, adventitious sounds; serum testosterone and serum PSA levels

Interventions

- Administer only with the syringes provided with the drug.
- Administer subcutaneously; monitor injection sites for bruising and rash; rotate injection sites to decrease local reaction.
- Give depot injection deep into muscle. Prepare a calendar of monthly (28–33 days every 3, 4, or 6 mo) return visits for new injection.
- Store below room temperature (25° C or 77° F); avoid freezing. Depot suspension is stable for 24 hr following reconstitution; product does not contain preservatives, so discard if not used properly.
- Arrange for periodic serum testosterone and PSA determinations.

⊗ **Warning** Consider stopping therapy for central precocious puberty before 11 yr in females, 12 yr in males. Monitor patient with GnRH stimulation test, sex steroids, and Tanner staging.

⊗ **Warning** There is a possible increased risk of diabetes and CV disease in men treated for prostate cancer; monitor patient closely.

- Advise patient to use barrier contraceptives; serious fetal harm can occur.
- Teach patient and significant other the technique for subcutaneous injection, and observe administration before home administration of daily doses.

Teaching points

- Administer subcutaneously only, using the syringes that come with the drug; arrange to dispose of needles and syringes appropriately. If depot is used, drug may be given IM or subcutaneously; prepare calendar for return dates, stressing the importance of receiving each injection.
- Do not stop taking this drug without first consulting your health care provider.
- This drug cannot be taken during pregnancy; using barrier contraceptives is advised.
- You may experience these side effects: Bone pain, difficulty urinating (usually transient); hot flashes (stay in cool places); nausea, vomiting (eat frequent small meals); dizziness, headache, light-headedness (use caution when driving or performing tasks that require alertness); decreased libido, impotence.
- Report injection site pain, burning, itching, swelling, numbness, tingling, severe GI upset, pronounced hot flashes, chest pain.

▽ levalbuterol (*lev al byoo' ter ole*)

levalbuterol hydrochloride

Xopenex

levalbuterol tartrate

Xopenex HFA

PREGNANCY CATEGORY C

Drug classes

Antiasthmatic

Beta₂-selective adrenergic agonist

Bronchodilator

Sympathomimetic

Therapeutic actions

In low doses, acts relatively selectively at beta₂-adrenergic receptors to cause bronchodilation and vasodilation; at higher doses, beta₂-selectivity is lost and the drug also acts at beta₁ receptors to cause typical sympathomimetic cardiac effects.

Indications

- Treatment and prevention of bronchospasm in adults and children 4 yr and older, (tartrate) and 6 yr and older (hydrochloride) with reversible obstructive pulmonary disease

Contraindications and cautions

- Contraindicated with hypersensitivity to albuterol or levalbuterol; tachyarrhythmias, tachycardia caused by digoxin toxicity; general anesthesia with halogenated hydrocarbons or cyclopropane (these sensitize the myocardium to catecholamines); unstable vasomotor system disorders; hypertension; coronary insufficiency, coronary artery disease; history of CVA; COPD in patients who have developed degenerative heart disease.
- Use cautiously in psychoneurotic individuals and with hyperthyroidism; history of seizure disorders; pregnancy; lactation.

Available forms

Solution for inhalation—0.31 mg/3 mL, 0.63 mg/3 mL, 1.25 mg/3 mL; solution for inhalation concentrate—1.25 mg/0.5 mL; inhalation—45 mcg/actuation

Dosages

Levalbuterol hydrochloride (Xopenex)

Adults and patients 12 yr and older 0.63 mg tid, every 6–8 hr by nebulization; if patient does not respond, the dose may be increased to up to 1.25 mg tid by nebulization.

Pediatric patients 6–11 yr

0.31 mg tid by nebulization; do not exceed 0.63 mg tid.

Pediatric patients younger than 6 yr

Safety and efficacy not established.

Levalbuterol tartrate (Xopenex HFA)

Adults and children 4 yr and older

Two inhalations (90 mcg) repeated every 4–6 hr; some patients may respond to 1 inhalation (45 mcg) every 4 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Inhalation	5 min	1 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 4–6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Apprehension, anxiety, fear, CNS stimulation, hyperkinesia, insomnia, tremor, dizziness, irritability, weakness, vertigo, headache*
- **CV:** Cardiac arrhythmias, tachycardia, palpitations, PVCs (rare), anginal pain (less likely with bronchodilator doses of this drug than with bronchodilator doses of a nonselective beta-agonist, eg, isoproterenol), increases or decreases in BP
- **Dermatologic:** Sweating, pallor, flushing
- **GI:** *Nausea, vomiting, heartburn, unusual or bad taste*
- **Respiratory:** Respiratory difficulties, pulmonary edema, coughing, URI, **bronchospasm**

Interactions

- **Drug-drug** • Risk of increased sympathomimetic effects when given with other sympathomimetics • Risk of increased toxicity, especially cardiac, when used in combination with theophylline, aminophylline • Possible decreased bronchodilating effects when given with beta-adrenergic blockers (eg, propranolol)
- Risk of severe toxicity if combined with MAO inhibitors; use extreme caution

■ Nursing considerations Assessment

- **History:** Hypersensitivity to levalbuterol or albuterol; tachyarrhythmias, tachycardia caused by digoxin toxicity; general anesthesia with halogenated hydrocarbons or cyclopropane; unstable vasomotor system disorders; hypertension; coronary artery disease; history of CVA; COPD in patients who have developed degenerative heart disease; diabetes mellitus; hyperthyroidism; history of seizure disorders; history of psychiatric illness; pregnancy, lactation
- **Physical:** Weight, skin color, T, turgor; orientation, reflexes, affect; P, BP; R, adventitious sounds; blood and urine glucose, serum electrolytes, thyroid function tests, ECG

Interventions

⊗ **Warning** Keep unopened drug in foil pouch until ready to use; protect from heat and light. Once foil pouch is open, use the vial within 2 wk, protected from light and heat. Once a vial is removed from foil pouch, use immediately. If not used, protect from light and use within 1 wk. Discard vial if solution is not colorless.

- Teach patient correct use of inhaler and maintenance of actuator (*Xopenex HFA*).
- Continue use to control recurrent bouts of bronchospasm; most effective with regular use.
- Do not exceed recommended dosage; administer inhalation drug forms during second half of inspiration, because the airways are open wider and the aerosol distribution is more extensive.

⊗ **Warning** Monitor patient response; if usual effective dosage regimen does not provide relief, this usually indicates a serious worsening of the asthma and indicates need for re-assessment of drug regimen.

- Establish safety precautions if CNS changes occur.
- Reassure patients with acute respiratory distress; provide appropriate supportive measures.
- Monitor environmental temperature if patient has flushing or sweating.

Teaching points

- Do not exceed recommended dosage—adverse effects or loss of effectiveness may result; read the instructions for use that come with the product for proper administration of nebulized drug.
- Keep unopened drug in foil pouch until ready to use; protect from heat and light. Once foil pouch is open, use the vial within 2 weeks, protected from light and heat. Once a vial is removed from its foil pouch, use immediately. If not used, protect from light and use within 1 week. Discard the vial if the solution is not colorless.
- You may experience these side effects: Dizziness, fatigue, headache (use caution if driving or performing tasks that require alertness if these effects occur); nausea, vomiting, change in taste (eat frequent small meals;

consult your health care provider if this is prolonged); rapid heart rate, anxiety, sweating, flushing.

- If using a metered inhaler (*Xopenex HFA*), prime the inhaler before use; blow out all the air you can expel, place the actuator in your mouth and slowly breathe in while pressing down on the top of the metal canister. Hold your breath for 10 seconds. If you are prescribed two inhalations, wait 10 seconds and then repeat the process. Wash and air dry the actuator at least once a week. Discard the metal canister after 200 sprays, even if you think the canister is not empty.
- Report chest pain, dizziness, insomnia, weakness, tremors or irregular heartbeat, difficulty breathing, productive cough, failure to respond to usual dosage.

levetiracetam

(*lev ah ty ray' ca tam*)

Keppra, Keppra XR ORIG

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not well understood; antiepileptic activity may be related to its ability to inhibit polysynaptic responses and block posttetanic potentiation.

Indications

- Adjunctive therapy in the treatment of partial-onset seizures in adults and children 4 yr and older with epilepsy, when used with other epilepsy medication
- Adjunctive therapy in the treatment of myoclonic seizures in patients 12 yr and older
- Adjunctive therapy in treatment of primary generalized tonic-clonic seizures in adults and children 6 yr and older with idiopathic generalized epilepsy
- Unlabeled uses: Migraine, adjunctive therapy for bipolar disease, monotherapy for new-onset pediatric epilepsy.

Contraindications and cautions

- Contraindicated with hypersensitivity to levetiracetam.
- Use cautiously with lactation, pregnancy, renal impairment.

Available forms

Tablets—250, 500, 750, 1,000 mg; oral solution—100 mg/mL; injection—500 mg/5 mL; ER tablets **onc**—500 mg

Dosages**Adults and children older than 16 yr**

- **Partial-onset seizures:** 1,000 mg/day given as 500 mg PO or IV bid; may be increased in 1,000-mg/day increments every 2 wk; maximum dose, 3,000 mg/day. ER tablets: 1,000 mg/day PO; increase every 2 wk in 1,000 mg/day intervals to maximum dosage 3,000 mg/day.
- **Generalized tonic-clonic seizures:** Initially, 1,000 mg/day PO given as 500 mg bid; increase by 1,000 mg/day every 2 wk to recommended 3,000 mg/day.

Adults and children 12 yr and older

- **Myoclonic seizures:** 1,000 mg/day given as 500 mg PO bid; slowly increase to recommended maximum dose, 3,000 mg/day.

Pediatric patients 6–15 yr

- **Generalized tonic-clonic seizures:** Initially, 20 mg/kg/day PO in two divided doses of 10 mg/kg. Increase every 2 wk by 20-mg/kg increments to recommended dosage of 60 mg/kg/day given as 30 mg/kg bid.

Pediatric patients 4–16 yr

- **Partial-onset seizures:** 10 mg/kg PO bid (500–1,000 mg/day), may be increased every 2 wk in 20 mg/kg increments to 30 mg/kg bid (1,500–3,000 mg/day). To determine daily dose of oral solution: total dose (mL/day) = daily dose (mg/kg/day) × patient weight (kg) divided by 100 mg/mL.

Patients with renal impairment

CrCl (mL/min)	Dosage (mg)
More than 80	500–1,500 every 12 hr
50–80	500–1,000 every 12 hr
30–50	250–750 every 12 hr
Less than 30	250–500 every 12 hr

For patients on dialysis, use 500–1,000 mg every 24 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: $T_{1/2}$: 6–8 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Dilute desired dose in 100 mL of 0.9% sodium chloride, lactated Ringer's solution, or 5% dextrose solution.

Infusion: Infuse over 15 min.

Compatibilities: Compatible with lorazepam, diazepam, valproate sodium.

Adverse effects

- **CNS:** *Dizziness, headache*, vertigo, nervousness, fatigue, *somnolence, ataxia*, diplopia, suicidal ideation
- **Dermatologic:** Pruritus
- **GI:** Dyspepsia, vomiting, nausea, constipation, anorexia
- **Respiratory:** Rhinitis, pharyngitis
- **Other:** Weight gain, facial edema, impotence

Nursing considerations

CLINICAL ALERT!
Name confusion has occurred between *Keppra* (levetiracetam) and *Kaletra* (lopinavir and ritonavir); use extreme caution.

Assessment

- **History:** Hypersensitivity to levetiracetam; lactation, renal impairment, pregnancy
- **Physical:** Body weight; body T; skin color, lesions; orientation, affect, reflexes; P, R, adventitious sounds; bowel sounds, normal output, renal function tests

Interventions

- Reserve IV use for short-term, when oral administration is not feasible; revert to oral use as soon as patient is able.
- Give drug with food to prevent GI upset; use oral solution for children or adults with

difficulty swallowing. Ensure that patient does not cut, crush, or chew ER tablets.

- If CNS, vision, or coordination changes occur, establish safety precautions (use side rails, accompany patient when ambulating).
- Advise using barrier contraceptives while this drug is being used.

⊗ **Warning** Do not stop drug abruptly. Risk of seizure precipitation; withdraw gradually.

- Offer support and encouragement for dealing with epilepsy and adverse drug effects; arrange for consultation with support groups for people with epilepsy as needed.

Teaching points

- Take this drug exactly as prescribed. Do not cut, crush, or chew ER tablets; swallow them whole.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Do not take this drug if you are pregnant or plan to become pregnant, serious fetal effects can occur, using barrier contraceptives is recommended.
- Wear or carry a medical alert tag at all times so that any emergency medical personnel taking care of you will know that you have epilepsy and are taking an antiepileptic.
- You may experience these side effects: Dizziness, blurred vision (avoid driving a car or performing other tasks requiring alertness or visual acuity if this occurs); GI upset (taking the drug with food or milk and eating frequent small meals may help); headache, nervousness (if these become severe, consult your health care provider); fatigue (periodic rest periods may be helpful).
- Report severe headache, sleepwalking, rash, severe vomiting, chills, fever, difficulty breathing.

levocetirizine dihydrochloride

(lev ob seh teer' ih zeen)

Xyzal

PREGNANCY CATEGORY B

Drug class

Antihistamine

Therapeutic actions

Potent histamine (H₁) receptor antagonist; inhibits histamine release and eosinophil chemotaxis during inflammation, reducing swelling and inflammatory response.

Indications

- Relief from symptoms of seasonal and perennial allergic rhinitis in adults and children 6 mo and older
- Treatment of uncomplicated skin effects in chronic idiopathic urticaria in patients 2 yr and older

Contraindications and cautions

- Contraindicated with hypersensitivity to levocetirizine, any of its components, or cetirizine; end-stage renal disease; renal impairment in children 6–11 yr; lactation.
- Use cautiously with pregnancy and with use of CNS depressants.

Available forms

Tablets—5 mg; oral solution—2.5 mg/5 mL

Dosages

Adults and children 12 yr and older

5 mg/day PO, taken in the evening.

Children 6–11 yr

2.5 mg/day PO taken in the evening.

Children 6 mo–5 yr

1.25 mg (½ tsp oral solution) PO once daily in the evening.

Patients with renal impairment

12 yr and older: If creatinine clearance is 50–80 mL/min, give 2.5 mg/day PO; if creatinine clearance is 30–50 mL/min, give 2.5 mg PO every other day; if creatinine clearance is 10–30 mL/min, give 2.5 mg PO twice weekly (once every 3–4 days); if creatinine clearance is less than 10 mL/min, drug is not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: $T_{1/2}$: 8 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** *Somnolence*, asthenia
- **GI:** Dry mouth
- **Respiratory:** *Nasopharyngitis*, cough, pharyngitis, epistaxis
- **Other:** *Fatigue*, fever

Interactions

★ **Drug-drug** • Risk of increased CNS depression and altered mental alertness if combined with alcohol or other CNS depressing drugs; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug or to cetirizine, renal impairment, pregnancy, lactation, use of CNS depressants
- **Physical:** T; orientation, affect, reflexes; R, adventitious sounds; renal function tests

Interventions

- Administer once each day, in the evening.
- Alert patient to possible alterations in mental alertness while taking this drug.
- Encourage use of humidifiers and adequate intake of fluids to help prevent severe dryness of mucous membranes.
- Provide skin care for urticaria.

Teaching points

- Take this drug once each day, in the evening. Do not take more than the prescribed dose in any one day.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, another method of feeding the baby should be selected.
- It is not known how this drug could affect a fetus; if you are pregnant, consult your health care provider.
- Avoid the use of alcohol or any CNS depressants while you are using this drug; these could increase the effects on mental alertness.
- You may experience these side effects: Sleepiness, decreased mental alertness (avoid driving

a car, operating dangerous machinery, or engaging in tasks that require mental alertness while you are on this drug); cough, nosebleed, sore throat (use a humidifier, and make sure you drink plenty of fluids to help prevent severe drying of your mucous membranes).

- Report difficulty breathing, nosebleeds, and marked changes in mental functioning.

▷ levodopa

(lee voe doe' pa)

PREGNANCY CATEGORY C

Drug class

Antiparkinsonian

Therapeutic actions

Biochemical precursor of the neurotransmitter dopamine, which is deficient in the basal ganglia of parkinsonism patients; unlike dopamine, levodopa penetrates the blood-brain barrier. It is transformed in the brain to dopamine; thus, levodopa is a form of replacement therapy. It is efficacious for 2–5 yr in relieving the symptoms of parkinsonism but not drug-induced extrapyramidal disorders.

Indications

- Treatment of parkinsonism (postencephalitic, arteriosclerotic, and idiopathic types) and symptomatic parkinsonism following injury to the nervous system by carbon monoxide or manganese intoxication
- Given with carbidopa (*Lodosyn*; fixed combinations, *Sinemet*), an enzyme inhibitor that decreases the activity of dopa decarboxylase in the periphery, thus reducing blood levels of levodopa and decreasing the intensity and incidence of many of the adverse effects of levodopa
- Unlabeled uses: Relief of herpes zoster (shingles) pain; restless leg syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to levodopa; allergy to tartrazine (an ingredient in *Dopar*); glaucoma, especially angle-closure glaucoma; lactation.
- Use cautiously in psychiatric patients, especially the depressed or psychotic; and with

severe CV or pulmonary disease; occlusive cerebrovascular disease; history of MI with residual arrhythmias; bronchial asthma; renal, hepatic, endocrine disease; history of peptic ulcer; pregnancy.

Available forms

Available only in combination products

Dosages

Adults

Individualize dosage. Increase dosage gradually to minimize side effects; titrate dosage carefully to optimize benefits and minimize side effects. Initially, 0.5–1 g PO daily divided into two or more doses given with food. Increase gradually in increments not exceeding 0.75 g/day every 3–7 days as tolerated. Do not exceed 8 g/day, except for exceptional patients. A significant therapeutic response may not be obtained for 6 mo. Only available in combination forms.

Pediatric patients

Safety for use in children younger than 12 yr not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	0.5–2 hr

Metabolism: Hepatic; $T_{1/2}$: 1–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Adventitious movement (eg, dystonic movements), ataxia, increased hand tremor, headache, dizziness, numbness, weakness and faintness, bruxism, confusion, insomnia, nightmares, hallucinations and delusions, agitation and anxiety, malaise, fatigue, euphoria, mental changes (including paranoid ideation), psychotic episodes, depression with or without suicidal tendencies, dementia, bradykinesia (“on-off” phenomenon), muscle twitching and blepharospasm, diplopia, blurred vision, dilated pupils*
- **CV:** Cardiac irregularities, palpitations, orthostatic hypotension

- **Dermatologic:** Flushing, hot flashes, increased sweating, rash
- **GI:** *Anorexia, nausea, vomiting, abdominal pain or distress, dry mouth, dysphagia, dysgeusia, bitter taste, sialorrhea, trismus, burning sensation of the tongue, diarrhea, constipation, flatulence, weight change, upper GI hemorrhage in patients with history of peptic ulcer*
- **GU:** Urinary retention, urinary incontinence
- **Hematologic:** Leukopenia, anemia, elevated BUN, AST, ALT, LDH, bilirubin, alkaline phosphatase, protein-bound iodine
- **Respiratory:** Bizarre breathing patterns

Interactions

- * **Drug-drug** ⊗ **Warning** Increased therapeutic effects and possible hypertensive crisis with MAOIs; withdraw MAOIs at least 14 days before starting levodopa therapy
- Decreased efficacy with pyridoxine (vitamin B₆), phenytoin, papaverine, TCAs, benzodiazepines
- * **Drug-lab test** • May interfere with urine tests for sugar or ketones • False Coombs’ test results • False elevations of uric acid when using colorimetric method

Nursing considerations Assessment

- **History:** Hypersensitivity to levodopa, trazine; glaucoma; history of melanoma; suspicious or undiagnosed skin lesions; severe CV or pulmonary disease; occlusive cerebrovascular disease; history of MI with residual arrhythmias; bronchial asthma; renal, hepatic, endocrine disease; history of peptic ulcer; psychiatric disorders; lactation, pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, bilateral grip strength, vision examination; P, BP, orthostatic BP, auscultation; R, depth, adventitious sounds; bowel sounds, normal output, liver evaluation; voiding pattern, normal output, prostate palpation; LFTs, renal function tests; CBC with differential

Interventions

- ⊗ **Warning** Arrange to decrease dosage if therapy is interrupted; observe for the development of suicidal tendencies.

- Give with meals if GI upset occurs.
- Ensure that patient voids before receiving dose if urinary retention is a problem.
- Monitor hepatic, renal, hematopoietic, and CV function.
- For patients who take multivitamins, provide a preparation without pyridoxine.

Teaching points

- Take this drug exactly as prescribed.
- Do not take multivitamin preparations with pyridoxine. These may prevent any therapeutic effect of levodopa. Notify your health care provider if you need vitamins.
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or engaging in activities that require alertness and visual acuity); nausea (take with meals, eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips); painful or difficult urination (empty bladder before each dose); constipation (maintain adequate fluid intake and exercise regularly, request correctives); dark sweat or urine (not harmful); dizziness or faintness when you get up (change position slowly and use caution when climbing stairs).
- Report fainting, light-headedness, dizziness; uncontrollable movements of the face, eyelids, mouth, tongue, neck, arms, hands, or legs; mental changes; irregular heart-beat or palpitations; difficult urination; severe or persistent nausea or vomiting.

▷ levofloxacin

(lee voh flox' a sin)

Levaquin

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Fluoroquinolone

Therapeutic actions

Bactericidal: Interferes with DNA by inhibiting DNA gyrase replication in susceptible gram-negative and gram-positive bacteria, preventing cell reproduction.

Indications

- Treatment of adults with community-acquired pneumonia, bacterial sinusitis caused by susceptible bacteria including multidrug resistant strains
- Treatment of acute exacerbation of chronic bronchitis caused by susceptible bacteria
- Treatment of complicated and uncomplicated skin and skin structure infections caused by susceptible bacteria
- Treatment of complicated and uncomplicated UTIs and acute pyelonephritis caused by susceptible bacteria
- Treatment of complicated UTIs caused by *Escherichia coli*, *Klebsiella pneumoniae*, or *Proteus mirabilis* and acute pyelonephritis caused by *E. coli*
- Treatment of chronic bacterial prostatitis caused by *E. coli*, *Enterococcus faecalis*, *Staphylococcus*
- Treatment of nosocomial pneumonia due to methicillin-sensitive *Staphylococcus aureus*, *Pseudomonas strains*, *Serratia*, *E. coli*, *Klebsiella*, *Haemophilus influenzae*, *Streptococcus pneumoniae*
- Treatment of postexposure inhalational anthrax
- Unlabeled uses: Traveler's diarrhea, epididymitis, gonococcal infection, pelvic inflammatory disease, urethritis

Contraindications and cautions

- Contraindicated with allergy to fluoroquinolones, lactation.
- Use cautiously with renal impairment, seizures, pregnancy.

Available forms

Tablets—250, 500, 750 mg; oral solution—25 mg/mL; injection—5 mg/mL; injection concentrate—25 mg/mL

Dosages

Adults

- *Community-acquired pneumonia*: 500 mg daily PO or IV for 7–14 days.
- *Sinusitis*: 500 mg daily PO or IV for 10–14 days or 750 mg/day PO or IV for 5 days.
- *Chronic bronchitis*: 500 mg daily PO or IV for 7 days.
- *Skin infection*: 500–750 mg daily PO or IV for 7–14 days.

- **UTIs:** 250 mg daily PO or IV for 3–10 days; complicated, 750 mg/day PO or IV for 5 days.
- **Pyelonephritis:** 250 mg daily PO or IV for 10 days or 750 mg PO or IV for 5 days.
- **Nosocomial pneumonia:** 750 mg daily PO or IV for 7–14 days.
- **Chronic prostatitis:** 500 mg/day PO for 28 days or 500 mg/day by slow IV infusion over 60 min for 28 days.
- **Postexposure anthrax:** 500 mg/day PO or IV for 60 days.

Pediatric patients

- **Inhalational anthrax:** 6 mo or older weighing more than 50 kg: 500 mg/day PO for 60 days; 6 mo or older weighing less than 50 kg: 8 mg/kg every 12 hr PO for 60 days. Do not exceed 250 mg/dose.

Patients with renal impairment

CrCl

(mL/min)	Dose
50–80	No adjustment
20–49	500 mg initially, then 250 mg daily; or 750 mg then 750 mg every 48 hr
10–19	500 mg initially, then 250 mg every 48 hr; or 750 mg, then 500 mg every 48 hr

For patients on dialysis, 750 mg initially, then 500 mg every 48 hr; or 500 mg initially, then 250 mg every 48 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	3–5 hr
IV	Rapid	End of infusion	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 6–8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is needed if using the premixed solution; dilute single-use vials in 50–100 mL D₅W.

Infusion: Administer slowly over at least 60–90 min. Do not administer IM or subcutaneously.

Compatibilities: Can be further diluted in 0.9% sodium chloride injection, 5% dextrose

injection, 5% dextrose/0.9% sodium chloride, 5% dextrose in lactated Ringer's, *Plasma-Lyte 56* and 5% *Dextrose* injection, 5% dextrose/0.45% sodium chloride, 0.15% potassium chloride, sodium lactate injection.

Adverse effects

- **CNS:** *Headache*, dizziness, *insomnia*, fatigue, somnolence, blurred vision
- **GI:** *Nausea*, vomiting, dry mouth, *diarrhea*, abdominal pain (occur less with this drug than with ofloxacin), constipation, flatulence, abnormal liver function
- **GU:** Abnormal renal function, acute renal failure, UTI, urine retention
- **Hematologic:** Elevated BUN, serum creatinine, and alkaline phosphatase; neutropenia, anemia
- **Other:** Fever, rash, photosensitivity, *muscle and joint tenderness*, increased serum glucose, tendinitis

Interactions

• **Drug-drug** • Decreased therapeutic effect with iron salts, sucralfate, antacids, zinc, magnesium (separate by at least 2 hr) • Increased risk of seizures with NSAIDs; avoid this combination • Risk of prolonged QT interval if combined with other drugs known to prolong QT interval; use caution

• **Drug-alternative therapy** • Increased risk of severe photosensitivity reactions if combined with St. John's wort therapy

Nursing considerations

Assessment

- **History:** Allergy to fluoroquinolones, renal impairment, seizures, lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; mucous membranes, bowel sounds; LFTs, renal function tests; blood glucose (patients with diabetes)

Interventions

⊗ **Black box warning** There is a risk of tendinitis and tendon rupture with drug administration. Risk increase in patients older than 60 yr; with concurrent corticosteroids use, and with kidney, heart, or lung transplant.

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy as indicated for condition being treated.
- Administer oral drug without regard to meals with a glass of water; separate oral drug from other cation administration, including antacids, by at least 2 hr.
- Ensure that patient is well hydrated during course of therapy.

⊗ **Warning** Discontinue drug at any sign of hypersensitivity (rash, photophobia) or at complaint of tendon pain, inflammation, or rupture.

- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat culture and sensitivity test.

Teaching points

- Take oral drug without regard to meals. If an antacid is needed, do not take it within 2 hours of levofloxacin dose.
- Drink plenty of fluids while you are using this drug.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation (consult your health care provider); drowsiness, blurred vision, dizziness (use caution if driving or operating dangerous equipment); sensitivity to sunlight (avoid exposure, use a sunscreen if needed).
- Report rash, visual changes, severe GI problems, weakness, tremors, muscle pain.

▷ levoleucovorin

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ levorphanol tartrate

(lee vor' fa nole)

Levo-Dromoran

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to severe acute and chronic pain
- Preoperative medication to allay apprehension, provide prolonged analgesia, reduce thiopental requirements, and shorten recovery time (*Levo-Dromoran*)

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning (before toxins are eliminated), pregnancy (neonatal withdrawal), labor or delivery (respiratory depression of neonate—premature infants are especially at risk; may prolong labor), bronchial asthma, acute alcoholism, increased intracranial pressure, respiratory depression, anoxia.
- Use cautiously with COPD, cor pulmonale, acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, kyphoscoliosis, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, and renal or hepatic impairment.

Available forms

Tablets—2 mg; injection—2 mg/mL

Dosages

Adults

Starting dose is 2 mg PO repeated every 6–8 hr (*Levo-Dromoran*) or 3–6 hr (levorphanol). Increase to 3 mg if necessary (*Levo-Dromoran*). Higher doses may be needed in opioid-tolerant patients or patients with severe pain. Usual dose 8–16 mg/day (levorphanol) or 6–12 mg/day (*Levo-Dromoran*).

IM or subcutaneous

1–2 mg; repeat in 6–8 hr as needed. Do not exceed 8 mg/day IM.

Geriatric patients or impaired adults

Use caution—respiratory depression may occur in the elderly, the very ill, and those with respiratory problems. Reduced dosage (by up to 50%) may be necessary.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–90 min	0.5–1 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 12–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex*
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope
- **Dermatologic:** Pruritus, urticaria, edema, hemorrhagic urticaria (rare)
- **GI:** *Nausea, vomiting, dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis*
- **GU:** Ureteral spasm, spasm of vesicle sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Respiratory:** **Bronchospasm, laryngospasm**
- **Major hazards:** Respiratory depression, apnea, circulatory depression, **respiratory arrest, shock, cardiac arrest**
- **Other:** *Sweating* (more common in ambulatory patients and those without severe pain), physical tolerance and dependence, psychological dependence

Interactions

• **Drug-drug** • Potentiation of effects of levorphanol when given with barbiturate anesthetics; decrease dose of levorphanol when coadministering • Increased risk of CNS effects with ethanol, barbiturates, antihistamines, and other sedating drugs

• **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase and lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

Nursing considerations Assessment

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, labor or delivery, bronchial asthma, acute alcoholism, increased intracranial pressure, respiratory depression, cor pulmonale, acute abdominal conditions, CV disease, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, kyphoscoliosis, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment
- **Physical:** T; skin color, texture, lesions; orientation, reflexes, pupil size, bilateral grip strength, affect; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; ECG; EEG; thyroid, LFTs, renal function tests

Interventions

- Give to lactating women 4–6 hr before the next feeding to minimize the amount in milk.
- Reassure patient that most people who receive opiates for medical reasons do not develop psychological dependency.

Teaching points

- Take drug exactly as prescribed.
- Do not take leftover medication for other disorders, and do not let anyone else take your prescription.
- You may experience these side effects: Nausea, loss of appetite (take with food, lie quietly, eat frequent small meals); constipation (laxative may help); dizziness, sedation, drowsiness, impaired visual acuity (avoid

driving, performing other tasks that require alertness or visual acuity).

- Report severe nausea, vomiting, constipation, shortness of breath, or difficulty breathing.

▷ levothyroxine sodium (L-thyroxine, T₄)

(lee voh thye rox' een)

Levothroid, Levoxine, Levoxyl,
Synthroid, Thyro-Tabs

PREGNANCY CATEGORY A

Drug class

Thyroid hormone

Therapeutic actions

Increases the metabolic rate of body tissues, thereby increasing oxygen consumption; respiration and HR; rate of fat, protein, and carbohydrate metabolism; and growth and maturation.

Indications

- Replacement therapy in hypothyroidism
- Pituitary TSH suppression in the treatment and prevention of euthyroid goiters and in the management of thyroid cancer
- Treatment of thyrotoxicosis in conjunction with antithyroid drugs and to prevent goitrogenesis, hypothyroidism, and thyrotoxicosis during pregnancy
- Treatment of myxedema coma

Contraindications and cautions

- Contraindicated with allergy to active or extraneous constituents of drug, untreated thyrotoxicosis, and acute MI uncomplicated by hypothyroidism.
- Use cautiously with Addison's disease (treat hypoadrenalism with corticosteroids before thyroid therapy), lactation, patients with coronary artery disease or angina.

Available forms

Tablets—25, 50, 75, 88, 100, 112, 125, 137, 150, 175, 200, 300 mcg; powder for injection—200, 500 mcg/vial; capsules—13, 25, 50, 75, 100, 125, 150 mcg

Dosages

50–100 mcg equals approximately 60 mg (1 grain) desiccated thyroid.

Adults

- *Hypothyroidism*: Initial dose, 12.5–25 mcg PO, with increasing increments of 25 mcg PO every 2–4 wk; maintenance up to 200 mcg/day. IV or IM injection can be substituted for the oral dosage form when oral ingestion is not possible. Usual IV dose is 50% of oral dose. Start at 25 mcg/day or less in patients with long-standing hypothyroidism or known cardiac disease. Usual replacement 1.7 mcg/kg per day.
- *Myxedema coma without severe heart disease*: 200–500 mcg IV as initial dose. An additional 100–300 mcg or more may be given the second day if necessary. Switch to PO once patient is able. Full effect not seen for 24 hr; dose based on improvement.
- *TSH suppression in thyroid cancer, nodules, and euthyroid goiters*: Doses should be individualized based on specific disease and patient. Larger amounts than used for normal suppression.
- *Thyroid suppression therapy*: 2.6 mcg/kg/day PO for 7–10 days.
- Older patients may require less than 1 mcg/kg/day. For most patients older than 50 yr or under age 50 with cardiac disease, an initial dose of 12.5 to 25 mcg/day with increases of 25 mcg/day every 6–8 wk.

Pediatric patients

- *Congenital hypothyroidism*: Infants require replacement therapy from birth.
0–3 mo: 10–15 mcg/kg/day.
3–6 mo: 8–10 mcg/kg/day.
6–12 mo: 6–8 mcg/kg/day.
1–5 yr: 5–6 mcg/kg/day.
6–12 yr: 4–5 mcg/kg/day.
Older than 12 yr: 2–3 mcg/kg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–3 wk
IV	6–8 hr	24–48 hr

Metabolism: Hepatic; T_{1/2}: 6–7 days

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add 5 mL 0.9% sodium chloride injection. Shake the vial to ensure complete mixing. Use immediately after reconstitution. Discard any unused portion.

Infusion: Inject directly, each 100 mcg over 1 min.

Incompatibilities: Do not mix with any other IV fluids.

Adverse effects

- **CNS:** Tremors, headache, nervousness, insomnia
- **CV:** Palpitations, tachycardia, angina, **cardiac arrest**
- **Dermatologic:** Allergic skin reactions, partial loss of hair in first few months of therapy in children
- **GI:** Diarrhea, nausea, vomiting, gagging, tablet stuck in throat, choking, esophageal atresia

Interactions

★ **Drug-drug** • Decreased absorption of oral thyroid preparation with cholestyramine, clolestipol, aluminum- and magnesium-containing antacids, iron, sucralate • Increased risk of bleeding with warfarin—reduce dosage of anticoagulant when T₄ is begun • Decreased effectiveness of cardiac glycosides if taken with thyroid replacement • Decreased theophylline clearance when patient is in hypothyroid state; monitor levels and patient response as euthyroid state is achieved

■ Nursing considerations**Assessment**

- **History:** Allergy to active or extraneous constituents of drug, thyrotoxicosis, acute MI uncomplicated by hypothyroidism, Addison's disease, lactation
- **Physical:** Skin lesions, color, T, texture; T; muscle tone, orientation, reflexes; P, auscultation, baseline ECG, BP; R, adventitious sounds; thyroid function tests

Interventions

⊗ **Black box warning** Do not use for weight loss; large doses may cause serious adverse effects.

- Monitor response carefully at start of therapy, and adjust dosage. Full therapeutic effect may not be seen for several days.
- Ensure that patient swallows tablet with a full glass of water.
- Do not change brands of T₄ products, due to possible bioequivalence problems.
- Do not add IV doses to other IV fluids.
- Use caution in patients with CV disease.
- Administer oral drug as a single daily dose before breakfast with a full glass of water.
- Arrange for regular, periodic blood tests of thyroid function.
- For children and other patients who cannot swallow tablets, crush and suspend in a small amount of water or formula, or sprinkle over soft food. Administer immediately.

⊗ **Warning** Most CV and CNS adverse effects indicate that the dose is too high. Check thyroid function tests and arrange to adjust dosage as necessary.

Teaching points

- Take as a single dose before breakfast with a full glass of water.
- This drug replaces an important hormone and will need to be taken for life. Do not discontinue drug without consulting your health care provider; serious problems can occur.
- Carry a medical ID tag to alert emergency medical personnel that you are use this drug.
- Arrange to have periodic blood tests and medical evaluations. Keep your scheduled appointments.
- Report headache, chest pain, palpitations, fever, weight loss, sleeplessness, nervousness, irritability, unusual sweating, intolerance to heat, diarrhea.

DANGEROUS DRUG**lidocaine hydrochloride***(lye' doe kane)***lidocaine HCl in 5% dextrose****lidocaine HCl without preservatives****Antiarrhythmic preparations:**

Xylocaine HCl IV for Cardiac Arrhythmias**Local anesthetic preparations:** Octocaine, Xylocaine HCl (injectable)**Topical for mucous membranes:** Anestacon, Burn-O-Jel, DentiPatch, Xylocaine, Zilactin-L**Topical Dermatologic:** L-M-X4, Lidamantle, Numby Stuff, RegeneCare, Solarcaine, Xylocaine**Transdermal:** Lidoderm**PREGNANCY CATEGORY B****Drug classes**Antiarrhythmic
Local anesthetic**Therapeutic actions**

Type 1b antiarrhythmic: Decreases diastolic depolarization, decreasing automaticity of ventricular cells; increases ventricular fibrillation threshold.

Local anesthetic: Blocks the generation and conduction of action potentials in sensory nerves by reducing sodium permeability, reducing height and rate of rise of the action potential, increasing excitation threshold, and slowing conduction velocity.

Indications

- As antiarrhythmic: Management of acute ventricular arrhythmias during cardiac surgery and MI (IV use). Use IM when IV administration is not possible or when ECG monitoring is not available and the danger of ventricular arrhythmias is great (single-dose IM use, for example, by paramedics in a mobile coronary care unit)
- As alternative to amiodarone to treat ventricular fibrillation or tachycardia with cardiac arrest
- As anesthetic: Infiltration anesthesia, peripheral and sympathetic nerve blocks, central nerve blocks, spinal and caudal anesthesia, retrobulbar and transtracheal injection; topical anesthetic for skin disorders and accessible mucous membranes

- As local analgesia for pain associated with postherpetic neuralgia

Contraindications and cautions

- Contraindicated with allergy to lidocaine or amide-type local anesthetics, heart failure, cardiogenic shock, second- or third-degree heart block (if no artificial pacemaker), Stokes-Adams syndrome, Wolff-Parkinson-White syndrome.
- Use cautiously with hepatic or renal disease, inflammation or sepsis in the region of injection (local anesthetic), labor and delivery (epidural anesthesia may prolong the second stage of labor; monitor for fetal and neonatal CV and CNS toxicity), and lactation.

Available forms

Direct injection—10, 20 mg/mL; IV injection (admixture)—5, 10, 15, 20, 40, 100 mg/mL; IV infusion—2, 4, 8 mg/mL; topical liquid—2.5%; topical ointment—5%; topical cream—0.5%, 3%, 4%; topical gel—0.5%, 2%, 2.5%, 4%, 5%; topical spray—0.5%, 10%; topical solution—2%, 4%; transdermal system—5%, topical lotion—3%; oral patch—46.1 mg

Dosages**Adults****IM**

- *Arrhythmia:* Use only the 10% solution for IM injection. 300 mg in deltoid or thigh muscle. Switch to IV lidocaine or oral antiarrhythmic as soon as possible. Repeat dose in 60–90 min if necessary.

IV bolus

- *Arrhythmia:* Use only lidocaine injection labeled for IV use and without preservatives or catecholamines. Monitor ECG constantly. Give 50–100 mg at rate of 25–50 mg/min. Give second bolus dose after 5 min if needed. Do not exceed 200–300 mg in 1 hr.

IV, continuous infusion

- *Arrhythmia:* Give 1–4 mg/min (or 20–50 mcg/kg/min). Titrate the dose down as soon as the cardiac rhythm stabilizes. Use lower doses in patients with heart failure, liver disease, and in patients older than 70 yr.

Topical, intratissue, epidural

- *Local anesthesia:* Preparations containing preservatives should not be used for spinal or epidural anesthesia. Drug concentration and

L

diluent should be appropriate to particular local anesthetic use: 5% solution with glucose is used for spinal anesthesia, 1.5% solution with dextrose for low spinal or “saddle block” anesthesia. Dosage varies with the area to be anesthetized and the reason for the anesthesia; use the lowest dose possible to achieve results.

Topical analgesia

- **Transdermal:** Apply up to 3 patches to area of pain for up to 12 hr within 24 hr.
- **Cream, ointment, gel, solution, oral patch, spray:** Apply as directed 1–3 times per day.

Pediatric patients

IV

- **Arrhythmia:** Safety and efficacy have not been established. American Heart Association recommends bolus of 0.5–1 mg/kg IV, followed by 30 mcg/kg/min with caution.

Topical, intratissue, epidural

- **Local anesthesia:** See adult dosage discussion. Use lower concentrations.

Geriatric or debilitated patients, patients with liver disease or heart failure

Use lower concentrations in these patients.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	5–10 min	5–15 min	2 hr
IV	Immediate	Immediate	10–20 min

Metabolism: Hepatic; $T_{1/2}$: 10 min, then 1.5–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare solution for IV infusion as follows: 1–2 g lidocaine to 1 L D_5W = 0.1%–0.2% solution; 1–2 mg lidocaine/mL. Stable for 24 hr after dilution.

Infusion: IV bolus: Give 50–100 mg at rate of 25–50 mg/min. Continuous infusion: Give at a rate of 1–4 mL/min of a 1 mg/mL solution will provide 1–4 mg lidocaine/min. Use only preparations of lidocaine specifically labeled for IV infusion.

Adverse effects

Antiarrhythmic with systemic administration

- **CNS:** *Dizziness or light-headedness, fatigue, drowsiness*, unconsciousness, tremors, twitching, vision changes; may progress to **seizures**
- **CV:** *Cardiac arrhythmias*, **cardiac arrest**, vasodilation, *hypotension*
- **GI:** *Nausea*, vomiting
- **Hypersensitivity:** Rash, **anaphylactoid reactions**
- **Respiratory:** Respiratory depression, **Respiratory arrest**
- **Other:** Malignant hyperthermia, fever, local injection site reaction

Injectable local anesthetic for epidural or caudal anesthesia

- **CNS:** *Headache, backache*, septic meningitis, persistent sensory, motor, or autonomic deficit of lower spinal segments, sometimes with incomplete recovery
- **CV:** *Hypotension* due to sympathetic block
- **Dermatologic:** Urticaria, pruritus, erythema, edema
- **GU:** *Urinary retention, urinary or fecal incontinence*

Topical local anesthetic

- **Dermatologic:** Contact dermatitis, urticaria, cutaneous lesions
- **Hypersensitivity:** **Anaphylactoid reactions**
- **Local:** *Burning, stinging, tenderness, swelling, tissue irritation*, tissue sloughing and necrosis
- **Other:** Methemoglobinemia, **seizures** (children)

Interactions

- **Drug-drug** • Increased lidocaine levels with beta blockers (propranolol, metoprolol, nadolol, pindolol, atenolol), cimetidine • Prolonged neuromuscular blockade with succinylcholine
- **Drug-lab test** • Increased CPK if given IM

Nursing considerations Assessment

- **History:** Allergy to lidocaine or amide-type local anesthetics, heart failure, cardiogenic

shock, second- or third-degree heart block, Wolff-Parkinson-White syndrome, Stokes-Adams syndrome, hepatic or renal disease, inflammation or sepsis in region of injection, lactation, pregnancy

- **Physical:** T; skin color, rashes, lesions; orientation, speech, reflexes, sensation and movement (local anesthetic); P, BP, auscultation, continuous ECG monitoring during use as antiarrhythmic; edema; R, adventitious sounds; bowel sounds, liver evaluation; urine output; serum electrolytes, LFTs, renal function tests

Interventions

⊗ **Warning** Check drug concentration carefully; many concentrations are available.

- Reduce dosage with hepatic or renal failure.
- Continuously monitor response when used as antiarrhythmic or injected as local anesthetic.

⊗ **Warning** Keep life-support equipment and vasopressors readily available in case severe adverse reaction (CNS, CV, or respiratory) occurs when lidocaine is injected.

⊗ **Warning** Establish safety precautions if CNS changes occur; have IV diazepam or short-acting barbiturate (thiopental) readily available in case of seizures.

⊗ **Warning** Monitor for malignant hyperthermia (jaw muscle spasm, rigidity); have life-support equipment and IV dantrolene readily available.

- Titrate dose to minimum needed for cardiac stability, when using lidocaine as antiarrhythmic.
- Reduce dosage when treating arrhythmias in heart failure, digoxin toxicity with AV block, and geriatric patients.
- Monitor fluid load carefully; more concentrated solutions can be used to treat arrhythmias in patients on fluid restrictions.
- Have patients who have received lidocaine as a spinal anesthetic remain lying flat for 6–12 hr afterward, and ensure that they are adequately hydrated to minimize risk of headache.

⊗ **Warning** Large amounts of anesthetics used during cosmetic procedures may result in severe, life-threatening adverse effects. Amount used should be as small as possible and monitored by an experienced physician.

⊗ **Warning** Check lidocaine preparation carefully; epinephrine is added to solutions of lidocaine to retard the absorption of the local anesthetic from the injection site. Make sure that such solutions are used only to produce local anesthesia. These solutions should be injected cautiously in body areas supplied by end arteries and used cautiously in patients with peripheral vascular disease, hypertension, thyrotoxicosis, or diabetes.

- Use caution to prevent choking. Patient may have difficulty swallowing after using oral topical anesthetic. Do not give food or drink for 1 hr after use of oral anesthetic.
- Apply lidocaine ointments or creams to a gauze or bandage before applying to the skin.

⊗ **Warning** Monitor for safe and effective serum drug concentrations (antiarrhythmic use: 1–5 mcg/mL). Concentrations of 6 or more mcg/mL are usually toxic.

Teaching points

- Dosage is changed frequently in response to cardiac rhythm on monitor.
- Oral lidocaine can cause numbness of the tongue, cheeks, and throat. Do not eat or drink for 1 hour after using oral lidocaine to prevent biting the inside of your mouth or tongue and choking.
- You may experience these side effects: Drowsiness, dizziness, numbness, double vision; nausea, vomiting; stinging, burning, local irritation (local anesthetic).
- Report difficulty speaking, thick tongue, numbness, tingling, difficulty breathing, pain or numbness at IV site, swelling, or pain at site of local anesthetic use.

lincomycin hydrochloride

See Appendix U, *Less commonly used drugs*.

linezolid (lab nez' ob lid)

Zyvox

PREGNANCY CATEGORY C

Drug class

Oxazolidinone antibiotic

Therapeutic actions

Bacteriostatic and bacteriocidal: Interferes with protein synthesis on the bacterial ribosome; effective in VRE, *Staphylococcus*, and methicillin-resistant *S. aureus* (MRSA) and penicillin-resistant *pneumococci* and *S. aureus*; is a reversible, nonselective MAOI.

Indications

- Treatment of infections due to vancomycin-resistant *Enterococcus faecium* (VREF)
- Treatment of nosocomial and community-acquired pneumonia due to *S. aureus* and penicillin-susceptible *Streptococcus pneumoniae*
- Treatment of skin and skin structure infections including those caused by MRSA
- Treatment of diabetic foot infections without osteomyelitis caused by gram-positive organisms including MRSA, *Streptococcus pyogenes*, or *Streptococcus agalactiae*

Contraindications and cautions

- Contraindicated with allergy to linezolid; lactation; phenylketonuria (oral suspension).
- Use cautiously with bone marrow suppression, hepatic impairment, hypertension, hyperthyroidism, pheochromocytoma, carcinoid syndrome, pregnancy.

Available forms

Tablets—600 mg; powder for oral suspension—100 mg/5 mL; injection—2 mg/mL

Dosages

No dosage adjustment is needed if switching between oral and IV forms.

Adults

- *VREF, MRSA, pneumonia, complicated skin and skin structure infections, including diabetic foot ulcers without osteomyelitis*: 600 mg IV or PO every 12 hr for 10–28 days, depending on infection.
- *Uncomplicated skin and skin structure infections*: 400 mg PO every 12 hr for 10–14 days.

Pediatric patients

- *VREF, CAP, nosocomial pneumonia, complicated skin, and skin structure infections*: 11 yr or younger: 10 mg/kg IV or PO every 8 hr.
- *Uncomplicated skin and skin structure infections*:
Younger than 5 yr: 10 mg/kg PO every 8 hr.
5–11 yr: 10 mg/kg PO every 12 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr
IV	Rapid	30 min

Metabolism: Hepatic; $T_{1/2}$: 5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Use premixed solution—available in 100, 200, and 300 mL forms; store at room temperature, protect from light, leave overwrap in place until ready to use; appears yellow.

Infusion: Infuse over 30–120 min, switch to oral form as soon as appropriate. May be infused into line using 5% dextrose injection, 0.9% sodium chloride, or lactated Ringer's.

Incompatibilities: ☒ **Warning** Do not introduce additives into this solution; do not mix in solution or at Y-connection with any other drugs. If other drugs are being given through the same line, the line should be flushed before and after linezolid administration.

Adverse effects

- **CNS:** *Headache*, dizziness, *insomnia*, fatigue, somnolence, depression, nervousness
- **GI:** *Nausea*, vomiting, dry mouth, *diarrhea*, anorexia, gastritis, **pseudomembranous colitis**
- **Hematologic:** **Thrombocytopenia**
- **Other:** Fever, rash, sweating, photosensitivity, tendinitis

Interactions

- **Drug-drug** • Risk of hypertension and related adverse effects if combined with drugs

containing pseudoephedrine, SSRIs, MAOIs; use caution and monitor patient carefully if any of these combinations are used • Increased risk of bleeding and thrombocytopenia if combined with antiplatelet drugs (aspirin, dipyridamole, NSAIDs); monitor platelet counts carefully

★ **Drug-food** ☒ **Warning** Risk of severe hypertension if combined with large amounts of food containing tyramine (see Appendix D, *Important dietary guidelines for patient teaching*, for tyramine food lists); patient should be cautioned to avoid eating large amounts of these foods.

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Zyvox* (linezolid) and *Zovirax* (acyclovir); use caution.

Assessment

- **History:** Allergy to linezolid; hepatic impairment, bone marrow depression, hypertension, phenylketonuria, hyperthyroidism, carcinoid syndrome, pheochromocytoma, pregnancy, lactation
- **Physical:** Culture site; skin color, lesions; T; orientation, reflexes, affect; P, BP; mucous membranes, bowel sounds; LFTs, CBC, and differential

Interventions

- Arrange for culture and sensitivity tests before beginning therapy.
- Reserve use of this drug for cases of well-documented bacteria-sensitive infections.
- Continue therapy as indicated for condition being treated.
- Monitor platelet counts regularly if drug is used for 2 wk or longer.
- Monitor BP before and periodically during therapy if patient is on antidepressants or drugs containing sympathomimetics.
- Advise patient to avoid foods high in tyramine to avoid risk of severe hypertension.
- Advise patient of high cost of drug and refer for financial support as needed.
- Monitor clinical response—if no improvement is seen or a relapse occurs, repeat culture and sensitivity tests.

Teaching points

- Take drug every 12 hours or every 8 hours as prescribed; take the full course of the drug; drug may be taken with or without food.
- Avoid foods high in tyramine (a list will be provided) while you are using this drug.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals; take the drug with food); diarrhea (consult your health care provider if this occurs).
- Report rash, severe GI problems, weakness, tremors, anxiety, increased bleeding.

▽ liothyronine sodium (T₃, triiodothyronine)

(*lye' ob thye' roe neen*)

Cytomel, Triostat

PREGNANCY CATEGORY A

Drug class

Thyroid hormone

Therapeutic actions

Increases the metabolic rate of body tissues, thereby increasing oxygen consumption; respiratory and HR; rate of fat, protein, and carbohydrate metabolism; and growth and maturation.

Indications

- Replacement therapy in hypothyroidism
- Pituitary TSH suppression in the treatment and prevention of euthyroid goiters and in the management of thyroid cancer
- Thyrotoxicosis in conjunction with antithyroid drugs and to prevent goitrogenesis, hypothyroidism, and thyrotoxicosis during pregnancy
- Synthetic hormone used with patients allergic to desiccated thyroid or thyroid extract derived from pork or beef
- Diagnostic use: T₃ suppression test to differentiate suspected hyperthyroidism from euthyroidism
- IV: Treatment of myxedema coma and precoma

Contraindications and cautions

- Contraindicated with allergy to active or extraneous constituents of drug, untreated thyrotoxicosis, and acute MI uncomplicated by hypothyroidism.
- Use cautiously with Addison's disease (treat hypoadrenalism with corticosteroids before thyroid therapy), lactation, patients with coronary artery disease or angina, pregnancy.

Available forms

Tablets—5, 25, 50 mcg; injection—10 mcg/mL

Dosages

15–37.5 mcg equals approximately 60 mg (1 grain) desiccated thyroid.

Adults

- *Hypothyroidism*: Initial dosage, 25 mcg/day PO. May be increased every 1–2 wk in increments of 12.5–25-mcg. For maintenance, 25–75 mcg/day.
- *Myxedema*: Initial dosage, 5 mcg/day PO. Increase in increments of 5–10 mcg every 1–2 wk. For maintenance, 50–100 mcg/day.
- *Myxedema coma and precoma*: 25–50 mcg IV every 4–12 hr; do not give IM or subcutaneously. In patients with cardiac disease, start at 10–20 mcg IV. Do not exceed 100 mcg/24 hr.
- *Simple goiter*: Initial dosage, 5 mcg/day PO. May be increased by increments of 5–10 mcg every 1–2 wk. For maintenance, 75 mcg/day.
- *T₃ suppression test*: 75–100 mcg/day PO for 7 days, then repeat iodine 131 (¹³¹I) uptake test. ¹³¹I uptake will be unaffected in the hyperthyroid patient but will be decreased by 50% or more in the euthyroid patient.

Pediatric patients

- *Congenital hypothyroidism*: Infants require replacement therapy from birth. Starting dose is 5 mcg/day PO with 5-mcg increments every 3–4 days until the desired dosage is reached. Usual maintenance dosage, 20 mcg/day PO up to age 1 yr; 50 mcg/day for age 1–3 yr. Use adult dosage after age 3 yr.

Geriatric patients

Start therapy with 5 mcg/day PO. Increase by only 5-mcg increments at 2-wk intervals, and monitor patient response.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–3 days	3–4 days
IV	Rapid	End of infusion	Unknown

Metabolism: Hepatic; T_{1/2}: 1–2 days

Distribution: Does not cross placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is needed; refrigerate vials before use; discard unused portions.

Infusion: Infuse slowly, each 10 mcg over 1 min. Switch to oral form as soon as possible.

Adverse effects

- **Dermatologic**: Allergic skin reactions, partial loss of hair in first few months of therapy in children
- **Endocrine**: Mainly symptoms of hyperthyroidism: *Palpitations, elevated pulse pressure, tachycardia, arrhythmias*, angina pectoris, **cardiac arrest**; tremors, *headache, nervousness, insomnia; nausea, diarrhea*, changes in appetite; weight loss, menstrual irregularities, sweating, heat intolerance, fever
- **Other**: Esophageal atresia

Interactions

- **Drug-drug** • Decreased absorption of oral thyroid preparation with cholestyramine • Increased risk of bleeding with warfarin—reduce dosage of anticoagulant when thyroid hormone is begun • Decreased effectiveness of cardiac glycosides with thyroid replacement
- Decreased clearance of theophyllines if patient is in hypothyroid state; monitor response and adjust dosage as patient approaches euthyroid state

■ Nursing considerations

Assessment

- **History:** Allergy to active or extraneous constituents of drug, thyrotoxicosis, acute MI uncomplicated by hypothyroidism, Addison's disease, lactation, pregnancy
- **Physical:** Skin lesions, color, T, texture; T; muscle tone, orientation, reflexes; P, auscultation, baseline ECG, BP; R, adventitious sounds; thyroid function tests

Interventions

⊗ **Black box warning** Do not use for weight loss; large doses may cause serious adverse effects.

- Monitor patient response carefully at start of therapy; adjust dosage.
- Monitor exchange from one form of thyroid replacement to T₃. Discontinue the other medication, then begin this drug at a low dose with gradual increases based on the patient's response.

⊗ **Warning** Most CV and CNS adverse effects indicate a too high dose. Stop medication for several days and reinstitute at a lower dose.

- Administer as a single daily dose before breakfast with a full glass of water.
- Arrange for regular, periodic blood tests of thyroid function.
- Monitor cardiac response.

Teaching points

- Take as a single dose before breakfast with a full glass of water.
- This drug replaces an important hormone and will need to be taken for life. Do not discontinue drug for any reason without consulting your health care provider; serious problems can occur.
- Wear or carry a medical ID tag to alert emergency medical personnel that you are using this drug.
- Have periodic blood tests and medical evaluations.
- Nausea and diarrhea may occur (dividing the dose may help).
- Report headache, chest pain, palpitations, fever, weight loss, sleeplessness, nervousness, irritability, unusual sweating, intolerance to heat, diarrhea.

liotrix (*lye' ob trix*)

Thyrolar

PREGNANCY CATEGORY A

Drug class

Thyroid hormone (contains synthetic T₃ and T₄ in a ratio of 1 to 4 by weight)

Therapeutic actions

Increases the metabolic rate of body tissues, thereby increasing oxygen consumption; respiratory and HR; rate of fat, protein, and carbohydrate metabolism; and growth and maturation.

Indications

- Replacement therapy in hypothyroidism
- Congenital hypothyroidism
- Pituitary TSH suppression in the treatment and prevention of euthyroid goiters and in the management of thyroid cancer
- Treatment of thyrotoxicosis in conjunction with antithyroid drugs and to prevent goitrogenesis, hypothyroidism, and thyrotoxicosis during pregnancy
- Diagnostic test for thyroid disease

Contraindications and cautions

- Contraindicated with allergy to active or extraneous constituents of drug, untreated thyrotoxicosis, and acute MI uncomplicated by hypothyroidism.
- Use cautiously with Addison's disease (hypoadrenalism; treat with corticosteroids before thyroid therapy), lactation, coronary artery disease, or angina, pregnancy.

Available forms

Tablets— $\frac{1}{4}$, $\frac{1}{2}$, 1, 2, 3 grains equivalent to 15, 30, 60, 120, 180 mg thyroid, respectively

Dosages

60 mg equals 65 mg (1 grain) desiccated thyroid; administered only PO.

Adults

- **Hypothyroidism:** Initial dosage, 30 mg/day PO. Increase gradually every 2–3 wk in 15-mg (thyroid equivalent) increments (2 wk in children). In patients with cardiac

disease, start with 15 mg/day (thyroid equivalent).

- **Maintenance dose:** 60–120 mg/day PO (thyroid equivalent).
- **Thyroid cancer:** Use larger doses than required for replacement surgery.
- **Diagnostic test:** 1.56 mcg/kg/day PO for 7–10 days.

Pediatric patients older than 12 yr
More than 90 mg/day (thyroid equivalent PO).

Pediatric patients 6–12 yr
60–90 mg/day (thyroid equivalent PO).

Pediatric patients 1–5 yr
45–60 mg/day (thyroid equivalent PO).

Pediatric patients 6–12 mo
30–45 mg/day (thyroid equivalent PO).

Pediatric patients 0–6 mo
15–30 mg/day (thyroid equivalent PO).

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–3 days	3 days

Metabolism: Hepatic; $T_{1/2}$: 1–6 days

Distribution: Does not cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Dermatologic:** Allergic skin reactions, partial hair loss in first few months of therapy in children
- **Endocrine:** Mainly symptoms of hyperthyroidism: *Palpitations, elevated pulse pressure, tachycardia, arrhythmias*, angina pectoris, **cardiac arrest**; tremors, *headache, nervousness, insomnia; nausea*, diarrhea, changes in appetite; weight loss, menstrual irregularities, sweating, heat intolerance, fever
- **Other:** Esophageal atresia

Interactions

• **Drug-drug** • Decreased absorption of oral thyroid preparation with cholestyramine • Increased risk of bleeding with warfarin—reduce dosage of anticoagulant when T_4 is begun • Decreased effectiveness of cardiac glycosides if taken with thyroid replacement • Decreased clearance of theophyllines in hypothyroid state; monitor response and adjust dosage as patient approaches euthyroid state

• **Drug-lab test** • Androgens, corticosteroids, estrogens, oral contraceptives, iodine-containing preparations may alter thyroid tests

Nursing considerations

Assessment

- **History:** Allergy to active or extraneous constituents of drug, thyrotoxicosis, acute MI uncomplicated by hypothyroidism, Addison's disease, lactation, pregnancy
- **Physical:** Skin lesions, color, T, texture; T; muscle tone, orientation, reflexes; P, auscultation, baseline ECG, BP; R, adventitious sounds; thyroid function tests

Interventions

⊗ **Black box warning** Do not use for weight loss; large doses may cause serious adverse effects.

• Monitor response carefully at start of therapy, and adjust dosage.

⊗ **Warning** Most CV and CNS adverse effects indicate a dose that is too high. Stop drug for several days and reinstitute at a lower dose.

- Administer as a single daily dose before breakfast with a full glass of water.
- Carefully check dosage; dosing can be confusing when converting from grains to thyroid-equivalent dosages.
- Arrange for regular, periodic blood tests of thyroid function.
- Monitor cardiac response.

Teaching points

- Take as a single dose before breakfast with a full glass of water.
- This drug replaces an important hormone and will need to be taken for life. Do not discontinue without consulting your health care provider; serious problems can occur.
- If you are also diabetic, dosages of your diabetic medications may need to be changed.
- Wear a medical ID tag to alert emergency medical personnel that you take this drug.
- Have periodic blood tests and medical evaluations.
- Nausea and diarrhea may occur (divide the dose).
- Report headache, chest pain, palpitations, fever, weight loss, sleeplessness, nervousness,

irritability, unusual sweating, intolerance to heat, diarrhea.

DANGEROUS DRUG

liraglutide

(*lir ah glōo' tide*)

Victoza

PREGNANCY CATEGORY C

Drug classes

Antidiabetic
Glucagon-like peptide receptor agonist

Therapeutic actions

Increases intracellular cyclic AMP in pancreatic beta cells, leading to insulin release in the presence of elevated glucose concentrations; this insulin secretion subsides as blood glucose levels approach normal; it also decreases glucagon secretion in a glucose-dependent manner; this mechanism of glucose lowering also causes a delay in gastric emptying, helping to achieve glucose control.

Indications

- As adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes

Contraindications and cautions

- Contraindicated with history of serious hypersensitivity reactions to liraglutide, personal or family history of medullary thyroid cancer, multiple endocrine neoplasia syndrome (MENS) type 2, type 1 diabetes, diabetic ketoacidosis.
- Use cautiously with pancreatitis, pregnancy, lactation.

Available forms

Solution for injection in prefilled pens—6 mg/mL (delivers 0.6, 1.2, or 1.8 mg)

Dosages

Adults

Initially, 0.6 mg by subcutaneous injection once a day, without regard to meals, for 1 wk; then increase to 1.2 mg/day by subcutaneous injection. May be increased to 1.8 mg/day if needed.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Moderate	8–12 hr

Metabolism: Endogenous; $T_{1/2}$: 13 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** Headache, dizziness
- **GI:** Nausea, diarrhea, vomiting, constipation, pancreatitis
- **GU:** UTI
- **Respiratory:** URI, sinusitis, nasopharyngitis
- **Other:** Urticaria, hypoglycemia, injection-site reactions, papillary thyroid carcinoma

Interactions

- **Drug-drug** • Possible altered absorption of oral drugs related to delay in gastric emptying; use caution when using oral drugs with liraglutide • Increased risk of hypoglycemia when combined with antidiabetic secretagogues (such as sulfonylureas); consider lowering secretagogue dosage
- **Drug-alternative therapies** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, personal or family history of medullary thyroid cancer, MENS type 2, pancreatitis, pregnancy, lactation
- **Physical:** R, adventitious sounds; GI exam; blood glucose, HbA1c levels

Interventions

- **⊗ Black box warning** Drug causes thyroid medullary cancer in rodents; not for use with personal or family history of thyroid medullary cancer or MENS type 2; monitor patient closely.
- Monitor blood glucose and HbA1c levels before and periodically during therapy.

- Ensure patient continues diet and exercise program for management of type 2 diabetes.
- Alert patient to risk of medullary thyroid cancer and pancreatitis.
- If appropriate, ensure patient continues use of other drugs prescribed to manage type 2 diabetes.
- Arrange for thorough diabetic teaching program, including diet, exercise, signs and symptoms of hypoglycemia and hyperglycemia, and safety measures to avoid infections and injuries.

Teaching points

- Liraglutide should be taken once a day, with or without food. It must be injected by subcutaneous injection. You and a significant other should learn to give these injections. Drug is supplied in a prefilled pen. You must dispose of needles appropriately.
- Before use, store pen in refrigerator. After first use, store at room temperature or in refrigerator. Mark date of first use on pen; pen can only be used for a total of 30 days after first use and should then be discarded. Protect pen from exposure to heat and light. Remove needle after each use and dispose of it properly; store pen with cap in place. Do not share pen with other patients.
- If you forget a dose, take it as soon as you remember, then begin your usual dosage the next day. Do not make up skipped doses and do not take more than one dose each day.
- Maintain your blood glucose level as directed by your health care provider.
- Continue the diet and exercise program designed for treatment of your type 2 diabetes; continue taking other drugs used to treat your diabetes if instructed to do so by your health care provider.
- Arrange for periodic monitoring of your fasting blood glucose and glycosylated hemoglobin levels.
- It is not known how drug affects a fetus. If you are pregnant or thinking about becoming pregnant, discuss this with your health care provider.
- Drug enters breast milk, but it is not known how this could affect a nursing baby. If you are breast-feeding, discuss this with your health care provider.

- During times of stress (surgery, infection, injury), the needs of your body change. Consult your health care provider immediately if you experience times of stress. The dosage of your antidiabetic drugs and the actual drugs that are needed may change.
- Tell your health care provider if you are taking herbal or over-the-counter products or other prescription drugs; many of these products may change your glucose level and dosage adjustments will be needed.
- Report uncontrolled glucose levels; severe abdominal pain that radiates to the back and may be accompanied by vomiting; severe headache; lump in the neck; hoarseness; difficulty swallowing; increased stress; trauma.

lisdexamfetamine dimesylate

(*liss dex am fet' a meen*)

Vyvanse

PREGNANCY CATEGORY C
CONTROLLED SUBSTANCE C-II

Drug classes

Amphetamine
CNS stimulant

Therapeutic actions

Thought to block reuptake of norepinephrine and dopamine in the presynaptic neuron and increase release of these monamines into the extraneuronal space, stimulating CNS activity and leading to suppressed appetite, increased alertness, elevated mood, improved physical performance when fatigue and sleep deprivation have caused impairment; mode of action in attention deficit/hyperactivity disorder (ADHD) is not understood.

Indications

- Treatment of ADHD in patients 6 yr and older as part of an integrated treatment plan

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, advanced arteriosclerosis, symptomatic CV disease, moderate

to severe hypertension, hyperthyroidism, hypersensitivity or idiosyncratic reaction to sympathetic amines, glaucoma, agitated states, history of drug abuse, during or within 14 days following treatment with an MAOI, lactation.

- Use cautiously with history of seizures, pre-existing psychosis or bipolar disorder, pregnancy.

Available forms

Capsules—20, 30, 40, 50, 60, 70 mg

Dosages

Adults and children 6 yr and older

30 mg/day PO in the morning; may increase at weekly intervals in increments of 10–20 mg/day to a maximum of 70 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3.5 hr

Metabolism: Hepatic; $T_{1/2}$: 1 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, dizziness, somnolence, *insomnia*, tics, *irritability*, aggression, mania, affect lability, seizures, visual disturbances
- **CV: Serious cardiac events, sudden death**, hypertension, tachycardia
- **GI:** *Abdominal pain*, *diarrhea*, nausea, *vomiting*, dry mouth, *decreased appetite*
- **Other:** Fever, *weight loss*, rash, drug dependence, slowed growth

Interactions

• **Drug-drug** • Risk of decreased effectiveness if combined with urine acidifying agents, methenamine • Risk of increased activity of TCAs and sympathomimetic agents and increased risk of CV events • Risk of toxic neurologic effects and potentially fatal malignant hyperpyrexia if combined with MAOIs; do not use for 14 days after stopping MAOI • Blocked effects if combined with chlorpromazine; do not use this combination (chlorpromazine

may be used to treat amphetamine poisoning)

• Decreased CNS stimulation if combined with haloperidol • Enhanced effects of meperidine, norepinephrine if combined with lisdexamfetamine • Risk of excessive CNS stimulation and fatal seizures if combined with propoxyphene overdose

• **Drug-lab test** • Significant elevation in plasma corticosteroid level, particularly in the evening

Nursing considerations

⊗ **Black box warning** High risk of abuse could lead to drug dependence; misuse of amphetamines has caused serious CV events and sudden death.

Assessment

- **History:** Hypersensitivity to any component of the drug, advanced arteriosclerosis, symptomatic CV disease, moderate to severe hypertension, hyperthyroidism, known hypersensitivity or idiosyncrasy to sympathetic amines, glaucoma, agitated states, history of drug abuse, during or within 14 days following treatment with an MAOI, lactation; history of seizures, preexisting psychosis or bipolar disorder, pregnancy
- **Physical:** Skin color, lesions; orientation, affect, reflexes; BP, P; height and weight

Interventions

- Ensure proper diagnosis before administering to children for behavioral syndromes; drug should not be used until other causes (learning disabilities, EEG abnormalities, neurologic deficits) are ruled out.
- Drug therapy should be part of a comprehensive program to help with the problem.
- Interrupt drug therapy periodically to determine if symptomatic response still validates drug therapy.
- Monitor growth of children on long-term therapy; failure to grow may indicate need to stop drug.
- Dispense the lowest feasible dose to minimize risk of overdose; drug should be stored securely out of the reach of anyone who might abuse drug (drug is a controlled substance).
- If child cannot swallow capsules, empty the capsule contents into a glass of water and

have the child drink it right away. Do not try to divide doses or save contents.

- Administer drug early in the day to help prevent insomnia.
- Provide small, frequent meals if GI upset is a problem.
- Monitor BP periodically.

Teaching points

- Store this drug at room temperature in a dry place (not in the bathroom or near the kitchen sink). It is a controlled substance with abuse potential; store it out of the reach of children.
- Give this drug once a day in the morning. If you or your child cannot swallow the capsule, open it, dissolve the entire contents in a glass of water, and drink or have the child drink it right away.
- You or your child will need to have periodic blood tests, blood pressure checks, and height and weight checks to monitor the effects of this drug.
- This drug should be used as part of a comprehensive ADHD treatment program that includes behavior modification.
- The effectiveness of this drug may be changed by combining with certain other drugs, especially antidepressants such as MAOIs, antipsychotic drugs, blood pressure drugs, seizure drugs, and opioid pain relievers. Tell all of your child's health care providers that your child is taking this drug so that appropriate dosage adjustments and precautions can be taken.
- You or your child may experience the following side effects: Irritability, insomnia (monitor the child, especially at the start of drug therapy); dry mouth, loss of appetite, abdominal pain (sucking sugarless candies may help, but make sure to safeguard the child's nutrition); slowing of growth, weight loss (report any marked changes to your health care provider).
- Report aggression, vision changes, manic symptoms, marked weight loss, seizures.

▽ lisinopril

(lyse *in'* oh pril)

Prinivil, Zestril

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Renin, synthesized by the kidneys, is released into the circulation where it acts on a plasma precursor to produce angiotensin I, which is converted by ACE to angiotensin II, a potent vasoconstrictor that also causes release of aldosterone from the adrenals. Lisinopril blocks the conversion of angiotensin I to angiotensin II, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss.

Indications

- Treatment of hypertension alone or in combination with other antihypertensives
- Adjunctive therapy in heart failure for patients unresponsive to diuretics and digoxin alone
- Treatment of stable patients within 24 hr of acute MI to improve survival with standard treatments

Contraindications and cautions

- Contraindicated with allergy to lisinopril, other ACE inhibitors, history of angioedema.
- Use cautiously with impaired renal function, heart failure, salt or volume depletion, IHSS, pregnancy, lactation.

Available forms

Tablets—2.5, 5, 10, 20, 30, 40 mg

Dosages

Adults not taking diuretics

Initial dose, 10 mg/day PO. Adjust dosage based on response. Usual range is 20–40 mg/day as a single dose.

Adults taking diuretics

Discontinue diuretic for 2–3 days. If it is not possible to discontinue, give initial dose of 5 mg, and monitor for excessive hypotension.

- **Heart failure:** 5 mg PO daily with diuretics and digitalis. Effective range, 5–20 mg/day (*Prinivil*) and 5–40 mg/day (*Zestril*).
- **Acute MI:** Start within 24 hr of MI with 5 mg PO followed in 24 hr by 5 mg PO; 10 mg PO after 48 hr, then 10 mg PO daily for 6 wk. Give with other recommended treatments.

Pediatric patients 6 yr and older

Usual starting dose is 0.07 mg/kg once daily up to 5 mg total.

Pediatric patients younger than 6 yr

Safety and efficacy not established; drug usually not recommended.

Geriatric patients and patients with renal impairment

Excretion is reduced in renal failure. Use smaller initial dose, and adjust upward to a maximum of 40 mg/day PO.

CrCl

(mL/min)	Initial Dose
More than 30	10 mg/day
10–30	5 mg/day (2.5 mg for HF)
Less than 10	2.5 mg/day

For patients on dialysis, give 2.5 mg on day of dialysis.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	7 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 12 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, insomnia, fatigue, paresthesias*
- **CV:** *Orthostatic hypotension, tachycardia, angina pectoris, MI, Raynaud's syndrome,*

heart failure, severe hypotension in salt- or volume-depleted patients

- **GI:** *Gastric irritation, nausea, diarrhea, peptic ulcers, dysgeusia, cholestatic jaundice, hepatocellular injury, anorexia, constipation*
- **GU:** *Proteinuria, renal insufficiency, renal failure, polyuria, oliguria, frequency*
- **Hematologic:** *Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, pancytopenia, hyperkalemia*
- **Other:** *Angioedema* (particularly of the face, extremities, lips, tongue, larynx); death has been reported with **airway obstruction**; *cough, muscle cramps, impotence, rash, pruritus*

Interactions

- **Drug-drug** • Decreased antihypertensive effects and increased risk of renal damage if taken with NSAIDs • Exacerbation of cough if combined with capsaicin

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between lisinopril and fosinopril; use caution.

Assessment

- **History:** Allergy to lisinopril or other ACE inhibitors, impaired renal function, heart failure, salt or volume depletion, lactation, pregnancy
- **Physical:** Skin color, lesions, turgor; T; P; BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential, potassium

Interventions

- Begin drug within 24 hr of acute MI; ensure that patient is also receiving standard treatment (eg, aspirin, beta-adrenergic blockers, thrombolytics).
- ⊗ **Warning** Keep epinephrine readily available in case of angioedema of the face or neck region; if breathing difficulty occurs, consult physician, and administer epinephrine.
- ⊗ **Warning** Alert surgeon, and mark the patient's chart with notice that lisinopril is being taken. The angiotensin II formation

subsequent to compensatory renin release during surgery will be blocked. Hypotension may be reversed with volume expansion.

- Monitor patients on diuretic therapy for excessive hypotension following the first few doses of lisinopril.
- Monitor patients closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.
- Arrange for reduced dosage in patients with impaired renal function.

⊗ **Black box warning** Suggest the use of contraceptives; if pregnancy should occur, discontinue drug as soon as possible; fetal injury or death may occur.

Teaching points

- Take this drug once a day. It may be taken with meals. Do not stop taking drug without consulting your health care provider.
- Be careful with any conditions that may lead to a drop in blood pressure (such as diarrhea, sweating, vomiting, dehydration). If lightheadedness or dizziness occurs, consult your health care provider.
- Do not take this during pregnancy; use of contraceptive measures is advised.
- You may experience these side effects: GI upset, loss of appetite, change in taste perception (may be transient; take with meals); rash; fast heart rate; dizziness, light-headedness (transient; change position slowly, and limit activities to those that do not require alertness and precision); headache, fatigue, sleeplessness.
- Report mouth sores; sore throat; fever; chills; swelling of the hands or feet; irregular heart-beat; chest pains; swelling of the face, eyes, lips, or tongue; and difficulty breathing.

▶ **lithium**
(*litb' ee um*)

lithium carbonate

Apo-Lithium Carbonate (CAN),
Carbolith (CAN), Duralith (CAN),

Lithane (CAN), Lithobid **OND**,
Lithonate, Lithotabs,
PMS-Lithium Carbonate (CAN)

lithium citrate

PREGNANCY CATEGORY D

Drug class

Antimanic drug

Therapeutic actions

Mechanism is not known; alters sodium transport in nerve and muscle cells; inhibits release of norepinephrine and dopamine, but not serotonin, from stimulated neurons; slightly increases intraneuronal stores of catecholamines; decreases intraneuronal content of second messengers and may thereby selectively modulate the responsiveness of hyperactive neurons that might contribute to the manic state.

Indications

- Treatment of manic episodes of bipolar disorder; maintenance therapy to prevent or diminish frequency and intensity of subsequent manic episodes
- Unlabeled uses: Prophylaxis of cluster headache and cyclic migraine headache, treatment of SIADH, hypothyroidism (doses of 600–900 mg/day), borderline personality disorder, major depression

Contraindications and cautions

- Contraindicated with hypersensitivity to tartrazine; significant renal or CV disease; severe debilitation, dehydration; sodium depletion, patients on diuretics (lithium decreases sodium reabsorption, and hyponatremia increases lithium retention); use of ACE inhibitors; pregnancy; lactation.
- Use cautiously with protracted sweating and diarrhea; suicidal or impulsive patients; infection with fever.

Available forms

Capsules—150, 300, 600 mg; tablets—300 mg; SR tablets **OND**—300 mg; syrup—300 mg/5 mL

Dosages

Individualize dosage according to serum levels and clinical response.

Adults

- **Acute mania:** 600 mg PO tid or 900 mg slow-release form PO bid to produce effective serum levels between 1 and 1.5 mEq/L. Serum levels should be determined twice per week in samples drawn immediately before a dose (at least 8–12 hr after previous dose).
- **Long-term use:** 300 mg PO tid–qid to produce a serum level of 0.6–1.2 mEq/L. Serum levels should be determined at least every 2 mo in samples drawn immediately before a dose (at least 8–12 hr after previous dose).
- **Conversion from conventional to slow-release dosage forms:** Give the same total daily dose divided into two or three doses.

Pediatric patients

Safety and efficacy for children younger than 12 yr not established.

Geriatric patients and patients with renal impairment

Reduced dosage may be needed. Elderly patients often respond to reduced dosage and may exhibit signs of toxicity at serum levels tolerated by other patients. Plasma half-life is prolonged in renal impairment.

Pharmacokinetics

Route	Onset	Peak
Oral (tablets, capsules)	Unknown	0.5–3 hr
Oral (SR, CR tablets, capsules)	Unknown	4–12 hr

Metabolism: $T_{1/2}$: 24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

Reactions are related to serum lithium levels. (Toxic lithium levels are close to therapeutic levels: Therapeutic levels in acute mania range between 1 and 1.5 mEq/L; therapeutic levels for maintenance are 0.6–1.2 mEq/L.)

Less than 1.5 mEq/L

- **CNS:** Lethargy, slurred speech, muscle weakness, fine hand tremor
- **GI:** Nausea, vomiting, diarrhea, thirst
- **GU:** Polyuria

1.5–2 mEq/L (mild to moderate toxic reactions)

- **CNS:** Coarse hand tremor, mental confusion, hyperirritability of muscles, drowsiness, incoordination
- **CV:** ECG changes
- **GI:** Persistent GI upset, gastritis, salivary gland swelling, abdominal pain, excessive salivation, flatulence, indigestion

2–2.5 mEq/L (moderate to severe toxic reactions)

- **CNS:** Ataxia, giddiness, fasciculations, tinnitus, blurred vision, clonic movements, seizures, stupor, coma
- **CV:** Serious ECG changes, severe hypotension with **cardiac arrhythmias**
- **GU:** Large output of dilute urine
- **Respiratory:** Fatalities secondary to **pulmonary complications**

Greater than 2.5 mEq/L (life-threatening toxicity)

- **General:** Complex involvement of multiple organ systems, including seizures, arrhythmias, **CV collapse**, stupor, coma

Reactions unrelated to serum levels

- **CNS:** Headache, worsening of organic brain syndromes, fever; reversible short-term memory impairment, dyspraxia
- **CV:** ECG changes; hyperkalemia associated with ECG changes; syncope; tachycardia-bradycardia syndrome; rarely, arrhythmias, heart failure, diffuse myocarditis, **death**
- **Dermatologic:** Pruritus with or without rash; maculopapular, acneiform, and follicular eruptions; cutaneous ulcers; edema of ankles or wrists
- **Endocrine:** Diffuse nontoxic goiter; hypothyroidism; hypercalcemia associated with hyperparathyroidism; transient hyperglycemia; irreversible nephrogenic diabetes insipidus, which improves with diuretic therapy; impotence or sexual dysfunction

- **GI:** Dysgeusia (taste distortion), salty taste; swollen lips; dental caries
- **Other:** Weight gain (5–10 kg); chest tightness; swollen or painful joints, eye irritation, worsening of cataracts, disturbance of visual accommodation, leukocytosis

Interactions

- *** Drug-drug** • Increased risk of toxicity with thiazide diuretics due to decreased renal clearance of lithium—reduced lithium dosage may be needed • Increased plasma lithium levels with indomethacin and some other NSAIDs (phenylbutazone, piroxicam, ibuprofen) and fluoxetine, methyldopa, and metronidazole • Increased CNS toxicity with carbamazepine • Encephalopathic syndrome (weakness, lethargy, fever, tremulousness, confusion, extrapyramidal symptoms, leukocytosis, elevated serum enzymes) with irreversible brain damage when taken with haloperidol • Greater risk of hypothyroidism with iodide salts • Decreased effectiveness due to increased excretion of lithium with urinary alkalizers, including antacids, tromethamine • Risk of increased adverse effects with SSRIs
- *** Drug-alternative therapy** • Increased effects and toxicity with juniper, dandelion

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to tartrazine; significant renal or CV disease; severe debilitation, dehydration; sodium depletion, patients on diuretics; protracted sweating, diarrhea; suicidal or impulsive patients; infection with fever; pregnancy; lactation
- **Physical:** Weight and T; skin color, lesions; orientation, affect, reflexes; ophthalmic examination; P, BP, R, adventitious sounds; bowel sounds, normal output; normal fluid intake, normal output, voiding pattern; thyroid, renal glomerular and tubular function tests, urinalysis, CBC and differential, baseline ECG

Interventions

- Give with caution and frequent monitoring of serum lithium levels to patients with re-

nal or CV disease, debilitation, or dehydration or life-threatening psychiatric disorders.

- Give drug with food or milk or after meals.
- **⊗ Black box warning** Monitor clinical status closely, especially during initial stages of therapy; monitor for therapeutic serum levels of 0.6–1.2 mEq/L; toxicity is closely related to serum levels.

- Individuals vary in their response to this drug; some patients may exhibit toxic signs at serum lithium levels considered within the therapeutic range.
- Advise patient that this drug may cause serious fetal harm and cannot be used during pregnancy; urge use of barrier contraceptives.
- Decrease dosage after the acute manic episode is controlled; lithium tolerance is greater during the acute manic phase and decreases when manic symptoms subside.
- **⊗ Warning** Ensure that patient maintains adequate intake of salt and adequate intake of fluid (2,500–3,000 mL/day).

Teaching points

- Take this drug exactly as prescribed, after meals or with food or milk. Swallow sustained-release tablets whole; do not chew or crush.
- Eat a normal diet with normal salt intake; maintain adequate fluid intake (at least 2.5 quarts/day).
- Arrange for frequent checkups, including blood tests. Keep all appointments for checkups to get the most benefits with the least toxicity.
- Use contraception to avoid pregnancy. If you wish to become pregnant or believe that you have become pregnant, consult your health care provider.
- Discontinue drug and notify your health care provider if toxicity occurs—diarrhea, vomiting, ataxia, tremor, drowsiness, lack of coordination or muscular weakness.
- You may experience these side effects: Drowsiness, dizziness (avoid driving or performing tasks that require alertness); GI upset (eat frequent small meals); mild thirst, greater than usual urine volume, fine hand tremor

(may persist throughout therapy; notify your health care provider if severe).

- Report diarrhea, fever, tremor, unsteady walking.

DANGEROUS DRUG

Iomustine (CCNU)

(loe *mus'* teen)

CeeNU

PREGNANCY CATEGORY D

Drug classes

Alkylating drug, nitrosourea
Antineoplastic

Therapeutic actions

Cytotoxic: Exact mechanism of action not known, but it involves alkylation of DNA, thus inhibiting DNA, RNA, and protein synthesis; cell-cycle nonspecific.

Indications

- Treatment with other drugs for primary and metastatic brain tumors and secondary treatment of Hodgkin's disease in patients who relapse following primary therapy

Contraindications and cautions

- Contraindicated with allergy to lomustine, myelosuppression, pregnancy (teratogenic and embryotoxic in preclinical studies), and lactation.
- Use cautiously with impaired renal or hepatic function.

Available forms

Capsules—10, 40, 100 mg

Dosages

Adults and pediatric patients

130 mg/m² PO as a single dose every 6 wk. Adjustments must be made with bone marrow suppression; initially reduce the dose to 100 mg/m² PO every 6 wk; do not give a repeat dose until platelets exceed 100,000/mm³ and leukocytes exceed 4,000/mm³; adjust dosage after initial dose based on hematologic response as follows:

Minimum (nadir) count after prior dose:

Leukocytes mm ³	Platelets mm ³	Percentage of Prior Dose to Give
More than 4,000	More than 100,000	100
3,000–3,999	75,000–99,999	100
2,000–2,999	25,000–74,999	70
Less than 2,000	Less than 25,000	50

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	10 min	1.6 hr	48 hr

Metabolism: Hepatic; T_{1/2}: 16–72 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Ataxia, lethargy
- **Dermatologic:** Alopecia
- **GI:** Nausea, vomiting, stomatitis, hepatotoxicity
- **GU:** Renal toxicity
- **Hematologic:** Leukopenia; thrombocytopenia; anemia, delayed for 4–6 wk; immunosuppression
- **Respiratory:** Pulmonary fibrosis
- **Other:** Secondary malignancies

Nursing considerations

Assessment

- **History:** Allergy to lomustine, radiation therapy, chemotherapy, hematopoietic depression, impaired renal or hepatic function, pregnancy, lactation
- **Physical:** T; weight; mucous membranes, liver evaluation; CBC, differential; urinalysis, LFTs, renal function tests

Interventions

⊗ **Black box warning** Arrange for blood tests to evaluate hematopoietic function before therapy and weekly for at least 6 wk thereafter; severe bone marrow suppression is possible.

⊗ **Warning** Do not give full dosage within 2–3 wk after a full course of radiation therapy or chemotherapy due to risk of severe bone marrow depression; reduced dosage may be needed.

- Advise patient that drug cannot be taken during pregnancy; suggest using barrier contraceptives.
- Reduce dosage in patients with depressed bone marrow function.
- Administer tablets on an empty stomach to decrease GI upset; antiemetics may be needed for nausea and vomiting.
- Monitor pulmonary function because of risk of pulmonary fibrosis.

Teaching points

- Take this drug on an empty stomach.
- Maintain your fluid intake and nutrition.
- Use birth control; this drug can cause severe birth defects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (take on an empty stomach, an antiemetic may be ordered; frequent small meals may help), hair loss.
- Report unusual bleeding or bruising, fever, chills, sore throat, stomach or flank pain, sores on your mouth or lips, unusual tiredness, confusion, difficulty breathing.

loperamide hydrochloride

(*loe per' a mide*)

Prescription: Apo-Loperamide (CAN), Imodium

OTC: Diar-Aid Caplets, Imodium A-D, K-Pek II, Neo-Diaral, Pepto Diarrhea Control

PREGNANCY CATEGORY B

Drug class

Antidiarrheal

Therapeutic actions

Slows intestinal motility and affects water and electrolyte movement through the bowel by inhibiting peristalsis through direct effects on the circular and longitudinal muscles of the intestinal wall.

Indications

- Control and symptomatic relief of acute non-specific diarrhea and chronic diarrhea associated with inflammatory bowel disease
- Reduction of volume of discharge from ileostomies
- OTC use: Control of diarrhea, including Traveler's diarrhea

Contraindications and cautions

- Contraindicated with allergy to loperamide, patients who must avoid constipation, diarrhea associated with organisms that penetrate the intestinal mucosa (*Escherichia coli*, *Salmonella*, *Shigella*, *Clostridium difficile*).
- Use cautiously with hepatic impairment, acute ulcerative colitis, pregnancy, and lactation.

Available forms

Tablets—2 mg; capsules—2 mg; liquid—1 mg/5 mL; 1 mg/7.5 mL

Dosages

Adults

- *Acute diarrhea:* Initial dose of 4 mg PO followed by 2 mg after each unformed stool. Do not exceed 16 mg/day unless directed by a physician. Clinical improvement is usually seen within 48 hr.
- *Chronic diarrhea:* Initial dose of 4 mg PO followed by 2 mg after each unformed stool until diarrhea is controlled. Individualize dose based on patient response. Average daily maintenance dose is 4–8 mg. If no clinical improvement is seen with dosage of 16 mg/day for 10 days, further treatment will probably not be effective.
- *Traveler's diarrhea (OTC):* 4 mg PO after first loose stool, followed by 2 mg after each subsequent stool; do not exceed 16 mg/day.

Pediatric patients

Avoid use in children younger than 2 yr, and use extreme caution in younger children.

- *Acute diarrhea:* First-day dosage schedule:

Age	Weight	Dose Form	Dosage
2–5 yr	13–20 kg	Liquid	1 mg tid
6–8 yr	20–30 kg	Liquid or capsule	2 mg bid
8–12 yr	More than 30 kg	Liquid or capsule	2 mg tid

Subsequent doses: Administer 1 mg/10 kg PO only after a loose stool. Daily dosage should not exceed recommended first-day dosage.

- **Chronic diarrhea:** Dosage schedule has not been established.
- **Traveler's diarrhea (OTC):**
Younger than 6 yr (21 kg and less): Consult with physician; not recommended.
6–8 yr (22–26 kg): 2 mg PO after first loose stool, followed by 1 mg after each subsequent loose stool; do not exceed 4 mg/day for more than 2 days.
9–11 yr (27–43 kg): 2 mg PO after first loose stool followed by 1 mg after each subsequent stool; do not exceed 6 mg/day for more than 2 days.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–6 hr

Metabolism: Hepatic; $T_{1/2}$: first phase, 6 hr; second phase, 1–2 days

Distribution: May cross placenta and enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Tiredness, drowsiness, dizziness
- **GI: Toxic megacolon** (in patients with ulcerative colitis), *abdominal pain, distention or discomfort, constipation, dry mouth, nausea*, vomiting
- **Hematologic:** Myelosuppression
- **Hypersensitivity:** Rash
- **Respiratory:** Pulmonary infiltrates, pulmonary fibrosis

■ Nursing considerations

Assessment

- **History:** Allergy to loperamide, patients who must avoid constipation, diarrhea associated with organisms that penetrate the intestinal mucosa (*E. coli*, *Salmonella*, *Shigella*); hepatic impairment, acute ulcerative colitis, lactation
- **Physical:** Skin color, lesions; orientation, reflexes; abdominal examination, bowel sounds, liver evaluation; serum electrolytes (with extended use)

Interventions

- Monitor for response. If improvement is not seen within 48 hr, discontinue treatment and notify health care provider.
- Give drug after each unformed stool. Keep track of amount given to avoid exceeding the recommended daily dosage unless directed by a physician.
- **⊗ Warning** Have the opioid antagonist naloxone readily available in case of overdose and CNS depression.

Teaching points

- Take drug as prescribed. Do not exceed prescribed dosage or recommended daily dosage.
- Drink clear fluids to prevent dehydration.
- You may experience these side effects: Abdominal fullness, nausea, vomiting; dry mouth (suck on sugarless lozenges); dizziness.
- Report abdominal pain or distention, fever, and diarrhea that does not stop after a few days.

▷ lopinavir (lopinavir and ritonavir)

(low *pin' ab ver*)

Kaletra ORIG

PREGNANCY CATEGORY C

Drug classes

Antiviral
Protease inhibitor combination

Therapeutic actions

Lopinavir in this combination exhibits antiviral activity; inhibits HIV protease activity, leading to the decrease in production of HIV particles; ritonavir in this preparation inhibits metabolism of lopinavir, allowing for increased plasma levels of lopinavir.

Indications

- Treatment of HIV infection in combination with other antiretrovirals

Contraindications and cautions

- Contraindicated with allergy to lopinavir, ritonavir.
- Use cautiously with pregnancy, hepatic impairment, pancreatitis, lactation.

Available forms

Tablets **ORC**—100 mg lopinavir/25 mg ritonavir, 200 mg lopinavir/50 mg ritonavir; oral solution—400 mg lopinavir/100 mg ritonavir/5 mL

Dosages

Dose is based on lopinavir component of lopinavir/ritonavir solution (400 mg/100 mg/5 mL).

Once-daily lopinavir/ritonavir can be used in patients with less than three lopinavir-resistance-associated substitutions.

Adults and pediatric patients older than 12 yr and weighing more than 40 kg

- *HIV infection, with other antiretrovirals in treatment-naïve patients:* 800 mg lopinavir and 200 mg ritonavir (four tablets or 10 mL) PO once daily or divided evenly bid.
- *HIV infection, with other antiretrovirals in treatment-experienced patients:* 400 mg lopinavir and 100 mg ritonavir (two tablets or 5 mL) PO bid.
- *Taken with efavirenz, nevirapine, fosamprenavir without ritonavir, or nelfinavir:* 600 mg lopinavir and 150 mg ritonavir (three tablets) PO bid for treatment-experienced patients. No dosage adjustment needed for treatment-naïve patients.
- *Patients using oral solution and also taking efavirenz, nevirapine, amprenavir, or nelfinavir:* Dosage should be adjusted to 533 mg lopinavir and 133 mg ritonavir (6.5 mL) bid with food.

Pediatric patients 6 mo to 12 yr

Dosage is usually based on weight.

Weight (kg)	Dosage	Volume of oral solution bid
7–less than 15	12 mg/kg bid	
7–10		1.25 mL
More than 10–less than 15		1.75 mL
15–40	10 mg/kg bid	
15–20		2.25 mL
More than 20–25		2.75 mL
More than 25–30		3.5 mL
More than 30–35		4 mL
More than 35–40		4.75 mL
More than 40	Adult dose	5 mL

- *Concomitant therapy with efavirenz, nevirapine, amprenavir*

Weight (kg)	Dosage	Volume of oral solution bid
7–less than 15	13 mg/kg bid	
7–10		1.5 mL
More than 10–less than 15		2 mL
15–40	11 mg/kg bid	
15–20		2.5 mL
More than 20–25		3.25 mL
More than 25–30		4 mL
More than 30–35		4.5 mL
More than 35–40		5 mL
More than 40–45		5.75 mL
More than 45	Adult dose	6.5 mL

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: 5–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces and urine

Adverse effects

- **CNS:** *Asthenia, peripheral and circumoral paresthesias*, anxiety, dreams, *headache*, dizziness, hallucinations, personality changes
- **CV:** DVTs, hypotension, syncope, tachycardia, chest pain, prolonged P-R interval, prolonged QTc interval

- **Dermatologic:** Rash, acne, alopecia, dry skin, exfoliative dermatitis
- **Endocrine:** *Increased triglycerides and cholesterol*, hyperglycemia, hyperuricemia, gynecomastia, hypothyroidism, hypogonadism
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain*, pancreatitis, *taste perversion*, dry mouth, hepatitis, hepatic impairment, dehydration
- **Hematologic:** Leukopenia, anemia
- **Other:** Hypothermia, chills, back pain, edema, cachexia, redistribution of body fat

Interactions

• **Drug-drug** ⊗ **Warning** Potentially large increase in serum concentration of drugs metabolized by CYP450 3A4 (caused by ritonavir). Do not administer lopinavir with any of these drugs, including amiodarone, bepridil, bupropion, clozapine, encainide, flecainide, meperidine, piroxicam, propafenone, propoxyphene, quinidine, and rifabutin. Potential for serious arrhythmias, seizures, and fatal reactions.

⊗ **Warning** Potentially large increases in serum concentration of these sedatives and hypnotics: Alprazolam, clonazepam, diazepam, estazolam, flurazepam, midazolam, triazolam, zolpidem. Extreme sedation and respiratory depression could occur. Do not administer lopinavir with any of these drugs.

• May increase level and adverse effects of phosphodiesterase-5 inhibitors (e.g., sildenafil, vardenafil, tadalafil) including hypotension and prolonged erection • May decrease effectiveness of hormonal contraceptives; using barrier contraceptives is advised

• **Drug-food** • Absorption of lopinavir oral solution is increased by the presence of food; taking the oral solution with food is strongly recommended

• **Drug-alternative therapy** • Potential for reduced effectiveness if combined with St. John's wort; avoid this combination

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Kaletra* (lopinavir/ritonavir) and *Kep-
pra* (levetiracetam); use extreme caution.

Assessment

- **History:** Allergy to lopinavir, ritonavir, hepatic impairment, pancreatitis, pregnancy, lactation
- **Physical:** T; orientation, reflexes; BP, P, peripheral perfusion; R, adventitious sounds; bowel sounds; skin color, perfusion; LFTs, serum amylase levels, triglycerides, cholesterol, electrolytes

Interventions

• Solution should be stored in the refrigerator; may be left at room temperature but should be used within 60 days; protect from light and extreme heat. Oral solution contains 42% alcohol.

• Obtain baseline triglycerides, cholesterol levels, electrolytes, and glucose levels. Monitor periodically during therapy.

⊗ **Warning** Screen medication history before administration to avoid potentially serious drug interactions.

• Administer oral solution with meals or food to increase absorption. Tablets may be taken without regard to food; ensure that tablets are swallowed whole and are not cut, crushed, or chewed.

• Didanosine and lopinavir/ritonavir tablets may be administered simultaneously without food.

• Administer didanosine 1 hr before or 2 hr after lopinavir solution.

Teaching points

• Take the oral solution with meals or food; store the solution in the refrigerator. The taste of the solution may be improved if mixed with chocolate milk, *Ensure*, or *Ad-
vera* 1 hour before taking.

• Tablets must be swallowed whole and may be taken with or without food. Do not crush, chew, or divide tablets.

• Take the full course of therapy as prescribed; do not take a double dose if one is missed; do not change dosage without consulting your health care provider. Take this drug with your other HIV medications.

• This drug does not cure HIV infection; long-term effects are not yet known; continue to take precautions because the risk of transmission is not reduced by this drug.

- This drug may cause hormonal contraceptives to be ineffective; using barrier contraceptives is advised.
- Do not take any other drug, prescription or over-the-counter, or use any herbal therapies without consulting with your health care provider; this drug interacts with many other drugs and serious problems can occur.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, abdominal pain; headache, dizziness, numbness, and tingling.
- Report severe diarrhea, severe nausea, personality changes, changes in the color of urine or stool, fever or chills, severe abdominal pain.

loratadine

(*lor at' a deen*)

Alavert, Alavert Childrens, Apo-Loratadine (CAN), Claritin, Claritin Hives Relief, Claritin Reditabs, Claritin 24-Hour Allergy, Dimetapp Children's ND Non-Drowsy Allergy, Triaminic Allerchews

PREGNANCY CATEGORY B

Drug class

Antihistamine (nonsedating type)

Therapeutic actions

Competitively blocks the effects of histamine at peripheral histamine-1 receptor sites; has anticholinergic (atropine-like) and antipruritic effects.

Indications

- Symptomatic relief of perennial and seasonal allergic rhinitis, vasomotor rhinitis, allergic conjunctivitis, and mild, uncomplicated urticaria and angioedema
- Treatment of rhinitis and chronic urticaria in children 2 yr and older

Contraindications and cautions

- Contraindicated with allergy to any antihistamines.
- Use cautiously with lactation, pregnancy.

Available forms

Tablets—10 mg; syrup—5 mg/5 mL; chewable tablets—5 mg; orally disintegrating tablets—5, 10 mg

Dosages

Place rapid dissolving tablets on tongue. Administer with or without water.

Adults and pediatric patients 6 yr and older

10 mg daily PO on an empty stomach.

Pediatric patients 2–5 yr

5 mg PO daily (syrup, chewable tablets).

Geriatric patients or patients with renal or hepatic impairment

10 mg PO every other day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–3 hr	8–12 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 8.4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, nervousness, dizziness, depression, drowsiness*
- **CV:** Palpitations, edema
- **GI:** *Appetite increase, nausea, diarrhea, abdominal pain*
- **Respiratory:** **Bronchospasm**, pharyngitis
- **Other:** Fever, photosensitivity, rash, myalgia, arthralgia, angioedema, *weight gain*, dry mouth

Interactions

- **Drug-drug** • Additive CNS depressant effects with alcohol or other CNS depressants
- **Drug-lab test** • False skin testing procedures if done while patient is taking antihistamines

Nursing considerations

Assessment

- **History:** Allergy to any antihistamines; lactation, pregnancy
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examinations;

R, adventitious sounds; prostate palpation; serum transaminase levels

Interventions

- Administer without regard to meals.

Teaching points

- If using rapid or orally disintegrating tablets, place on tongue; tablet will dissolve within seconds. Swallow with or without water.
- Avoid the use of alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); headache; thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, irregular heart-beat.

Lorazepam

(lor a' ze pam)

Apo-Lorazepam (CAN), Ativan,
Lorazepam Intensol,
PMS-Lorazepam (CAN)

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Anxiolytic
Benzodiazepine
Sedative-hypnotic

Therapeutic actions

Exact mechanisms are not understood; acts mainly at subcortical levels of the CNS, binding to benzodiazepine receptors on postsynaptic GABA neurons in the CNS, leaving the cortex relatively unaffected. Main sites of action may be the limbic system and reticular formation; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter; anxiolytic effects occur at doses well below those needed to cause sedation and ataxia.

Indications

- Oral: Management of anxiety disorders or for short-term relief of symptoms of anxiety or anxiety associated with depression; insomnia due to anxiety or transient situational stress
- Parenteral: Preanesthetic medication in adults to produce sedation, relieve anxiety, and decrease recall of events related to surgery; treatment of status epilepticus

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, propylene glycol, polyethylene glycol or benzyl alcohol (parenteral lorazepam); psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication with depression of vital signs; pregnancy (crosses placenta; risk of congenital malformations and neonatal withdrawal syndrome); labor and delivery ("floppy infant" syndrome); lactation.
- Use cautiously with impaired hepatic or renal function.

Available forms

Injection—2, 4 mg/mL; oral solution—2 mg/mL; tablets—0.5, 1, 2 mg

Dosages

Adults

Oral

Usual dose is 2–6 mg/day; range, 1–10 mg/day in divided doses with largest dose at bedtime.

- *Insomnia due to transient stress*: 2–4 mg given at bedtime.

IM

0.05 mg/kg up to a maximum of 4 mg administered at least 2 hr before operative procedure.

IV

Initial dose is 2 mg total or 0.044 mg/kg, whichever is smaller. Do not exceed this dose in patients older than 50 yr. Doses as high as 0.05 mg/kg up to a total of 4 mg may be given 15–20 min before the procedure to those benefited by a greater lack of recall.

- *Status epilepticus*: For patients older than 18 yr, 4 mg slowly at 2 mg/min. May give another 4 mg after 10–15 min if needed.

Pediatric patients

Drug should not be used in children younger than 12 yr.

Patients with renal or hepatic impairment

Initially, 1–2 mg/day in divided doses. Adjust as needed and tolerated.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Intermediate	1 hr	12–24 hr
IM	15–30 min	60–90 min	12–24 hr
IV	1–5 min	10–15 min	12–24 hr

Metabolism: Hepatic; $T_{1/2}$: 10–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute lorazepam immediately before IV use. For direct IV injection or injection into IV line, dilute with an equal volume of compatible solution (sterile water for injection, sodium chloride injection, or 5% dextrose injection); do not use if solution is discolored or contains a precipitate. Protect from light.

Infusion: Direct inject slowly, or infuse at maximum rate of 2 mg/min.

Y-site incompatibilities: Do not mix with foscarnet, ondansetron, aztreonam, imipenem/cilastatin, omeprazole.

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, anger, hostility*, episodes of mania and hypomania, *restlessness, confusion*, crying, delirium, *headache*, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty concentrating, vivid dreams, psychomotor retardation, extrapyramidal symptoms; *mild paradoxical excitatory reactions during first 2 wk of treatment*, anterograde amnesia
- **CV:** Bradycardia, tachycardia, **CV collapse**, hypertension and hypotension, palpitations, edema
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis

- **EENT:** Visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **GI:** Constipation, diarrhea, *dry mouth*, salivation, *nausea*, anorexia, vomiting, difficulty in swallowing, gastric disorders, hepatic impairment
- **GU:** Incontinence, urinary retention, libido changes, menstrual irregularities
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia; *drug dependence with withdrawal syndrome when drug is discontinued; more common with abrupt discontinuation of higher dosage used for longer than 4 mo*

Interactions

- **Drug-drug** • Increased CNS depression with alcohol and other sedating medications, such as barbiturates and opioids • Decreased effectiveness with theophyllines • Risk of toxicity if combined with probenecid, valproate; reduce lorazepam dose by 50%
- **Drug-alternative therapy** • Kava kava increases the sedative effects of benzodiazepines; coma has been reported with concurrent use

Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between lorazepam and alprazolam; use caution.

Assessment

- **History:** Hypersensitivity to benzodiazepines, propylene glycol, polyethylene glycol or benzyl alcohol; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication with depression of vital signs; pregnancy; lactation; impaired liver or renal function, debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Sublingual administration has more rapid absorption than PO, and bioavailability compares to IM use.
- Do not administer intra-arterially; arteriospasm or gangrene may result.
- Give IM injections of undiluted drug deep into muscle mass, monitor injection sites.
- Do not use solutions that are discolored or contain a precipitate. Protect drug from light, and refrigerate oral solution.
- Oral solution may be mixed with water, juice, soda, applesauce, or pudding.
- ⊗ **Warning** Keep equipment to maintain a patent airway readily available when drug is given IV.
- Refrigerate injection and oral solution (36° F to 46° F). Can be stored at room temperature for 60 days.
- Reduce dose of opioid analgesics by at least half in patients who have received parenteral lorazepam.
- Keep patients who have received parenteral doses under close observation, preferably in bed, up to 3 hr. Do not permit ambulatory patients to drive following an injection.
- ⊗ **Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy.

Teaching points

- Take drug exactly as prescribed; do not stop taking drug (in long-term therapy) without consulting your health care provider.
- You may experience these side effects: Drowsiness, dizziness (may be transient; avoid driving or engaging in dangerous activities); GI upset (take drug with food); nocturnal sleep disturbances for several nights after discontinuing the drug if used as a sedative and hypnotic; depression, dreams, emotional upset, crying.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, palpitations, edema of the extremities; visual changes; difficulty voiding.

losartan potassium (low sar' tan)

Cozaar

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Antihypertensive
ARB

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the vascular smooth muscle and adrenal gland; this action blocks the vasoconstriction effect of the renin-angiotensin system as well as the release of aldosterone leading to decreased BP.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- Treatment of diabetic nephropathy with an elevated serum creatinine and proteinuria in patients with type 2 (non-insulin-dependent) diabetes and a history of hypertension
- Reduction of the risk of CVA in patients with hypertension and left ventricular hypertrophy

Contraindications and cautions

- Contraindicated with hypersensitivity to losartan, pregnancy (use during the second or third trimester can cause injury or even death to the fetus), lactation.
- Use cautiously with hepatic or renal impairment, hypovolemia, history of angioedema.

Available forms

Tablets—25, 50, 100 mg

Dosages

Adults

- **Hypertension:** Starting dose of 50 mg PO daily. Patients on diuretics or hypovolemic patients may only require 25 mg daily.

Dosage ranges from 25–100 mg daily PO given once or twice a day have been used.

- **Diabetic nephropathy:** 50 mg/day PO once daily; may be increased to 100 mg/day once daily based on BP response.
- **Hypertension with left ventricular hypertrophy:** 50 mg/day PO with 12.5 mg/day hydrochlorothiazide. May be increased to 100 mg/day PO with 25 mg/day hydrochlorothiazide if needed.

Pediatric patients 6 yr and older

- **Hypertension:** 0.7 mg/kg once daily up to 50 mg/day total.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr, then 6–9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, *dizziness*, syncope, insomnia
- **CV:** Hypotension
- **Dermatologic:** Rash, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea*, constipation, dry mouth
- **Respiratory:** *URI symptoms, cough*, sinus disorders
- **Other:** Back pain, fever, gout, muscle weakness

Interactions

★ **Drug-drug** • Decreased serum levels and effectiveness if taken concurrently with phenobarbital, indomethacin, and rifamycin

• Losartan is converted to an active metabolite by CYP450 3A4, and 2C9 (fluconazole); drugs that inhibit 3A4 (ketoconazole, fluconazole) may increase antihypertensive effects of losartan

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to losartan, pregnancy, lactation, hepatic or renal impairment, hypovolemia

- **Physical:** Skin lesions, turgor; T; reflexes, affect; BP; R, respiratory auscultation; LFTs, renal function tests

Interventions

- Administer without regard to meals.
- ⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy, suggest the use of barrier birth control while using losartan; fetal injury and deaths have been reported.
- Find an alternative method of feeding the baby if given to a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.
- ⊗ **Warning** Alert surgeon and mark the patient's chart with notice that losartan is being taken. The blockage of the renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.
- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea—excessive hypotension can occur.

Teaching points

- Take drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while using this drug; if you become pregnant or desire to become pregnant, consult with your health care provider. If you are breastfeeding, you should find another method of feeding the baby.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (request medications); nausea, vomiting, diarrhea (proper nutrition is important, consult a dietitian to maintain nutrition); symptoms of upper respiratory tract infection, cough (do not self-medicate; consult your health care provider if uncomfortable).
- Report fever, chills, dizziness, pregnancy.

▷ lovastatin (mevinolin)

(loe va *sta'* tin)

Altoprev **OND**, Apo-Lovastatin (CAN), Co-Lovastatin (CAN), Gen-Lovastatin (CAN), Mevacor, Nu-Lovastatin (CAN), PMS-Lovastatin (CAN), ratio-Lovastatin (CAN)

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic
HMG-CoA reductase inhibitor

Therapeutic actions

Inhibits the enzyme that catalyzes the rate-limiting step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs (the lipids associated with the development of coronary artery disease), and either an increase or no change in serum HDLs (the lipids associated with decreased risk of CAD).

Indications

- Treatment of familial hypercholesterolemia
- Adjunctive treatment of type II hyperlipidemia (ER only)
- To slow the progression of atherosclerosis in patients with CAD
- Primary prevention of coronary heart disease in patients without symptomatic disease; average to moderately elevated total cholesterol and LDL cholesterol, and low HDLs
- Treatment of primary hypercholesterolemia with diet and exercise to decrease total and LDL cholesterol
- As adjunct to diet to reduce total cholesterol, LDLs, apolipoprotein B levels in adolescent boys and girls who are at least 1 yr postmenarche who have heterozygous familial hypercholesterolemia

Contraindications and cautions

- Contraindicated with allergy to lovastatin, active liver disease, unexplained persistent serum transaminase, pregnancy.
- Use cautiously with impaired hepatic function, cataracts, lactation.

Available forms

Tablets—10, 20, 40 mg; ER tablets **OND**—10, 20, 40, 60 mg

Dosages

Adults

Initially, 20 mg/day PO given in the evening with meals. Maintenance range, 10–80 mg/day PO single or divided doses. Do not exceed 80 mg/day. For ER tablets, 10–60 mg/day as single dose PO, taken in the evening. Adjust at intervals of 4 wk or more. Maximum daily dose, 40 mg/day if taking amiodarone or verapamil. Patients receiving cyclosporine should start at 10 mg daily and not exceed 20 mg daily. May be combined with bile acid sequestrants. If combined with fibrates or niacin, do not exceed 20 mg daily.

Pediatric patients

- *Adolescent boys and postmenarchal girls, 10–17 yr:* 10–40 mg/day PO; may increase to a maximum of 40 mg/day.

Patients with renal impairment

For creatinine clearance less than 30 mL/min, use doses more than 20 mg/day with caution.

Pharmacokinetics

Route	Onset	Peak
Oral	2 wk	4–6 wk

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces

Adverse effects

- **CNS:** *Headache*, blurred vision, dizziness, insomnia, fatigue, muscle cramps, cataracts
- **GI:** *Flatulence, abdominal pain, cramps, constipation, nausea*, dyspepsia, heartburn, elevations of alkaline phosphatase, transaminases
- **Other:** Myalgia, rhabdomyolysis, rash

Interactions

★ **Drug-drug** ⊗ **Warning** Possibility of severe myopathy or rhabdomyolysis with cyclosporine, amiodarone, verapamil, or gemfibrozil or other HMG-CoA inhibitors, or niacin and azole antifungals; avoid these combinations.

- Increased serum levels and risk of myopathy if combined with drugs that inhibit CYP450 3A4 (e.g., itraconazole, ketoconazole); reduce

L

lovastatin dose or interrupt treatment if these drugs are needed

★ **Drug-food** • Decreased metabolism and increased risk of toxic effects if taken with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to lovastatin, impaired hepatic function, cataracts, pregnancy, lactation
- **Physical:** Orientation, affect, ophthalmologic examination; liver evaluation; lipid studies, LFTs

Interventions

- Give in the evening; highest rates of cholesterol synthesis are between midnight and 5 AM. Ensure that extended-release tablets are not cut, crushed, or chewed.
- Arrange for regular checkups.
- Advise patient that this drug cannot be taken during pregnancy; urge the use of barrier contraceptives.
- Arrange for periodic ophthalmologic examinations to check for cataract development, and liver function studies every 4–6 wk during first 15 mo and then periodically.
- Administer only when diet restricted in cholesterol and saturated fats fails to lower cholesterol and lipids adequately.
- Discontinue lovastatin if LFTs increase to three times the upper limit of normal.

Teaching points

- Take drug in the evening. Continue following a cholesterol-lowering diet while taking this medication. Avoid drinking grapefruit juice while taking this drug.
- Do not cut, crush, or chew extended-release tablets.
- Use a barrier contraceptive while you are taking this drug; if you think you are pregnant or wish to become pregnant, consult your health care provider.
- Have periodic ophthalmologic examinations.
- You may experience these side effects: Nausea (eat frequent small meals), headache, muscle and joint aches and pains (may lessen).
- Report severe GI upset, changes in vision, unusual bleeding or bruising, dark urine,

or light-colored stools, severe muscle pain, soreness.

▽ loxapine

(lox' a peen)

loxapine hydrochloride

loxapine succinate

Apo-Loxapine (CAN),
Loxapac (CAN), Loxitane,
PMS-Loxapine (CAN)

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dopaminergic blocker

Therapeutic actions

Mechanism of action is not fully understood: Antipsychotic drugs block postsynaptic dopamine receptors in the brain, but this may not be necessary and sufficient for antipsychotic activity.

Indications

- Treatment of schizophrenia

Contraindications and cautions

- Contraindicated with coma or severe CNS depression; bone marrow depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver disease; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension.
- Use cautiously with respiratory disorders ("silent pneumonia"); glaucoma, prostatic hypertrophy; epilepsy or history of epilepsy; breast cancer (elevations in prolactin may stimulate a prolactin-dependent tumor); thyrotoxicosis; peptic ulcer, decreased renal function; exposure to heat or phosphorus insecticides; pregnancy; and lactation.

Available forms

Capsules—5, 10, 25, 50 mg

Dosages

Adults

Oral

Individualize dosage, and administer in divided doses bid–qid, initially 10 mg bid. Severely disturbed patients may need up to 50 mg/day. Increase dosage fairly rapidly over the first 7–10 days until symptoms are controlled. Usual dosage range is 60–100 mg/day; dosage greater than 250 mg/day is not recommended. For maintenance, reduce to minimum effective dose. Usual range is 20–60 mg/day.

Pediatric patients

Not recommended for patients younger than 16 yr.

Geriatric patients

Use lower doses, and increase dosage more gradually than in younger patients.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1.5–3 hr	12 hr

Metabolism: Hepatic; $T_{1/2}$: 1–14 hr

Distribution: Unknown

Excretion: Urine

Adverse effects

Adverse effects listed are those of antipsychotic drugs.

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, facial flushing, sweating, constipation, paralytic ileus, urinary retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition, male impotence
- **CNS:** *Drowsiness*, insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, extrapyramidal syndromes—*pseudoparkinsonism*; *dystonias*; *akathisia*, tardive dyskinesias, potentially irreversible, **neuroleptic malignant syndrome**
- **CV:** Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, cardiac arrest, heart failure, cardiomegaly, **refractory arrhythmias**, pulmonary edema
- **Endocrine:** Lactation, breast engorgement, galactorrhea; SIADH; amenorrhea,

menstrual irregularities; gynecomastia; changes in libido; hyperglycemia or hypoglycemia; glycosuria; hyponatremia; pituitary tumor with hyperprolactinemia; inhibition of ovulation, infertility, pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, progesterins

- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia; aplastic anemia; hemolytic anemia; thrombocytopenic or nonthrombocytopenic purpura; pancytopenia
- **Hypersensitivity:** Jaundice, urticaria, angioneurotic edema, laryngeal edema, photosensitivity, eczema, asthma, anaphylactoid reactions, exfoliative dermatitis
- **Respiratory:** **Bronchospasm, laryngospasm**, dyspnea; suppression of cough reflex and potential for aspiration

Interactions

★ **Drug-drug** • Increased risk of CNS effects if combined with other CNS medications

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Loxitane* (ioxapine), *Lexapro* (escitalopram), and *Soriatane* (acitretin); use caution.

Assessment

- **History:** Coma or severe CNS depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; respiratory disorders; glaucoma, prostatic hypertrophy; epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or myelography scheduled within 48 hr; exposure to heat or phosphorus insecticides; pregnancy, lactation
- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output, liver evaluation; urinary output, prostate size; CBC, urinalysis, thyroid, LFTs, renal function tests

Interventions

⊗ **Black box warning** There is increased risk of mortality when antipsychotics are used in elderly patients with dementia-related psychosis. Avoid this use; not approved for this use.

⊗ **Warning** Arrange for discontinuation if WBC count is depressed.

⊗ **Warning** Monitor elderly patients for dehydration; institute remedial measures promptly; sedation and decreased thirst sensation due to CNS effects can lead to severe dehydration (drug may impair heat regulation).

- Consult physician about appropriate warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about dosage reduction and use of anticholinergic antiparkinsonian drugs (controversial) if extrapyramidal effects occur.

Teaching points

- Take drug exactly as prescribed.
- Avoid driving or engaging in dangerous activities if dizziness or vision changes occur.
- Avoid prolonged exposure to sun or use a sunscreen or covering garments.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine, pale stools, and yellowing of the skin or eyes.

▷ lutropin

See Appendix U, *Less commonly used drugs*.

▷ magaldrate (aluminum magnesium hydroxide) sulfate (mag' al drate)

losopan, Riopan

PREGNANCY CATEGORY C

Drug class

Antacid

Therapeutic actions

Neutralizes or reduces gastric acidity, resulting in an increase in the pH of the stomach and duodenal bulb and inhibiting the proteolytic activity of pepsin; the combination of magnesium (causes diarrhea when administered alone) and aluminum (constipating when administered alone) salts usually minimizes adverse GI effects.

Indications

- Symptomatic relief of upset stomach associated with hyperacidity
- Hyperacidity associated with peptic ulcer, gastritis, peptic esophagitis, gastric hyperacidity, and hiatal hernia
- Treatment of hypomagnesemia, hypocalcemia, hyperphosphatemia

Contraindications and cautions

- Contraindicated with allergy to magnesium or aluminum products.
- Use cautiously with renal insufficiency, gastric outlet obstruction (aluminum salt may inhibit gastric emptying), pregnancy, lactation.

Available forms

Suspension—540 mg/5 mL; liquid—540 mg/5 mL

Dosages

Adults

540–1,080 mg (5–10 mL) PO between meals and at bedtime. Do not exceed 80 mL (16 teaspoonfuls) in 24 hr. Do not use maximum dosage for more than 2 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	30 min	30–60 min

Generally no systemic absorption

Adverse effects

- **GI:** *Rebound hyperacidity*, diarrhea, constipation

- **Metabolic:** Decreased absorption of fluoride and accumulation of aluminum in serum, bone, CNS (aluminum may be neurotoxic, especially in patients with renal failure); *alkalosis*; hypermagnesemia and toxicity in patients with renal failure

Interactions

★ **Drug-drug** ☒ **Warning** Do not administer other oral drugs within 1–2 hr of antacid administration; change in gastric pH may interfere with absorption of oral drugs.

- Decreased pharmacologic effect of tetracyclines, penicillamine, nitrofurantoin, fluoroquinolones, ketoconazole
- Decreased absorption and therapeutic effects of clindamycin and lincomycin

■ Nursing considerations

Assessment

- **History:** Allergy to magnesium or aluminum products, renal insufficiency, gastric outlet obstruction, pregnancy, lactation
- **Physical:** Bone and muscle strength; abdominal examination, bowel sounds; renal function tests, serum magnesium as appropriate

Interventions

- Do not administer other oral drugs within 1–2 hr of antacid administration.
- Give between meals and at bedtime.
- ☒ **Warning** Monitor patients on long-term therapy for signs of aluminum accumulation: Bone pain, muscle weakness, malaise. Discontinue drug as needed.

Teaching points

- Take between meals and at bedtime.
- Do not take with any other oral medications; absorption of those medications can be inhibited. Take other oral medications at least 1–2 hours after aluminum salt.
- Report bone pain, muscle weakness, coffee-ground vomitus, black tarry stools, no relief from symptoms being treated.

▽ magnesium salts

(mag *nee'* zee um)

magnesia

magnesium citrate

Citro-Mag (CAN)

magnesium hydroxide

Milk of Magnesia, Phillips' Chewable

magnesium oxide

Mag-Ox 400, Maox 420, Uro-Mag

PREGNANCY CATEGORY C

PREGNANCY CATEGORY A
(ANTACID)

PREGNANCY CATEGORY B
(LAXATIVE)

Drug classes

Antacid
Laxative

Therapeutic actions

Antacid (magnesium hydroxide, magnesium oxide): Neutralizes or reduces gastric acidity, resulting in an increase in the pH of the stomach and duodenal bulb and inhibition of the proteolytic activity of pepsin. Laxative (magnesium citrate, magnesium hydroxide): Attracts and retains water in intestinal lumen and distends bowel; causes the duodenal secretion of cholecystokinin, which stimulates fluid secretion and intestinal motility.

Indications

- Symptomatic relief of upset stomach associated with hyperacidity
- Hyperacidity associated with peptic ulcer, gastritis, peptic esophagitis, gastric hyperacidity, and hiatal hernia
- Prophylaxis of GI bleeding, stress ulcers, aspiration pneumonia
- Short-term relief of constipation; evacuation of the colon for rectal and bowel examination

Contraindications and cautions

- Contraindicated with allergy to magnesium products.

- Use cautiously with renal insufficiency, pregnancy, lactation.

Available forms

Tablets—311 (chewable), 400, 420, 500 mg; capsules—140 mg; liquid—various

Dosages

Adults

Magnesium citrate

- *Laxative*: 300 mL or in divided doses with a full glass of water.

Magnesium hydroxide

- *Antacid*: 5–15 mL liquid or 622–1,244 mg tablets PO qid (adult and patients older than 12 yr).
- *Laxative*: 15–60 mL PO taken with liquid.

Magnesium oxide

- *Capsules*: 140 mg PO tid–qid.
- *Tablets*: 400–800 mg/day PO.

Pediatric patients

Magnesium citrate

- *Laxative*: 90–210 mL for ages 6–12 yr with full glass of water; 60 mL for ages 2–6 yr with full glass of water.

Magnesium hydroxide

- *Laxative*:
Younger than 2 yr: Do not administer unless directed by a physician.
2–5 yr: 5–15 mL PO.
6–11 yr: 15–30 mL PO.

Pharmacokinetics

Route	Onset
Oral	20–60 min

Minimal systemic absorption

Excretion: Renal

Adverse effects

- **CNS:** Dizziness, fainting, sweating
- **GI:** *Diarrhea, nausea, perianal irritation*
- **Metabolic:** Hypermagnesemia and toxicity in patients with renal failure

Interactions

* **Drug-drug** ⊗ **Warning** Do not give other oral drugs within 1–2 hr of antacid administration; change in gastric pH may interfere with absorption.

- Decreased pharmacologic effect of tetracyclines, penicillamine, nitrofurantoin, fluoroquinolones, ketoconazole

Nursing considerations

Assessment

- **History:** Allergy to magnesium products; renal insufficiency
- **Physical:** Abdominal examination, bowel sounds; renal function tests, serum magnesium

Interventions

- Do not administer other oral drugs within 1–2 hr of antacid administration.
- Have patient chew antacid tablets thoroughly before swallowing; follow with a glass of water.
- Give antacid between meals and at bedtime.

Teaching points

- Take antacid between meals and at bedtime. If tablets are being used, chew thoroughly before swallowing, and then drink a glass of water.
- Do not use laxatives if you have abdominal pain, nausea, or vomiting.
- Refrigerate magnesium citrate solutions to keep them effective and improve their taste.
- Do not take with any other oral medications; absorption of those medications can be inhibited. Take other oral medications at least 1–2 hours after aluminum salt.
- Diarrhea may occur with antacid therapy.
- Do not use laxatives long-term. Prolonged or excessive use can lead to serious problems. You should increase your intake of water (to 6–8 glasses/day) and fiber, and exercise regularly.
- You may experience these side effects: Excessive bowel activity, cramping, diarrhea, nausea, dizziness (be careful not to fall).
- With antacid use, report diarrhea; coffee-ground vomitus; black, tarry stools; no relief from symptoms being treated. With laxative use, report rectal bleeding, muscle cramps or pain, weakness, dizziness (not related to abdominal cramps and bowel movement), unrelieved constipation.

DANGEROUS DRUG (IV)**magnesium sulfate
(epsom salt)***(mag nee' zee um)*

PREGNANCY CATEGORY A

PREGNANCY CATEGORY B
(LAXATIVE)**Drug classes**Antiepileptic
Electrolyte
Laxative**Therapeutic actions**

Cofactor of many enzyme systems involved in neurochemical transmission and muscular excitability; prevents or controls seizures by blocking neuromuscular transmission; attracts and retains water in the intestinal lumen and distends the bowel to promote mass movement and relieve constipation.

Indications

- Acute nephritis (children), to control hypertension
- IV: Hypomagnesemia, replacement therapy
- IV or IM: Preeclampsia or eclampsia
- PO: Short-term treatment of constipation
- PO: Evacuation of the colon for rectal and bowel examinations
- To correct or prevent hypomagnesemia in patients on parenteral nutrition
- Unlabeled uses: Inhibition of premature labor (parenteral), adjunct treatment of exacerbations of acute asthma; treatment torsades de pointes, atypical ventricular arrhythmias

Contraindications and cautions

- Contraindicated with allergy to magnesium products; heart block, myocardial damage; abdominal pain, nausea, vomiting, or other symptoms of appendicitis; acute surgical abdomen, fecal impaction, intestinal and biliary tract obstruction, hepatitis. Do not give during 2 hr preceding delivery because of risk of magnesium toxicity in the neonate.
- Use cautiously with renal insufficiency.

Available forms

Granules—40 mEq/5 g; injection—0.325, 0.65, 1, 4 mEq/mL

Dosages**Adults**

- *Parenteral nutrition*: 8–24 mEq/day IV.
- *Mild magnesium deficiency*: 1 g IM or IV every 6 hr for 4 doses (32.5 mEq/24 hr).
- *Severe hypomagnesemia*: Up to 2 mEq/kg IM within 4 hr or 5 g (40 mEq)/1,000 mL D₂W or 0.9% normal saline IV infused over 3 hr.
- *Eclampsia, severe preeclampsia*: Total initial dose of 10–14 g. May infuse 4–5 g in 250 mL 5% dextrose injection or 0.9% sodium chloride while giving IM doses up to 10 g (5 g or 10 mL of undiluted 50% solution in each buttock). Or, may give initial IV dose of 4 g by diluting 50% solution to 10% or 20%; may inject diluted fluid (40 mL of 10% or 20 mL of 20% solution) IV over 3–4 min. Then inject 4–5 g (8 to 10 mL of 50% solution) IM into alternate buttocks every 4 hr as needed depending on patellar reflex and respiratory function. Or, after initial IV dose, may give 1–2 g/hr by constant IV infusion. Continue until paroxysms stop. To control seizures, optimal serum magnesium level is 6 mg/100 mL. Do not exceed 30–40 g in 24 hr.

IM

- *Toxemia*: 4–5 g of a 50% solution every 4 hr as needed.

IV

1–4 g of a 10%–20% solution. Do not exceed 1.5 mL/min of a 10% solution. Or, 4–5 g in 250 mL of 5% dextrose. Do not exceed 3 mL/min.

- *Arrhythmias*: 3–4 g IV over several min; then 3–20 mg/min continuous infusion for 5–48 hr.
- *Acute MI*: 2 g IV over 5–15 min followed by 18 g IV over 24 hr.

PO

- *Laxative*: 10–30 g daily given as single dose or divided doses.

Pediatric patients

- *Laxative*:
6–11 yr: 5–10 g daily in single dose or divided doses; 15–30 mL/day.

2–5 yr: 2.5–5 g daily in single dose or divided doses; 5–15 mL/day.

IM

100 mg/kg (0.8 mEq/kg or 0.2 mL/kg of a 50% solution) IM every 4–6 hr as needed. Or, 20–40 mg/kg (0.16–0.32 mEq/kg or 0.1–0.2 mL/kg of a 20% solution).

IV

For severe symptoms, 100–200 mg/kg of a 1%–3% solution IV over 1 hr with half of dose given in first 15–20 min (seizure control).

Patients with renal impairment

- **Severe preeclampsia, eclampsia:** In severe impairment, maximum dosage is 20 g in 48 hr. Check serum magnesium level often.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	30 min
IM	60 min	3–4 hr
Oral	1–2 hr	3–4 hr

Metabolism: $T_{1/2}$: Unknown

Distribution: Crosses placenta, enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute IV infusion to a concentration of 20% or less before IV administration; dilute 4–5 g in 250 mL D₅W or sodium chloride solution.

Infusion: Do not exceed 1.5 mL of a 10% solution per minute IV or 3 mL/min IV infusion.

Incompatibilities: Do not mix with other IV drugs.

Adverse effects

- **CNS:** *Weakness, dizziness, fainting, sweating (PO)*
- **CV:** Palpitations
- **GI:** *Excessive bowel activity, perianal irritation (PO)*
- **Metabolic:** *Magnesium intoxication* (flushing, sweating, hypotension, depressed reflexes, flaccid paralysis, hypothermia, circulatory collapse, cardiac and CNS depression—parenteral); hypocalcemia with tetany (secondary to treatment of eclampsia—parenteral)

Interactions

★ **Drug-drug** • Potentiation of neuromuscular blockade produced by nondepolarizing neuromuscular relaxants (atracurium, pancuronium, vecuronium)

Nursing considerations

Assessment

- **History:** Allergy to magnesium products; renal insufficiency; heart block, myocardial damage; symptoms of appendicitis; acute surgical abdomen, fecal impaction, intestinal and biliary tract obstruction, hepatitis
- **Physical:** Skin color, texture; muscle tone; T; orientation, affect, reflexes, peripheral sensation; P, auscultation, BP, rhythm strip; abdominal examination, bowel sounds; renal function tests, serum magnesium and calcium, LFTs (oral use)

Interventions

- Reserve IV use in eclampsia for immediate life-threatening situations.
- Give IM route by deep IM injection of the undiluted (50%) solution for adults; dilute to a 20% solution for children.
- ⊗ **Warning** Monitor serum magnesium levels during parenteral therapy. Arrange to discontinue administration as soon as levels are within normal limits (1.5–3 mEq/L) and desired clinical response is obtained.
- ⊗ **Warning** Monitor knee-jerk reflex before repeated parenteral administration. If knee-jerk reflexes are suppressed, do not administer magnesium because respiratory center failure may occur.
- Give oral magnesium sulfate as a laxative only as a temporary measure. Arrange for dietary measures (fiber, fluids), exercise, and environmental control to return to normal bowel activity.
- Do not give oral magnesium sulfate with abdominal pain, nausea, or vomiting.
- Monitor bowel function; if diarrhea and cramping occur, discontinue oral drug.
- Maintain urine output at a level of 100 mL every 4 hr during parenteral administration.

Teaching points

- Use only as a temporary measure to relieve constipation. Do not take if abdominal pain, nausea, or vomiting occurs.
- You may experience diarrhea with oral use. If this occurs, discontinue drug and consult your health care provider.
- Report sweating, flushing, muscle tremors or twitching, inability to move extremities.

mannitol (man' i tole)

Osmitol

PREGNANCY CATEGORY B

Drug classes

Diagnostic agent

Osmotic diuretic

Urinary irrigant

Therapeutic actions

Elevates the osmolarity of the glomerular filtrate, thereby hindering the reabsorption of water and leading to a loss of water, sodium, chloride (used for diagnosis of glomerular filtration rate); creates an osmotic gradient in the eye between plasma and ocular fluids, thereby reducing IOP; creates an osmotic effect, leading to decreased swelling in post-transurethral prostatic resection.

Indications

- Prevention and treatment of the oliguric phase of renal failure
- Reduction of intracranial pressure and treatment of cerebral edema; of elevated IOP when the pressure cannot be lowered by other means
- Promotion of the urinary excretion of toxic substances
- Diagnostic use: Measurement of GFR

Contraindications and cautions

- Contraindicated with anuria due to severe renal disease.
- Use cautiously with pulmonary congestion, active intracranial bleeding (except during craniotomy), dehydration, renal disease, heart failure, pregnancy, lactation.

Available forms

Injection—5%, 10%, 15%, 20%, 25%

Dosages

Adults

IV infusion only; individualize concentration and rate of administration. Dosage is 50–200 g/day. Adjust dosage to maintain urine flow of 30–50 mL/hr.

- *Prevention of oliguria:* 50–100 g IV as a 5%–25% solution.
- *Treatment of oliguria:* 50–100 g IV of a 15%–25% solution.
- *Reduction of intracranial pressure and cerebral edema:* 1.5–2 g/kg IV as a 15%–25% solution over 30–60 min. Evidence of reduced pressure should be seen in 15 min.
- *Reduction of IOP:* Infuse 1.5–2 g/kg IV as a 25% solution, 20% solution, or 15% solution over 30 min. If used preoperatively, use 60–90 min before surgery for maximal effect.
- *Adjunctive therapy to promote diuresis in intoxications:* Maximum of 200 g IV of mannitol with other fluids and electrolytes.
- *Measurement of glomerular filtration rate:* Dilute 100 mL of a 20% solution with 180 mL of sodium chloride injection. Infuse this 280 mL of 7.2% solution IV at a rate of 20 mL/min. Collect urine with a catheter for the specified time for measurement of mannitol excreted in mg/min. Draw blood at the start and at the end of the time for measurement of mannitol in mg/mL plasma.
- *Test dose of mannitol for patients with inadequate renal function:* 0.2 g/kg IV (about 50 mL of a 25% solution, 75 mL of a 20% solution) in 3–5 min to produce a urine flow of 30–50 mL/hr. If urine flow does not increase, repeat dose. If no response to second dose, reevaluate patient situation.

Pediatric patients

Dosage for children younger than 12 yr not established.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	30–60 min	1 hr	6–8 hr
Irrigant	Rapid	Rapid	Short

Metabolism: $T_{1/2}$: 15–100 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Mannitol may crystallize at low temperatures, especially solutions of more than 15%. If crystals are observed, warm solution to dissolve.

Infusion: Infuse at rates listed (above). Use an infusion set with a filter if concentrated mannitol is used.

Incompatibilities: Do not add to blood products.

Adverse effects

- **CNS:** *Dizziness*, headache, blurred vision, **seizures**
- **CV:** Hypotension, hypertension, edema, HF, thrombophlebitis, tachycardia, chest pain
- **Dermatologic:** Urticaria, skin necrosis with infiltration
- **GI:** *Nausea, anorexia, dry mouth, thirst*
- **GU:** *Diuresis*, urine retention
- **Hematologic:** Fluid and electrolyte imbalances, hyponatremia
- **Respiratory:** Pulmonary congestion, rhinitis

Nursing considerations

Assessment

- **History:** Pulmonary congestion, active intracranial bleeding, dehydration, renal disease, heart failure, pregnancy, lactation
- **Physical:** Skin color, lesions, edema, hydration; orientation, muscle strength, reflexes, pupils; pulses, BP, perfusion; R, pattern, adventitious sounds; urinary output patterns; serum electrolytes, urinalysis, renal function tests

Interventions

- ⊗ **Warning** Do not give electrolyte-free mannitol with blood. If blood must be given, add at least 20 mEq of sodium chloride to each liter of mannitol solution.
- Do not expose solutions to low temperatures; crystallization may occur. If crystals are seen, warm the bottle in a hot water bath, then cool to body temperature before administering.

- Make sure the infusion set contains a filter if giving concentrated mannitol.
- Monitor serum electrolytes periodically with prolonged therapy.

Teaching points

- You may experience these side effects: Increased urination; GI upset (eat frequent small meals); dry mouth (suck sugarless lozenges); headache, blurred vision (use caution when moving, ask for assistance).
- Report difficulty breathing, pain at the IV site, chest pain.

maprotiline hydrochloride

(*ma'proe' ti leen*)

Novo-Maprotiline (CAN)

PREGNANCY CATEGORY B

Drug class

Antidepressant (tetracyclic)

Therapeutic actions

Mechanism of action unknown; appears to act similarly to TCAs; the TCAs act to inhibit the presynaptic reuptake of the neurotransmitters norepinephrine (primarily) and serotonin; anticholinergic at CNS and peripheral receptors; sedating; the relation of these effects to clinical efficacy is unknown.

Indications

- Treatment of depressive illness in patients with depressive neurosis (dysthymic disorder)
- Treatment of depression in patients with bipolar disorder (depressed type)
- Treatment of anxiety associated with depression

Contraindications and cautions

- Contraindicated with hypersensitivity to tetracyclic drugs, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr, known or suspected seizure disorder, pregnancy (limb reduction abnormalities reported), lactation.

- Use cautiously with EST; preexisting CV disorders (increased risk of serious CV toxicity); angle-closure glaucoma, increased IOP, urine retention, ureteral or urethral spasm; seizure disorders (lowers seizure threshold); hyperthyroidism (predisposes to CV toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric disorders (schizophrenic or paranoid patients may worsen); manic-depression (may shift to hypomanic or manic phase); elective surgery (stop use as soon as possible before surgery).

Available forms

Tablets—25, 50, 75 mg

Dosages

Adults

- *Mild to moderate depression:* Initially, 75 mg/day PO in outpatients. Maintain initial dosage for 2 wk due to long drug half-life. Dosage may then be increased gradually in 25-mg increments. Most patients respond to 150 mg/day.
- *More severe depression:* Initially, 100–150 mg/day PO in hospitalized patients. If needed, gradually increase to 225 mg/day.
- *Maintenance:* Reduce dosage to lowest effective level, usually 75–150 mg/day PO.

Pediatric patients

Not recommended in patients younger than 18 yr.

Geriatric patients

Give lower doses to patients older than 60 yr; begin at 25 mg PO daily and gradually increase to 50–75 mg/day PO for maintenance.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	12 hr	2–4 wk

Metabolism: Hepatic; T_{1/2}: 51 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects; confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased

memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, **seizures**, speech blockage, dysarthria, tinnitus, altered EEG, suicidal ideation

- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of HF, CVA
- **Endocrine:** Elevated or depressed blood sugar, elevated prolactin levels, inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis, jaundice (rare), elevated transaminases, altered alkaline phosphatase
- **GU:** Urine retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; increased or decreased libido; impotence
- **Hematologic:** Bone marrow depression, eosinophilia, thrombocytopenia, leukopenia
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema
- **Withdrawal:** Symptoms with abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight gain or loss; sweating (paradoxical effect in a drug with prominent anticholinergic effects), alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug-drug** • Risk of seizures if taken with benzodiazepines (or if benzodiazepines are rapidly tapered during maprotiline therapy), phenothiazines • Additive atropine-like effects if combined with anticholinergics, sympathomimetics; monitor patient closely and adjust dosages as needed • Increased risk of

cardiotoxicity if taken with thyroid medications; monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP, urine retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric problems; bipolar disorder; elective surgery, pregnancy, lactation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

⊗ **Warning** Limit drug access to depressed and potentially suicidal patients.

⊗ **Black box warning** Monitor children, adolescents, and young adults for increased risk of suicidal thinking and behavior.

- Expect clinical response in 3 wk, although some have improved in 3–7 days.
- Give major portion of dose at bedtime if drowsiness or severe anticholinergic effects occur.
- Reduce dosage with minor side effects; discontinue drug if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or signs of infection.

Teaching points

- Take drug exactly as prescribed, and do not stop taking this drug without consulting your health care provider.
- Avoid pregnancy while taking this drug, fetal abnormalities have been reported; using barrier contraceptive is advised.
- Avoid alcohol, sleep-inducing drugs, and over-the-counter drugs.

- Avoid prolonged exposure to sunlight or sunlamps, use sunscreen or protective garments if exposure is unavoidable.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; use caution if severe, avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (frequent small meals, frequent mouth care, sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty in urination, excessive sedation, chest pain, thoughts of suicide.

 **maraviroc**

(*mar ab vye' rock*)

Selzentry 

PREGNANCY CATEGORY B

Drug classes

Antiviral

CCR5 co-receptor antagonist

Therapeutic actions

Selectively binds to the human chemokine receptor CCR5 on the cell membrane, preventing interaction of HIV-1 and CCR5 needed for HIV to enter the cell and multiply.

Indications

- Combination antiretroviral treatment of adults infected with detectable CCR5-tropic HIV-1 who have evidence of viral replication and HIV-1 strains resistant to multiple antiretroviral drugs
- **NEW INDICATION:** In combination with antiretrovirals for treatment of therapy-naive adults with CCR5-tropic HIV infection

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, lactation.
- Use cautiously with co-infection with hepatitis B, liver disease, increased risk of CV events, hypotension, pregnancy.

Available formsTablets **ORC**—150, 300 mg**Dosages****Adults**

When given with strong CYP3A inhibitors, protease inhibitors (except tipranavir/ritonavir), delavirdine, 150 mg PO bid. When given with tipranavir/ritonavir, nevirapine, enfuvirtide, nucleoside reverse transcriptase inhibitors, other drugs that are not strong CYP3A inhibitors, 300 mg PO bid. When given with efavirenz, rifampin, carbamazepine, phenobarbital, phenytoin, 600 mg PO bid.

Pediatric patients younger than 16 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	0.5–4 hr

Metabolism: Hepatic; $T_{1/2}$: 14–18 hr**Distribution:** May cross placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** *Dizziness*, paresthesias, dysesthesias, peripheral neuropathies, sensory abnormalities, depression, sleep disturbances
- **GI:** *Abdominal pain*, constipation, dyspepsia, stomatitis, appetite disorder, **hepatotoxicity**
- **Respiratory:** *Cough*, URI, sinusitis, bronchitis, pneumonia
- **Other:** *Fever; musculoskeletal symptoms*, pruritus, dermatitis, infections

Interactions

• **Drug-drug** • Increased serum levels and toxicity when combined with CYP3A inhibitors (ketoconazole, lopinavir/ritonavir, ritonavir, saquinavir, atazanavir, delavirdine); adjust maraviroc dosage accordingly • Decreased serum levels and loss of effectiveness if combined with CYP3A inducers (nevirapine, rifampin, efavirenz); adjust maraviroc dose accordingly

• **Drug-alternative therapy** • Loss of effectiveness if taken with St. John's wort; avoid this combination

■ Nursing considerations

⊗ **Black box warning** Risk of severe hepatotoxicity, possibly preceded by evidence of systemic allergic reaction (rash, eosinophilia, elevated IgE level); immediately evaluate and support patient with any sign of hepatitis or allergic reaction.

Assessment

- **History:** Hypersensitivity to any component of the drug, history of liver impairment, hepatitis B infection, risk factors for cardiovascular events, pregnancy, lactation
- **Physical:** T; orientation, affect; BP; R, lung sounds; abdominal exam; LFTs

Interventions

- Give this drug with other antiretroviral drugs.
- Review antiviral therapy and adjust dosage according to effects on liver enzyme systems.
- Ensure that patient swallows tablet whole; do not cut, crush, or allow patient to chew tablet.
- Monitor patient for any sign of allergic reaction or hepatitis; severe hepatotoxicity could occur. Check CBC and IgE markers.
- Encourage nursing mothers to find a different method of feeding the baby while on this drug.
- Protect patient from exposure to infection, and encourage patient to avoid situations that increase risk of infection.

Teaching points

- Take this drug twice a day without regard to food. Swallow the tablets whole; do not cut, crush, or chew them.
- Always take this drug with other anti-HIV drugs that have been prescribed for you.
- Do not take St. John's wort while on this drug; antiviral activity could be lost.
- If you miss a dose, take it as soon as you remember and then take the regularly scheduled dose at the regular time. If it is less than 6 hours until the next scheduled dose, skip the missed dose and just take the next scheduled dose. Do not double doses. Do not take more than two doses on any one day.
- Do not stop taking this drug; it could lose effect if stopped for even a short period of time. If you are running low, talk to your health care provider about a refill.

- This drug does not cure HIV or AIDS; you may still develop opportunistic infections, and you should seek regular medical care to manage the disease.
- Maraviroc does not reduce the risk of transmitting HIV to others by sexual contact or blood contamination; use appropriate precautions.
- It is not known if this drug could affect a fetus. If you wish to become pregnant, discuss this with your health care provider. If you become pregnant while taking this drug, consult your health care provider about enrolling in the Antiretroviral Pregnancy Registry.
- It is not known how this drug could affect a nursing baby. Because of the risk of serious adverse effects on an infant, you should choose another method of feeding the baby while you are on this drug.
- Your health care provider will monitor your CD4 levels and your liver function regularly while you are on this drug.
- You may experience these side effects: Headache, fever, rash (medication may be available to relieve these symptoms); dizziness (do not drive a car or operate dangerous machinery until you know how this drug will affect you); increased risk of infection, cancer (have regular screenings, and consult your health care provider at the first sign of infection).
- Report rash, difficulty breathing, changes in the color of your stool or urine, fainting, yellowing of the eyes or skin, infections.

mebendazole (*me ben' da zole*)

Vermox

PREGNANCY CATEGORY C

Drug class

Anthelmintic

Therapeutic actions

Irreversibly blocks glucose uptake by susceptible helminths, depleting glycogen stores needed for survival and reproduction of the helminths, causing death.

Indications

- Treatment of *Trichuris trichiura* (whipworm), *Enterobius vermicularis* (pinworm), *Ascaris lumbricoides* (roundworm), *Ancylostoma duodenale* (common hookworm), *Necator americanus* (American hookworm)

Contraindications and cautions

- Contraindicated with allergy to mebendazole, pregnancy (embryotoxic and teratogenic); avoid use, especially during first trimester).
- Use cautiously with lactation.

Available forms

Chewable tablets—100 mg

Dosages

Adults and patients 2 yr and older

- *Trichuriasis, ascariasis, hookworm infections*: 1 tablet PO morning and evening on 3 consecutive days.
- *Enterobiasis*: 1 tablet PO once. If not cured 3 wk after treatment, a second treatment course is advised.

Pediatric patients younger than 2 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–9 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **GI**: *Transient abdominal pain, diarrhea*
- **Other**: Fever

■ Nursing considerations

Assessment

- **History**: Allergy to mebendazole, pregnancy, lactation
- **Physical**: T; bowel sounds, output

Interventions

- Culture for ova and parasites.

- Administer drug with food; tablets may be chewed, swallowed whole, or crushed and mixed with food.
- Arrange for second course of treatment if patient is not cured 3 weeks after treatment.
- Treat all family members for pinworm infestation.
- Disinfect toilet facilities after patient use (pinworms).
- Arrange for daily laundry of bed linens, towels, nightclothes, and undergarments (pinworms).

Teaching points

- Chew or swallow whole or crushed and mixed with food.
- Pinworms are easily transmitted; all family members should be treated for complete eradication.
- Use strict handwashing and hygiene measures. Launder undergarments, bed linens, and nightclothes daily. Disinfect toilet facilities daily and bathroom floors periodically (pinworms).
- You may experience these side effects: Nausea, abdominal pain, diarrhea (eat frequent small meals).
- Report fever, return of symptoms, severe diarrhea.

DANGEROUS DRUG

mechlorethamine hydrochloride (HN₂, nitrogen mustard)

(*me klor eth' a meen*)

Mustargen

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic
Nitrogen mustard

Therapeutic actions

Cytotoxic: Reacts chemically with DNA, RNA, other proteins to prevent replication and function of susceptible cells, causing cell death; cell-cycle nonspecific.

Indications

- IV use: Palliative treatment of bronchogenic carcinoma, Hodgkin's disease, lymphosarcoma, chronic myelogenous leukemia, chronic lymphocytic leukemia, mycosis fungoides, polycythemia vera
- Intrapleural, intraperitoneal, intrapericardial use: Palliative treatment of effusion secondary to metastatic carcinoma
- Unlabeled use: Topical treatment of cutaneous mycosis fungoides

Contraindications and cautions

- Contraindicated with allergy to mechlorethamine, active infection, pregnancy, lactation.
- Use cautiously with amyloidosis, hematopoietic depression, concomitant steroid therapy.

Available forms

Powder for injection—10 mg

Dosages

Individualize dosage based on hematologic profile and response.

Adults

IV

Usual dose, total of 0.4 mg/kg IV for each course of therapy as a single dose or in two to four divided doses of 0.1–0.2 mg/kg/day. Give at night in case sedation is required for side effects. Interval between courses of therapy is usually 3–6 wk.

Intracavitary

Dose and preparation vary greatly with cavity and disease treated. Consult manufacturer's label; usual dose 0.2–0.4 mg/kg.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	Seconds	Minutes

Metabolism: T_{1/2}: A few minutes

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute vial with 10 mL of sterile water for injection or sodium chloride injection; resultant solution contains 1 mg/mL of mechlorethamine hydrochloride.

Prepare solution immediately before use; decomposes on standing.

Infusion: Inject into tubing of a flowing IV infusion slowly over 3–5 min.

Adverse effects

- **CNS:** *Weakness*, vertigo, tinnitus, diminished hearing
- **Dermatologic:** Maculopapular rash, alopecia, herpes zoster
- **GI:** *Nausea, vomiting, anorexia, diarrhea, jaundice*
- **GU:** *Impaired fertility*
- **Hematologic:** *Bone marrow depression, immunosuppression, hyperuricemia*
- **Local:** *Vesicant thrombosis, thrombophlebitis*, tissue necrosis if extravasation occurs

■ Nursing considerations

Assessment

- **History:** Allergy to mechlorethamine, active infection, amyloidosis, hematopoietic depression, concomitant steroid therapy, pregnancy, lactation
- **Physical:** T; weight; skin color; lesions; injection site; orientation, reflexes, hearing evaluation; CBC, differential, uric acid

Interventions

- Arrange for blood tests to evaluate hematopoietic function before and during therapy.

⊗ **Black box warning** Use caution when preparing drug for administration; use chemo-safe nonpermeable gloves for handling drug; drug is highly toxic and a vesicant. Avoid inhalation of dust or vapors and contact with skin or mucous membranes (especially the eyes). If eye contact occurs, immediately irrigate with copious amount of ophthalmic irrigating solution, and obtain an ophthalmologic consultation. If skin contact occurs, irrigate with copious amount of water for 15 min, followed by application of 2% sodium thiosulfate.

⊗ **Warning** Use caution when determining correct amount of drug for injection. The margin of safety is very small; double check dosage before administration.

⊗ **Black box warning** Monitor injection site for any sign of extravasation. Painful

inflammation and induration or sloughing of skin may occur. If leakage is noted, promptly infiltrate with sterile isotonic sodium thiosulfate (1/6M), and apply an ice compress for 6–12 hr. Notify physician.

- Consult physician for premedication with antiemetics or sedatives to prevent severe nausea and vomiting. Giving at night may help alleviate the problem.
- Ensure that patient is well hydrated before treatment.
- Caution patient to avoid pregnancy while taking this drug; advise using barrier contraceptives.
- Monitor uric acid levels; ensure adequate fluid intake, and prepare for appropriate treatment if hyperuricemia occurs.

Teaching points

- This drug must be given IV or directly into a body cavity.
- Use birth control. This drug cannot be taken during pregnancy; serious fetal effects can occur. If you think you are pregnant or wish to become pregnant, consult your health care provider.
- You may experience these side effects: Nausea, vomiting, loss of appetite (use antiemetic or sedative at night; maintain fluid intake and nutrition); weakness, dizziness, ringing in the ears or loss of hearing (use special precautions to avoid injury); infertility, from irregular menses to complete amenorrhea; men may stop producing sperm (may be irreversible).
- Report pain, burning at IV site, severe GI distress, sore throat, rash, joint pain, fever.

▽ meclizine hydrochloride

(mek' li zeen)

Bonamine (CAN), Bonine

Oral prescription tablets:

Antivert, Antrizine, Dramamine Less Drowsy Formula, Meni-D

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Antiemetic
Antihistamine
Anti-motion-sickness drug

Therapeutic actions

Reduces sensitivity of the labyrinthine apparatus; probably acts at least partly by blocking cholinergic synapses in the vomiting center, which receives input from the CTZ and from peripheral nerve pathways; peripheral anticholinergic effects may contribute to efficacy.

Indications

- Prevention and treatment of nausea, vomiting, motion sickness
- Possibly effective for the management of vertigo associated with diseases affecting the vestibular system

Contraindications and cautions

- Contraindicated with allergy to meclizine or cyclizine; tartrazine sensitivity (more common in patients with aspirin hypersensitivity).
- Use cautiously with lactation, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias, postoperative state (hypotensive effects may be confusing and dangerous), pregnancy.

Available forms

Tablets—12.5, 25, 50 mg; chewable tablets—25 mg; capsules—25 mg

Dosages**Adults**

- *Motion sickness*: 25–50 mg PO 1 hr before travel. May repeat dose every 24 hr for the duration of the journey.
- *Vertigo*: 25–100 mg PO daily in divided doses.

Pediatric patients

Not recommended for children younger than 12 yr.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and

hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	1–2 hr	4–24 hr

Metabolism: $T_{1/2}$: 6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Drowsiness, confusion*, euphoria, nervousness, restlessness, insomnia and excitement, seizures, vertigo, tinnitus, blurred vision, diplopia, auditory and visual hallucinations
- **CV:** Hypotension, palpitations, tachycardia
- **Dermatologic:** Urticaria, rash
- **GI:** *Dry mouth, anorexia, nausea*, vomiting, diarrhea or constipation
- **GU:** *Urinary frequency, difficult urination*, urine retention
- **Respiratory:** **Respiratory depression, death** (due to overdose, especially in young children), dry nose and throat

Interactions

★ **Drug-drug** • Increased sedation with alcohol or other CNS depressants

■ Nursing considerations**Assessment**

- **History:** Allergy to meclizine or cyclizine, pregnancy, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias, postoperative patients, lactation, pregnancy
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; ophthalmic examination; P, BP, R, adventitious sounds; bowel sounds, normal output, status of mucous membranes; prostate palpation, urinary output

Interventions

- Monitor I & O, and take appropriate measures with urine retention.

Teaching points

- Take as prescribed. Avoid excessive dosage. If you are using chewable tablets, chew them carefully before swallowing.
- Anti-motion-sickness drugs work best if used ahead of time for prevention.
- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); epigastric distress, diarrhea, or constipation (take with food); dry mouth (practice frequent mouth care, suck sugarless lozenges); dryness of nasal mucosa (try another motion-sickness or antiemetic remedy).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, visual disturbances, irregular heartbeat.

⚠ DANGEROUS DRUG

▶ medroxyPROGESTERone acetate

(*me drox' ee proe jess' te rone*)

Oral: Apo-Medroxyprogesterone (CAN), Gen-Medroxy (CAN), Provera

Parenteral: Depo-Provera, depo-subQ provera 104

PREGNANCY CATEGORY X

Drug classes

Antineoplastic
Contraceptive
Hormone
Progestin

Therapeutic actions

Progesterone derivative; endogenous progesterone transforms proliferative endometrium into secretory endometrium; inhibits the secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; inhibits spontaneous uterine contraction.

Indications

- Reduction of endometrial hyperplasia in postmenopausal women
- Oral: Treatment of secondary amenorrhea
- Oral: Abnormal uterine bleeding due to hormonal imbalance in the absence of organic pathology
- Parenteral: Adjunctive therapy and palliation of inoperable, recurrent, and metastatic endometrial carcinoma or renal carcinoma; long acting contraceptive (*Depo-Provera*)
- Subcutaneous depot: Long-acting contraceptive; management of endometriosis-associated pain (*depo-subQ provera 104*)
- Unlabeled use for depot form: Treatment of breast cancer

Contraindications and cautions

- Contraindicated with allergy to progestins; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage or history of these conditions; hepatic disease, carcinoma of the breast, ovaries, or endometrium, undiagnosed vaginal bleeding, missed abortion; pregnancy (fetal abnormalities, including masculinization of the female fetus have been reported); lactation.
- Use cautiously with epilepsy; migraine; asthma; cardiac or renal impairment.

Available forms

Tablets—2.5, 5, 10 mg; injection—150, 400 mg/mL; 104 mg/0.65 mL (Depo-subQ)

Dosages

Adults

- *Contraception monotherapy:* 150 mg IM every 3 mo. For *Depo-subQ Provera:* 104 mg subcutaneously into thigh or abdomen every 12–14 wk.
- *Secondary amenorrhea:* 5–10 mg/day PO for 5–10 days. A dose for inducing an optimum secretory transformation of an endometrium that has been primed with exogenous or endogenous estrogen is 10 mg/day for 10 days. Start therapy at any time; withdrawal bleeding usually occurs 3–7 days after therapy ends.
- *Abnormal uterine bleeding:* 5–10 mg/day PO for 5–10 days, beginning on the 16th or

21st day of the menstrual cycle. To produce an optimum secretory transformation of an endometrium that has been primed with estrogen, give 10 mg/day PO for 10 days, beginning on the 16th day of the cycle. Withdrawal bleeding usually occurs 3–7 days after discontinuing therapy. If bleeding is controlled, administer two subsequent cycles.

- **Endometrial or renal carcinoma:** 400–1,000 mg/wk IM. If improvement occurs within a few weeks or months and the disease appears stabilized, it may be possible to maintain improvement with as little as 400 mg/mo IM.
- **Reduction of endometrial hyperplasia:** 5–10 mg/day PO for 12–14 consecutive days/mo. Start on 1st or 16th day of cycle.
- **Management of endometriosis-associated pain:** 104 mg subcutaneously (*Depo-subQ Provera*) into anterior thigh or abdomen every 12–14 wk; do not use for longer than 2 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	Unknown
IM	Weeks	Months

Metabolism: Hepatic; $T_{1/2}$: 50 days (IM)

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

Adverse effects

- **CNS:** Sudden, partial, or complete loss of vision; proptosis, diplopia, migraine, precipitation of acute intermittent porphyria, mental depression, pyrexia, insomnia, somnolence, nervousness, fatigue
- **CV:** Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, pulmonary embolism, thromboembolic and thrombotic disease, increased BP
- **Dermatologic:** *Rash with or without pruritus, acne, melasma or chloasma, alopecia, hirsutism, photosensitivity, pruritus, urticaria*
- **GI:** Cholestatic jaundice, nausea
- **GU:** *Breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, changes in cervical erosion and cervical secretions, breast tenderness and secretion*

- **Other:** *Fluid retention, edema, increase or decrease in weight, decreased glucose tolerance; bone loss*

Interactions

- **Drug-lab test** • Inaccurate tests of hepatic and endocrine function

Nursing considerations

Assessment

- **History:** Allergy to progestins; thrombophlebitis; thromboembolic disorders; cerebral hemorrhage; hepatic disease; carcinoma of the breast, ovaries, or endometrium; undiagnosed vaginal bleeding; missed abortion; epilepsy; migraine; asthma; cardiac dysfunction; renal impairment; pregnancy; lactation
- **Physical:** Skin color, lesions, turgor; hair; breasts; pelvic examination; orientation, affect; ophthalmologic examination; P, auscultation, peripheral perfusion, edema; R, adventitious sounds; liver evaluation; LFTs, renal function tests, glucose tolerance, Papanicolaou (Pap) test

Interventions

- Arrange for pretreatment and periodic (at least annual) history and physical, which should include BP, breasts, abdomen, pelvic organs, and a Pap test.

⊗ **Black box warning** Before therapy begins, ensure that patient is not pregnant and caution patient to prevent pregnancy and to have frequent medical follow-up visits.

⊗ **Black box warning** Alert patients using contraceptive injections that drug does not protect them from HIV or other STDs; precautions should be used.

⊗ **Warning** Discontinue medication and consult physician if sudden, partial, or complete loss of vision occurs; if papilledema or retinal vascular lesions are present, discontinue drug.

⊗ **Warning** Discontinue medication and consult physician at the first sign of thromboembolic disease (leg pain, swelling, peripheral perfusion changes, shortness of breath).

Teaching points

- If you are taking the oral form of this drug, mark days you should take the medication on a calendar.

- If using the subcutaneous depot form of this drug, mark your calendar for days you should receive new injections. This drug does not protect you from HIV or other STDs; use precautions.
- This drug should not be taken during pregnancy due to risk of serious fetal abnormalities. If drug is used for indications other than contraception, using barrier contraceptives is suggested.
- You may experience these side effects: Sensitivity to light (avoid exposure to the sun; use sunscreen and protective clothing); dizziness, sleeplessness, depression (use caution driving or performing tasks that require alertness); skin rash, color changes, loss of hair; fever; nausea.
- Report pain or swelling and warmth in the calves, acute chest pain or shortness of breath, sudden severe headache or vomiting, dizziness or fainting, visual disturbances, numbness or tingling in the arm or leg.

mefenamic acid (*me fe nam' ik*)

Apo-Mefenamic (CAN), Ponstel

PREGNANCY CATEGORY C

Drug class

NSAID

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Relief of moderate pain when therapy will not exceed 1 wk
- Treatment of primary dysmenorrhea

Contraindications and cautions

- Contraindicated with hypersensitivity to mefenamic acid, aspirin or NSAID allergy, and as treatment of perioperative pain with coronary artery bypass grafting.

- Use cautiously with asthma, renal or hepatic impairment, peptic ulcer disease, GI bleeding, hypertension, heart failure, pregnancy, lactation.

Available forms

Capsules—250 mg

Dosages

Adults and patients older than 14 yr

- **Acute pain:** Initially, 500 mg PO followed by 250 mg every 6 hr as needed. Do not exceed 1 wk of therapy.
- **Primary dysmenorrhea:** Initially, 500 mg PO then 250 mg every 6 hr starting with the onset of bleeding. Can be initiated at start of menses and should not be necessary for longer than 2–3 days.

Pediatric patients

Safety and efficacy for patients younger than 14 yr not established.

Geriatric patients

Use caution in treating patients 65 yr and older. Elderly patients are at greater risk for serious GI events.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, somnolence, *insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, *constipation*, flatulence, ulcers, GI bleed
- **GU:** Dysuria, **renal impairment**
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia,

aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia

- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

Interactions

- ★ **Drug-drug** • Increased risk of GI bleeds with ASA, anticoagulants, other NSAIDs
- ★ **Drug-lab test** • False-positive reaction for urinary bile using the Diazo tablet test

■ Nursing considerations

Assessment

- **History:** Allergies; renal, hepatic, CV, GI conditions; pregnancy; lactation
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Give with milk or food to decrease GI upset.
- Arrange for periodic ophthalmologic examinations during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—supportive therapy and induced emesis, activated charcoal, and/or an osmotic cathartic.

Teaching points

- Take drug with food; take only the prescribed dosage; do not take the drug longer than 1 week.
- Discontinue drug and consult your health care provider if rash, diarrhea, or digestive problems occur.
- Dizziness or drowsiness can occur (avoid driving and using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools; severe diarrhea, right upper abdominal pain, flulike symptoms, chest pain.

DANGEROUS DRUG

(as antineoplastic)

▽ **megestrol acetate**
(*me jess' trole*)

Apo-Megestrol (CAN), Megace, Megace ES, Megace OS (CAN)

PREGNANCY CATEGORY X
(ORAL SUSPENSION)

PREGNANCY CATEGORY D
(TABLETS)

Drug classes

Antineoplastic
Hormone
Progestin

Therapeutic actions

Inhibits secretion of pituitary gonadotropins with resulting decrease in estrogen secretion; exerts cytotoxic effects on tumor cells.

Indications

- Tablets: Palliation of advanced carcinoma of the breast or endometrium and as an adjunct to surgery or radiation
- Suspension: Appetite stimulant in HIV-related cachexia, anorexia or unexplained weight loss
- Unlabeled uses: Appetite stimulant for cachexia in advanced cancer; treatment for hot flashes

Contraindications and cautions

- Contraindicated with allergy to progestins; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage or history of these conditions; hepatic disease, undiagnosed vaginal bleeding, missed abortion; pregnancy (masculinization of female fetus); lactation.
- Use cautiously with epilepsy, migraine, asthma, cardiac dysfunction, renal impairment.

Available forms

Tablets—20, 40 mg; suspension—40 mg/mL; extra strength suspension—125 mg/mL

Dosages**Adults**

- **Breast cancer:** 160 mg/day PO (40 mg qid).
- **Endometrial cancer:** 40–320 mg/day PO in divided doses.
- **Cachexia with HIV:** Initially, 800 mg/day; normal range, 400–800 mg/day (suspension only) or 625 mg/day ES suspension.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	Weeks

Metabolism: Hepatic; $T_{1/2}$: 13–105 hr (tablets)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** Paresthesia, confusion, seizures, depression, neuropathy, hypesthesia, abnormal thinking
- **CV:** Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, **pulmonary embolism**, thromboembolic and thrombotic disease, increased BP
- **Dermatologic:** *Rash with or without pruritus, acne, melasma or chloasma, alopecia, hirsutism, photosensitivity, pruritus, urticaria*
- **GI:** Cholestatic jaundice, nausea
- **GU:** *Breakthrough bleeding, spotting, change in menstrual flow, amenorrhea*, changes in cervical erosion and cervical secretions, breast tenderness and secretion
- **Other:** *Fluid retention, edema, increase in weight*, decreased glucose tolerance

Interactions

* **Drug-lab test** • Inaccurate tests of hepatic and endocrine function

■ Nursing considerations**Assessment**

- **History:** Allergy to progestins; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage; hepatic disease; carcinoma of the breast or genital organs, un-

diagnosed vaginal bleeding, missed abortion; epilepsy, migraine, asthma, cardiac dysfunction, renal impairment; pregnancy; lactation

- **Physical:** Skin color; lesions, turgor; hair; breasts; pelvic examination; orientation, affect; ophthalmologic examination; P, auscultation, peripheral perfusion, edema; R, adventitious sounds; liver evaluation; LFTs, renal function tests, glucose tolerance, Papanicolaou test

Interventions

⊗ **Warning** Discontinue drug and consult physician at signs of thromboembolic disease—leg pain, swelling, peripheral perfusion changes, shortness of breath.

⊗ **Black box warning** Caution patient to avoid using drug during pregnancy because of risks to the fetus; advise using barrier contraceptives.

- Shake suspension well before use; store in a tightly closed bottle in a cool place.

Teaching points

- If the suspension form is ordered, store in a cool place in a tightly closed bottle; shake well before each use. Take care to differentiate long-acting from regular suspension.
- This drug causes serious fetal abnormalities or fetal death; avoid pregnancy. Use of barrier contraceptives is advised.
- You may experience these side effects: Sensitivity to light (avoid exposure to the sun; use sunscreen and protective clothing); dizziness, sleeplessness, depression (use caution if driving or performing tasks that require alertness); skin rash, color changes, loss of hair; fever; nausea.
- Report pain or swelling and warmth in the calves, acute chest pain or shortness of breath, sudden severe headache or vomiting, dizziness or fainting, numbness or tingling in the arm or leg.

meloxicam

(*mel ox' i kam*)

Apo-Meloxicam (CAN),
CO Meloxicam (CAN), Gen-
Meloxicam (CAN), Mobic,
Mobicox (CAN), Novo-Meloxicam (CAN),
PMS-Meloxicam (CAN),
ratio-Meloxicam (CAN)

PREGNANCY CATEGORY C
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug class

NSAID (oxicam derivative)

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities related to inhibition of the enzyme cyclooxygenase (COX), which is required for the synthesis of prostaglandins and thromboxanes. Somewhat more selective for COX-2 sites (found in the brain, kidney, ovary, uterus, cartilage, bone, and at sites of inflammation) than for COX-1 sites, which are found throughout the tissues and are related to protection of the GI mucosa.

Indications

- Relief from the signs and symptoms of osteoarthritis and rheumatoid arthritis
- Relief from the signs and symptoms of pauciarticular or polyarticular course juvenile rheumatoid arthritis in patients 2 yr or older
- Unlabeled uses: Treatment of ankylosing spondylitis, acute shoulder pain

Contraindications and cautions

- Contraindicated with allergy to aspirin or meloxicam; for perioperative pain after coronary artery bypass surgery.
- Use cautiously with allergies; renal, hepatic, CV, GI conditions; bleeding disorders; pregnancy; lactation.

Available forms

Tablets—7.5, 15 mg; oral suspension—7.5 mg/5 mL

Dosages

Adults

Starting dose, 7.5 mg PO daily. Maximum dosage, 15 mg PO daily.

Pediatric patients

0.125 mg/kg PO once daily up to a maximum dose of 7.5 mg, using oral suspension.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	5–6 hr

Metabolism: Hepatic; $T_{1/2}$: 15–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, somnolence, *insomnia*, fatigue, tiredness, tinnitus, ophthalmologic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition (with higher doses), neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema, anaphylactoid reactions to **anaphylactic shock**

Interactions

★ **Drug-drug** • Increased serum lithium levels and risk of toxicity if taken concurrently; monitor patient carefully • Possible increased risk of renal failure if combined with ACE inhibitors, diuretics • Increased risk of GI bleeding if combined with aspirin, anticoagulants, oral corticosteroids

■ Nursing considerations

Assessment

- **History:** Allergies; renal, hepatic, CV, and GI bleeding; history of ulcers; pregnancy; lactation; bleeding disorders

- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Administer drug with food or milk if GI upset occurs.
- Establish safety measures if CNS disturbances occur.
- Monitor patient on prolonged therapy for signs of GI bleeding or hepatic toxicity.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage followed by activated charcoal, supportive therapy.

- Provide further comfort measures to reduce pain (positioning, environmental control), and to reduce inflammation (warmth, positioning, rest).

Teaching points

- Take drug with food if GI upset occurs.
- Take only the prescribed dosage.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery while taking this drug).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black, tarry stools.

DANGEROUS DRUG

▶ **melphalan (L-Pam, L-Phenylalanine Mustard, L-Sarcollysin)**
(*mel' fa lan*)

Alkeran

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic
Nitrogen mustard

Therapeutic actions

Cytotoxic: Alkylates cellular DNA, thus interfering with the replication of susceptible cells, causing cell death; cell-cycle nonspecific.

Indications

- Treatment of multiple myeloma, nonresectable epithelial ovarian carcinoma; use IV only when oral therapy is not possible
- Unlabeled uses: Breast cancer, testicular cancer, bone marrow transplantation

Contraindications and cautions

- Contraindicated with allergy to melphalan, lactation.
- Use cautiously with radiation therapy, chemotherapy, pregnancy (potentially mutagenic and teratogenic; avoid use in the first trimester).

Available forms

Tablets—2 mg; powder for injection—50 mg

Dosages

Individualize dosage based on hematologic profile and response.

Adults

Oral

- **Multiple myeloma:** 6 mg/day PO. After 2–3 wk, stop drug for up to 4 wk, and monitor blood counts. When blood counts are rising, institute maintenance dose of 2 mg/day PO. Response may occur gradually over many months (many alternative regimens, some including prednisone, are used).
- **Epithelial ovarian carcinoma:** 0.2 mg/kg/day PO for 5 days as a single course. Repeat courses every 4–5 wk, depending on hematologic response.

IV

- **Multiple myeloma:** 16 mg/m² administered as a single infusion over 15–20 min; administered at 2-wk intervals for 4 doses, then at 4-wk intervals.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Consider reducing initial oral dosage in patients with moderate to severe impairment;

reduce IV dosage by 50% in patients with BUN of 30 mg/dL or more.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr
IV	Rapid	1 hr

Metabolism: $T_{1/2}$: 90 min (oral)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute with 10 mL of supplied diluent, and shake vigorously until a clear solution is obtained; this provides 5 mg/mL solution. Immediately dilute in 0.9% sodium chloride injection to a dilution of less than 0.45 mg/mL. Complete infusion within 60 min of reconstitution. Protect from light. Dispense in glass containers. Do not refrigerate reconstituted solution.

Infusion: Administer dilute product over a minimum of 15 min; complete within 60 min of reconstitution.

Adverse effects

- **Dermatologic:** Maculopapular rash, urticaria, *alopecia*
- **GI:** *Nausea, vomiting*, oral ulceration, diarrhea
- **Hematologic:** Bone marrow depression, hyperuricemia
- **Respiratory:** Bronchopulmonary dysplasia, **pulmonary fibrosis**
- **Other:** *Amenorrhea*, cancer, acute leukemia, **anaphylaxis**

Interactions

★ **Drug-lab test** • Increased urinary 5-HIAA levels due to tumor cell destruction

■ Nursing considerations

Assessment

- **History:** Allergy to melphalan or chlorambucil, radiation therapy, chemotherapy, pregnancy, lactation
- **Physical:** T; weight; skin color, lesions; R, adventitious sounds; liver evaluation; CBC, differential, Hgb, renal function tests

Interventions

⊗ **Black box warning** Arrange for blood tests to evaluate hematopoietic function before therapy and weekly during therapy; severe bone marrow suppression may occur.

⊗ **Warning** Do not give full dosage until 4 wk after a full course of radiation therapy or chemotherapy due to risk of severe bone marrow depression.

- Consider dosage reductions in patients with impaired renal function.
- Ensure that patient is well hydrated before treatment.

⊗ **Black box warning** Caution patient to avoid pregnancy while taking this drug; drug is considered to be mutagenic.

- Divide single daily dose if nausea and vomiting occur.

Teaching points

- Take drug once a day. If nausea and vomiting occur, consult with your health care provider about dividing the dose.
- Refrigerate tablets in glass bottle.
- This drug causes severe birth defects; use of barrier contraceptives is advised.
- You may experience these side effects: Nausea, vomiting, loss of appetite (divided dose, frequent small meals may help; maintain fluid intake and nutrition; drink at least 10–12 glasses of fluid each day); skin rash, loss of hair (obtain a wig if hair loss occurs; head should be covered at extremes of temperature).
- Report unusual bleeding or bruising, fever, chills, sore throat, cough, shortness of breath, black tarry stools, flank or stomach pain, joint pain.

▽ memantine hydrochloride

(*meh man' teen*)

Ebixa (CAN), Namenda, Namenda XR OND

PREGNANCY CATEGORY B

Drug classes

Alzheimer's disease drug

N-methyl-*D*-aspartate (NMDA) receptor antagonist**Therapeutic actions**

Exerts a low to moderate affinity for NMDA receptor sites with no effects on GABA, dopamine, histamine, glycine, or adrenergic receptor sites; persistent activation of the CNS NMDA receptors by the excitatory amino acid glutamate has been suggested to contribute to the symptomatology of Alzheimer's disease.

Indications

- Treatment of moderate to severe dementia of the Alzheimer's type
- Unlabeled uses: Treatment of vascular dementia, treatment of ADHD, prevention of migraines

Contraindications and cautions

- Contraindicated with allergy to memantine or any component of the drug.
- Use cautiously with pregnancy, lactation, renal impairment.

Available forms

Tablets—5, 10 mg; ER capsules —7, 14, 21, 28 mg; oral solution—2 mg/mL

Dosages**Adults**

Initially, 5 mg/day PO, increase at weekly intervals to 5 mg bid (10 mg/day), 15 mg/day (5 mg and 10 mg doses) with at least 1 week between increases; target dose is 20 mg/day (10 mg bid). Use solution-dosing device if solution is used. If using ER form: Initially 7 mg PO once a day; may be increased by 7 mg/day after at least 1 week. Maintenance dose is 28 mg PO once daily.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Consider dosage reduction and closely monitor the patient; avoid use with severe renal impairment. If using ER form, maximum dose of 14 mg once a day is recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–7 hr

Metabolism: Hepatic metabolism; $T_{1/2}$: 60–80 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Fatigue, *headache*, *dizziness*, *confusion*, somnolence, hallucinations, agitation, insomnia, anxiety
- **CV:** Hypertension, peripheral edema
- **GI:** Vomiting, diarrhea, *constipation*
- **GU:** UTI, urinary incontinence
- **Respiratory:** Cough, dyspnea, URI, bronchitis
- **Other:** Pain, back pain, arthralgia

Interactions

★ **Drug-drug** • Increased effects and risk of toxicity of memantine if taken with drugs that alkalinize the urine, including carbonic anhydrase inhibitors, sodium bicarbonate; monitor patient closely and make dosage adjustments as needed • Potential for increased effects and toxicity if combined with amantadine, ketamine, or dextromethorphan; use caution if this combination is used

■ Nursing considerations**Assessment**

History: Allergy to memantine or component of the drug, pregnancy, lactation, renal impairment

Physical: Orientation, affect, reflexes; BP; R, adventitious sounds, assessment of normal function

Interventions

- Establish baseline functional profile to follow evaluation of drug effectiveness.
- Administer without regard to food; may take with food if GI upset is a problem; switch to oral solution if swallowing is difficult. If using ER form, make sure patient swallows capsule whole; do not cut, crush, or allow patient to chew capsule. Capsule may be

opened and contents sprinkled on applesauce and then swallowed.

- Provide patient safety measures if CNS effects occur.
- Establish bowel program if constipation becomes an issue.

Teaching points

- Take drug exactly as prescribed; take with food to decrease GI upset; learn to use the solution-dosing device rather than spoon to determine exact dose of solution. If using ER capsule, swallow capsule whole; do not cut, crush, or chew capsule. If swallowing is difficult, you can open capsule and sprinkle contents on applesauce, then swallow.
- This drug does not cure the disease; it is not thought to prevent or slow the degeneration associated with the disease.
- Dosage changes will be needed and will be made on a weekly basis until the target dosage is reached.
- You may experience these side effects: Headache (an analgesic may be available); dizziness, fatigue, confusion (use caution if driving or performing tasks that require alertness); constipation (consult your health care provider for an appropriate bowel program).
- Report severe nausea, vomiting, severe headache, swelling of the legs, respiratory problems, lack of improvement in day-to-day functioning.

menotropins (*men oh troe' pins*)

Menopur, Repronex

PREGNANCY CATEGORY X

Drug classes

Fertility drug
Hormone

Therapeutic actions

A purified preparation of human gonadotropins; in women, produces ovarian follicular growth; when followed by administration HCG,

produces ovulation; used with HCG for at least 3 mo to induce spermatogenesis in men with primary or secondary pituitary hypofunction who have previously achieved adequate masculinization with HCG administration.

Indications

- Women: Given with HCG sequentially to induce ovulation and pregnancy in anovulatory infertile patients without primary ovarian failure; used with HCG to stimulate multiple follicles for in vitro fertilization programs
- Unlabeled use: Treatment of male infertility caused by hypogonotropic hypogonadism

Contraindications and cautions

- Contraindicated with known sensitivity to menotropins; high gonadotropin levels, indicating primary ovarian failure; overt thyroid or adrenal dysfunction; abnormal bleeding of undetermined origin; ovarian cysts or enlargement not due to polycystic ovary syndrome; intracranial lesion, such as pituitary tumor; pregnancy (women); normal gonadotropin levels, indicating pituitary function; elevated gonadotropin levels, indicating primary testicular failure; infertility disorders other than hypogonadotropic hypogonadism (men).
- Use cautiously with lactation.

Available forms

Powder or pellet for injection—75 international units FSH/75 international units LH; 150 international units FSH/150 international units LH

Dosages

Women

To achieve ovulation, HCG must be given following menotropins when clinical assessment indicates sufficient follicular maturation as indicated by urinary excretion of estrogens.

Menopur, Repronex

225 units IM; then 75–150 units/day by subcutaneous injection up to a maximum of 450 units/day for no longer than 12 days (*Repronex*) or 20 days (*Menopur*). Base actual dose on follicular development.

Repronex

Patients who have received gonadotropin-releasing hormone agonists or pituitary suppression: Initially, 150 international units subcutaneously or IM daily for first 5 days; adjust dosage as needed after 2 or more days. Do not adjust by more than 150 international units per adjustment and do not exceed maximum daily dose of 450 international units. Do not use longer than 12 days. If patient response is adequate, give HCG 5,000–10,000 units 1 day following last dose of menotropins.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Slow	Weeks	Months

Metabolism: $T_{1/2}$: 11–13 hr (*Menopur*), 53–59 hr (*Repronex*)

Distribution: Crosses placenta

Excretion: Urine

Adverse effects**Women**

- **CNS:** Dizziness
- **CV:** Arterial thromboembolism, tachycardia
- **GI:** Nausea, vomiting, abdominal pain, bloating
- **GU:** *Ovarian enlargement*, hyperstimulation syndrome, hemoperitoneum
- **Hypersensitivity:** Hypersensitivity reactions
- **Other:** *Febrile reactions*; birth defects in resulting pregnancies, *multiple pregnancies*

■ Nursing considerations**Assessment**

- **History:** Sensitivity to menotropins; high gonadotropin levels; overt thyroid or adrenal dysfunction, abnormal bleeding of undetermined origin, ovarian cysts or enlargement not due to polycystic ovary syndrome, intracranial lesion, pregnancy, lactation (women); normal gonadotropin levels; elevated gonadotropin levels; infertility disorders other than hypogonadotropin hypogonadism (men)
- **Physical:** Abdominal examination, pelvic examination; testicular examination; serum

gonadotropin levels; 24 hr urinary estrogens and estriol excretion (women); T; masculinization, serum testosterone levels (men)

Interventions

- Dissolve contents of 1–6 vials in 1–2 mL of sterile saline. Administer subcutaneously immediately. *Repronex* may also be given IM. Discard any unused portion.
- Store ampules at room temperature or in refrigerator; do not freeze.
- Monitor women for any sign of ovarian enlargement at least every other day during treatment and for 2 wk after treatment.
- ⊗ **Warning** Discontinue drug at any sign of ovarian overstimulation, and arrange to have patient admitted to the hospital for observation and supportive measures. Do not attempt to remove ascitic fluid because of the risk of injury to the ovaries. Have the patient refrain from intercourse if ovarian enlargement occurs.
- Provide women with calendar of treatment days and explanations about what signs of estrogen and progesterone activity to watch for. Caution patient that 24-hr urine collections will be needed periodically, that HCG also must be given to induce ovulation, and that daily intercourse should begin 1 day prior to HCG administration and until ovulation occurs.
- Alert patient to risks and hazards of multiple births.

Teaching points

- Prepare a calendar showing the treatment schedule; drug can only be given intramuscularly and must be used with human chorionic gonadotropin (HCG) to achieve the desired effects. If you are administering the drug yourself, dispose of needles and syringes properly.
- Know that there is a risk of multiple pregnancy when using this drug.
- Have intercourse daily beginning on the day prior to HCG therapy until ovulation occurs.
- Report pain at injection site, severe abdominal or lower back pain, fever, fluid in the abdomen.

DANGEROUS DRUG**meperidine hydrochloride (pethidine)***(me per' i deen)*

Demerol

PREGNANCY CATEGORY B

PREGNANCY CATEGORY D
(PROLONGED USE)

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Oral, parenteral: Relief of moderate to severe acute pain
- Parenteral: Preoperative medication, support of anesthesia, and obstetric analgesia

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning (before toxins are eliminated), bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, kyphoscoliosis, acute alcoholism, increased intracranial pressure, pregnancy, seizure disorder, renal impairment. Contraindicated in premature infants.
- Use cautiously with acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, labor or delivery (opioids given to the mother can cause respiratory depression of neonate; premature infants are especially at risk), renal or hepatic impairment, lactation.

Available forms

Tablets—50, 100 mg; syrup—50 mg/5 mL; injection—10, 25, 50, 75, 100 mg/mL; oral solution—50 mg/5 mL

Dosages**Adults**

- *Relief of pain:* Individualize dosage; 50–150 mg IM, subcutaneously, or PO every 3–4 hr as needed. Diluted solution may be given by slow IV injection. IM route is preferred for repeated injections.
- *Preoperative medication:* 50–100 mg IM or subcutaneously, 30–90 min before beginning anesthesia.
- *Support of anesthesia:* Dilute to 10 mg/mL, and give repeated doses by slow IV injection, or dilute to 1 mg/mL and infuse continuously. Individualize dosage.
- *Obstetric analgesia:* When contractions become regular, 50–100 mg IM or subcutaneously; repeat every 1–3 hr.

Pediatric patients

Contraindicated in premature infants.

- *Relief of pain:* 1.1–1.75 mg/kg IM, subcutaneously, or PO up to adult dose every 3–4 hr as needed.
- *Preoperative medication:* 1.1–2.2 mg/kg IM or subcutaneously, up to adult dose, 30–90 min before beginning anesthesia.

Geriatric or debilitated patients

Use caution; respiratory depression may occur in elderly, the very ill, and those with respiratory problems. Reduced dosage may be needed.

Patients with renal impairment

Reduce dose with severe renal impairment: for creatinine clearance of 10–50 mL/min, give 75% of normal dose; for creatinine clearance of less than 10 mL/min, give 25–50% of normal dose. Not recommended for patients on dialysis.

Patients with hepatic impairment

Give with caution; reduce initial dose for patients with severe impairment.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15 min	60–90 min	2–4 hr
IM, Subcut.	10–15 min	3–50 min	2–4 hr
IV	Immediate	5–7 min	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute parenteral solution prior to IV injection using 5% dextrose and lactated Ringer's; dextrose-saline combinations; 2.5%, 5%, or 10% dextrose in water, Ringer's, or lactated Ringer's; 0.45% or 0.9% sodium chloride; 1/6M sodium lactate.

Infusion: Administer by slow IV injection over 4–5 min or by continuous infusion when diluted to 1 mg/mL.

Incompatibilities: ☒ **Warning** Do not mix meperidine solutions with solutions of barbiturates, aminophylline, heparin, morphine sulfate, methicillin, phenytoin, sodium bicarbonate, iodide, sulfadiazine, sulfisoxazole.

Y-site incompatibilities: Do not give with other drugs.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation*, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope
- **Dermatologic:** Pruritus, urticaria, laryngospasm, bronchospasm, edema
- **GI:** *Nausea, vomiting*, dry mouth, anorexia, *constipation*, biliary tract spasm, increased colonic motility in patients with chronic ulcerative colitis
- **GU:** Ureteral spasm, spasm of vesical sphincters, urine retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Tissue irritation and induration (subcutaneous injection)
- **Major hazards:** **Respiratory depression, apnea, circulatory depression,**

respiratory arrest, shock, cardiac arrest

- **Other:** *Sweating*, physical tolerance and dependence, psychological dependence

Interactions

• **Drug-drug** ☒ **Warning** Severe and sometimes fatal reactions (resembling opioid overdose; characterized by seizures, hypertension, hyperpyrexia) when given to patients receiving or who have recently received MAOIs; do not give meperidine to patients on MAOIs • Potentiation of effects with barbiturate anesthetics; decrease dose of meperidine when coadministering • Increased likelihood of respiratory depression, hypotension, profound sedation, or coma with phenothiazines

• **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, kyphoscoliosis, acute alcoholism, increased intracranial pressure, acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment, pregnancy, lactation
- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

- Administer to lactating women 4–6 hr before the next feeding to minimize the amount in milk.

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available during parenteral administration.

⊗ **Warning** Use caution when injecting subcutaneously into chilled areas of the body or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.

- Reduce dosage of meperidine by 25%–50% in patients receiving phenothiazines or other tranquilizers.
- Give each dose of the oral syrup in half glass of water. If taken undiluted, it may exert a slight local anesthetic effect on mucous membranes.
- Reassure patient that addiction is unlikely; most patients who receive opiates for medical reasons do not develop dependence syndromes.

⊗ **Warning** Use meperidine with extreme caution in patients with renal impairment or those requiring repeated dosing due to accumulation of normeperidine, a toxic metabolite that may cause seizures.

Teaching points

- Take drug exactly as prescribed.
- Avoid alcohol, antihistamines, sedatives, tranquilizers, and over-the-counter drugs.
- Do not take leftover medication for other disorders, and do not let anyone else take this prescription.
- You may experience these side effects: Nausea, loss of appetite (take with food and lie quietly, eat frequent small meals); constipation (request a laxative); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness or visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath, or difficulty breathing.

meprobamate (*me proe ba' mate*)

Miltown

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug class

Anxiolytic

Therapeutic actions

Has effects at many sites in the CNS, including the thalamus and limbic system; inhibits multineuronal spinal reflexes; is mildly tranquilizing; has some antiepileptic and central skeletal muscle relaxing properties.

Indications

- Management of anxiety disorders for the short-term relief of the symptoms of anxiety (anxiety or tension associated with the stress of everyday life usually does not require treatment with anxiolytic drugs); effectiveness for longer than 4 mo not established.

Contraindications and cautions

- Contraindicated with hypersensitivity to meprobamate or to related drugs, such as carisoprodol; acute intermittent porphyria; hepatic or renal impairment; pregnancy; lactation.
- Use cautiously with epilepsy (drug may precipitate seizures).

Available forms

Tablets—200, 400 mg

Dosages

Adults

1,200–1,600 mg/day PO in three or four divided doses. Do not exceed 2,400 mg/day.

Pediatric patients 6–12 yr

100–200 mg PO bid–tid.

Pediatric patients younger than 6 yr

Safety and efficacy not established.

Geriatric patients

Use lowest effective dose to avoid oversedation.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 6–14 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, ataxia, dizziness, headache, slurred speech, vertigo, weakness, impairment of visual accommodation, euphoria, overstimulation, paradoxical excitement, paresthesias*
- **CV:** *Palpitations, tachycardia*, various arrhythmias, syncope, **hypotensive crisis**
- **GI:** *Nausea, vomiting, diarrhea*
- **Hematologic:** Agranulocytosis, aplastic anemia; thrombocytopenic purpura; exacerbation of porphyric symptoms
- **Hypersensitivity:** Allergic or idiosyncratic reactions (usually seen between first and fourth doses in patients without previous drug exposure): *Itchy, urticarial or erythematous maculopapular rash*; leukopenia, acute nonthrombocytopenic purpura, petechiae, ecchymoses, eosinophilia, peripheral edema, adenopathy, fever, fixed drug eruption; hyperpyrexia, chills, angioneurotic edema, bronchospasm, oliguria, anuria, anaphylaxis, erythema multiforme, exfoliative dermatitis, stomatitis, proctitis; **Stevens-Johnson syndrome**, bullous dermatitis
- **Other:** Physical, psychological dependence; withdrawal reaction

Interactions

★ **Drug-drug** • Additive CNS depression with alcohol, opioids, barbiturates, and other CNS depressants

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to meprobamate or to related drugs; acute intermittent porphyria; hepatic or renal impairment; epilepsy; pregnancy; lactation
- **Physical:** T; skin color, lesions; orientation, affect, reflexes, vision examination; P, BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, CBC and differential, EEG and ECG

Interventions

- Supervise dose and amount for patients who are addiction-prone or alcoholic.

⊗ **Warning** Dispense least amount of drug feasible to patients who are depressed or suicidal.

- Withdraw gradually over 2 wk if patient has been maintained on high doses for weeks or months.
- Withdraw drug if allergic or idiosyncratic reactions occur.
- Caution patient about the need to avoid pregnancy while taking this drug.

⊗ **Warning** Keep epinephrine, antihistamines, corticosteroids, and life-support equipment readily available in case allergic or idiosyncratic reaction occurs.

Teaching points

- Take this drug exactly as prescribed. This drug may not be effective after several months of therapy; continue to see your health care provider.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- Use barrier method of birth control while taking this drug; do not take this drug during pregnancy. Consult your health care provider immediately if you decide to become pregnant or find that you are pregnant.
- You may experience these side effects: Drowsiness, dizziness, light-headedness, blurred vision (avoid driving or performing other tasks requiring alertness or visual acuity); GI upset (eat frequent small meals).
- Report rash, sore throat, fever, easy bruising, bleeding, thoughts of suicide.

DANGEROUS DRUG

▽ **mercaptopurine**
(6-mercaptopurine,
6-MP)

(*mer kap toe pyoor' een*)

Purinethol

PREGNANCY CATEGORY D

Drug classes

Antimetabolite

Antineoplastic

Therapeutic actions

Tumor-inhibiting properties, probably due to interference with purine nucleotide synthesis and hence with RNA and DNA synthesis, leading to cell death; cell-cycle specific.

Indications

- Remission induction, remission consolidation, and maintenance therapy of acute leukemia (lymphocytic, myelogenous)

Contraindications and cautions

- Contraindicated with allergy to mercaptopurine, prior resistance to mercaptopurine (cross-resistance with thioguanine is frequent), hematopoietic depression, pregnancy, lactation.
- Use cautiously with impaired renal function (slower elimination and greater accumulation; reduce dosage).

Available forms

Tablets—50 mg

Dosages

Adults and pediatric patients

- **Induction therapy:** Usual initial dose is 2.5 mg/kg/day PO (about 100–200 mg in adults, 50 mg in the average 5-yr-old child). Continue daily for several weeks. After 4 wk, if no clinical improvement or toxicity, increase to 5 mg/kg/day.
- **Maintenance therapy after complete hematologic remission:** 1.5–2.5 mg/kg/day PO as a single daily dose. Often effective in children with ALL, especially in combination with methotrexate.

Patients with renal impairment

Reduce dosage and monitor patient closely.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 47 min (adults)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **GI:** Hepatotoxicity; oral lesions (resembling thrush); nausea; vomiting; anorexia, pancreatitis
- **Hematologic:** **Bone marrow depression**, immunosuppression, hyperuricemia as consequence of antineoplastic effect and cell lysis
- **Other:** Drug fever, **cancer**, chromosomal aberrations, rash, hyperpigmentation

Interactions

- *** Drug-drug** • Increased risk of severe toxicity with allopurinol; reduce mercaptopurine to one-third to one-fourth the usual dose

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Purinethol* (mercaptopurine) and propylthiouracil; use extreme caution.

Assessment

- **History:** Allergy to mercaptopurine; prior resistance to mercaptopurine; hematopoietic depression; impaired renal function; pregnancy; lactation
- **Physical:** T; mucous membranes, liver evaluation, abdominal examination; CBC, differential, Hgb, platelet counts; LFTs, renal function tests; urinalysis; serum uric acid

Interventions

⊗ **Black box warning** Reserve use for patients with established diagnosis of acute lymphatic leukemia; serious adverse effects can occur.

- Evaluate hematopoietic status before and frequently during therapy.
- Round dose to nearest 25 mg (tablets are scored).
- Ensure that patient is well hydrated before and during therapy to minimize adverse effects of hyperuricemia.
- Caution patient about the risk of serious fetal harm while taking this drug; advise patient to use barrier contraceptives.
- Administer as a single daily dose.

Teaching points

- Drink adequate fluids; drink at least 8–10 glasses of fluid each day.
- Have frequent, regular medical follow-up visits, including blood tests to follow the drug effects.
- This drug is not for use during pregnancy; use of contraceptives is advised.
- If you are nursing a baby, you should use another method of feeding the baby; serious reactions can occur in the baby.
- You may experience these side effects: Mouth sores (practice frequent mouth care); miscarriages (use barrier contraceptives); nausea, vomiting.
- Report fever, chills, sore throat, unusual bleeding or bruising, yellow discoloration of the skin or eyes, abdominal pain, flank pain, joint pain, fever, weakness, diarrhea.

meropenem (mare ob pen' ehm)

Merrem IV

PREGNANCY CATEGORY B

Drug class

Antibiotic (carbapenem)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall and causes cell death in susceptible cells.

Indications

- Susceptible intra-abdominal infections caused by viridans group streptococci, *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, and *Peptostreptococcus*
- Bacterial meningitis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Neisseria meningitidis* in pediatric patients 3 mo and older
- Treatment of complicated skin and skin structure infections due to *Staphylococcus aureus* (beta-lactamase and non-beta-lactamase-producing methicillin-susceptible isolates

only), *Streptococcus pyogenes*, *Streptococcus agalactiae*, viridans group streptococci, *Enterococcus faecalis* (excluding vancomycin-resistant isolates), *Pseudomonas aeruginosa*, *E. coli*, *Proteus mirabilis*, *Bacteroides fragilis*, *Peptostreptococcus* species

- Unlabeled uses: Community-acquired pneumonia, therapy for patients with febrile neutropenia, nosocomial pneumonia

Contraindications and cautions

- Contraindicated with allergy to cephalosporins, penicillins, beta-lactams; lactation.
- Use cautiously with CNS disorders, seizures, renal or hepatic impairment, pregnancy.

Available forms

Powder for injection—500 mg, 1 g

Dosages

Adults

- *Meningitis, intra-abdominal infections*: 1 g IV every 8 hr.
- *Skin and skin structure infections*: 500 mg IV every 8 hr.

Pediatric patients 3 mo and older

- *Intra-abdominal infections*: If less than 50 kg, 20 mg/kg IV every 8 hr. If more than 50 kg, 1 g IV every 8 hr.
- *Meningitis*: If less than 50 kg, 40 mg/kg IV every 8 hr; if more than 50 kg, 2 g IV every 8 hr.
- *Skin and skin structure infections*: If less than 50 kg, 10 mg/kg IV every 8 hr; if more than 50 kg, 500 mg IV every 8 hr.

Pediatric patients younger than 3 mo

Not recommended.

Patients with impaired renal function

CrCl (mL/min)	Dose (meningitis, intra-abdominal infections)	Dose (skin, skin structure infections)
26–50	1 g IV every 12 hr	500 mg IV every 12 hr
10–25	500 mg IV every 12 hr	250 mg IV every 12 hr
Less than 10	500 mg IV every 24 hr	250 mg IV every 24 hr

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	5 min	10–12 min

Metabolism: $T_{1/2}$: 1 hr

Distribution: Unknown whether crosses placenta; may enter breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Dilute in 0.9% sodium chloride injection; 5% or 10% dextrose injection; dextrose in sodium chloride, potassium chloride, sodium bicarbonate, Normosol-M, Ringer's lactate; 2.5% mannitol injection; Ringer's injection; Ringer's lactate injection; sodium lactate injection 1/6N; sodium bicarbonate. Store at room temperature or 39° F (4° C); stability in each solution varies—consult manufacturer's instructions if not used immediately.

Infusion: Infuse over 15–30 min or give by direct IV injection over 3–5 min.

Incompatibilities: Do not mix in solution with other drugs.

Adverse effects

- **CNS:** *Headache*, dizziness, lethargy, paresthesias, **seizures**, insomnia
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence*, **pseudomembranous colitis**, liver toxicity
- **Other:** *Superinfections*, abscess (redness, tenderness, heat, tissue sloughing), inflammation at injection site, *phlebitis, rash*, urticaria, pruritus

Interactions

★ **Drug-drug** • Possible toxic levels if combined with probenecid; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to cephalosporins, penicillins, beta lactams; renal failure; CNS disorders, seizures, renal or hepatic impairment; pregnancy, lactation
- **Physical:** Orientation, affect; skin color, lesions; culture site of infection; R, adventitious sounds; bowel sounds, abdominal examination; LFTs, renal function tests

Interventions

- Culture infected area and arrange for sensitivity tests before beginning therapy.
- Monitor for superinfections and arrange treatment as appropriate.
- ⊗ **Warning** Discontinue drug at any sign of colitis and arrange for appropriate supportive treatment.

Teaching points

- This drug can only be given IV.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea (stay near bathroom); headache, dizziness.
- Report severe diarrhea, difficulty breathing, unusual tiredness, pain at injection site.

▽ mesalamine (5-aminosalicylic acid, 5-ASA)

(*me sal' a meen*)

Apriso, Asacol **onc**, CANASA, Lialda **onc**, Mesasal (CAN), Pentasa **onc**, Rowasa, Salofalk (CAN)

PREGNANCY CATEGORY B

Drug class

Anti-inflammatory

Therapeutic actions

Mechanism of action is unknown; thought to be a direct, local anti-inflammatory effect in the colon where mesalamine blocks cyclooxygenase and inhibits prostaglandin production in the colon.

Indications

- Oral: Remission and treatment, and induction of remission with one daily dose, of active mild to moderate ulcerative colitis
- Suppository: Treatment of active, distal, mild to moderate ulcerative colitis, ulcerative proctitis, or proctosigmoiditis

Contraindications and cautions

- Contraindicated with hypersensitivity to mesalamine, salicylates, any component of the formulation.

- Use cautiously with renal impairment, pregnancy, lactation.

Available forms

DR tablets **ONC**—400 mg, 1.2 g; CR capsules **ONC**—250, 500 mg; ER capsules **ONC**—375 mg; suppositories—1 g; rectal suspension—4 g/60 mL

Dosages

Adults

Rectal

- *Suspension enema*: 60 mL units in one rectal instillation (4 g) once a day, preferably at bedtime, and retained for approximately 8 hr. Usual course of therapy is 3–6 wk. Effects may be seen within 3–21 days.
- *Rectal suppository*: 1 g (1 suppository) bid. Retain suppository for 1–3 hr or longer. Usual course is 3–6 wk.

Oral

- *DR tablets*: 2–4 1.2 g tablets PO once daily with food for total dose of 2.4–4.8 g. Treatment beyond 8 wk has not been studied (*Lialda*).
- *ER capsules*: 1.5 g/day PO (4 capsules) in the morning (*Apriso*). Treatment for up to 6 mo.
- *CR capsules*: 1 g PO qid for a total daily dose of 4 g for up to 8 wk (*Pentasa*).
- *DR tablets*: 1.6 g/day PO in divided doses (*Asacol*).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–6 hr
Rectal	Slow	3–6 hr

Metabolism: $T_{1/2}$: 5–10 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Headache, fatigue, malaise*, dizziness, asthenia, insomnia
- **GI:** *Abdominal pain, cramps, discomfort; gas; flatulence; nausea*; diarrhea, bloating, hemorrhoids, rectal pain, constipation
- **GU:** Urinary urgency, dysmenorrhea

- **Other:** *Flulike symptoms, fever, cold*, rash, back pain, hair loss, peripheral edema, pruritus

Nursing considerations

Assessment

- **History:** Hypersensitivity to mesalamine, salicylates, any component of the formulation; renal impairment; lactation, pregnancy
- **Physical:** T, hair status; reflexes, affect; abdominal examination, rectal examination; urinary output; renal function tests

Interventions

- Administer enemas as follows: Shake bottle well to ensure suspension is homogeneous. Remove protective applicator sheath; hold bottle at the neck to ensure that none of the dose is lost. Have patient lie on the left side (to facilitate migration of drug into the sigmoid colon) with the lower leg extended and the upper leg flexed forward. Knee-chest position can be used if more acceptable to the patient. Gently insert the application tip into the rectum pointing toward the umbilicus; steadily squeeze the bottle to discharge the medication. Patient must retain medication for approximately 8 hr.
- Administer rectal suppository as follows: Remove the foil wrapper; avoid excessive handling (suppository will melt at body temperature); insert completely into the rectum with pointed end first; have patient retain for 1–3 hr or longer.
- Caution patient not to chew tablet or capsule; swallow whole. Notify physician if intact tablets are found in the stool.
- Monitor patients with renal impairment for possible side effects.

Teaching points

- This drug may be given as a suspension enema, so the medication must be retained for approximately 8 hours; it is best given at bedtime to facilitate the retention; the effects of the drug are usually seen within 3–21 days, but a full course of therapy is about 6 weeks. (Review administration with patient and significant other.)
- Administer rectal suppository as follows: Remove the foil wrapper; avoid excessive

handling (suppository will melt at body temperature); insert completely into the rectum with pointed end first; retain for 3 hours or longer; staining of clothing may occur, using a protective pad is suggested.

- Do not chew oral tablets or capsules; swallow whole. If intact tablets are seen in the stool, notify your health care provider.
- You may experience these side effects: Abdominal cramping, discomfort, pain, gas (relax; maintain the position used for insertion to relieve pressure on the abdomen); headache, fatigue, fever, flulike symptoms (request medication); hair loss (usually mild and transient).
- Report difficulty breathing, rash, severe abdominal pain, fever, headache.

▷ mesna

See Appendix U, *Less commonly used drugs*.

▷ metaproterenol sulfate

(*met a proe ter' e nol*)

PREGNANCY CATEGORY C

Drug classes

Antiasthmatic
Beta₂-selective adrenergic agonist
Bronchodilator
Sympathomimetic

Therapeutic actions

In low doses, acts relatively selectively at beta₂-adrenergic receptors to cause bronchodilation; at higher doses, beta₂ selectivity is lost and the drug also acts at beta₁ receptors to cause typical sympathomimetic cardiac effects.

Indications

- Prophylaxis and treatment of bronchial asthma and reversible bronchospasm that may occur with bronchitis and emphysema

Contraindications and cautions

- Contraindicated with hypersensitivity to metaproterenol; tachyarrhythmias, tachycardia caused by digitalis intoxication.

- Use cautiously with unstable vasomotor system disorders; hypertension; CAD; history of CVA; COPD in patients who have developed degenerative heart disease; hyperthyroidism; history of seizure disorders; psychoneurotic individuals; pregnancy; labor and delivery (may inhibit labor; parenteral use of beta₂-adrenergic agonists can accelerate fetal heartbeat, cause hypoglycemia, hypokalemia, and pulmonary edema in the mother and hypoglycemia in the neonate); lactation.

Available forms

Tablets—10, 20 mg; syrup—10 mg/5 mL

Dosages

Adults and children 12 yr and older

Oral

20 mg PO tid–qid.

Pediatric patients

Oral

Younger than 6 yr: Not recommended.

6–9 yr or weight less than 27 kg: 10 mg PO tid–qid.

Older than 9 yr or weight more than 27 kg: 20 mg PO tid–qid.

Geriatric patients

Patients older than 60 yr are more likely to develop side effects; use extreme caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	2–3 hr	3–6 hr

Metabolism: Liver and tissue; T_{1/2}: Unknown

Excretion: Feces

Adverse effects

- **CNS:** *Restlessness, apprehension, anxiety, fear, CNS stimulation*, hyperkinesia, insomnia, tremor, drowsiness, irritability, weakness, vertigo, headache
- **CV:** Cardiac arrhythmias, *tachycardia*, palpitations, PVCs (rare), anginal pain—less likely with bronchodilator doses of this drug than with bronchodilator doses of a nonselective beta-agonist (isoproterenol), changes in BP
- **GI:** *Nausea, vomiting, heartburn*, unusual or bad taste in mouth

- **Respiratory:** Respiratory difficulties, pulmonary edema, coughing, **bronchospasm**, paradoxical airway resistance with repeated, excessive use of inhalation preparations
- **Other:** *Sweating, pallor, flushing*

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to metaproterenol; tachyarrhythmias; unstable vasomotor system disorders; hypertension; CAD; CVA; COPD patients who have developed degenerative heart disease; hyperthyroidism; seizure disorders; psychoneuroses; pregnancy; labor; lactation
- **Physical:** Weight; skin color, T, turgor; orientation, reflexes; P, BP; R, adventitious sounds; blood and urine glucose, serum electrolytes, thyroid function tests, ECG

Interventions

- Use minimal doses for minimal periods—drug tolerance can occur with prolonged use.
- Switch to syrup if swallowing is difficult.
- ⊗ **Warning** Keep a beta-adrenergic blocker (a cardioselective beta-blocker such as atenolol should be used in patients with respiratory distress) readily available in case cardiac arrhythmias occur.
- Do not exceed recommended dosage.

Teaching points

- If taking tablets, protect from moisture.
- Do not exceed recommended dosage; adverse effects or loss of effectiveness may result. Read product instructions and ask your health care provider or pharmacist if you have any questions.
- You may experience these side effects: Nausea, vomiting, change in taste (eat small frequent meals); dizziness, drowsiness, fatigue, weakness (use caution if driving or performing tasks that require alertness); irritability, apprehension, sweating, flushing.
- Report chest pain, dizziness, insomnia, weakness, tremor or irregular heartbeat, difficulty breathing, productive cough, failure to respond to usual dosage.

▷ metaxalone

(*me tax' ab lone*)

Skelaxin

PREGNANCY CATEGORY C

Drug class

Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Precise mechanism of action not known, but may be due to general CNS depression; does not directly relax tense skeletal muscles or directly affect the motor endplate or motor nerves.

Indications

- Adjunct to rest, physical therapy, and other measures for the relief of discomfort associated with acute, painful musculoskeletal disorders

Contraindications and cautions

- Contraindicated with hypersensitivity to metaxalone; tendency for hemolytic or other anemias; severe renal or hepatic impairment, lactation.
- Use cautiously with mild hepatic impairment, pregnancy.

Available forms

Tablets—800 mg

Dosages

Adults and patients 12 yr and older

800 mg PO tid–qid.

Pediatric patients younger than 12 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	60 min	3 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, drowsiness, headache, fever, blurred vision*
- **Dermatologic:** *Urticaria, pruritus, rash*
- **GI:** *Nausea, vomiting, GI upset, hepatic impairment*
- **Other:** **Hemolytic anemia, leukopenia**

Interactions

- **Drug-drug** • Increased risk of sedation with other CNS depressants and alcohol
- **Drug-lab test** • False-positive Benedict's test; use of a more specific glucose test is advised

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to metaxalone; tendency for hemolytic or other anemias; severe renal or hepatic impairment; lactation, pregnancy
- **Physical:** T; skin color, lesions; orientation, affect, vision examination, reflexes; bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Establish safety precautions if dizziness, drowsiness, or blurred vision occurs (use side rails, accompany patient when ambulating).
- Arrange for analgesics if headache occurs (and possibly as adjunct for relief of discomfort of muscle spasm).
- Provide positioning, massage, and warm soaks as appropriate for relief of pain of muscle spasm.
- Provide support and encouragement to deal with discomfort of underlying condition and drug effects.

Teaching points

- Take this drug exactly as prescribed. Do not take a higher dosage than that prescribed.
- Continue the use of rest, physical therapy, and other measures to relieve the discomfort.
- Avoid the use of alcohol, sleep-inducing, or over-the-counter drugs while you are taking this drug. These could cause dangerous effects. If you feel that you need one of these preparations, consult your health care provider.

- You may experience these side effects: Drowsiness, dizziness (avoid driving a car or engaging in activities that require alertness if these occur); nausea (take drug with food and eat frequent small meals).
- Report rash, itching, yellow discoloration of the skin or eyes.

⚠ DANGEROUS DRUG

metformin hydrochloride

(*met fore' min*)

Apo-Metformin (CAN), CO Metformin Coated (CAN), Fortamet, Gen-Metformin (CAN), Glucophage, Glucophage XR **OND**, Glumetza **OND**, Metformin HCl ER **OND**, Nu-Metformin (CAN), PMS-Metformin (CAN), ratio-Metformin (CAN), Riomet

PREGNANCY CATEGORY B

Drug class

Antidiabetic

M

Therapeutic actions

Exact mechanism is not understood; possibly increases peripheral utilization of glucose, decreases hepatic glucose production, and alters intestinal absorption of glucose.

Indications

- Adjunct to diet to lower blood glucose with type 2 diabetes mellitus in patients 10 yr and older; ER in patients 17 yr and older; 18 yr and older for *Glumetza*
- As part of combination therapy with a sulfonylurea or insulin when either drug alone cannot control glucose levels in patients with type 2 diabetes mellitus
- Unlabeled uses: Treatment of anovulation in women with polycystic ovary syndrome; treatment of antipsychotic drug-induced weight gain

Contraindications and cautions

- Contraindicated with allergy to metformin; heart failure; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (use insulin);

type 1 diabetes, serious hepatic impairment, serious renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; labor and delivery (if metformin is used during pregnancy, discontinue drug at least 1 mo before delivery); lactation (safety not established).

- Use cautiously with the elderly.

Available forms

Tablets—500, 850, 1,000 mg; ER tablets **onc**—500, 750, 1,000 mg; oral solution—500 mg/5 mL

Dosages

Adults

500 mg bid or 850 mg once daily PO. May increase 500 mg/wk or 850 mg/2 wk to maximum of 2,550 mg/day in divided doses. Dosage should be adjusted based on response and blood glucose level. ER tablet: Initially, 500 mg/day PO with evening meal; may be increased by 500 mg/wk to a maximum of 2,000 mg once daily (2,500 mg *Fortamet*). If higher doses are required, use immediate-release tablets.

Pediatric patients 10–16 yr

500 mg bid with meals. May increase 500 mg/wk to maximum of 2,000 mg/day in divided doses. ER tablet is not recommended.

Geriatric patients and patients with renal impairment

Smaller doses may be necessary; monitor closely and adjust slowly.

Pharmacokinetics

Route	Peak	Duration
Oral	2–2.5 hr	10–16 hr

Metabolism: $T_{1/2}$: 6.2 and 17.6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Endocrine:** Hypoglycemia, **lactic acidosis**
- **GI:** *Anorexia, nausea, vomiting, epigastric discomfort, heartburn, diarrhea, flatulence*
- **Hypersensitivity:** *Allergic skin reactions, eczema, pruritus, erythema, urticaria*

Interactions

• **Drug-drug** • Increased risk of hypoglycemia with sulfonylureas, cimetidine, furosemide, cationic drugs such as digoxin, amiloride, vancomycin • Increased risk of lactic acidosis with ethanol • Increased risk of acute renal failure and lactic acidosis with iodinated contrast material used in radiologic studies; stop metformin at or before time of procedure and hold for 48 hr afterward

• **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

Nursing considerations

Assessment

- **History:** Allergy to metformin; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma; type 1 diabetes, serious hepatic or renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; HF; pregnancy, lactation
- **Physical:** Skin color, lesions; T, orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, serum creatinine, LFTs, blood glucose, CBC

Interventions

⊗ **Black box warning** Risk of severe lactic acidosis; monitor patient, and treat any suspicion of lactic acidosis.

- Monitor serum glucose levels frequently to determine effectiveness of drug and dosage.
- ⊗ **Warning** Arrange for transfer to insulin therapy during periods of high stress (infections, surgery, trauma).

⊗ **Warning** Use IV glucose if severe hypoglycemia occurs as a result of overdose.

- Ensure that patient swallows ER forms whole; do not cut, crush, or allow patient to chew tablets.

Teaching points

- Do not discontinue this medication without consulting your health care provider.
- Monitor blood for glucose and ketones as prescribed.

- Swallow extended-release tablets whole; do not cut, crush, or chew.
- Do not use this drug during pregnancy; if you become pregnant, consult your health care provider for appropriate therapy.
- Avoid using alcohol while taking this drug.
- Report fever, sore throat, unusual bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions.

 DANGEROUS DRUG

methadone hydrochloride
(meth' a done)

Dolophine, Methadone HCl Diskets, Methadone HCl Intensol, Methadose

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins); when used in approved methadone maintenance programs, can substitute for heroin, other illicit opioids in patients who want to terminate a drug use.

Indications

- Relief of severe pain not responsive to non-opioid analgesics
- Detoxification and temporary maintenance treatment of opioid addiction (ineffective for relief of general anxiety)

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning (before toxins are eliminated), bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, kyphoscoliosis, acute alcoholism, increased intracranial pressure.

- Use cautiously with acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, pregnancy before labor (crosses placenta; neonatal withdrawal observed in infants born to drug-using mothers; safety in pregnancy before labor not established), labor or delivery (administration of opioids to mother can cause respiratory depression of neonate—risk greatest for premature neonates), renal or hepatic impairment, lactation.

Available forms

Tablets—5, 10 mg; oral solution—5 mg/5 mL, 10 mg/5 mL; oral concentrate—10 mg/mL; injection—10 mg/mL; dispersible tablets—40 mg

Dosages

Oral methadone is approximately one-half as potent as parenteral methadone.

Adults

- *Relief of pain:* 2.5–10 mg IM, subcutaneously, or PO every 8–12 hr as necessary. IM route is preferred to subcutaneous for repeated doses (subcutaneous use may cause local irritation). Individualize dosage; patients with excessively severe pain and those who have become tolerant to the analgesic effect of opioids may need higher dosage.
- *Detoxification:* Initially 20–30 mg PO or parenteral; PO preferred. Increase dose to suppress withdrawal signs. 40 mg/day in single or divided doses is usually an adequate stabilizing dose for those physically dependent on high doses. Continue stabilizing doses for 2–3 days, then gradually decrease dosage every day or every 2 days. A daily reduction of 20% of the total dose may be tolerated. Provide sufficient dosage to keep withdrawal symptoms at tolerable level. Treatment should not exceed 21 days and may not be repeated earlier than 4 wk after completion of previous course. Detoxification treatment continued longer than 21 days becomes maintenance treatment, which may be undertaken only by approved programs

(addicts hospitalized for other medical conditions may receive methadone maintenance treatment).

- **Maintenance treatment:** For patients who are heavy heroin users up until hospital admission, initial dose of 20 mg 4–8 hr after heroin is stopped or 40 mg in a single dose PO. For patients with little or no opioid tolerance, half this dose may suffice. Dosage should suppress withdrawal symptoms but not produce acute opioid effects of sedation, respiratory depression. Give additional 10-mg doses if needed to suppress withdrawal syndrome. Adjust dosage, up to 120 mg/day.

Pediatric patients

Not recommended for relief of pain in children due to insufficient documentation.

Geriatric patients or impaired adults

Use caution. Respiratory depression may occur in the elderly, the very ill, and those with respiratory problems. Reduced dosage may be necessary.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1.5–2 hr	4–12 hr
IM	10–20 min	1–2 hr	4–8 hr
Subcut.	10–20 min	1–2 hr	4–8 hr

Metabolism: Hepatic; $T_{1/2}$: 25 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex*
- **CV:** Facial flushing, peripheral circulatory collapse, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope, prolonged QT interval

- **Dermatologic:** Pruritus, urticaria, laryngospasm, bronchospasm, edema, hemorrhagic urticaria (rare)
- **GI:** *Nausea, vomiting, dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis*
- **GU:** Ureteral spasm, spasm of vesical sphincters, urine retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Tissue irritation and induration (subcutaneous injection)
- **Major hazards: Respiratory depression, apnea, circulatory depression, respiratory arrest, shock, cardiac arrest**
- **Other:** Sweating (more common in ambulatory patients and those without severe pain), physical tolerance and dependence, psychological dependence

Interactions

- **Drug-drug** • Potentiation of effects of methadone with barbiturate anesthetics—decrease dose of methadone when coadministering • Decreased effectiveness of methadone with hydantoins, rifampin, urinary acidifiers (ammonium chloride, potassium acid phosphate, sodium acid phosphate) • Numerous interactions with HIV antiretrovirals, especially protease inhibitors
- **Drug-lab test** • Elevated biliary tract pressure (opioid effect) may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, bronchial asthma, COPD, cor pulmonale, respiratory depression, kyphoscoliosis, acute alcoholism, increased intracranial pressure; acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis; pregnancy; labor; lactation

- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; pulse, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

⊗ **Black box warning** Use for opioid addiction should be part of an approved program. Deaths have been reported during initiation of treatment for opioid dependence. Use care to determine all drugs patient is using, and keep emergency services on standby.

⊗ **Black box warning** Monitor patient for QT interval prolongation, especially at higher doses.

- Give to lactating women 4–6 hr before the next feeding to minimize the amount in milk.

⊗ **Warning** Keep opioid antagonist and equipment for assisted or controlled respiration readily available during parenteral administration. Monitor respirations carefully.

⊗ **Warning** Use caution when injecting subcutaneously into chilled body areas or in patients with hypotension or in shock—impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.

Teaching points

- Take drug exactly as prescribed.
- Avoid alcohol—serious adverse effects may occur.
- Do not take leftover medication for other disorders; do not let anyone else take the prescription.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised.
- You may experience these side effects: Nausea, loss of appetite (take with food, lie quietly, eat frequent small meals); constipation (laxative may help); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness or visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath, or difficulty breathing.

▷ methazolamide

See Appendix U, *Less commonly used drugs*.

▷ methenamine (meth en' a meen)

methenamine

Dehydral (CAN)

methenamine hippurate

Hiprex, Urex

PREGNANCY CATEGORY C

Drug classes

Antibacterial

Urinary tract anti-infective

Therapeutic actions

Hydrolyzed in acid urine to ammonia and formaldehyde, which is bactericidal; the hippurate and mandelate salts help to maintain an acid urine.

Indications

- Suppression or elimination of bacteriuria associated with pyelonephritis, cystitis, chronic UTIs, residual urine (accompanying some neurologic disorders), and in anatomic abnormalities of the urinary tract

Contraindications and cautions

- Contraindicated with allergy to methenamine, tartrazine (in methenamine hippurate marketed as *Hiprex*), aspirin (associated with tartrazine allergy), lactation.
- Use cautiously with hepatic or renal impairment, gout (causes urate crystals to precipitate in urine), pregnancy, severe dehydration.

Available forms

Tablets—0.5, 1 g

Dosages

Adults

Methenamine

1 g qid PO after meals and at bedtime.

Methenamine hippurate

1 g bid PO.

Pediatric patients**Methenamine**

Younger than 6 yr: 50 mg/kg/day PO divided into three doses.

6–12 yr: 500 mg qid PO.

Methenamine hippurate

6–12 yr: 0.5–1 g bid PO.

Older than 12 yr: 1 g bid PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30–90 min
Oral (hippurate)	Rapid	2 hr

Metabolism: Hepatic; $T_{1/2}$: 3–6 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Urine**Adverse effects**

- **Dermatologic:** Pruritus, urticaria, erythematous eruptions, rash
- **GI:** Nausea, abdominal cramps, vomiting, diarrhea, anorexia, stomatitis
- **GU:** *Bladder irritation, dysuria*, proteinuria, hematuria, frequency, urgency, crystalluria
- **Other:** Headache, dyspnea, generalized edema, elevated serum transaminase (with hippurate salt)

Interactions

• **Drug-lab test** • False increase in 17-hydroxycorticosteroids, catecholamines • False decrease in 5-HIAA • Inaccurate measurement of urine estriol levels by acid hydrolysis procedures during pregnancy

■ Nursing considerations**Assessment**

- **History:** Allergy to methenamine, tartrazine, aspirin; renal or hepatic impairment; dehydration; gout; pregnancy, lactation
- **Physical:** Skin color, lesions; hydration; ear lobes—tophi; joints; liver evaluation; urinalysis, LFTs; serum uric acid

Interventions

- Arrange for culture and sensitivity tests before and during therapy.
- Administer drug with food to prevent GI upset; give drug around-the-clock for best effects.
- Ensure patient avoids foods and medications that alkalinize the urine.
- Ensure adequate hydration for patient.
- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat urine culture and sensitivity tests.
- Monitor LFTs with methenamine hippurate.

Teaching points

- Take drug with food. Complete the full course of therapy to resolve the infection.
- Take this drug at regular intervals around-the-clock; develop a schedule with the help of your health care provider.
- Avoid alkalinizing foods: Citrus fruits, milk products; or alkalinizing medications (sodium bicarbonate).
- Review other medications with your health care provider.
- Drink plenty of fluids.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea; painful urination, frequency, blood in urine (drink plenty of fluids).
- Report rash, painful urination, severe GI upset.

▽ methimazole*(meth im' a zole)*

Northyx, Tapazole

PREGNANCY CATEGORY D

Drug class

Antithyroid drug

Therapeutic actions

Inhibits the synthesis of thyroid hormones.

Indications

- Treatment of hyperthyroidism
- Palliation of certain thyroid cancers

Contraindications and cautions

- Contraindicated with allergy to antithyroid products, pregnancy (use only if absolutely necessary and when mother has been informed about potential harm to the fetus; if an antithyroid drug is required, propylthiouracil is the drug of choice), lactation.
- Use cautiously with bone marrow depression.

Available forms

Tablets—5, 10, 15, 20 mg

Dosages

Adults

Initial dose, 15–60 mg/day PO in three equal doses every 8 hr. Maintenance dose, 5–15 mg/day PO.

Pediatric patients

Initially, give 0.4 mg/kg/day PO, followed by maintenance dose of approximately one-half the initial dose; actual dose is determined by the patient's response. Alternatively, give initial dose of 0.5–0.7 mg/kg/day or 15–20 mg/m²/day PO in three divided doses, followed by maintenance dose of one-third to two-thirds of initial dose, starting when patient becomes euthyroid. Maximum dose is 30 mg/24 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–40 min	60 min	2–4 hr

Metabolism: T_{1/2}: 6–13 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Paresthesias, neuritis*, vertigo, drowsiness, neuropathies, depression, headache
- **Dermatologic:** *Rash*, urticaria, pruritus, skin pigmentation, exfoliative dermatitis, lupuslike syndrome, loss of hair
- **GI:** Nausea, vomiting, epigastric distress, loss of taste, sialadenopathy, jaundice, hepatitis
- **GU:** Nephritis
- **Hematologic:** *Agranulocytosis, granulocytopenia, thrombocytopenia, hypoprotrombinemia, bleeding*, vasculitis, periarteritis

- **Other:** Arthralgia, myalgia, edema, lymphadenopathy, drug fever

Interactions

- *** Drug-drug** • Increased theophylline clearance and decreased effectiveness if given to hyperthyroid patients; clearance will change as patient approaches euthyroid state
- Altered effects of oral anticoagulants with methimazole
- Increased therapeutic effects and toxicity of cardiac glycosides, metoprolol, propranolol when hyperthyroid patients become euthyroid

Nursing considerations

Assessment

- **History:** Allergy to antithyroid products; pregnancy, lactation
- **Physical:** Skin color, lesions, pigmentation; orientation, reflexes, affect; liver evaluation; CBC, differential, PT, LFTs, renal function tests

Interventions

- Give drug in three equally divided doses at 8-hr intervals; try to schedule to allow patient to sleep at his or her regular time.
- Obtain regular, periodic blood tests to monitor bone marrow depression and bleeding tendencies.
- Advise medical and surgical personnel that patient is taking this drug, which increases the risk of bleeding problems.
- Ensure patient is not pregnant before giving this drug; advise patient to use barrier contraceptives.

Teaching points

- Take this drug around-the-clock at 8-hour intervals. Establish a schedule, with the aid of your health care provider, which fits your routine.
- This drug will need to be taken for a prolonged period to achieve the desired effects.
- Using barrier contraceptives is advised while taking this drug; serious fetal abnormalities may occur.
- If you are nursing a baby, another method of feeding the baby should be used.
- You may experience these side effects: Dizziness, weakness, vertigo, drowsiness (use caution driving or operating dangerous machinery); nausea, vomiting, loss of

appetite (eat frequent small meals); rash, itching.

- Report fever, sore throat, unusual bleeding or bruising, headache, general malaise.

methocarbamol

(meth oh kar' ba mole)

Robaxin, Robaxin-750

PREGNANCY CATEGORY C

Drug class

Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Precise mechanism of action not known but may be due to general CNS depression; does not directly relax tense skeletal muscles or directly affect the motor end plate or motor nerves.

Indications

- Relief of discomfort associated with acute, painful musculoskeletal conditions, as an adjunct to rest, physical therapy, and other measures
- Control of neuromuscular manifestations of tetanus

Contraindications and cautions

- Contraindicated with hypersensitivity to methocarbamol; known or suspected renal pathology (parenteral methocarbamol is contraindicated because of polyethylene glycol 300 in vehicle).
- Use cautiously in patients with epilepsy, pregnancy, lactation.

Available forms

Tablets—500, 750 mg; injection—100 mg/mL

Dosages

Adults

Oral

Initially, 1.5 g qid PO. For the first 48–72 hr, 6 g/day or up to 8 g/day is recommended. For maintenance, 1 g qid or 750 mg every 4 hr PO or 1.5 g tid for total dosage of 4–4.5 g/day.

- *Tetanus*: Up to 24 g/day may be needed.

Parenteral

1 g IM or IV; 2–3 g may be needed in severe cases. Do not exceed 3 g for longer than 3 days except when treating tetanus.

Pediatric patients

Oral

Not recommended.

Parenteral

- *Tetanus*: 15 mg/kg IV, repeated every 6 hr as needed.

Pharmacokinetics

Route	Onset	Peak
Oral	30 min	2 hr
IM/IV	Unknown	Unknown

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Administer undiluted, as provided.

Infusion: Administer at maximum rate of 300 mg/min (3 mL/min). May dilute 1 vial in no more than 250 mL sodium chloride injection or 5% dextrose solution. For tetanus, inject 1–2 g directly into IV tubing; add 1–2 g to infusion bottle for total dose of 3 g or less. May repeat every 6 hr.

Adverse effects

- **CNS:** *Light-headedness, dizziness, drowsiness, headache, fever, blurred vision*
- **CV:** Bradycardia, flushing, hypotension, syncope
- **Dermatologic:** *Urticaria, pruritus, rash*
- **GI:** *Nausea, vomiting, dyspepsia*
- **Other:** Conjunctivitis with nasal congestion

Interactions

★ **Drug-lab test** • May cause interference with color reactions in tests for 5-HIAA and vanillylmandelic acid

Nursing considerations

Assessment

- **History:** Hypersensitivity to methocarbamol; known or suspected renal pathology,

epilepsy (use caution with parenteral administration), pregnancy, lactation

- **Physical:** T; skin color, lesions; nasal mucous membranes, conjunctival examination; orientation, affect, vision examination, reflexes; P, BP; bowel sounds, normal output; urinalysis, renal function tests

Interventions

- Do not exceed 3 g total dosage for longer than 3 days except when treating tetanus.
- Have patient remain recumbent during and for at least 15 min after IV injection.
- For IM use, do not inject more than 5 mL into each gluteal region; repeat at 8-hr intervals.
- Switch from parenteral to oral route as soon as possible.
- Ensure patient is not pregnant before use; use in pregnancy only if benefits clearly outweigh risk to the fetus.
- Patient's urine may darken on standing.

Teaching points

- Take this drug exactly as prescribed. Do not take a higher dosage than prescribed, and do not take it longer than prescribed.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- Your urine may darken to a brown, black, or green color on standing.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving or engaging in activities that require alertness); nausea (take with food, eat frequent small meals).
- Report rash, itching, fever, or nasal congestion.

DANGEROUS DRUG

methotrexate **(amethopterin, MTX)**

(meth ob t'rex' ate)

ratio-Methotrexate (CAN),
Rheumatrex, Rheumatrex Dose Pack,
Trexall

PREGNANCY CATEGORY X

Drug classes

Antimetabolite
Antineoplastic
Antipsoriatic
Antirheumatic

Therapeutic actions

Inhibits dihydrofolic acid reductase, leading to inhibition of DNA synthesis and inhibition of cellular replication; selectively affects the most rapidly dividing cells (neoplastic and psoriatic cells).

Indications

- Treatment of gestational choriocarcinoma, chorioadenoma destruens, hydatidiform mole
- Treatment and prophylaxis of meningeal leukemia, mycosis fungoides
- Symptomatic control of severe, recalcitrant, disabling psoriasis
- Management of severe, active, classical, or definite rheumatoid arthritis
- Management of polyarticular course juvenile rheumatoid arthritis
- High-dose regimen followed by leucovorin rescue for adjuvant therapy of nonmetastatic osteosarcoma (orphan drug designation)
- Unlabeled uses: To reduce corticosteroid requirements in patients with severe corticosteroid-dependent asthma; as a maintenance regimen for Wegener's agranulomatosis, dermatomyositis, relapsing-remitting MS, myositis, ulcerative colitis, refractory Crohn's disease, uveitis, SLE, psoriatic arthritis

Contraindications and cautions

- Contraindicated with pregnancy, lactation, alcoholism, chronic liver disease, immune deficiencies, blood dyscrasias, hypersensitivity to methotrexate.
- Use cautiously with renal disease, infection, peptic ulcer, ulcerative colitis, debility.

Available forms

Tablets—2.5, 5, 7.5, 10, 15 mg; powder for injection—20 mg, 1 g per vial; injection—25 mg/mL

Dosages

Adults

- *Choriocarcinoma and other trophoblastic diseases:* 15–30 mg PO or IM daily for a

5-day course. Repeat courses three to five times with rest periods of 1 wk or longer between courses until toxic symptoms subside. Continue one to two courses of methotrexate after chorionic gonadotropin hormone levels are normal.

- **Leukemia:** Induction: 3.3 mg/m² of methotrexate PO or IM with 60 mg/m² of prednisone daily for 4–6 wk. Maintenance: 30 mg/m² methotrexate PO or IM twice weekly or 2.5 mg/kg IV every 14 days. If relapse occurs, return to induction doses.
- **Meningeal leukemia:** Give methotrexate intrathecally in cases of lymphocytic leukemia as prophylaxis. 12 mg/m² (maximum 15 mg) intrathecally at intervals of 2–5 days; repeat until cell count of CSF is normal, then give one additional dose.
- **Lymphomas:** Burkitt's tumor, stages I and II: 10–25 mg/day PO for 4–8 days. In stage III, combine with other neoplastic drugs. All usually require several courses of therapy with 7- to 10-day rest periods between doses.
- **Mycosis fungoides:** 2.5–10 mg/day PO for weeks or months or 50 mg IM once weekly or 25 mg IM twice weekly. Alternatively, in early stage, 5–50 mg PO or IM once weekly, or 15–37.5 mg PO or IM twice weekly; can also give IV with combination chemotherapy regimens in advanced disease.
- **Osteosarcoma:** Starting dose is 12 g/m² or up to 15 g/m² IV to give a peak serum concentration of 1,000 micromol. Must be used as part of a cytotoxic regimen with leucovorin rescue.
- **Severe psoriasis:** 10–25 mg/wk PO, IM, or IV as a single weekly dose. Do not exceed 30 mg/wk. Or 2.5 mg PO at 12-hr intervals for three doses each wk. Do not exceed 30 mg/wk. After optimal clinical response is achieved, reduce dosage to lowest possible with longest rest periods and consider return to conventional, topical therapy.
- **Severe rheumatoid arthritis:** Starting dose: Single doses of 7.5 mg/wk PO or divided dosage of 2.5 mg PO at 12-hr intervals for three doses given as a course once weekly. Dosage may be gradually increased, based on response. Do not exceed 20 mg/wk. Therapeutic response usually begins with-

in 3–6 wk, and improvement may continue for another 12 wk. Improvement may be maintained for up to 2 yr with continued therapy.

Pediatric patients

- **Meningeal leukemia:**
 Younger than 1 yr: 6 mg intrathecally every 2–5 days.
 1–2 yr: 8 mg intrathecally every 2–5 days.
 2–3 yr: 10 mg intrathecally every 2–5 days.
 3 yr or older: 12 mg intrathecally every 2–5 days.
- **Polyarticular course juvenile rheumatoid arthritis (2–16 yr):** Initially, 10 mg/m² PO weekly. Dosage may be increased based on patient response. Maximum 20 mg/m²/wk. Therapeutic response usually begins in 3–6 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
IM, IV	Rapid	0.5–1 hr

Metabolism: T_{1/2}: 3–15 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute 20-mg vials with an appropriate sterile preservative-free medium, 5% dextrose solution, or sodium chloride injection to a concentration no greater than 25 mg/mL; reconstitute 1-g vial with 19.4 mL to a concentration of 50 mg/mL.

Infusion: Administer diluted drug by direct IV injection at a rate of not more than 10 mg/min. **⊗ Warning** Do not give formulations with benzyl alcohol or preservatives intrathecally or for high-dose therapy.

Incompatibilities: Do not combine with bleomycin, prednisolone.

Y-site incompatibility: Do not give with droperidol.

Adverse effects

- **CNS:** Headache, drowsiness, blurred vision, aphasia, hemiparesis, paresis, seizures, *fatigue, malaise, dizziness*

- **Dermatologic:** *Erythematous rashes*, pruritus, urticaria, photosensitivity, depigmentation, *alopecia*, ecchymosis, telangiectasia, acne, furunculosis
- **GI:** *Ulcerative stomatitis*, gingivitis, pharyngitis, anorexia, *nausea*, vomiting, diarrhea, hematemesis, melena, GI ulceration and bleeding, enteritis, **hepatic toxicity**
- **GU:** Renal failure, *effects on fertility* (defective oogenesis, defective spermatogenesis, transient oligospermia, menstrual dysfunction, infertility, abortion, fetal defects)
- **Hematologic: Severe bone marrow depression, increased susceptibility to infection**
- **Hypersensitivity: Anaphylaxis, sudden death**
- **Respiratory: Interstitial pneumonitis**, chronic interstitial obstructive pulmonary disease
- **Other:** *Chills and fever*; metabolic changes (diabetes, osteoporosis), cancer

Interactions

- * **Drug-drug** ⊗ **Warning** Potentially serious to fatal reactions when given with NSAIDs; use extreme caution if this combination is used.
- ⊗ **Warning** Risk of toxicity if combined with alcohol; avoid this combination.
- Increased risk of toxicity with salicylates, phenytoin, probenecid, sulfonamides
- Decreased serum levels and therapeutic effects of digoxin
- May decrease theophylline clearance

■ Nursing considerations

Assessment

- **History:** Allergy to methotrexate, hematopoietic depression, severe hepatic or renal disease, infection, peptic ulcer, ulcerative colitis, debility, psoriasis, pregnancy, lactation
- **Physical:** Weight; T; skin lesions, color; hair; vision, speech, orientation, reflexes, sensation; R, adventitious sounds; mucous membranes, liver evaluation, abdominal examination; CBC, differential; LFTS, renal function tests; urinalysis, blood and urine glucose, glucose tolerance test, chest X-ray

Interventions

- ⊗ **Black box warning** Arrange for tests to evaluate CBC, urinalysis, renal and liver

function tests, and chest X-ray before therapy, during therapy, and for several weeks after therapy; severe toxicity could occur.

⊗ **Black box warning** Ensure that patient is not pregnant before administering this drug; counsel patient about the severe risks of fetal abnormalities associated with this drug.

⊗ **Black box warning** Reserve use for life-threatening neoplastic diseases or severe psoriasis or rheumatoid arthritis unresponsive to other therapies.

⊗ **Black box warning** Monitor liver function carefully with long-term use; serious liver toxicity can occur.

⊗ **Black box warning** Drug is associated with high risk of serious opportunistic infections. Monitor patient closely during therapy.

⊗ **Black box warning** Use with caution in patients who have malignant lymphomas or rapidly growing tumors as worsening of malignancy may result.

⊗ **Warning** Reduce dosage or discontinue if renal failure occurs.

- Reconstitute powder for intrathecal use with preservative-free sterile sodium chloride injection; intended for one dose only; discard remainder. The solution for injection contains benzyl alcohol and should not be given intrathecally.
- ⊗ **Warning** Arrange to have leucovorin or levoleucovorin readily available as antidote for methotrexate overdose or when large doses are used. In general, doses of leucovorin (calcium leucovorin or levoleucovorin) should be equal or higher than doses of methotrexate and should be given within the first hour. Up to 75 mg IV within 12 hr, followed by 12 mg IM every 6 hr for four doses. For average doses of methotrexate that cause adverse effects, give 6–12 mg leucovorin IM, every 6 hr for four doses or 10 mg/m² PO followed by 10 mg/m² every 6 hr for 72 hr.
- Arrange for an antiemetic if nausea and vomiting are severe.
- Arrange for adequate hydration during therapy to reduce the risk of hyperuricemia.
- Do not administer any other medications containing alcohol.

Teaching points

- Prepare a calendar of treatment days.

- This drug may cause birth defects or miscarriages. Use birth control while taking this drug and for 3 months thereafter. Men using this drug should also use barrier contraceptives.
- Avoid alcohol and NSAIDs; serious side effects may occur.
- Arrange for frequent, regular medical follow-up visits, including blood tests to follow the drug's effects.
- You may experience these side effects: Nausea, vomiting (request medication; eat frequent small meals); numbness, tingling, dizziness, drowsiness, blurred vision, difficulty speaking (drug effects; seek dosage adjustment; avoid driving or operating dangerous machinery); mouth sores (frequent mouth care is needed); infertility; loss of hair (obtain a wig or other suitable head covering; keep the head covered at extremes of temperature); rash, sensitivity to sun and ultraviolet light (avoid sun; use a sunscreen and protective clothing).
- Report black, tarry stools; fever; chills; sore throat; unusual bleeding or bruising; cough or shortness of breath; darkened or bloody urine; abdominal, flank, or joint pain; yellow color to the skin or eyes; mouth sores.

methoxsalen

See Appendix U, *Less commonly used drugs*.

methoxy polyethylene glycol–epoetin beta

(meth *oks' ee polly eth' ab leen gleye' kol eh poe eh' tin bay' tab*)

Mircera

PREGNANCY CATEGORY C

Drug class

Erythropoiesis stimulator

Therapeutic actions

An erythropoietin receptor activator with a longer half-life than natural erythropoietin; stimulates RBC production in bone marrow in

the same manner as natural erythropoietin, a hormone released into bloodstream in response to renal hypoxia.

Indications

- Management of anemia associated with chronic renal failure (not chemotherapy) in adults, including those receiving and not receiving dialysis

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of this drug or drugs in this class; uncontrolled hypertension; anemia caused by cancer chemotherapy.
- Use cautiously with hypertension, history of seizures, pregnancy, lactation.

Available forms

Single-use vials—50, 100, 200, 300, 400, 600, 1,000 mcg/mL; prefilled syringes—50, 75, 100, 150, 200, 250 mcg/0.3 mL; 400, 600, 800 mcg/0.6 mL

Dosages

Adults

Initially, 0.6 mcg/kg once every 2 wk by subcutaneous or IV injection; dosage should be adjusted to keep hemoglobin at 10–12 g/dL. Once hemoglobin has been maintained, drug may be given once monthly using twice the dose given every 2 wk.

Patients being treated with other erythropoiesis stimulators

See table below.

Pharmacokinetics

Route	Onset	Peak
IV	Slow	48 hr
Subcut.	Slow	72 hr

Metabolism: $T_{1/2}$: 134 +/- 65 hr (IV); 139 +/- 67 hr (subcutaneous)

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Administer as provided; no additional preparation is required. Enter vial only

Weekly epoetin alfa dose (units)	Weekly darbepoetin alfa dose (mcg)	Monthly methoxy polyethylene glycol–epoetin beta dose (mcg)	Every-2-wk methoxy polyethylene glycol–epoetin beta dose (mcg)
Less than 8,000	Less than 40	120	60
8,000–16,000	40–80	200	100
More than 16,000	More than 80	360	180

once, and discard used solution. Refrigerate vial. Do not shake vial. Inspect for discoloration or particulate matter before use.

Injection: Administer by direct IV injection or into the tubing of a running IV.

Incompatibilities: Do not mix with or add to solutions containing any other drugs.

Adverse effects

- **CNS:** *Headache, fatigue*, asthenia, dizziness, **seizures**
- **CV:** *Hypertension*, hypotension, **serious CV events, thromboembolic events, septic shock**
- **GI:** *Diarrhea*, vomiting, constipation
- **Respiratory:** *Nasopharyngitis, URI*
- **Other:** **Increased mortality and tumor progression in patient with cancer, pure red cell aplasia with anti-erythropoietin antibodies**, injection site reactions

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to methoxy polyethylene glycol—epoetin beta or any drugs of this class, hypertension, history of seizures, pregnancy, lactation
- **Physical:** Reflexes, affect, BP, P, R, adventitious sounds, urinary output, renal function tests, CBC, Hct, hemoglobin, electrolytes

Interventions

⊗ **Black box warning** There is increased risk of death and serious CV and thromboembolic events when patients receiving erythropoiesis stimulating agents have a target Hgb level exceeding 12 g/dL; target dosage to maintain Hgb level between 10 and 12 g/dL.

⊗ **Black box warning** There is increased risk of death and tumor progression if this drug is used for anemia secondary to cancer chemotherapy. It is not indicated for this use.

- Store vials in the refrigerator or at room temperature for up to 7 days; prefilled syringes may be kept at room temperature for up to 30 days, protected from light.
- Do not shake vials or syringes. Inspect solution. Do not use if color changes or particulate matter appears.
- Rotate sites, if giving subcutaneous injections, to prevent injection site irritation.
- Target dose to achieve a Hgb level between 10 and 12 g/dL. If patient does not respond to drug within 4 wk, evaluate cause of anemia.
- Evaluate iron stores before and periodically during therapy; supplemental iron may be needed.
- Monitor patient for sudden loss of response and severe anemia with low reticulocyte count; withhold drug and check patient for anti-erythropoietin antibodies. If antibodies are present, discontinue drug permanently and do not switch to another erythropoiesis stimulating agent; cross sensitivity can occur.
- Establish safety precautions (e.g., side rails, environmental control, lighting) if CNS effects occur.
- Maintain seizure precautions during administration.
- Provide additional comfort measures as necessary to alleviate discomfort from GI effects, headache.
- Offer support and encouragement to deal with chronic disease and need for prolonged therapy and testing.

Teaching points

- This drug is given once every 2 weeks by IV or subcutaneous injection. Mark your calendar for treatment days. After your response to the drug has stabilized, you may receive the drug once monthly.
- You and a significant other should learn to prepare and administer the drug by subcutaneous injection. Rotate injection sites to

prevent irritation. Dispose of syringes and needles in an appropriate disposal box.

- Store vials in the refrigerator, protected from light; if using prefilled syringes, they may be kept at room temperature, protected from light, for up to 30 days.
- Do not shake the vial or syringe; inspect the solution to make sure it has not changed color and that it contains no particles in the solution.
- If you miss a dose, administer it as soon as you remember and then return to the usual dose schedule. If you miss two doses, contact your health care provider.
- Your health care provider will follow your body's response to this drug carefully with regular blood tests. Your hemoglobin should be 10–12 g/dL.
- It is not known how this drug could affect a fetus; if you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, discuss this with your health care provider.
- You may experience these side effects: Headache (consult your health care provider because medication may be available to help); nausea (frequent small meals may help); diarrhea (if this becomes severe, contact your health care provider immediately); irritation and inflammation at the injection site.
- Report trouble breathing, chest pain, sudden confusion or trouble speaking, trouble seeing, trouble walking, sudden severe headache, sudden numbness or weakness, loss of consciousness.

methscopolamine bromide

Parasympatholytic

Therapeutic actions

Competitively blocks the effects of acetylcholine at muscarinic cholinergic receptors that mediate the effects of parasympathetic postganglionic impulses, relaxing the GI tract and inhibiting gastric acid secretion.

Indications

- Adjunctive therapy in the treatment of peptic ulcer

Contraindications and cautions

- Contraindicated with known hypersensitivity to the drug; glaucoma; adhesions between iris and lens; stenosing peptic ulcer, pyloro-duodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction; bronchial asthma, COPD; cardiac arrhythmias, myocardial ischemia; sensitivity to anticholinergic drugs, bromides, tartrazine (tartrazine sensitivity is more common with allergy to aspirin); impaired metabolic, liver, or renal function; myasthenia gravis.
- Use cautiously with hypertension, hyperthyroidism, pregnancy, lactation.

Available forms

Tablets—2.5, 5 mg

Dosages

Adults

2.5 mg PO 30 min before meals and 2.5–5 mg PO at bedtime.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Oral	1 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** *Blurred vision*, mydriasis, cycloplegia, photophobia, increased IOP
- **CV:** Palpitations, tachycardia
- **GI:** *Dry mouth, altered taste perception, nausea, vomiting, dysphagia*, heartburn, constipation, bloated feeling, paralytic ileus, gastroesophageal reflux
- **GU:** *Urinary hesitancy and retention*; impotence
- **Other:** Decreased sweating and predisposition to heat prostration, suppression of lactation, nasal congestion, xerostomia

Interactions

★ **Drug-drug** • Decreased antipsychotic effectiveness of haloperidol with anticholinergic drugs

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to methscopolamine; glaucoma, adhesions between iris and lens; stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction; bronchial asthma, COPD; cardiac arrhythmias, myocardial ischemia; sensitivity to anticholinergic drugs, bromides, tartrazine, impaired metabolic, liver, or renal function; myasthenia gravis; hypertension; hyperthyroidism; pregnancy; lactation
- **Physical:** Bowel sounds, normal output; urinary output, prostate palpation; R; adventitious sounds; P, BP; IOP, vision; bilateral grip strength, reflexes; liver palpation, LFTs, renal function tests; skin color, lesions, texture

Interventions

- Ensure adequate hydration; control environment (temperature) to prevent hyperpyrexia.
- Encourage patient to void before each dose of medication if urine retention becomes a problem.

Teaching points

- Take drug exactly as prescribed.

- Avoid hot environments (you will be heat intolerant, and dangerous reactions may occur).
- You may experience these side effects: Constipation (ensure adequate fluid intake, proper diet); dry mouth (suck sugarless lozenges, use frequent mouth care); blurred vision, sensitivity to light (avoid tasks that require acute vision; wear sunglasses when in bright light); impotence (reversible); difficulty with urination (empty bladder immediately before taking dose).
- Report rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, palpitations, headache, abdominal distention, hallucinations, severe or persistent dry mouth, difficulty swallowing, difficulty in urination, severe constipation, sensitivity to light.

▽ methsuximide

See Appendix U, *Less commonly used drugs*.

▽ methyclothiazide

(*meth i kloe thye' a zide*)

Enduron

PREGNANCY CATEGORY B

Drug class

Thiazide diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, thereby increasing excretion of sodium, chloride, and water by the kidney.

Indications

- Adjunctive therapy in edema associated with heart failure, cirrhosis, corticosteroid and estrogen therapy, renal impairment
- Hypertension, as sole therapy or in combination with other antihypertensives

Contraindications and cautions

- Contraindicated with hypersensitivity to thiazides.

- Use cautiously with fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism.

Available forms

Tablets—2.5, 5 mg

Dosages

Adults

- **Edema:** 2.5–10 mg daily PO. Maximum single dose is 10 mg.
- **Hypertension:** 2.5–5 mg daily PO. If BP is not controlled by 5 mg daily within 8–12 wk, another antihypertensive may be needed.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2 hr	6 hr	24 hr

Metabolism: T_{1/2}: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, vertigo*, paresthesias, weakness, headache, drowsiness, fatigue
- **CV:** Orthostatic hypotension, volume depletion
- **Dermatologic:** Photosensitivity, rash, purpura, hives
- **GI:** *Nausea, anorexia, vomiting, dry mouth*, diarrhea, constipation, jaundice
- **GU:** *Polyuria, nocturia*
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia
- **Other:** Muscle cramp, hyperglycemia, hyperuricemia, electrolyte imbalance

Interactions

• **Drug-drug** • Risk of hyperglycemia with diazoxide • Decreased absorption with cholestyramine, colestipol • Increased risk of digoxin toxicity if hypokalemia occurs • Increased risk of lithium toxicity when taken with thiazides • Increased fasting blood glucose leading to need to adjust dosage of antidiabetics

• **Drug-lab test** • Decreased PBI levels without clinical signs of thyroid disturbances

Nursing considerations

Assessment

- **History:** Fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorders, pregnancy, lactation
- **Physical:** Skin color and lesions; orientation, reflexes, muscle strength; pulses, BP, orthostatic BP, perfusion, edema, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds; CBC, serum electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

- Give with food or milk if GI upset occurs.
- Administer early in the day so increased urination will not disturb sleep.
- Measure and record regular body weights to monitor fluid changes.

Teaching points

- Take drug early in the day so sleep will not be disturbed by increased urination.
- Weigh yourself daily, and record weight on a calendar.
- Protect skin from exposure to sun or bright lights (sensitivity may occur).
- Increased urination will occur.
- Use caution if you feel dizzy, drowsy, or faint.
- Report rapid weight change, swelling in ankles or fingers, unusual bleeding or bruising, muscle cramps.

methyldopa

(meth ill doe' pa)

methyldopa

Apo-Methyldopa (CAN)

methyldopate hydrochloride

PREGNANCY CATEGORY B (ORAL)

PREGNANCY CATEGORY C (IV)

Drug classes

Antihypertensive
Sympatholytic (centrally acting)

Therapeutic actions

Mechanism of action not conclusively demonstrated; probably due to drug's metabolism, which lowers arterial BP by stimulating CNS α_2 -adrenergic receptors, which in turn decreases sympathetic outflow from the CNS.

Indications

- Hypertension
- IV methyldopate: Acute hypertensive crisis; not drug of choice because of slow onset of action
- Unlabeled use: Hypertension of pregnancy

Contraindications and cautions

- Contraindicated with hypersensitivity to methyldopa, active hepatic disease, previous methyldopa therapy associated with liver disorders.
- Use cautiously with previous liver disease, renal failure, dialysis, bilateral cerebrovascular disease, pregnancy, lactation.

Available forms

Tablets—250, 500 mg; injection—50 mg/mL

Dosages**Adults****Oral therapy (methyldopa)**

- **Initial therapy:** 250 mg bid–tid in the first 48 hr. Adjust dosage at minimum intervals of at least 2 days until response is adequate. Increase dosage in the evening to minimize sedation. For maintenance, 500 mg–2 g/day in two to four doses. Usually given in two to four doses; some patients may be controlled with a single dose at bedtime.
- **Concomitant therapy:** With antihypertensives other than thiazides, limit initial dosage to 500 mg/day in divided doses. When added to a thiazide, dosage of thiazide need not be changed.

IV therapy (methyldopate)

250–500 mg every 6 hr as required (maximum 1 g every 6 hr). Switch to oral therapy as soon as control is attained; use the dosage schedule used for parenteral therapy.

Pediatric patients**Oral therapy (methyldopa)**

Individualize dosage; initial dosage is based on 10 mg/kg/day in two to four doses. Maximum dosage is 65 mg/kg/day or 3 g/day, whichever is less.

IV therapy (methyldopate)

20–40 mg/kg/day in divided doses every 6 hr. Maximum dosage is 65 mg/kg or 3 g/day, whichever is less.

Geriatric patients and patients with impaired renal function

Reduce dosage. Drug is largely excreted by the kidneys.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	12–24 hr
IV	4–6 hr	4–6 hr	10–16 hr

Metabolism: Hepatic; $T_{1/2}$: 1.8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add the dose to 100 mL of 5% dextrose, or give in D₅W in a concentration of 10 mg/mL.

Infusion: Administer over 30–60 min.

Incompatibilities: Do not combine with barbiturates or sulfonamides.

Adverse effects

- **CNS:** Sedation, headache, asthenia, weakness (usually early and transient), dizziness, light-headedness, symptoms of cerebrovascular insufficiency, paresthesias, parkinsonism, Bell's palsy, decreased mental acuity, involuntary choreoathetotic movements, psychic disturbances
- **CV:** Bradycardia, prolonged carotid sinus hypersensitivity, aggravation of angina pectoris, paradoxical pressor response, pericarditis, myocarditis, orthostatic hypotension, edema
- **Dermatologic:** Rash seen as eczema or lichenoid eruption, toxic epidermal necrolysis fever, lupuslike syndrome
- **Endocrine:** Breast enlargement, gynecomastia, lactation, hyperprolactinemia,

amenorrhea, galactorrhea, impotence, failure to ejaculate, decreased libido

- **GI:** *Nausea, vomiting, distention, constipation*, flatus, diarrhea, colitis, dry mouth, sore or black tongue, pancreatitis, sialadenitis, abnormal liver function tests, jaundice, hepatitis, **hepatic necrosis**
- **Hematologic:** Positive Coombs' test, hemolytic anemia, bone marrow depression, leukopenia, granulocytopenia, thrombocytopenia, positive tests for antinuclear antibody, lupuslike syndrome, and rheumatoid factor
- **Other:** Nasal stuffiness, mild arthralgia, myalgia, septic shock–like syndrome

Interactions

• **Drug-drug** • Potentiation of the pressor effects of sympathomimetic amines • Increased hypotension with levodopa • Risk of hypotension during surgery with central anesthetics; monitor patient carefully

• **Drug-lab test** • Methylodopa may interfere with tests for urinary uric acid, serum creatinine, AST, urinary catecholamines

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to methylodopa; hepatic disease; previous methylodopa therapy associated with liver disorders; renal failure; dialysis; bilateral cerebrovascular disease; lactation, pregnancy
- **Physical:** Weight; T; skin color, lesions; mucous membrane color, lesions; orientation, affect, reflexes; P, BP, orthostatic BP, perfusion, edema, auscultation; bowel sounds, normal output, liver evaluation; breast examination; LFTs, renal function tests, urinalysis, CBC and differential, direct Coombs' test

Interventions

- Administer IV slowly over 30–60 min; monitor injection site.
- ⊗ **Warning** Monitor hepatic function, especially in the first 6–12 wk of therapy or if unexplained fever appears. Discontinue drug if fever, abnormalities in liver function tests, or jaundice occurs. Ensure that methylodopa is not reinstated in such patients.

⊗ **Warning** Monitor blood counts periodically to detect hemolytic anemia; a direct Coombs' test before therapy and 6 and 12 mo later may be helpful. Discontinue drug if Coombs'-positive hemolytic anemia occurs. If hemolytic anemia is related to methylodopa, ensure that drug is not reinstated.

⊗ **Warning** Discontinue therapy if involuntary choreoathetotic movements occur.

⊗ **Warning** Discontinue if edema progresses or signs of HF occur.

- Add a thiazide to drug regimen or increase dosage if methylodopa tolerance occurs (second and third month of therapy).

⊗ **Warning** Monitor BP carefully when discontinuing methylodopa; drug has short duration of action, and hypertension usually returns within 48 hr.

Teaching points

- Take this drug exactly as prescribed; it is important that you not miss doses.
- You may experience these side effects: Drowsiness, dizziness, light-headedness, headache, weakness (often transient; avoid driving or engaging in tasks that require alertness); GI upset (eat frequent small meals); dreams, nightmares, memory impairment (reversible); dizziness, light-headedness when you get up (get up slowly; use caution when climbing stairs); urine that darkens on standing (expected effect); impotence, failure of ejaculation, decreased libido; breast enlargement, sore breasts.
- Report unexplained, prolonged general tiredness; yellowing of the skin or eyes; fever; bruising; rash.

▽ methylene blue

(*meth' i leen*)

Methblue 65, Urolene Blue

PREGNANCY CATEGORY C

Drug classes

Antidote
Diagnostic agent
Urinary tract anti-infective

Therapeutic actions

Oxidation-reduction agent that converts the ferrous iron of reduced Hgb to the ferric form, producing methemoglobin; weak germicide in lower doses; tissue staining.

Indications

- Treatment of cyanide poisoning and drug-induced methemoglobinemia
- May be useful in the management of patients with oxalate urinary tract calculi
- GU antiseptic for cystitis and urethritis
- Unlabeled uses: Delineation of body structures and fistulas through dye effect; neonatal glutaricaciduria II unresponsive to riboflavin

Contraindications and cautions

- Contraindicated with allergy to methylene blue, renal insufficiency, intraspinal injections.
- Use cautiously with G6PD deficiency; anemias; CV deficiencies; pregnancy, lactation.

Available forms

Tablets—65 mg; injection—10 mg/mL

Dosages

Adults

Oral

65–130 mg tid with a full glass of water.

IV

1–2 mg/kg (0.1–0.2 mL/kg) or 25–50 mg/m² injected over several minutes. May repeat after 1 hour as needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	Unknown
IV	Immediate	End of infusion

Metabolism: Tissue; T_{1/2}: Unknown

Excretion: Bile, feces, urine

IV FACTS

Preparation: No preparation required.

Infusion: Inject directly IV or into tubing of actively running IV; inject slowly over several minutes.

Adverse effects

- **CNS:** Dizziness, headache, mental confusion, sweating
- **CV:** Precordial pain
- **GI:** Nausea, vomiting, diarrhea, abdominal pain, *blue-green stool*
- **GU:** *Discolored urine* (blue-green); bladder irritation
- **Other:** Necrotic abscess (subcutaneous injection); fetal anemia and distress (amniotic injection); neural damage, paralysis (intrathecal injection); *skin stained blue*

■ Nursing considerations

Assessment

- **History:** Allergy to methylene blue, renal insufficiency, presence of G6PD deficiency; anemias; CV deficiencies; pregnancy, lactation
- **Physical:** Skin color, lesions; urinary output, bladder palpation; abdominal examination, normal output; CBC with differential

Interventions

- Give oral drug after meals with a full glass of water.
- Give IV slowly over several minutes; avoid exceeding recommended dosage.
- ⊗ **Warning** Use care to avoid subcutaneous injection; monitor intrathecal sites used for diagnostic injection for necrosis and damage.
- Contact with skin will dye the skin blue; stain may be removed by hypochlorite solution.
- Monitor CBC for signs of marked anemia.

Teaching points

- Take drug after meals with a full glass of water.
- Avoid bubble baths, excessive ingestion of citrus juice, and sexual contacts if bladder infection or urethritis is being treated.
- You may experience these side effects: Urine or stool discolored blue-green; abdominal pain, nausea, vomiting (eat frequent small meals).
- Report difficulty breathing, severe nausea or vomiting, fatigue.

methylergonovine maleate

(meth ill er goe *noe'* veen)

Methergine

PREGNANCY CATEGORY C

Drug class

Oxytocic

Therapeutic actions

A partial agonist or antagonist at alpha receptors; as a result, it increases the strength, duration, and frequency of uterine contractions, which shortens the third stage of labor and reduces blood loss.

Indications

- Routine management after delivery of the placenta
- Treatment of postpartum atony and hemorrhage; subinvolution of the uterus
- Uterine stimulation during the second stage of labor following the delivery of the anterior shoulder, under strict medical supervision

Contraindications and cautions

- Contraindicated with allergy to methylergonovine, hypertension, toxemia, lactation, pregnancy.
- Use cautiously with sepsis, obliterative vascular disease, hepatic or renal impairment.

Available forms

Tablets—0.2 mg; injection—0.2 mg/mL

Dosages

Adults

IM

0.2 mg after delivery of the placenta, after delivery of the anterior shoulder, or during puerperium. May be repeated every 2–4 hr.

IV

Same dosage as IM; infuse slowly over at least 60 sec. Monitor BP very carefully as severe hypertensive reaction can occur; reserve this route for emergency situations.

Oral

0.2 mg PO tid or qid daily in the puerperium for up to 1 wk.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	5–10 min	30–60 min	3 hr
IM	2–5 min	30 min	3 hr
IV	Immediate	2–3 min	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–12.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces

IV FACTS

Preparation: No additional preparation required.

Infusion: Inject directly IV or into tubing of running IV; inject very slowly, over no less than 60 sec; rapid infusion can result in sudden hypertension or cerebral events.

Adverse effects

- **CNS:** *Dizziness, headache*, tinnitus, diaphoresis
- **CV:** *Hypertension*, palpitations, chest pain, dyspnea
- **GI:** *Nausea*, vomiting

Interactions

★ **Drug-drug** • Risk of severe hypertension, vasoconstriction, MI if combined with vasoconstrictors, ergot alkaloids; use extreme caution • Avoid use with potent CYP3A4 inhibitors (such as clarithromycin, erythromycin, itraconazole, ritonavir) • Use caution with mild CYP3A4 inhibitors (such as fluoxetine, fluvoxamine, nefazodone)

■ Nursing considerations

Assessment

- **History:** Allergy to methylergonovine, hypertension, toxemia, sepsis, obliterative vascular disease, hepatic or renal impairment, lactation, pregnancy
- **Physical:** Uterine tone, vaginal bleeding; orientation, reflexes, affect; P, BP, edema; CBC, LFTs, renal function tests; fetal monitoring when used during labor

Interventions

- Administer by IM injection or orally unless emergency requires IV use. Complications are more frequent with IV use.
- Monitor postpartum women for BP changes and amount and character of vaginal bleeding.
- Discontinue if signs of toxicity occur.
- Avoid prolonged use of the drug.

Teaching points

- This drug should not be needed for longer than 1 week.
- The patient receiving a parenteral oxytocic is usually receiving it as part of an immediate medical situation, and the drug teaching should be incorporated into the teaching about delivery. The patient needs to know the name of the drug and what she can expect after it is administered.
- You may experience these side effects: Nausea, vomiting, dizziness, headache, ringing in the ears (short-term use may make it tolerable).
- Report difficulty breathing, headache, numb or cold extremities, severe abdominal cramping.

▷ methylaltraxone bromide

See Appendix U, *Less commonly used drugs*.

▷ methylphenidate hydrochloride

(*meth ill fen' i date*)

Apo-Methylphenidate (CAN),
Apo-Methylphenidate SR (CAN),
Biphentin (CAN), Concerta **ONC**,
Daytrana, Metadate CD **ONC**, Metadate
ER **ONC**, Methylin, Methylin ER **ONC**,
PMS-Methylphenidate (CAN),
Ritalin, Ritalin LA **ONC**, Ritalin-SR **ONC**

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

CNS stimulant

Therapeutic actions

Mild cortical stimulant with CNS actions similar to those of the amphetamines; efficacy in hyperkinetic syndrome, attention-deficit disorders in children appear paradoxical and are not understood.

Indications

- Narcolepsy (*Ritalin*, *Ritalin SR*, *Metadate ER*, *Methylin*)
- Attention-deficit disorders, hyperkinetic syndrome, minimal brain dysfunction in children or adults with a behavioral syndrome characterized by the following symptoms: Moderate to severe distractibility, short attention span, hyperactivity, emotional lability, and impulsivity, not secondary to environmental factors or psychiatric disorders
- Unlabeled use: Treatment of depression in the elderly, cancer and CVA patients; alleviation of neurobehavioral symptoms after traumatic brain injury; improvement in pain control and sedation in patients receiving opiates

Contraindications and cautions

- Contraindicated with hypersensitivity to methylphenidate; marked anxiety, tension, and agitation; glaucoma; motor tics, family history or diagnosis of Tourette syndrome; severe depression of endogenous or exogenous origin; normal fatigue states; concurrent use or use within 2 wk of MAOI.
- Use cautiously with seizure disorders; hypertension; drug dependence, alcoholism; emotional instability, psychosis; seizures; lactation, pregnancy; short gut syndrome, peritonitis, esophageal motility disorders (*Concerta*).

Available forms

Tablets—5, 10, 20 mg; chewable tablets—2.5, 5, 10 mg; SR tablets **ONC**—20 mg; ER tablets **ONC**—10, 18, 20, 27, 36, 54 mg; ER capsules **ONC**—20, 30 mg (*Metadate CD ONC*); and 10, 20, 30, 40, 50, 60 mg (*Ritalin LA ONC*); transdermal patch—1.1, 1.6, 2.2, 3.3 mg/hr; solution—1, 2 mg/mL

Dosages

Adults

Individualize dosage. Give orally in divided doses bid or tid, preferably 30–45 min before

meals; dosage ranges from 10–60 mg/day PO. If insomnia is a problem, drug should be taken before 6 PM. Timed-release tablets have a duration of 8 hr and may be used when timing and dosage are adjusted to the 8-hr daily regimen. ER forms: 18 mg PO daily in the morning; may be increased by 18 mg/day at 1-wk intervals to a maximum of 54 mg/day (*Concerta*); 10- to 20-mg/day increments to a maximum 60 mg/day (*Metadate CD*, *Ritalin LA*).

Pediatric patients 13–17 yr

Initially, 18 mg/day PO taken in the morning without regard to food; titrate to a maximum 72 mg/day PO. Do not exceed 2 mg/kg/day. Tablets must be swallowed whole and should not be cut, crushed, or chewed (*Concerta*, *Daytrana*). Or, 10–30 mg/day by transdermal patch; apply patch 2 hr before effect needed and remove after 9 hr.

Pediatric patients 6–12 yr

Start with small oral doses (5 mg PO before breakfast and lunch with gradual increments of 5–10 mg weekly). Daily dosage of more than 60 mg not recommended. Discontinue use after 1 mo if no improvement. Discontinue periodically to assess condition; usually discontinued after puberty. ER forms: Use adult dosage up to a maximum of 54 mg/day. Or, 10–30 mg/day by transdermal patch; apply patch 2 hr before effect needed and remove after 9 hr.

Pediatric patients younger than 6 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–3 hr	3–6 hr
Oral (ER)	Varies	5–8 hr	3–12 hr
Trans-dermal	2 hr	3 hr	Up to 3 hr after removal

Metabolism: Hepatic; $T_{1/2}$: 1–3 hr (6.8 hr ER; 3–4 hr transdermal)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

• **CNS:** *Nervousness, insomnia*, dizziness, headache, dyskinesia, chorea, drowsiness,

tics, Tourette's syndrome, toxic psychosis, blurred vision, accommodation difficulties

• **CV:** *Increased or decreased pulse and BP; tachycardia*, angina, cardiac arrhythmias, palpitations

• **Dermatologic:** Rash, urticaria, fever, exfoliative dermatitis, erythema multiforme with necrotizing vasculitis and thrombocytopenic purpura, loss of scalp hair

• **GI:** *Anorexia, nausea, abdominal pain*, weight loss

• **Hematologic:** Leukopenia, anemia

• **Other:** Tolerance, psychological dependence, abnormal behavior with abuse, arthralgia

Interactions

* **Drug-drug** • Increased effects and toxicity of methylphenidate with MAOIs • Increased serum levels of phenytoin, TCAs, oral anticoagulants, SSRIs with methylphenidate; monitor for toxicity

* **Drug-lab test** • Methylphenidate may increase the urinary excretion of epinephrine

Nursing considerations

Assessment

• **History:** Hypersensitivity to methylphenidate; marked anxiety, tension, and agitation; glaucoma; motor tics, Tourette syndrome; severe depression; normal fatigue state; seizure disorders; hypertension; drug dependence, alcoholism, emotional instability; pregnancy, lactation

• **Physical:** Weight; T; skin color; lesions; orientation, affect, ophthalmologic examination (tonometry); P, BP, auscultation; R, adventitious sounds; bowel sounds, normal output; CBC with differential, platelet count, baseline ECG

Interventions

⊗ **Black box warning** Be aware that drug has potential for abuse; use caution with emotionally unstable patients.

• Ensure proper diagnosis before administering to children for behavioral syndromes; drug should not be used until other causes or concomitants of abnormal behavior (learning disability, EEG abnormalities, neurologic deficits) are ruled out.

- Ensure that patient does not have underlying cardiac problems before beginning therapy; serious cardiac effects have been reported.
- Apply transdermal patch to clean, dry area of the hip approximately 2 hr before effect needed. Remove after 9 hr. Alternate hips.
- Interrupt drug dosage periodically in children to determine if symptoms warrant continued drug therapy.
- Monitor growth of children on long-term methylphenidate therapy.
- Ensure that all timed-release tablets and capsules are swallowed whole, not chewed or crushed.
- Dispense the smallest feasible dose to minimize risk of overdose.
- Give before 6 PM to prevent insomnia.
- Monitor CBC and platelet counts periodically in patients on long-term therapy.
- Monitor BP frequently early in treatment.

Teaching points

- Take this drug exactly as prescribed. Timed-release tablets and capsules must be swallowed whole, not chewed or crushed. *Metadate CD* capsules may be opened and entire contents sprinkled on soft food—do not chew or crush granules. Transdermal patch should be applied to clean, dry area of the hip. Remove after 9 hours. Alternate hips.
- Chewable tablets must be taken with at least 8 ounces of water to reduce the risk of choking.
- Take drug before 6 PM to avoid nighttime sleep disturbance.
- Avoid alcohol and over-the-counter drugs, including nose drops, cold remedies; some over-the-counter drugs could cause dangerous effects.
- You may experience these side effects: Nervousness, restlessness, dizziness, insomnia, impaired thinking (may lessen over time; avoid driving or engaging in activities that require alertness); headache; loss of appetite; dry mouth.
- Avoid heating pads, electric blankets if wearing the transdermal patch; heat will alter drug's effects.
- Keep drug in secure place; do not share with others; upon removing the transdermal patch, fold patch so adhesive sides stick

together and discard in a container with a lid.

- Report nervousness, insomnia, palpitations, vomiting, rash, fever.

methylPREDNISolone

(*meth ill pred niss' oh lone*)

methylPREDNISolone

Oral: Medrol

methylPREDNISolone acetate

IM injection: Depo-Medrol

methylPREDNISolone sodium succinate

IV, IM injection: A-Methapred, Solu-Medrol

PREGNANCY CATEGORY C

Drug classes

Corticosteroid
Glucocorticoid
Hormone

Therapeutic actions

Enters target cells and binds to intracellular corticosteroid receptors, initiating many complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

- Short-term management of various inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (eg, SLE), dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders (eg, MS)
- Hematologic disorders: Thrombocytopenia purpura, erythroblastopenia
- Ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas
- Trichinosis with neurologic or myocardial involvement
- Prevention of nausea and vomiting associated with chemotherapy

- Unlabeled use: Septic shock, RDS, acute spinal cord injury

Contraindications and cautions

- Contraindicated with infections, especially TB, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections; lactation.
- Administration of live vaccines is contraindicated in patients receiving immunosuppressive doses.
- Use cautiously with kidney or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus, pregnancy.

Available forms

Tablets—2, 4, 8, 16, 24, 32 mg; powder for injection—40, 125, 500 mg/vial; 1, 2 g/vial; suspension for injection—20, 40, 80 mg/mL

Dosages

Adults

Individualize dosage, depending on severity and response. Give daily dose before 9 AM to minimize adrenal suppression. For maintenance, reduce initial dose in small increments at intervals until the lowest satisfactory clinical dose is reached. If long-term therapy is needed, consider alternate-day therapy with a short-acting corticosteroid. After long-term therapy, withdraw drug slowly to prevent adrenal insufficiency.

Oral

4–48 mg/day. For alternate-day therapy, give twice the usual dose every other morning.

IV, IM

10–40 mg IV administered over several min. Give subsequent doses IV or IM.

- *High-dose therapy*: 30 mg/kg IV infused over 10–30 min; may repeat every 4–6 hr but not longer than 72 hr.

⊗ **Warning** Rapid IV administration of large doses (more than 0.5–1 g in less than 10 min) has caused serious cardiac complications.

Methylprednisolone acetate

- *Rheumatoid arthritis, maintenance*: 40–120 mg IM weekly.
- *Adrenogenital syndrome*: 40 mg IM every 2 wk.
- *Dermatologic lesions*: 40–120 mg IM weekly for 1–4 wk.
- *Asthma and allergic rhinitis*: 80–120 mg IM.
- *Intralesional*: 20–60 mg.
- *Intra-articular dose depends on site of injection*: 4–10 mg (small); 10–40 mg (medium); 20–80 mg (large joints).

Pediatric patients

Individualize dosage on the basis of severity and response rather than by formulae of correct doses for age or weight. Carefully observe growth and development in infants and children on prolonged therapy. Minimum dose of methylprednisolone is 0.5 mg/kg per 24 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	1.2–1.5 days
IV	Rapid	Rapid	Unknown
IM	8–12 hr	Unknown	4–8 days

Metabolism: Hepatic; $T_{1/2}$: 78–188 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No additional preparation is required.

Infusion: Inject directly into vein or into tubing of running IV; administer slowly, over at least 30 min, to reduce cardiac effects. Acetate form should not be given IV.

Incompatibilities: Do not combine with allopurinol, calcium gluconate, ciprofloxacin, docetaxel, etoposide, filgrastim, gemcitabine, glycopyrrolate, insulin, nafcillin, ondansetron, paclitaxel, penicillin G sodium, propofol, sargramostim, tetracycline, vinorelbine.

Adverse effects

Effects depend on dose, route, and duration of therapy.

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis, cataracts, increased IOP, glaucoma
- **CV:** Hypotension, **shock**, hypertension and heart failure secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias
- **Electrolyte imbalance:** *Na⁺ and fluid retention*, hypokalemia, hypocalcemia
- **Endocrine:** Amenorrhea, irregular menses, growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state (long-term effect), increased blood sugar, increased serum cholesterol, decreased T₃ and T₄ levels, HPA suppression with systemic therapy longer than 5 days
- **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention, nausea, vomiting, *increased appetite, weight gain*
- **Hypersensitivity:** Anaphylactoid reactions
- **Musculoskeletal:** Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures
- **Other:** *Immunosuppression; aggravation or masking of infections; impaired wound healing*; thin, fragile skin; petechiae, ecchymoses, purpura, striae; subcutaneous fat atrophy

Interactions

- * **Drug-drug** • Increased therapeutic and toxic effects with erythromycin, azole antifungals, toleandomycin • Risk of severe deterioration of muscle strength when given to myasthenia gravis patients who are receiving ambenonium, edrophonium, neostigmine, pyridostigmine • Decreased steroid blood levels with barbiturates, phenytoin, rifampin • Decreased effectiveness of salicylates
- * **Drug-lab test** • False-negative nitroblue-tetrazolium test for bacterial infection • Suppression of skin test reactions

■ Nursing considerations Assessment

- **History:** Infections; recent vaccinations; kidney or liver disease, hypothyroidism, ulcerative colitis, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic

disorders, osteoporosis, seizure disorders, diabetes mellitus; pregnancy; lactation

- **Physical:** Weight, T, reflexes and grip strength, affect and orientation, P, BP, peripheral perfusion prominence of superficial veins, R and adventitious sounds, serum electrolytes, blood glucose

Interventions

- Use caution with the 24-mg tablets marketed as *Medrol*; these contain tartrazine, which may cause allergic reactions, especially in people who are allergic to aspirin.
- Give daily dose before 9 AM to mimic normal peak corticosteroid blood levels.
- Monitor glucose levels with prolonged therapy; dietary adjustments may be needed.
- Increase dosage when patient is subject to stress.
- ⊗ **Warning** Taper doses when discontinuing high-dose or long-term therapy to allow adrenal recovery.
- ⊗ **Warning** Do not give live-virus vaccines with immunosuppressive doses of corticosteroids.
- ⊗ **Warning** Some injectable products contain benzyl alcohol. Do not administer them to neonates or inject intrathecally.

Teaching points

- Do not stop taking the oral drug without consulting your health care provider.
- Avoid exposure to infections.
- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry stools, fever, prolonged sore throat, colds or other infections, worsening of disorder.

▽ metoclopramide

(*met ob kloef pra' mide*)

Apo-Metoclop (CAN), Metozolv ODT, Nu-Metoclopramide (CAN), Reglan

PREGNANCY CATEGORY B

Drug classes

Antiemetic
Dopaminergic blocker
GI stimulant

Therapeutic actions

Stimulates motility of upper GI tract without stimulating gastric, biliary, or pancreatic secretions; appears to sensitize tissues to action of acetylcholine; relaxes pyloric sphincter, which, when combined with effects on motility, accelerates gastric emptying and intestinal transit; little effect on gallbladder or colon motility; increases lower esophageal sphincter pressure; has sedative properties; induces release of prolactin.

Indications

- Relief of symptoms of acute and recurrent diabetic gastroparesis
- Short-term therapy (4–12 wk) for adults with symptomatic gastroesophageal reflux who fail to respond to conventional therapy
- Parenteral: Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy
- Prophylaxis of postoperative nausea and vomiting when nasogastric suction is undesirable
- Single-dose parenteral use: Facilitation of small-bowel intubation when tube does not pass the pylorus with conventional maneuvers
- Single-dose parenteral use: Stimulation of gastric emptying and intestinal transit of barium when delayed emptying interferes with radiologic examination of the stomach or small intestine
- Unlabeled uses: Improvement of lactation (doses of 30–45 mg/day); treatment of nausea and vomiting of a variety of etiologies; adjunctive therapy for migraines, gastric bezoars, gastroparesis, hiccoughs, Tourette syndrome

Contraindications and cautions

- Contraindicated with allergy to metoclopramide; GI hemorrhage, mechanical obstruction or perforation; pheochromocytoma (may cause hypertensive crisis); epilepsy.
- Use cautiously with previously detected breast cancer (one-third of such tumors are prolactin dependent); lactation, pregnancy; fluid overload; renal impairment.

Available forms

Tablets—5, 10 mg; oral solution (syrup)—1 mg/mL; injection—5 mg/mL; orally disintegrating tablets—5, 10 mg

Dosages

Adults

- *Relief of symptoms of gastroparesis:* 10 mg PO 30 min before each meal and at bedtime for 2–8 wk. If symptoms are severe, initiate therapy with 10 mg IM or IV administration for up to 10 days until symptoms subside.
- *Symptomatic gastroesophageal reflux:* 10–15 mg PO up to four times/day 30 min before meals and at bedtime. If symptoms occur only at certain times or in relation to specific stimuli, single doses of 20 mg may be preferable; guide therapy by endoscopic results. Do not use longer than 12 wk.
- *Prevention of postoperative nausea and vomiting:* 10–20 mg IM at the end of surgery.
- *Prevention of chemotherapy-induced emesis:* Dilute and give by IV infusion over at least 15 min. Give first dose 30 min before chemotherapy; repeat every 2 hr for two doses, then every 3 hr for three doses. The initial two doses should be 2 mg/kg for highly emetogenic drugs (cisplatin, dacarbazine); 1 mg/kg may suffice for other chemotherapeutic drugs. If extrapyramidal symptoms occur, administer 50 mg of diphenhydramine IM.
- *Facilitation of small bowel intubation, gastric emptying:* 10 mg (2 mL) by direct IV injection over 1–2 min.

Pediatric patients

- *Facilitation of intubation, gastric emptying:*
Younger than 6 yr: 0.1 mg/kg by direct IV injection over 1–2 min.
6–14 yr: 2.5–5 mg by direct IV injection over 1–2 min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	60–90 min	1–2 hr
IM	10–15 min	60–90 min	1–2 hr
IV	1–3 min	60–90 min	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 5–6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute dose in 50 mL of a par-parental solution (D₅W, sodium chloride injection, dextrose 5% in 0.45% sodium chloride, Ringer's injection, or lactated Ringer's injection). May be stored for up to 48 hr if protected from light or up to 24 hr under normal light.

Infusion: Give direct IV doses slowly (over 1–2 min); give infusions over at least 15 min.

Incompatibilities: Do not mix with solutions containing chloramphenicol, sodium bicarbonate, cisplatin, erythromycin.

Y-site incompatibilities: Do not give with allopurinol, furosemide, cefepime.

Adverse effects

- **CNS:** Restlessness, drowsiness, fatigue, lassitude, insomnia, extrapyramidal reactions, parkinsonism-like reactions, akathisia, dystonia, myoclonus, dizziness, anxiety
- **CV:** Transient hypertension
- **GI:** Nausea, diarrhea

Interactions

★ **Drug-drug** • Decreased absorption of digoxin from the stomach • Increased toxic and immunosuppressive effects of cyclosporine • Increased neuromuscular blocking effects with succinylcholine

■ Nursing considerations

Assessment

- **History:** Allergy to metoclopramide, GI hemorrhage, mechanical obstruction or perforation, depression, pheochromocytoma, epilepsy, lactation, previously detected breast cancer
- **Physical:** Orientation, reflexes, affect; P, BP; bowel sounds, normal output; EEG

Interventions

⊗ **Black box warning** Long-term treatment has been associated with permanent tardive dyskinesia; the risk increases with patients older than 60 yr, especially women. Use the

smallest dose possible; do not exceed 3-mo therapy.

- Monitor BP carefully during IV administration.
- Monitor for extrapyramidal reactions, and consult physician if they occur.
- Monitor patients with diabetes, arrange for alteration in insulin dose or timing if diabetic control is compromised by alterations in timing of food absorption.

⊗ **Warning** Keep diphenhydramine injection readily available in case extrapyramidal reactions occur (50 mg IM).

⊗ **Warning** Have phentolamine readily available in case of hypertensive crisis (most likely to occur with undiagnosed pheochromocytoma).

Teaching points

- Take this drug exactly as prescribed.
- Do not use alcohol, sleep remedies, or sedatives; serious sedation could occur.
- You may experience these side effects: Drowsiness, dizziness (do not drive or perform other tasks that require alertness); restlessness, anxiety, depression, headache, insomnia (reversible); nausea, diarrhea.
- Report involuntary movement of the face, eyes, or limbs, severe depression, severe diarrhea.

metolazone (me tole' a zone)

Zaroxolyn

PREGNANCY CATEGORY B

Drug class

Thiazide-like diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, increasing excretion of sodium, chloride, and water by the kidney.

Indications

- Treatment of salt and water retention, including edema of HF and renal disease, nephrotic syndrome, and diminished renal function
- Hypertension, as monotherapy or in combination with other antihypertensives

- Unlabeled uses: Osteoporosis, diabetes insipidus

Contraindications and cautions

- Contraindicated with hypersensitivity to thiazides, hepatic coma, fluid or electrolyte imbalances, renal or liver disease, sulfonamide derivatives.
- Use cautiously with gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorder, lactation, pregnancy.

Available forms

Tablets: 2.5, 5, 10 mg

Dosages

Adults

- *Hypertension*: 2.5–5 mg daily PO.
- *Edema of renal disease*: 5–20 mg daily PO.
- *Edema of heart failure*: 5–20 mg daily PO.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	8 hr	12–24 hr

Metabolism: Hepatic; $T_{1/2}$: 8–14 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, vertigo, paresthesias, weakness, headache, drowsiness, fatigue*
- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain
- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation, jaundice, hepatitis, pancreatitis*
- **GU:** *Polyuria, nocturia, impotence, decreased libido*
- **Hematologic:** Leukopenia, thrombocytopenia, neutropenia, agranulocytosis, aplastic anemia, fluid and electrolyte imbalances
- **Other:** Muscle cramps and muscle spasms, fever, hives, gouty attacks, flushing

Interactions

- **Drug-drug** • Increased thiazide effects and chance of acute hyperglycemia with diazoxide • Decreased absorption with cholestyramine, colestipol • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Increased dosage of antidiabetics may be needed • Increased risk of severe hypokalemia with dofetilide; combination is contraindicated
- **Drug-lab test** • Decreased PBI levels without clinical signs of thyroid disturbances

Nursing considerations

Assessment

- **History:** Fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorder, hepatic coma or precoma, lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, muscle strength; pulses, BP, orthostatic BP, perfusion, edema, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds; CBC, serum electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

⊗ **Black box warning** Do not interchange *Zaroxolyn* with other formulations; they are not therapeutically equivalent.

⊗ **Warning** Withdraw drug 2–3 days before elective surgery; for emergency surgery, reduce dosage of preanesthetic or anesthetic.

- Give with food or milk if GI upset occurs.
- Measure and record body weight to monitor fluid changes.

Teaching points

- Take drug early in the day so sleep will not be disturbed by increased urination.
- Weigh yourself daily and record weights.
- Protect skin from the sun and bright lights.
- You may experience these side effects: Increased urination; dizziness, drowsiness, feeling faint (use caution; avoid driving or operating dangerous machinery); headache.
- Report rapid weight change, swelling in ankles or fingers, unusual bleeding or bruising, muscle cramps.

DANGEROUS DRUG**metoprolol***(me toe' proe lole)***metoprolol**

Apo-Metoprolol SR (CAN) **ONC**,
 Gen-Metoprolol (CAN),
 Lopressor, Novo-Metoprol (CAN),
 Nu-Metop (CAN)

metoprolol succinateToprol-XL **ONC****metoprolol tartrate**

Apo-Metoprolol (CAN),
 Lopressor Injection,
 PMS-Metoprolol-L (CAN)

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
 Beta₁-selective adrenergic blocker

Therapeutic actions

Competitively blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, decreasing the influence of the sympathetic nervous system on these tissues and the excitability of the heart, decreasing cardiac output and the release of renin, and lowering BP; acts in the CNS to reduce sympathetic outflow and vasoconstrictor tone.

Indications

- Hypertension, alone or with other drugs, especially diuretics
- Immediate-release tablets and injection: Prevention of reinfarction in MI patients who are hemodynamically stable or within 3–10 days of the acute MI
- Long-term treatment of angina pectoris
- ER forms only: Treatment of stable, symptomatic heart failure of ischemic, hypertensive, or cardiomyopathic origin

Contraindications and cautions

- Contraindicated with sinus bradycardia (HR less than 45 beats/min), second- or third-degree heart block (PR interval more than

0.24 sec), cardiogenic shock, HF, second and third trimesters of pregnancy.

- Use cautiously with diabetes or thyrotoxicosis; asthma or COPD; pregnancy.

Available forms

Tablets—25, 50, 100 mg; ER tablets **ONC**—25, 50, 100, 200 mg; injection—1 mg/mL

Dosages**Adults**

- *Hypertension*: Initially, 100 mg/day PO in single or divided doses; gradually increase dosage at weekly intervals. Usual maintenance dose is 100–450 mg/day.
- *Angina pectoris*: Initially, 100 mg/day PO in two divided doses; may be increased gradually, effective range, 100–400 mg/day.
- *MI, early treatment*: Three IV bolus doses of 5 mg each at 2-min intervals with careful monitoring. If these are tolerated, give 50 mg PO 15 min after the last IV dose and every 6 hr for 48 hr. Thereafter, give a maintenance dose of 100 mg PO bid. Reduce initial PO doses to 25 mg, or discontinue in patients who do not tolerate the IV doses.
- *MI, late treatment*: 100 mg PO bid as soon as possible after infarct, continuing for at least 3 mo and possibly for 1–3 yr.

ER tablets

- *Hypertension*: 25–100 mg/day PO as one dose; may increase at weekly intervals to a maximum of 400 mg/day.
- *Angina*: 100 mg/day PO as one dose.
- *HF*: 12.5–25 mg/day ER tablets for 2 wk; may then be increased by 25 mg every 2 wk to a maximum of 200 mg.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15 min	90 min	Varies
IV	Immediate	60–90 min	15–19 hr

Metabolism: Hepatic; T_{1/2}: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No additional preparation is required.

Infusion: Inject directly into vein or into tubing of running IV over 1 min. Inject as a bolus; monitor carefully; wait 2 min between doses; do not give if bradycardia is less than 45 beats/min, heart block, systolic pressure less than 100 mm Hg.

Incompatibilities: Do not mix with amino acids, amphotericin B complex, aztreonam, dopamine.

Adverse effects

- **Allergic:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** *Heart failure, cardiac arrhythmias*, peripheral vascular insufficiency, claudication, CVA, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin, worsening of psoriasis
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, dysuria, Peyronie's disease, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory:** **Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis
- **Other:** *Decreased exercise tolerance, development of ANA*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase

Interactions

• **Drug-drug** • Increased effects of metoprolol with verapamil, cimetidine, methimazole, propylthiouracil • Increased effects of both drugs if metoprolol is taken with hy-

dralazine • Increased serum levels and toxicity of IV lidocaine, if given concurrently • Increased risk of orthostatic hypotension with prazosin • Decreased antihypertensive effects if taken with NSAIDs, clonidine, rifampin • Decreased therapeutic effects with barbiturates • Hypertension followed by severe bradycardia if given concurrently with epinephrine
 * **Drug-lab test** • Possible false results with glucose or insulin tolerance tests (oral)

Nursing considerations

Assessment

- **History:** Sinus bradycardia (HR less than 45 beats/min), second- or third-degree heart block (PR interval greater than 0.24 sec), cardiogenic shock, heart failure, systolic BP less than 100 mm Hg; diabetes or thyrotoxicosis; asthma or COPD; lactation, pregnancy
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- ⊗ **Black box warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Ensure that patient swallows the ER tablets whole; do not cut, crush, or chew. *Toprol XL* tablets may be divided at the score; divided tablets should be swallowed whole, not crushed or chewed.
- Consult physician about withdrawing drug if patient is to undergo surgery (controversial).
- Give oral drug with food to facilitate absorption.
- Provide continual cardiac monitoring for patients receiving IV metoprolol.

Teaching points

- Do not stop taking this drug unless instructed to do so by your health care provider.
- Swallow the extended-release tablets whole; do not cut, crush, or chew. If using ER tablets, you can divide the tablets at the score;

divided tablets must be swallowed whole, not crushed or chewed.

- You may experience these side effects: Dizziness, drowsiness, light-headedness, blurred vision (avoid driving or dangerous activities); nausea, loss of appetite (eat frequent small meals); nightmares, depression (discuss change of medication); sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

metronidazole (*me troe ni' da zole*)

Apo-Metronidazole (CAN), Flagyl, Flagyl 375, Flagyl ER, MetroGel, MetroGel-Vaginal, NidaGel (CAN), Noritate, Protostat, Vandazole

PREGNANCY CATEGORY B

Drug classes

Amebicide
Antibacterial
Antibiotic
Antiprotozoal

Therapeutic actions

Bactericidal: Inhibits DNA synthesis in specific (obligate) anaerobes, causing cell death; antiprotozoal-trichomonacidal, amebicidal: Biochemical mechanism of action is not known.

Indications

- Acute infection with susceptible anaerobic bacteria
- Acute intestinal amebiasis
- Amebic liver abscess
- Trichomoniasis (acute and partners of patients with acute infection)
- Bacterial vaginosis
- Preoperative, intraoperative, postoperative prophylaxis for patients undergoing colorectal surgery
- Topical application: Treatment of inflammatory papules, pustules, and erythema of rosacea

- Unlabeled uses: Prophylaxis for patients undergoing gynecologic, abdominal surgery; hepatic encephalopathy; Crohn's disease; antibiotic-associated pseudomembranous colitis; treatment of *Gardnerella vaginalis*; giardiasis (use recommended by the CDC); infected decubitus ulcers; perioral dermatitis

Contraindications and cautions

- Contraindicated with hypersensitivity to metronidazole; pregnancy (do not use for trichomoniasis in first trimester).
- Use cautiously with CNS diseases, hepatic disease, candidiasis (moniliasis), blood dyscrasias, lactation.

Available forms

Tablets—250, 500 mg; ER tablets—750 mg; capsules—375 mg; injection—500 mg/100 mL; lotion, cream, gel—0.75%; cream, gel—1%; vaginal gel—0.75%

Dosages

Adults

Oral

- Amebiasis*: 750 mg PO tid for 5–10 days. (In amebic dysentery, combine with iodoquinol 650 mg PO tid for 20 days.)
- Antibiotic-associated pseudomembranous colitis*: 1–2 g/day PO in 3–4 divided doses for 7–10 days.
- Gardnerella vaginalis*: 500 mg PO bid for 7 days.
- Giardiasis*: 250 mg PO tid for 7 days.
- Trichomoniasis*: 2 g PO in 1 day (1-day treatment) or 250 mg PO tid for 7 days.
- Bacterial vaginosis*:
Nonpregnant women: 750 mg PO daily for 7 days.
Pregnant women: 750 mg PO once daily for 7 days; avoid treatment in the first trimester.

IV

- Anaerobic bacterial infection*: 15 mg/kg IV infused over 1 hr; then 7.5 mg/kg infused over 1 hr every 6 hr for 7–10 days, not to exceed 4 g/day.
- Prophylaxis*: 15 mg/kg infused IV over 30–60 min and completed about 1 hr before surgery. Then 7.5 mg/kg infused over 30–60 min at 6- to 12-hr intervals after initial dose during the day of surgery only.

Topical (MetroGel)

- *Treatment of inflammatory papules, pustules, and erythema of rosacea:* Apply and rub in a thin film twice daily, morning and evening, to entire affected areas after washing; results should be seen within 3 wk; treatment through 9 wk has been effective.

Vaginal (MetroGel-Vaginal)

- *Nonpregnant women:* 1 applicatorful intravaginally one to two times/day for 5 days.

Pediatric patients

- *Anaerobic bacterial infection:* Not recommended.
- *Amebiasis:* 35–50 mg/kg/day PO in three divided doses for 10 days.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
IV	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 6–8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute by adding 4.4 mL of sterile water for injection, bacteriostatic water for injection, 0.9% sodium chloride injection, or bacteriostatic 0.9% sodium chloride injection to the vial and mix thoroughly. Resultant volume is 5 mL with a concentration of 100 mg/mL. Solution should be clear to pale yellow to yellow-green; do not use if cloudy or contains precipitates; use within 24 hr; protect from light. Add reconstituted solution to glass or plastic container containing 0.9% sodium chloride injection, 5% dextrose injection or lactated Ringer's to a final concentration of 8 mg/mL or less before administering; discontinue other solutions while running metronidazole.

Infusion: Before administration, add 5 mEq sodium bicarbonate injection for each 500 mg used (if not using premixed bags); mix thoroughly. Do not refrigerate neutralized solution. Do not administer solution that has not been neutralized. Infuse over 1 hr.

Adverse effects

- **CNS:** *Headache, dizziness, ataxia,* vertigo, incoordination, insomnia, seizures, peripheral neuropathy, fatigue
- **GI:** *Unpleasant metallic taste, anorexia, nausea, vomiting, diarrhea,* GI upset, cramps
- **GU:** Dysuria, incontinence, *darkening of the urine*
- **Local:** Thrombophlebitis (IV); *redness, burning, dryness, and skin irritation* (topical)
- **Other:** Severe, disulfiram-like interaction with alcohol, candidiasis (superinfection)

Interactions

★ **Drug-drug** • Decreased effectiveness with barbiturates • Disulfiram-like reaction (flushing, tachycardia, nausea, vomiting) with alcohol • Psychosis if taken with disulfiram

• Increased bleeding tendencies with oral anticoagulants

★ **Drug-lab test** • False-low (or zero) values in AST, ALT, LDH, triglycerides, hexokinase glucose tests

■ Nursing considerations**Assessment**

- **History:** CNS or hepatic disease, candidiasis (moniliasis), blood dyscrasias, pregnancy, lactation
- **Physical:** Reflexes, affect; skin lesions, color (with topical application); abdominal examination, liver palpation; urinalysis, CBC, LFTs

Interventions

- ⊗ **Black box warning** Avoid use unless needed. Metronidazole may be carcinogenic.
- Administer oral doses with food.
- Apply topically (*MetroGel*) after cleansing the area. Advise patient that cosmetics may be used over the area after application.
- Reduce dosage in hepatic disease.

Teaching points

- Take full course of drug therapy; take the drug with food if GI upset occurs.
- Do not drink alcohol (beverages or preparations containing alcohol, cough syrups)

for 24–72 hr of drug use; severe reactions may occur.

- Your urine may be a darker color than usual; this is expected.
- Refrain from sexual intercourse during treatment for trichomoniasis, unless partner wears a condom.
- Apply the topical preparation by cleansing the area and then rubbing a thin film into the affected area. Avoid contact with the eyes. Cosmetics may be applied to the area after medication is dry.
- You may experience these side effects: Dry mouth with strange metallic taste (frequent mouth care, sucking sugarless candies may help); nausea, vomiting, diarrhea (eat frequent small meals).
- Report severe GI upset, dizziness, unusual fatigue or weakness, fever, chills.

metyrosine

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

mexiletine hydrochloride

(*mex ill' i teen*)

Mexitil, Novo-Mexiletine (CAN)

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic

Therapeutic actions

Type I antiarrhythmic: Decreases automaticity of ventricular cells by membrane stabilization.

Indications

- Treatment of documented life-threatening ventricular arrhythmias (use with lesser arrhythmias is not recommended)
- Unlabeled uses: Prophylactic use to decrease arrhythmias in acute phase of acute MI (mortality may not be affected); reduction of pain, dysesthesia, and paresthesia associated with diabetic neuropathy

Contraindications and cautions

- Contraindicated with allergy to mexiletine, cardiogenic shock, hypotension, second- or third-degree heart block (without artificial pacemaker), lactation.
- Use cautiously with hepatic disease, seizure disorders, hypotension, severe HF, pregnancy.

Available forms

Capsules—150, 200, 250 mg

Dosages

Adults

200 mg every 8 hr PO. Increase in 50- to 100-mg increments every 2–3 days until desired antiarrhythmic effect is obtained. Maximum dose, 1,200 mg/day PO. Rapid control, 400 mg loading dose, then 200 mg every 8 hr PO.

- *Transferring from other antiarrhythmics:*
Lidocaine: Stop the lidocaine with the first dose of mexiletine; leave IV line open until adequate arrhythmia suppression is ensured.
Quinidine sulfate: Initial dose of 200 mg 6–12 hr PO after the last dose of quinidine.
Procainamide: Initial dose of 200 mg 3–6 hr PO after the last dose of procainamide. *Disopyramide:* 200 mg 6–12 hr PO after the last dose of disopyramide.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	0.5–2 hr	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 10–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, fatigue, drowsiness, tremors, coordination difficulties, visual disturbances, numbness, nervousness, sleep difficulties*
- **CV:** *Cardiac arrhythmias, chest pain*
- **GI:** *Nausea, vomiting, heartburn, abdominal pain, diarrhea, liver injury*
- **Hematologic:** Positive ANA, thrombocytopenia, leukopenia
- **Respiratory:** *Dyspnea*
- **Other:** *Rash*

Interactions

- ★ **Drug-drug** • Decreased mexiletine levels with hydantoin and rifampin • Increased theophylline levels and toxicity with mexiletine
- Increased mexiletine levels with propafenone

■ Nursing considerations

Assessment

- **History:** Allergy to mexiletine, HF, cardiogenic shock, hypotension, second- or third-degree heart block, hepatic disease, seizure disorders, lactation, pregnancy
- **Physical:** Weight; orientation, reflexes; P, BP, auscultation, ECG, edema; R, adventitious sounds; bowel sounds, liver evaluation; urinalysis, urine pH, CBC, electrolytes, LFTs, renal function tests

Interventions

⊗ **Black box warning** Reserve use for life-threatening arrhythmias; may have serious proarrhythmic effects.

- Monitor patient response carefully, especially when beginning therapy.
- Reduce dosage with hepatic failure.

⊗ **Warning** Monitor for safe and effective serum levels (0.5–2 mcg/mL).

Teaching points

- Take with food to reduce GI problems.
- Frequent monitoring of cardiac rhythm is needed.
- Do not stop taking this drug without consulting your health care provider.
- Return for regular follow-up visits to check your heart rhythm and to have blood tests.
- Do not change your diet. Maintain acidity level in urine. Discuss dietary change with your health care provider.
- You may experience these side effects: Drowsiness, dizziness, numbness, visual disturbances (avoid driving or working with dangerous machinery); nausea, vomiting, heartburn (eat frequent small meals); diarrhea; headache; sleep disturbances.
- Report fever, chills, sore throat, excessive GI discomfort, chest pain, excessive tremors, numbness, lack of coordination, headache, sleep disturbances.

▽ micafungin sodium

(mick ab fun' gin)

Mycamine

PREGNANCY CATEGORY C

Drug classes

Antifungal
Echinocandin

Therapeutic actions

Inhibits the synthesis of components needed for the production of fungal cell walls, leading to cell death.

Indications

- Treatment of patients with esophageal candidiasis
- Prevention of *Candida* infections in patients undergoing hematopoietic stem cell transplantation
- Treatment of candidemia, acute disseminated candidiasis, *Candida* peritonitis and abscesses

Contraindications and cautions

- Contraindicated with known hypersensitivity to micafungin.
- Use cautiously with liver impairment, renal impairment, pregnancy, lactation.

Available forms

Powder for injection—50 mg

Dosages

Adults

- *Treatment of esophageal candidiasis:* 150 mg/day by IV infusion over 1 hr for 10–30 days.
- *Prophylaxis of Candida infection:* 50 mg/day by IV infusion over 1 hr for about 19 days.
- *Treatment of Candida infections:* 100 mg/day IV infused over 1 hr for 10–47 days based on infection being treated.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: $T_{1/2}$: 14–17 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute with 5 mL 0.9% sodium chloride without bacteriostatic agent to yield 10 mg/mL using sterile technique. Swirl to mix; do not shake vigorously. Solution should be clear with no particulate matter. Protect reconstituted solution from light. Further dilute in 100 mL 0.9% sodium chloride injection. Discard any unused solution. Store diluted solution at room temperature for up to 24 hr; diluted solution protected from light, is stable for 24 hr.

Infusion: Infuse over 1 hr; flush the tubing of any running IV with 0.9% sodium chloride injection before infusing micafungin.

Incompatibilities: Do not mix in solution with any other drug; has been shown to form precipitates with many commonly used drugs.

Adverse effects

- **CNS:** Delirium, *headache*, dizziness, somnolence
- **CV:** Arrhythmias, changes in BP, cyanosis
- **GI:** Nausea, abdominal pain, vomiting, elevated liver enzymes
- **Hematologic:** Leukopenia, neutropenia, thrombocytopenia, anemia, lymphopenia, **hemolytic anemia**
- **Other: Potentially serious hypersensitivity reaction, rash, *phlebitis***

Interactions

★ **Drug-drug** • Concentrations of sirolimus and nifedipine may increase when used with micafungin; monitor for toxicity

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to micafungin, hepatic impairment, renal impairment, pregnancy, lactation
- **Physical:** Orientation, reflexes; abdominal examination; skin color, lesions; LFTs, renal function tests, CBC with differential

Interventions

- Establish baseline liver function, renal function, and CBC before beginning therapy.
- Use sterile technique in preparing solution for IV infusion, there are no bacteriostatic agents in the preparation.
- Monitor injection site for any sign of reaction or the development of *phlebitis*.
- Maintain life support equipment on hand when beginning therapy, potentially serious hypersensitivity reactions have been reported.
- Advise the use of contraceptives during therapy.
- If the patient is nursing during therapy, suggest another method of feeding the baby.
- Provide comfort measures and possible analgesics for headache and pain.
- Encourage frequent small meals if GI effects are uncomfortable.

Teaching points

- You will receive *Mycamine* as a 1-hour IV infusion each day. If you are being treated for an infection, this will last 10–47 days depending on your response. If prevention of the infection is the goal of therapy, treatment will last for about 19 days.
- If you experience shortness of breath or difficulty breathing, consult your health care provider immediately.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, another method of feeding the baby should be selected.
- It is not known how this drug could affect a fetus, if you are pregnant or decide to become pregnant while on this drug, consult your health care provider. Use of contraceptive measures is advised.
- You will need to have periodic blood tests to evaluate the effects of this drug on your body.
- You may experience these side effects: Headache (consult your health care provider, medication may be available to help); nausea, diarrhea (eating frequent small meals may help); dizziness (do not drive a car or operate hazardous machinery if this occurs).
- Report redness, pain or swelling at the IV site; changes in the color of urine or stool, rash, yellowing of the skin or eyes, difficulty breathing, increased bleeding or bruising.

miconazole nitrate*(mi kon' a zole)*

Topical: Breeze Mist Antifungal, Fungoid Tincture, Lotrimin AF, Micatin, Neosporin AF, Tetterine, Ting, Triple Paste AF, Zeasorb-AF

Vaginal suppositories, topical: Micozole (CAN), Monistat 1, Monistat 1 Combination Pack, Monistat 1 Vaginal Ovule, Monistat 3, Monistat 3 Vaginal Ovule (CAN), Monistat 7, Monistat Dual Pak, Buccal tablet: Oravig **ORIG**

PREGNANCY CATEGORY B (TOPICAL)

PREGNANCY CATEGORY C (BUCCAL)

Drug class

Antifungal

Therapeutic actions

Fungicidal: Alters fungal cell membrane permeability, causing cell death; also may alter fungal cell DNA and RNA metabolism or cause accumulation of toxic peroxides intracellularly.

Indications

- Vaginal suppositories: Local treatment of vulvovaginal candidiasis (moniliasis)
- Topical administration: Tinea pedis, tinea cruris, tinea corporis caused by *Trichophyton rubrum*, *Trichophyton mentagrophytes*, *Epidermophyton floccosum*; cutaneous candidiasis (moniliasis), tinea versicolor
- **NEW INDICATION:** Buccal tablets: Treatment of oropharyngeal candidiasis in adults and children 16 yr and older

Contraindications and cautions

- Contraindicated with allergy to miconazole or components, including milk protein concentrate (*Oravig*) used in preparation.
- Use cautiously with pregnancy, lactation.

Available forms

Vaginal suppositories—100, 200, 1,200 mg; topical cream—2%; vaginal cream—2%;

topical powder—2%; topical spray—1%, 2%; topical ointment—2%; spray powder or liquid—2%; solution—2%; buccal tablets **ORIG**—50 mg

Dosages**Adults****Vaginal suppositories**

- *Monistat 3:* Insert 1 suppository intravaginally once daily at bedtime for 3 days.
- *Monistat 7:* One applicator cream or 1 suppository in the vagina daily at bedtime for 7 days. Repeat course if needed. Alternatively, one 1,200-mg suppository at bedtime for 1 dose.

Topical

- *Cream and lotion:* Cover affected areas bid, morning and evening. Powder: Spray or sprinkle powder liberally over affected area in the morning and evening.

Buccal tablets

Apply 1 tablet (50 mg) to gum region once daily for 14 days.

Pediatric patients**Topical**

2 yr and older: Use adult dosage.

Younger than 2 yr: Not recommended.

Pharmacokinetics

Route	Onset	Peak
Topical	Rapid	Unknown
Vaginal	Unknown	Unknown

Metabolism: Hepatic; $T_{1/2}$: 21–24 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects**Vaginal suppositories**

- **Local:** Irritation, sensitization or vulvovaginal burning, pelvic cramps
- **Other:** Rash, headache

Topical application

- **Local:** Irritation, burning, maceration, allergic contact dermatitis

Buccal tablets

- **CNS:** Headache
- **GI:** Nausea, vomiting, diarrhea, abdominal pain, dyspepsia

■ Nursing considerations

Assessment

- **History:** Allergy to miconazole or components used in preparation; lactation, pregnancy
- **Physical:** Skin color, lesions, area around lesions; T; orientation, affect; culture of area involved

Interventions

- Culture fungus involved before therapy.
- Insert vaginal suppositories high into the vagina; have patient remain recumbent for 10–15 min after insertion; provide sanitary napkin to protect clothing from stains.
- Apply buccal tablet to gum area once daily; ensure that patient does not cut, crush, or chew tablet.
- Monitor response; if none is noted, arrange for further cultures to determine causative organism.
- Apply lotion to intertriginous areas if topical application is required; if cream is used, apply sparingly to avoid maceration of the area.
- Ensure patient receives the full course of therapy to eradicate the fungus and to prevent recurrence.

⊗ **Warning** Discontinue topical or vaginal administration if rash or sensitivity occurs.

Teaching points

- Take the full course of drug therapy even if symptoms improve. Continue during menstrual period even if vaginal route is being used. Long-term use will be needed; beneficial effects may not be seen for several weeks.
- Place buccal tablet in gum region once daily; do not cut, crush, or chew tablet.
- Insert vaginal suppositories high into the vagina.
- Use hygiene measures to prevent reinfection or spread of infection.
- This drug is for the fungus being treated; do not self-medicate other problems with this drug.
- Refrain from sexual intercourse, or advise partner to use a condom to avoid reinfection; with vaginal form of drug, use a sanitary napkin to prevent staining of clothing.

- Avoid pregnancy while using buccal tablets; contraceptive use is advised.
- You may experience these side effects: Irritation, burning, stinging.
- Report local irritation, burning (topical application); rash, irritation, pelvic pain (vaginal use).

■ DANGEROUS DRUG

midazolam hydrochloride

(*mid ay' zob lam*)

Apo-Midazolam (CAN)

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Benzodiazepine (short-acting)
CNS depressant

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at the limbic system and reticular formation; potentiates the effects of GABA, an inhibitory neurotransmitter; anxiolytic and amnesia effects occur at doses below those needed to cause sedation, ataxia; has little effect on cortical function.

Indications

- IV or IM: Sedation, anxiolysis, and amnesia prior to diagnostic, therapeutic, or endoscopic procedures or surgery
- Induction of general anesthesia
- Continuous sedation of intubated and mechanically ventilated patients as a component of anesthesia or during treatment in the critical care setting
- Unlabeled uses: Treatment of epileptic seizure or refractory status epilepticus

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, allergy to cherries (syrup), psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication, pregnancy (cleft lip or palate, inguinal hernia, cardiac defects, microcephaly, pyloric stenosis have been reported when used in

first trimester; neonatal withdrawal syndrome reported in infants) and in neonates.

- Use cautiously in elderly or debilitated patients; in patients being treated for open-angle glaucoma; with impaired liver or renal function, lactation.

Available forms

Injection—5 mg/mL, 1 mg/mL, syrup—2 mg/mL

Dosages

⊗ **Black box warning** Midazolam should only be administered by a person trained in general anesthesia and with equipment for maintaining airway and resuscitation on hand; respiratory depression and respiratory arrest can occur. Administer IV with continuous monitoring of respiratory and CV function. Individualize dosage; use lower dosage in the elderly and debilitated patients. Adjust dosage according to use of other premedication.

⊗ **Warning** Rapid injection should be avoided in neonates, especially when given with fentanyl.

⊗ **Warning** Midazolam syrup has been associated with respiratory depression and arrest, especially when given with opioids.

Adults

- *Preoperative sedation, anxiety, amnesia:*
Younger than 60 yr: 70–80 mcg/kg IM 1 hr before surgery (usual dose, 5 mg).
Older than 60 yr or debilitated: 20–50 mcg/kg IM 1 hr before surgery (usual dose, 1–3 mg).
- *Conscious sedation for short procedures:*
Younger than 60 yr: 1–2.5 mg IV initially, maintenance dose of 25% of initial dose; total dose, 5 mg.
Older than 60 yr: 1–1.5 mg IV initially, maintenance dose of 25% initial dose; total dose, 3.5 mg.
- *Induction of anesthesia:*
Younger than 55 yr: 300–350 mcg/kg IV (up to a total of 600 mcg/kg).
Older than 55 yr: 150–300 mcg/kg IV as initial dose.
Debilitated adults: 200–250 mcg/kg IV as initial dose.

- *Sedation in critical care areas:* 10–50 mcg/kg (0.5–4 mg usual dose) as a loading dose; may repeat every 10–15 min until desired effect is seen; continuous infusion of 20–100 mcg/kg/hr to sustain effect.

Pediatric patients

- *Preoperative sedation, anxiety, amnesia:*
6 mo–16 yr: 0.1–0.15 mg/kg IM; do not exceed 10 mg/dose.
- *Conscious sedation for short procedures:*
Older than 12 yr: 1–2.5 mg IV initially, maintenance dose of 25% of initial dose.
- *Conscious sedation for short procedures prior to anesthesia:*
6–12 yr: 25–50 mcg/kg IV initially. Up to 400 mcg/kg may be used; do not exceed 10 mg/dose.
6 mo–5 yr: 50–100 mcg/kg IV. Do not exceed 6 mg total dose.
- *Sedation in critical care areas for intubated patients only:* 50–200 mcg/kg IV as a loading dose, then continuous infusion of 60–120 mcg/kg/hr.
Neonates older than 32 wk gestation: 60 mcg/kg/hr IV.
Neonates younger than 32 wk gestation: 30 mcg/kg/hr IV.

IV FACTS

Preparation: Do not mix with other solutions; do not mix in plastic bags or tubing; may be used undiluted or diluted in D₅W, 0.9% normal saline, or lactated Ringer's.

Infusion: Inject slowly into large vein over 2 min, monitoring patient response.

Y-site incompatibilities: Albumin, ampicillin, ceftazidime, cefuroxime, clonidine, dexamethasone, foscarnet, furosemide, hydrocortisone, methotrexate, nafcillin, omeprazole, sodium bicarbonate.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	15 min	30 min	2–6 hr
IV	3–5 min	Less than 30 min	2–6 hr

Metabolism: Hepatic metabolism; T_{1/2}: 1.8–6.8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Transient and mild drowsiness (initially), sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms, mild paradoxical excitatory reactions (during first 2 wk of treatment), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **CV:** Bradycardia, tachycardia, CV collapse, hypertension, hypotension, palpitations, edema
- **Dependence:** Drug dependence with withdrawal syndrome when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)
- **Dermatologic:** Urticaria, pruritus, skin rash, dermatitis
- **GI:** Constipation, diarrhea, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes: LDH, alkaline phosphatase, AST, ALT, hepatic impairment, jaundice
- **GU:** Incontinence, urine retention, changes in libido, menstrual irregularities
- **Hematologic:** Decreased Hct, blood dyscrasias
- **Other:** Phlebitis and thrombosis at IV injection sites, hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia; pain, burning, and redness after IM injection

Interactions

• **Drug-drug** • Risk of increased CNS depression if combined with alcohol, antihistamines, opioids, other sedatives; protease inhibitors, decrease midazolam dose by up to 50% if any of these combinations are used • Decreased effectiveness if given with carbamazepine, phenytoin, rifampin,

rifabutin, phenobarbital; monitor patient's response carefully

• **Drug-food** • Decreased metabolism and increased effects of midazolam with grapefruit juice; avoid this combination

Nursing considerations Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs; elderly or debilitated; impaired liver or renal function; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes, sensory nerve function, ophthalmologic examination; P, BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; normal output; LFTs, renal function tests, CBC

Interventions

⊗ **Warning** Do not administer intra-arterially, which may produce arteriospasm or gangrene.

- Do not use small veins (dorsum of hand or wrist) for IV injection.
- Administer IM injections deep into muscle.
- Monitor IV injection site for extravasation.
- Arrange to reduce dosage of midazolam if patient is also being given opioid analgesics; reduce dosage by at least 50% and monitor patient closely.
- Monitor level of consciousness before, during, and for at least 2–6 hr after administration of midazolam.
- Carefully monitor P, BP, and respirations carefully during administration.

⊗ **Warning** Keep resuscitative facilities readily available; have flumazenil available as antidote if overdose should occur.

- Keep patients in bed for 3 hr; do not permit ambulatory patients to operate a vehicle following an injection.
- Arrange to monitor liver and renal function and CBC at intervals during long-term therapy.
- Establish safety precautions if CNS changes occur (use side rails, accompany ambulating patient).
- Provide comfort measures and reassurance for patients receiving diazepam for tetanus.

- Arrange to taper dosage gradually after long-term therapy.
- Provide patient with written information regarding recovery and follow-up care. Midazolam is a potent amnesiac and memory may be altered.

Teaching points

- This drug will help you to relax and will make you go to sleep; this drug is a potent amnesiac and you will not remember what has happened to you.
- Avoid using alcohol or sleep-inducing or over-the-counter drugs before receiving this drug. If you feel that you need one of these preparations, consult your health care provider.
- You may experience these side effects: Drowsiness, dizziness (these may become less pronounced after a few days; avoid driving a car or engaging in other dangerous activities if these occur); GI upset; dreams, difficulty concentrating, fatigue, nervousness, crying (it may help to know that these are effects of the drug; consult your health care provider if these become bothersome).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, visual or hearing disturbances, difficulty voiding.

▶ midodrine

See Appendix U, *Less commonly used drugs*.

▶ mifepristone (RU-486)

(*miff'eb prist' own*)

Mifeprex

PREGNANCY CATEGORY X

Drug class

Abortifacient

Therapeutic actions

Acts as an antagonist of progesterone sites in the endometrium, allowing prostaglandins to stimulate uterine contractions, causing implanted trophoblast to separate from the pla-

cental wall; may also decrease placental viability and accelerate degenerative changes resulting in sloughing of the endometrium.

Indications

- Termination of pregnancy through 49 days gestational age; most effective when combined with a prostaglandin
- Unlabeled uses: Postcoital contraception, endometriosis, unresectable meningioma, fetal death, or nonviable early pregnancy

Contraindications and cautions

- Contraindicated with allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease; undiagnosed adrenal mass; hemorrhagic disorder, anticoagulation; ectopic pregnancy; and in patients with an IUD in place.
- Use cautiously with history of asthma; anemia, jaundice, diabetes, epilepsy, scarred uterus, cervicitis, infected endocervical lesions, acute vaginitis.

Available forms

Tablets—200 mg

Dosages

Adults

Day 1: 600 mg (3 tablets) PO taken as a single dose. Day 3: If termination of pregnancy cannot be confirmed, 400 mcg (2 tablets) misoprostol (*Cytotec*). Day 14: Evaluation for termination of pregnancy; if unsuccessful, surgical intervention is suggested at this time.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–3 hr

Metabolism: Tissue; $T_{1/2}$: 18 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **GI:** *Vomiting, diarrhea, nausea, abdominal pain*
- **GU:** Heavy uterine bleeding, endometritis, uterine or vaginal pain

- **Other:** Potentially serious to fatal infection

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between mifepristone and misoprostol and between *Mifeprex* and *Mirapex* (pramipexole); use extreme caution.

Assessment

- **History:** Allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease; history of asthma; hypotension; hypertension; CV, adrenal, renal, or hepatic disease; anemia; jaundice; diabetes; epilepsy; scarred uterus; cervicitis, infected endocervical lesions, acute vaginitis
- **Physical:** T; BP, P; auscultation; bowel sounds, liver evaluation; vaginal discharge, pelvic examination, uterine tone; LFTs, renal function tests, WBC count, urinalysis, CBC

Interventions

⊗ **Black box warning** Serious or fatal infection may develop after abortion. Monitor patient for sustained fever, prolonged heavy bleeding, severe abdominal pain. Urge patient to seek emergency medical help if these occur.

- Provide appropriate referrals and counseling for abortion.
- Alert patient that menses usually begins within 5 days of treatment and lasts for 1–2 wk.
- Arrange to follow drug within 48 hr with a prostaglandin (*Cytotec*) as appropriate.

⊗ **Warning** Ensure that abortion is complete or that other measures are used to complete the abortion if drug effects are not sufficient.

- Prepare for dilatation and curettage if heavy bleeding does not resolve.
- Provide analgesic and antiemetic as needed to increase comfort.
- Ensure patient follow-up; serious to fatal infections have been reported.

Teaching points

Teaching about mifepristone should be incorporated into the total teaching plan for the patient undergoing an abortion; specific information that should be included follows:

- Menses begins within 5 days of treatment and will last 1–2 weeks.
- You may experience these side effects: Nausea, vomiting, diarrhea (medication may be ordered); uterine or vaginal pain, headache (an analgesic may be ordered).
- Be aware that another pregnancy could occur before normal menses begin; start contraception as soon as termination of pregnancy is confirmed and sexual intercourse is resumed.
- Report immediately sustained fever, severe abdominal pain, prolonged heavy bleeding, dizziness on arising, or persistent malaise.

DANGEROUS DRUG

▽ **miglitol**
(mig' lab tall)

Glyset

PREGNANCY CATEGORY B

Drug classes

Alpha-glucosidase inhibitor
Antidiabetic

Therapeutic actions

An alpha-glucosidase inhibitor that delays the digestion of ingested carbohydrates, leading to a smaller increase in blood glucose following meals and a decrease in glycosylated Hgb; does not enhance insulin secretion and so its effects are additive to those of the sulfonylureas in controlling blood glucose.

Indications

- Adjunct to diet and exercise to lower blood glucose in patients with type 2 diabetes mellitus whose hyperglycemia cannot be managed by diet and exercise alone
- Combination therapy with a sulfonylurea to enhance glycemic control in those patients with type 2 diabetes who do not receive adequate control with diet and either drug

Contraindications and cautions

- Contraindicated with hypersensitivity to the drug; diabetic ketoacidosis; cirrhosis; inflammatory bowel disease; intestinal obstruction or predisposition to intestinal

obstruction; colon ulceration; type 1 diabetes; conditions that would deteriorate with increased gas in the bowel.

- Use cautiously with renal impairment, pregnancy, lactation.

Available forms

Tablets—25, 50, 100 mg

Dosages

Adults

- **Monotherapy:** Initial dose, 25 mg PO tid at the first bite of each meal; may start at 25 mg PO daily if severe GI effects are seen. After 4–8 wk, start maintenance, 50 mg PO tid at first bite of each meal. Maximum dose, 100 mg PO tid.
- **Combination with a sulfonylurea:** Blood glucose may be much lower; monitor closely and adjust dosages of each drug accordingly.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–3 hr

Metabolism: Not metabolized; $T_{1/2}$: 2 hr

Distribution: Very little

Excretion: Urine

Adverse effects

- **Dermatologic:** Rash
- **Endocrine:** *Hypoglycemia* (taken in combination with other antidiabetic drugs)
- **GI:** Abdominal pain, flatulence, diarrhea, anorexia, nausea, vomiting

Interactions

- **Drug-drug** • Decreased bioavailability and effectiveness of propranolol, ranitidine
- Miglitol is less effective if taken with digestive enzymes or charcoal; avoid combining
- **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

Nursing considerations

Assessment

- **History:** Hypersensitivity to the drug; diabetic ketoacidosis; cirrhosis; inflammatory bowel disease; intestinal obstruction or predisposition to intestinal obstruction; type 1 diabetes; conditions that would deteriorate with increased gas in the bowel; renal impairment; pregnancy; lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, blood glucose, renal function tests

Interventions

- Give drug tid with the first bite of each meal.
- Monitor serum glucose levels often to determine effectiveness of drug and dosage.
- Tell patient abdominal pain and flatulence are likely.
- Arrange for consult with dietitian to establish weight loss program and dietary control as appropriate. Plan thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, and hygiene.

Teaching points

- Do not discontinue this medication without consulting your health care provider.
- Take this drug three times a day with the first bite of each meal.
- Monitor blood for glucose and ketones as prescribed.
- Continue diet and exercise program established for control of diabetes.
- You may experience these side effects: Abdominal pain, flatulence, bloating.
- Report fever, sore throat, unusual bleeding or bruising, severe abdominal pain.

miglustat

See Appendix U, *Less commonly used drugs.*

milnacipran

See Appendix U, *Less commonly used drugs.*

DANGEROUS DRUG**milrinone lactate***(mill'ri none)*

PREGNANCY CATEGORY C

Drug class

Inotropic

Therapeutic actions

Increases force of contraction of ventricles (positive inotropic effect); causes vasodilation by a direct relaxant effect on vascular smooth muscle.

Indications

- Heart failure: Short-term IV management of patients with acute decompensated heart failure

Contraindications and cautions

- Contraindicated with allergy to milrinone or bisulfites; severe aortic or pulmonic valvular disease.
- Use cautiously in the elderly, and with pregnancy, lactation.

Available forms

Injection—1 mg/mL; premixed injection—0.2 mg/mL

Dosages**Adults**

Loading dose, 50 mcg/kg IV bolus, given over 10 min. Maintenance infusion, 0.375–0.75 mcg/kg/min. Do not exceed a total of 1.13 mg/kg/day.

Pediatric patients

Not recommended.

Patients with renal impairment

Do not exceed 1.13 mg/kg/day. For patients with renal impairment, refer to this table:

CrCl (mL/min)	Infusion Rate (mcg/kg/min)
5	0.2
10	0.23
20	0.28
30	0.33
40	0.38
50	0.43

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	5–15 min	8 hr

Metabolism: Hepatic; $T_{1/2}$: 2.3–2.5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Add diluent of 0.45% or 0.9% sodium chloride injection, USP or 5% dextrose injection, USP. Add 180 mL per 20-mg vial to prepare solution of 100 mcg/mL; 113 mL per 20-mg vial to prepare a solution of 150 mcg/mL; add 80 mL diluent to 20-mg vial to prepare solution of 200 mcg/mL. Or, premixed infusion may be used without further dilution.

Infusion: Administer while carefully monitoring patient's hemodynamic and clinical response; see manufacturer's insert for detailed guidelines.

Incompatibility: Do not mix directly with other drugs. Furosemide should not be administered through same IV line because precipitate may form.

Adverse effects

- **CNS:** Headache
- **CV:** *Ventricular arrhythmias*, hypotension, supraventricular arrhythmias, chest pain, angina, **death**
- **Hematologic:** Thrombocytopenia, hypokalemia

Interactions

★ **Drug-drug** • Precipitate formation in solution if given in the same IV line with furosemide; avoid this combination

Nursing considerations Assessment

- **History:** Allergy to milrinone or bisulfites, severe aortic or pulmonic valvular disease, lactation, pregnancy
- **Physical:** Weight, orientation, P, BP, cardiac auscultation, peripheral pulses and perfusion, R, adventitious sounds, serum electrolyte levels, platelet count, ECG, renal function tests

Interventions

- Monitor cardiac rhythm continually.
- Monitor BP and P and reduce dose if marked decreases occur.
- Monitor I & O and electrolyte levels.

Teaching points

- You will need frequent monitoring of your blood pressure, pulse, and heart activity during therapy.
- You may experience increased voiding; appropriate bathroom arrangements will be made.
- Report pain at IV injection site, numbness or tingling, shortness of breath, chest pain.

minocycline hydrochloride

(mi noe sye' kleen)

Apo-Minocycline (CAN), Arestin, Cleervue-M, Dynacin, Gen-Minocycline (CAN), Minocin, Myrac, ratio-Minocycline (CAN), Solodyn

PREGNANCY CATEGORY D

Drug classes

Antibiotic
Tetracycline

Therapeutic actions

Bacteriostatic: Inhibits protein synthesis of susceptible bacteria, causing cell death.

Indications

- Infections caused by rickettsiae; *Mycoplasma pneumoniae*; agents of psittacosis, ornithosis, lymphogranuloma venereum and granuloma inguinale; *Borrelia recurrentis*; *Haemophilus ducreyi*; *Pasteurella pestis*; *Pasteurella tularensis*; *Bartonella bacilliformis*; *Bacteroides*; *Vibrio comma*; *Vibrio fetus*; *Brucella*; *Escherichia coli*; *Enterobacter aerogenes*; *Shigella*; *Acinetobacter calcoaceticus*; *Haemophilus influenzae*; *Klebsiella*; *Diplococcus pneumoniae*; *Staphylococcus aureus*, *Streptococcus pneumoniae*

- When penicillin is contraindicated, infections caused by *Neisseria gonorrhoeae*, *Treponema pallidum*, *Treponema pertenuis*, *Listeria monocytogenes*, *Clostridium*, *Bacillus anthracis*, *Fosobacterium fusiforme*, *Actinomyces israelii*
- As an adjunct to amebicides in acute intestinal amebiasis
- Oral tetracyclines are indicated for treatment of severe acne, uncomplicated urethral, endocervical, or rectal infections in adults caused by *Chlamydia trachomatis*
- Treatment of inflammatory lesions of non-nodule, moderate to severe acne vulgaris in patients 12 yr and older (ER tablets)
- Oral minocycline is indicated in treatment of asymptomatic carriers of *N. meningitidis* (not useful for treating the infection); infections caused by *Mycobacterium marinum*; uncomplicated urethral, endocervical, or rectal infections caused by *Ureaplasma urealyticum*; uncomplicated gonococcal urethritis in men due to *N. gonorrhoeae*
- *Arestin*: Adjunct to scaling and root planing to reduce pocket depth in patients with adult periodontitis
- Unlabeled use: Alternative to sulfonamides in the treatment of nocardiosis; treatment of early rheumatoid arthritis, gallbladder infection caused by *Escherichia coli*

Contraindications and cautions

- Contraindicated with allergy to tetracyclines.
- Use cautiously with renal or hepatic impairment, pregnancy, lactation, asthma.

Available forms

Capsules—50, 75, 100 mg; pellet-filled capsules—50, 100 mg; oral suspension—50 mg/5 mL; tablets—50, 75, 100 mg; sustained release microsphere—1 mg; ER tablets—45, 55, 80, 90, 105, 115, 135 mg; injection—100 mg/vial

Dosages

Adults

200 mg initially, followed by 100 mg every 12 hr PO. May be given as 100–200 mg initially and then 50 mg qid PO.

- *Syphilis*: Usual PO dose for 10–15 days.

- *Urethral, endocervical, rectal infections:* 100 mg every 12 hr PO for 7 days.
- *Gonococcal urethritis in men:* 100 mg bid PO for 5 days.
- *Gonorrhea:* 200 mg PO followed by 100 mg every 12 hr for 4 days; get post-therapy cultures within 2–3 days.
- *Meningococcal carrier state:* 100 mg every 12 hr PO for 5 days.
- *Adult periodontitis:* Unit dose cartridge discharged in subgingival area.
- *Moderate to severe acne vulgaris (12 yr and older):* 1 mg/kg/day PO for up to 12 wk (ER tablets).

IV

200 mg followed by 100 mg every 12 hr. Do not exceed 400 mg/day. Switch to oral form as soon as possible.

Pediatric patients older than 8 yr

4 mg/kg PO followed by 2 mg/kg every 12 hr PO.

ER tablets

Once daily based on patient weight:

45–59 kg: 45 mg

60–90 kg: 90 mg

91–136 kg: 135 mg

IV

4 mg/kg followed by 2 mg/kg every 12 hr. Switch to oral form as soon as possible.

Geriatric patients or patients with renal failure

Decrease recommended dosage; increase dosing interval with renal impairment. Do not exceed 200 mg *Mimocin* in 24 hr in patients with renal impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 11–24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute with 5 mL sterile water for injection and immediately dilute with 500–1,000 mL sodium chloride injection, dextrose, dextrose and sodium chloride injection, Ringer's injection, or lactated Ringer's.

Administer immediately. Stable 24 hr at room temperature. Discard unused portion.

Infusion: Avoid rapid administration.

Incompatibilities: Do not mix in solution with other drugs, calcium, or whole blood.

Adverse effects

- **Dental:** *Discoloring and inadequate calcification of primary teeth of fetus if used by pregnant women; discoloring and inadequate calcification of permanent teeth if used during period of dental development*
- **Dermatologic:** *Phototoxic reactions, rash, exfoliative dermatitis (more frequent and severe with this tetracycline than with others)*
- **GI:** *Fatty liver, liver failure, anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, esophageal ulcer, dyspepsia*
- **Hematologic:** *Hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia, leukocytosis, leukopenia*
- **Local:** *Local irritation at injection site*
- **Other:** *Superinfections, nephrogenic diabetes insipidus syndrome*

Interactions

★ **Drug-drug** • Decreased absorption of minocycline with antacids, iron, alkali • Increased digoxin toxicity • Decreased activity of penicillin

★ **Drug-food** • Decreased absorption of minocycline if taken with food, dairy products

Nursing considerations**Assessment**

- **History:** Allergy to tetracyclines, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin status, orientation and reflexes, R and adventitious sounds, GI function and liver evaluation, urinalysis and BUN, LFTs, renal function tests; culture of infected area

Interventions

- Administer oral medication without regard to food or meals; if GI upset occurs, give with meals.
- Reserve IV use for situations in which oral use is not possible. Switch from IV to oral route as soon as possible.

Teaching points

- Take drug throughout the day for best results.
- Take with meals if GI upset occurs.
- *Arestin*: After treatment, avoid eating hard, crunchy, or sticky foods for 1 week and postpone brushing for 12 hours.
- You may experience these side effects: Sensitivity to sunlight (wear protective clothing, use sunscreen); diarrhea, nausea (take with meals; eat frequent small meals).
- Report rash, itching; difficulty breathing; dark urine or light-colored stools; severe cramps, watery diarrhea.

minoxidil (*mi nox' i dill*)

Topical: Rogaine, Rogaine Extra Strength

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Vasodilator

Therapeutic actions

Acts directly on vascular smooth muscle to cause vasodilation, reducing elevated systolic and diastolic BP; does not interfere with CV reflexes; does not usually cause orthostatic hypotension but does cause reflex tachycardia and renin release, leading to sodium and water retention; mechanism in stimulating hair growth is not known, possibly related to arterial dilation.

Indications

- Severe hypertension that is symptomatic or associated with target organ damage and is not manageable with maximum therapeutic doses of a diuretic plus two other antihypertensive drugs; use in milder hypertension not recommended
- Topical use (when compounded as a 1%–5% lotion or 1% ointment): Alopecia areata and male pattern alopecia

Contraindications and cautions

- Contraindicated with hypersensitivity to minoxidil or any component of the topical

preparation (topical); pheochromocytoma (may stimulate release of catecholamines from tumor); acute MI; dissecting aortic aneurysm; lactation.

- Use cautiously with malignant hypertension, HF (use diuretic), angina pectoris (use a beta-blocker), pregnancy.

Available forms

Tablets—2.5, 10 mg; topical 2%, 5%

Dosages

Adults and patients 12 yr and older

Oral

- *Monotherapy*: Initial dosage is 5 mg/day PO as a single dose. Daily dosage can be increased to 10, 20, then 40 mg in single or divided doses. Effective range is usually 10–40 mg/day PO. Maximum dosage is 100 mg/day. If supine diastolic BP has been reduced less than 30 mm Hg, administer the drug only once a day. If reduced more than 30 mm Hg, divide the daily dose into two equal parts. Dosage adjustment should normally be at least at 3-day intervals; in emergencies, every 6 hr with careful monitoring is possible.
- *Concomitant therapy with diuretics*: Use minoxidil with a diuretic in patients relying on renal function for maintaining salt and water balance; the following diuretic dosages have been used when starting minoxidil therapy: Hydrochlorothiazide, 50 mg bid; chlorthalidone, 50–100 mg daily; furosemide, 40 mg bid. If excessive salt and water retention result in weight gain more than 5 lb, change diuretic therapy to furosemide; if patient already takes furosemide, increase dosage.
- *Concomitant therapy with beta-adrenergic blockers or other sympatholytics*: The following dosages are recommended when starting minoxidil therapy: Propranolol, 80–160 mg/day; other beta blockers, dosage equivalent to the above; methyl dopa 250–750 mg bid (start methyl dopa at least 24 hr before minoxidil); clonidine, 0.1–0.2 mg bid.

Topical

Apply 1 mL to the total affected areas of the scalp twice daily. The total daily dosage should not exceed 2 mL. Twice daily application for

longer than 4 mo may be required before evidence of hair regrowth is observed. Once hair growth is realized, twice daily application is necessary for continued and additional hair regrowth. Balding process reported to return to untreated state 3–4 mo after cessation of the drug.

Pediatric patients younger than 12 yr

Experience is limited, particularly in infants; use recommendations as a guide; careful adjustment is necessary. Initial dosage is 0.2 mg/kg/day PO as a single dose. May increase by 50%–100% increments until optimum BP control is achieved. Effective range is usually 0.25–1 mg/kg/day; maximum dose is 50 mg daily. Experience in children is limited; monitor carefully.

Geriatric patients or patients with impaired renal function

Smaller doses may be required; closely supervise to prevent cardiac failure or exacerbation of renal failure.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	2–3 hr	75 hr

Metabolism: Hepatic; $T_{1/2}$: 4.2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Fatigue, headache
- **CV:** Tachycardia (unless given with beta-adrenergic blocker or other sympatholytic drug), pericardial effusion and tamponade; *changes in direction and magnitude of T-waves*; cardiac necrotic lesions (reported in patients with known ischemic heart disease, but risk of minoxidil-associated cardiac damage cannot be excluded)
- **Dermatologic:** *Temporary edema, hypertrichosis* (elongation, thickening, and enhanced pigmentation of fine body hair occurring within 3–6 wk of starting therapy; usually first noticed on temples, between eyebrows and extending to other parts of face, back, arms, legs, scalp); rashes including bullous eruptions; **Stevens-Johnson syndrome**; darkening of the skin

- **GI:** Nausea, vomiting
- **Hematologic:** Initial decrease in Hct, Hgb, RBC count
- **Local:** *Irritant dermatitis, allergic contact dermatitis, eczema, pruritus, dry skin or scalp, flaking, alopecia* (topical use)
- **Respiratory:** *Bronchitis, upper respiratory infection, sinusitis* (topical use)

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to minoxidil or any component of the topical preparation; pheochromocytoma; acute MI, dissecting aortic aneurysm; malignant hypertension; heart failure; angina pectoris; lactation, pregnancy
- **Physical:** Skin color, lesions, hair, scalp; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; bowel sounds, normal output; CBC with differential, renal function tests, urinalysis, ECG

Interventions

- Apply topical preparation to affected area; if you use your fingers, wash hands thoroughly afterward.
- Do not apply other topical drugs, including topical corticosteroids, retinoids, and petrolatum or agents known to enhance cutaneous drug absorption.
- Do not apply topical preparation to open lesions or breaks in the skin, which could increase risk of systemic absorption.

⊗ **Warning** Arrange to withdraw oral drug gradually, especially from children; rapid withdrawal may cause a sudden increase in BP (rebound hypertension has been reported in children, even with gradual withdrawal; use caution and monitor BP closely when withdrawing from children).

⊗ **Black box warning** Arrange for echocardiographic evaluation of possible pericardial effusion if using oral drug; more vigorous diuretic therapy, dialysis, other treatment (including minoxidil withdrawal) may be required.

Teaching points

Oral

- Take this drug exactly as prescribed. Take all other medications that have been prescribed. Do not discontinue any drug or reduce the

dosage without consulting your health care provider.

- You may experience these side effects: Enhanced growth and darkening of fine body and face hair (do not discontinue medication without consulting your health care provider); GI upset (eat frequent small meals).
- Report increased heart rate of 20 beats or more per minute over normal (your normal heart rate is ___ beats per minute); rapid weight gain of more than 5 pounds; unusual swelling of the extremities, face, or abdomen; difficulty breathing, especially when lying down; new or aggravated symptoms of angina (chest, arm, or shoulder pain); severe indigestion; dizziness, light-headedness, or fainting.

Topical

- Apply the prescribed amount to the affected area twice a day. If using your fingers, wash hands thoroughly after application. It may take 4 months or longer for any noticeable hair regrowth to appear. Response to this drug is very individual. If no response is seen within 4 months, consult your health care provider about efficacy of continued use.
- Do not apply more frequent or larger applications. This will not speed up or increase hair growth but may increase side effects.
- If one or two daily applications are missed, restart twice-daily applications, and return to usual schedule. Do not attempt to make up missed applications.
- Do not apply any other topical medication to the area while you are using this drug.
- Do not apply to any sunburned, broken skin or open lesions; this increases the risk of systemic effects. Do not apply to any part of the body other than the scalp.
- Twice-daily use of the drug will be needed to retain or continue the hair regrowth.

mirtazapine

(*mer tab' zab peen*)

Gen-Mirtazapine (CAN), Novo-Mirtazapine OD (CAN), Remeron, Remeron SolTab , Sandoz-Mirtazapine (CAN)

PREGNANCY CATEGORY C

Drug class

Antidepressant (tetracyclic)

Therapeutic actions

Mechanism of action unknown; appears to act similarly to TCAs, which inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; sedating; relation of these effects to clinical efficacy is unknown.

Indications

- Treatment of major depressive disorder
- Unlabeled uses: Chronic urticaria, hot flashes, drug-induced hyperhidrosis, pruritus, prevention of migraines in adults

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic or tetracyclic drug; concomitant therapy with an MAOI; pregnancy (limb reduction abnormalities reported); lactation.
- Use cautiously with ECT; preexisting CV disorders (eg, severe coronary heart disease, progressive HF, angina pectoris, paroxysmal tachycardia [possible increased risk of serious CVS toxicity with TCAs]); angle-closure glaucoma, increased IOP; urine retention, ureteral or urethral spasm; seizure disorders (TCAs lower the seizure threshold); hyperthyroidism (predisposes to CVS toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis with TCAs); bipolar disorder (may shift to hypomanic or manic phase); elective surgery (TCAs should be discontinued as long as possible before surgery).

Available forms

Tablets—7.5, 15, 30, 45 mg; orally disintegrating tablet —15, 30, 45 mg

Dosages

Adults

Initial dose, 15 mg PO daily, as a single dose in evening. May be increased up to 45 mg/day as needed. Change dose only at intervals greater

than 1–2 wk. Continue treatment for up to 6 mo for acute episodes.

- **Switching from MAOI:** Allow at least 14 days between discontinuation of MAOI and beginning of mirtazapine therapy. Allow 14 days after stopping mirtazapine before starting MAOI.

Pediatric patients

Not recommended in patients younger than 18 yr.

Geriatric patients and patients with renal or hepatic impairment

Give lower doses to patients older than 60 yr; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	2–4 hr	2–4 wk

Metabolism: Hepatic; $T_{1/2}$: 20–40 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects, confusion* (especially in elderly), *disturbed concentration, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, agitation* (less likely with this drug than with other antidepressants)
- **CV:** Orthostatic hypotension, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, **heart block**, precipitation of heart failure, **stroke**
- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; inappropriate ADH secretion
- **GI:** *Dry mouth, constipation, paralytic ileus, nausea* (less likely with this drug than with other antidepressants), *increased appetite, weight gain, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, liver enzyme elevations*

- **GU:** Urine retention, delayed micturition, dilation of urinary tract, gynecomastia, testicular swelling in men; breast enlargement, menstrual irregularity, galactorrhea in women; increased or decreased libido; impotence
- **Hematologic:** **Agranulocytosis**, *neutropenia*
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema

Interactions

★ **Drug-drug** ☒ **Warning** Risk of serious, sometimes fatal reactions if combined with MAOIs; do not use this combination or within 14 days of MAOI therapy.

Nursing considerations Assessment

- **History:** Hypersensitivity to any antidepressant; concomitant therapy with MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; ECT; pre-existing CV disorders; angle-closure glaucoma, increased IOP; urine retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric problems; bipolar disorder; elective surgery; pregnancy, lactation
- **Physical:** Body weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, renal function tests; ECG

Interventions

- ☒ **Black box warning** Ensure that depressed and potentially suicidal patients have access only to limited quantities of the drug; increased risk of suicidality in children, adolescents, and young adults. Monitor accordingly.
- Administer orally disintegrating tablets to patients who have difficulty swallowing: Open blister pack and have patient place tablet on tongue. Do not split tablet or allow patient to chew tablet.
- Expect clinical response in 3–7 days up to 3 wk (latter is more usual).

- Arrange for CBC if patient develops fever, sore throat, or other sign of infection during therapy.
- Establish safety precautions if CNS changes occur (raise side rails, accompany patient when ambulating).

Teaching points

- Take this drug exactly as prescribed; do not stop taking the drug abruptly or without consulting your health care provider.
- Place orally disintegrating tablet on tongue; it can be swallowed without water. Open blister pack with dry hands and use tablet immediately; do not cut, break, or chew tablet.
- Avoid using alcohol, other sleep-inducing drugs, or over-the-counter drugs while using this drug.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments if long exposure to sunlight is unavoidable.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals; use frequent mouth care, suck on sugarless candies); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report fever, flulike symptoms, any infection, dry mouth, difficulty urinating, excessive sedation, suicidal thoughts.

misoprostol

(mye soe **prost'** ole)

Apo-Misoprostol (CAN), Cytotec

PREGNANCY CATEGORY X

Drug class

Prostaglandin

Therapeutic actions

Asynthetic prostaglandin E₁ analogue; inhibits gastric acid secretion and increases bicarbonate and mucus production, protecting the lining of the stomach.

Indications

- Prevention of NSAID (including aspirin)-induced gastric ulcers in patients at high risk of complications from a gastric ulcer (the elderly; patients with concomitant debilitating disease, history of ulcers)
- With mifepristone as an abortifacient (see mifepristone)
- Unlabeled use: Appears effective in treating but not preventing duodenal ulcers in patients unresponsive to histamine-2 antagonists; cervical ripening and labor induction; postpartum hemorrhage; chronic idiopathic constipation

Contraindications and cautions

- Contraindicated with history of allergy to prostaglandins; pregnancy (abortifacient; advise women of childbearing age in written and oral form of use, have a negative serum pregnancy test within 2 wk prior to therapy, provide contraceptives, and begin therapy on the second or third day of the next normal menstrual period); lactation.
- Use cautiously in the elderly, and with renal impairment, duodenal ulcers.

Available forms

Tablets—100, 200 mcg

Dosages

Adults

200 mcg four times daily PO with food. If this dose cannot be tolerated, 100 mcg can be used. Take misoprostol for the duration of the NSAID therapy. Take the last dose of the day at bedtime.

Pediatric patients

Safety and efficacy in patients younger than 18 yr not established.

Geriatric patients or patients with renal impairment

Dosage adjustment is usually not needed, but dosage can be reduced if 200-mcg PO dose cannot be tolerated.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	12–15 min

Metabolism: Hepatic; $T_{1/2}$: 20–40 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **GI:** *Nausea, diarrhea, abdominal pain, flatulence*, vomiting, dyspepsia, constipation
- **GU:** *Miscarriage*, excessive bleeding, *spotting, cramping*, hypermenorrhea, menstrual disorders, dysmenorrhea
- **Other:** Headache

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between misoprostol and mifepristone; use extreme caution.

Assessment

- **History:** Allergy to prostaglandins; pregnancy, lactation; renal impairment, duodenal ulcer
- **Physical:** Abdominal examination, normal bowel function, urinary output

Interventions

- Give to patients at high risk for developing NSAID-induced gastric ulcers; give for the full term of the NSAID use.

⊗ **Black box warning** Arrange for serum pregnancy test for any woman of child-bearing age; women must have a negative test within 2 wk of beginning therapy; drug can act as an abortifacient.

- Arrange for oral and written explanation of the risks to pregnancy; appropriate contraceptive measures must be taken; begin therapy on the second or third day of a normal menstrual period.

Teaching points

- Take this drug four times a day, with meals and at bedtime. Continue to take your NSAID while taking this drug. Take the drug exactly as prescribed. Do not give this drug to anyone else.
- This drug can cause miscarriage and is often associated with dangerous bleeding. Do not take if pregnant; do not become pregnant while taking this medication. If preg-

nancy occurs, discontinue drug, and consult your health care provider immediately.

- You may experience these side effects: Abdominal pain, nausea, diarrhea, flatulence (take with meals); menstrual cramping, abnormal menstrual periods, spotting, even in postmenopausal women (request analgesics); headache.
- Report severe diarrhea, spotting or menstrual pain, severe menstrual bleeding, pregnancy.

DANGEROUS DRUG

▽ **mitomycin**
(mitomycin-C, MTC)
(*mye toe mye' sin*)

PREGNANCY CATEGORY D

Drug classes

Antibiotic
Antineoplastic

Therapeutic actions

Cytotoxic: Inhibits DNA synthesis and cellular RNA and protein synthesis in susceptible cells, causing cell death.

Indications

- Disseminated adenocarcinoma of the stomach or pancreas; part of combination therapy or as palliative measure when other modalities fail
- Unlabeled uses: Intravesical route—superficial bladder cancer; ophthalmic route—may be useful adjunct to surgery in primary or recurrent pterygia; intraarterial route—hepatocellular cancer; topical route—otolaryngologic procedures; other unlabeled uses include colorectal cancer; breast cancer; squamous cell carcinoma of the head, neck, lungs, and cervix; tracheal stenosis

Contraindications and cautions

- Contraindicated with allergy to mitomycin; thrombocytopenia, coagulation disorders, or increase in bleeding tendencies; severe impaired renal function (creatinine level above 1.7 mg/dL); myelosuppression; pregnancy; lactation.
- Use cautiously with renal impairment.

Available forms

Powder for injection—5-, 20-, 40-mg vials

Dosages**Adults**

After hematologic recovery from previous chemotherapy, use the following schedule at 6- to 8-wk intervals: 20 mg/m² IV as a single dose. Reevaluate patient for hematologic response between courses of therapy; adjust dosage accordingly:

Leukocytes (mm ³)	Platelets (mm ³)	% of Prior Dose to Be Given
More than 4,000	More than 100,000	100
3,000–3,999	75,000–99,999	100
2,000–2,999	25,000–74,999	70
Less than 2,000	Less than 25,000	50

Do not repeat dosage until leukocyte count has returned to 4,000/mm³ and platelet count to 100,000/mm³.

Pharmacokinetics

Route	Onset	Peak
IV	Slow	Unknown

Metabolism: Hepatic; T_{1/2}: 17 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute 5- to 20-mg vial with 10 or 40 mL of sterile water for injection, respectively; reconstitute 40-mg vial with 80 mL sterile water. Shake vial to improve dissolution. If product does not dissolve immediately, allow to stand at room temperature until solution is obtained. This solution is stable for 14 days if refrigerated, 7 days at room temperature; further dilution in various IV fluids reduces stability—check manufacturer's insert.

Infusion: Infuse slowly over 5–10 min; monitor injection site to avoid local reaction.

Incompatibility: Do not mix with bleomycin.

Adverse effects

- **CNS:** Headache, blurred vision, confusion, drowsiness, syncope, fatigue

- **GI:** *Anorexia, nausea, vomiting*, diarrhea, hematemesis, stomatitis
- **GU:** Renal toxicity, **hemolytic uremic syndrome**
- **Hematologic:** **Bone marrow toxicity**, microangiopathic hemolytic anemia (a syndrome of anemia, thrombocytopenia, renal failure, hypertension)
- **Respiratory:** **Pulmonary toxicity, acute respiratory distress syndrome**
- **Other:** *Fever*; cancer in preclinical studies, *cellulitis at injection site, alopecia*

Nursing considerations
Assessment

- **History:** Allergy to mitomycin; thrombocytopenia, coagulation disorders or increase in bleeding tendencies; impaired renal function; myelosuppression; pregnancy; lactation
- **Physical:** T; skin color, lesions; weight; hair; local injection site; orientation, reflexes; R, adventitious sounds; mucous membranes; CBC, clotting tests, renal function tests

Interventions

- Do not give IM or subcutaneously due to severe local reaction and tissue necrosis.
- ⊗ **Warning** Monitor injection site for extravasation: If patient reports burning or stinging, discontinue infusion immediately and restart in another vein.
- ⊗ **Black box warning** Monitor patient response frequently at beginning of therapy (CBC, renal function tests, pulmonary examination) because of the risk of bone marrow suppression and hemolytic uremic syndrome with renal failure. Adverse effects may require a decreased dose or discontinuation of drug; consult with physician.

Teaching points

- Prepare a calendar with return dates for drug therapy; this drug can only be given IV.
- Take precautions to avoid pregnancy while using this drug; using barrier contraceptives is advised.
- Have regular medical follow-up visits, including blood tests to monitor drug's effects.
- You may experience these side effects: Rash, skin lesions, loss of hair (obtain a

wig; skin care may help); loss of appetite, nausea, mouth sores (frequent mouth care, eat frequent small meals; maintain good nutrition; consult a dietitian; request an antiemetic); drowsiness, dizziness, syncope, headache (use caution driving or operating dangerous machinery; take special precautions to prevent injuries).

- Report difficulty breathing, sudden weight gain, swelling, burning or pain at injection site, unusual bleeding or bruising.

▶ mitotane

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▶ mitoxantrone hydrochloride

(mye toe zan' trone)

Novantrone

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
MS drug

Therapeutic actions

Cytotoxic; cell-cycle nonspecific, appears to be DNA reactive, causing the death of both proliferating and nonproliferating cells.

Indications

- As part of combination therapy in the treatment of acute nonlymphocytic leukemia in adults, including myelogenous, promyelocytic, monocytic, and erythroid acute leukemias
- Treatment of pain in patients with advanced prostatic cancer, in combination with steroids
- Treatment of chronic progressive, progressive relapsing, or worsening relapsing-remitting MS
- Unlabeled uses: Treatment of breast cancer, refractory lymphomas, autologous bone marrow transplantation

Contraindications and cautions

- Contraindicated with hypersensitivity to mitoxantrone, pregnancy.
- Use cautiously with bone marrow suppression, HF, lactation.

Available forms

Injection—2 mg/mL

Dosages

Adults

- **Combination therapy:** For induction, 12 mg/m² IV per day on days 1–3, with 100 mg/m² of cytarabine for 7 days given as a continuous infusion on days 1–7. If remission does not occur, a second series can be used, with mitoxantrone given for 2 days and cytarabine for 5 days.
- **Consolidation therapy:** Mitoxantrone 12 mg/m² IV for days 1 and 2, and cytarabine 100 mg/m² given as a continuous 24-hr infusion on days 1–5; given 6 wk after induction therapy if needed. Severe myelosuppression may occur.
- **Hormone-refractory prostate cancer:** 12–14 mg/m² as short IV infusion every 21 days.
- **MS:** 12 mg/m² IV over 5–15 min every 3 mo; do not exceed cumulative lifetime dose of 140 mg/m².

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	2–3 days

Metabolism: Hepatic; T_{1/2}: 5.8 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute solution to at least 50 mL in either 0.9% sodium chloride or D₅W; may be further diluted in D₅W, normal saline, or dextrose 5% in normal saline if needed. Inject this solution into tubing of a freely running IV of 0.9% sodium chloride injection or 5% dextrose injection over period of at least 3 min. Use immediately after dilution and discard any leftover solution immediately. Wear

gloves and goggles and avoid any contact with skin or mucous membranes.

Infusion: Inject slowly over at least 3 min.

Incompatibilities: Do not mix in solution with heparin; a precipitate may form. Do not mix in solution with any other drug; studies are not yet available regarding the safety of such mixtures.

Adverse effects

- **CNS:** Headache, seizures
- **CV: Heart failure,** potentially fatal; arrhythmias; chest pain
- **GI:** *Nausea, vomiting, diarrhea,* abdominal pain, mucositis, GI bleeding, jaundice
- **Hematologic: Bone marrow depression,** *infections of all kinds, hyperuricemia*
- **Respiratory:** *Cough,* dyspnea
- **Other:** *Fever, alopecia, cancer in laboratory animals*

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to mitoxantrone, bone marrow depression, HF, pregnancy, lactation
- **Physical:** Neurologic status, T, P, BP, auscultation, peripheral perfusion; R, adventitious sounds; abdominal examination, mucous membranes; LFTs, CBC with differential

Interventions

⊗ **Black box warning** Follow CBC and LFTs carefully before and frequently during therapy; dose adjustment may be needed if myelosuppression becomes severe.

- Monitor patient for hyperuricemia, which frequently occurs as a result of rapid tumor lysis; monitor serum uric acid levels and arrange for appropriate treatment as needed.

⊗ **Warning** Handle drug with great care; the use of gloves, gowns, and goggles is recommended; if drug comes in contact with skin, wash immediately with warm water; clean spills with calcium hypochlorite solution.

⊗ **Black box warning** Monitor IV site for signs of extravasation; if extravasation occurs, stop administration and restart at another site immediately.

⊗ **Black box warning** Left ventricular ejection fraction (LVEF) should be evaluated before each dose when treating MS. Yearly evaluations should be done after finishing treatment to detect late cardiac toxic effects; decreased LVEF and frank HF can occur.

⊗ **Black box warning** Monitor BP, P, cardiac output regularly during administration; supportive care for heart failure should be started at the first sign of failure.

- Protect patient from exposure to infection; monitor occurrence of infection at any site and arrange for appropriate treatment.

Teaching points

- This drug will need to be given IV for 3 days in conjunction with cytarabine therapy; mark calendar with days of treatment. Regular blood tests will be needed to evaluate the effects of this treatment (antineoplastic).
- This drug will be given IV every 3 months when being used to treat MS.
- Using barrier contraceptives is advised; fetal harm may occur if you are pregnant while taking this drug.
- You may experience these side effects: Nausea, vomiting (may be severe; antiemetics may be helpful; eat frequent small meals); increased susceptibility to infection (avoid crowds and exposure to disease); loss of hair (obtain a wig; it is important to keep your head covered in extremes of temperature); blue-green color of the urine (may last for 24 hours after treatment is finished; the whites of the eyes may also be tinted blue for a time; this finding is expected and will pass).
- Report severe nausea and vomiting; fever, chills, sore throat; unusual bleeding or bruising; fluid retention or swelling; severe joint pain.

▽ modafinil (*moe daff' in ill*)

Alertec (CAN), Provigil

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-IV

Drug classes

CNS stimulant
Narcolepsy drug

Therapeutic actions

A CNS stimulant that helps to improve vigilance and decrease excessive daytime sleepiness associated with narcolepsy and other sleep disorders; may act through dopaminergic mechanisms; exact mechanism of action is not known. Not associated with the cardiac and other systemic stimulatory effects of amphetamines.

Indications

- Treatment of narcolepsy with excessive daytime sleepiness
- Improvement in wakefulness in patients with shift-work sleep disorder (SWSD)
- Improvement in wakefulness in patients with obstructive sleep apnea/hypopnea syndrome (OSAHS)
- Unlabeled uses: Treatment of fatigue associated with MS, Parkinson's disease, brain injury

Contraindications and cautions

- Contraindicated with hypersensitivity to modafinil, left ventricular hypertrophy, ischemic ECG changes, mitral valve prolapse.
- Use cautiously with impaired renal or hepatic function, epilepsy, emotional instability, psychosis, depression, mania, pregnancy, lactation.

Available forms

Tablets—100, 200 mg

Dosages

Adults

- *Narcolepsy, OSAHS*: 200 mg PO daily given as a single dose. Up to 400 mg/day as a single dose may be used.
- *SWSD*: 200 mg/day taken 1 hr before start of shift.

Pediatric patients

Safety and efficacy not established in patients younger than 16 yr.

Geriatric patients or patients with hepatic impairment

In elderly patients, elimination may be reduced; monitor response and consider use of

lower dose. With severe hepatic impairment, reduce dosage to 50%.

Pharmacokinetics

Route	Onset	Peak
Oral	Gradual	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 15 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Insomnia, headache, nervousness, anxiety, fatigue*
- **Dermatologic:** Rashes, **Stevens-Johnson syndrome**
- **GI:** Dry mouth, choking, nausea, diarrhea, anorexia

Interactions

- **Drug-drug** • Increased plasma levels of triazolam when used concurrently; triazolam dosage may need reduction • Possible decreased effectiveness of hormonal contraceptives; suggest the use of barrier contraceptives • Risk of increased levels and effects of warfarin, phenytoin, and TCAs; monitor patient and decrease dosage as appropriate

Nursing considerations

Assessment

- **History:** Hypersensitivity to modafinil, left ventricular hypertrophy, mitral valve prolapse, ischemic ECG changes, epilepsy, pregnancy, lactation, drug dependence, emotional instability
- **Physical:** Body weight; T; skin color, lesions; orientation, affect, reflexes; P, BP, auscultation; R, adventitious sounds; bowel sounds, normal output; LFTs, renal function tests, baseline ECG

Interventions

- Ensure proper diagnosis before administering to rule out underlying medical problems.
- **Warning** Arrange to dispense the least feasible amount of drug at any one time to minimize risk of overdose.
- Administer drug once a day in the morning.
- Arrange to monitor liver function tests periodically in patients on long-term therapy.

- Establish safety precautions if CNS changes occur (use side rails, accompany patient when ambulating).

Teaching points

- Take this drug exactly as prescribed; if taking to improve wakefulness with shift work, take 1 hour before the start of your shift.
- Avoid pregnancy while using this drug; using barrier contraceptives is advised.
- You may experience these side effects: Insomnia, nervousness, restlessness, dizziness, impaired thinking (these effects may become less pronounced after a few days; avoid driving a car or engaging in activities that require alertness if these effects occur, notify your health care provider if they are pronounced or bothersome), headache.
- Report insomnia, abnormal body movements, rash, severe diarrhea, pale-colored stools, yellowing of the skin or eyes.

moexipril (*mo ex' ab pril*)

Univasc

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor

Antihypertensive

Therapeutic actions

Renin, synthesized by the kidneys, is released into the circulation where it acts on a plasma precursor to produce angiotensin I, which is converted by ACE to angiotensin II, a potent vasoconstrictor that also causes release of aldosterone from the adrenals. Both of these actions increase BP; moexipril blocks the conversion of angiotensin I to angiotensin II, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased

prostaglandin synthesis may also be involved in the antihypertensive action.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives such as thiazide-type diuretics

Contraindications and cautions

- Contraindicated with allergy to ACE inhibitors, impaired renal function, HF, salt or volume depletion, history of ACE inhibitor-induced angioedema, lactation, pregnancy.
- Use cautiously with hepatic impairment and in elderly patients.

Available forms

Tablets—7.5, 15 mg

Dosages

Adults

- *Patients not receiving diuretics:* Initially, 7.5 mg PO daily, given 1 hr before a meal; for maintenance, 7.5–30 mg PO daily or in one to two divided doses 1 hr before meals.
- *Patients receiving diuretics:* Discontinue diuretic for 2 or 3 days before beginning moexipril; follow dosage listed above, if BP is not controlled, diuretic therapy may be added. If diuretic cannot be stopped, start moexipril therapy with 3.75 mg and monitor for symptomatic hypotension.

Pediatric patients

Safety and efficacy not established.

Geriatric patients and patients with renal impairment

Excretion is reduced in renal failure; use with caution. If creatinine clearance 40 mL/min or less, start with 3.75 mg PO daily, adjust up to a maximum of 15 mg/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	3–4 hr	24 hr

Metabolism: $T_{1/2}$: 2–9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CV:** *Tachycardia*, angina pectoris, **MI**, hypotension in salt- or volume-depleted patients
- **GI:** *Gastric irritation, aphthous ulcers, peptic ulcers, diarrhea, dysgeusia*, cholestatic jaundice, hepatocellular injury, anorexia, constipation
- **GU:** *Proteinuria*, renal insufficiency, renal failure, polyuria, oliguria, urinary frequency
- **Hematologic:** Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, **pancytopenia**
- **Skin:** *Rash, pruritus, flushing*, scalded mouth sensation, exfoliative dermatitis, photosensitivity, alopecia
- **Other:** *Cough*, malaise, dry mouth, lymphadenopathy, *flu-like symptoms, dizziness*, angioedema

Interactions

- **Drug-drug** • Increased risk of hyperkalemia with potassium supplements, potassium-sparing diuretics, salt substitutes • Risk of excessive hypotension with diuretics • Risk of abnormal response with lithium
- **Drug-lab test** • False-positive test for urine acetone

■ Nursing considerations

Assessment

- **History:** Allergy to ACE inhibitors, impaired renal or hepatic function, HF, salt or volume depletion, pregnancy, lactation
- **Physical:** Skin color, lesions, turgor; T; P; BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Warning** Alert the surgeon and mark patient's chart with notice that moexipril is being taken; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

⊗ **Black box warning** Do not administer during pregnancy; drug may cause serious fetal injury or death.

- Monitor patient closely for a fall in BP secondary to reduction in fluid volume from excessive perspiration and dehydration, vom-

iting, or diarrhea; excessive hypotension may occur. Monitor potassium levels carefully in patients receiving potassium supplements, using potassium-sparing diuretics or salt substitutes.

- Reduce dosage in patients with impaired renal function.
- Monitor for excessive hypotension with any diuretic therapy.

Teaching points

- Do not stop taking this drug without consulting your health care provider. Take tablet 1 hr before meals.
- This drug is associated with fetal defects; using barrier contraceptives is advised to prevent pregnancy.
- Be careful in any situation that may lead to a drop in blood pressure (diarrhea, sweating, vomiting, dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- You may experience these side effects: GI upset, diarrhea, loss of appetite, change in taste perception; mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, light-headedness (transient; change position slowly and limit activities to those that do not require alertness and precision).
- Report mouth sores; sore throat, fever, chills; swelling of the hands or feet; irregular heart-beat, chest pains; swelling of the face, eyes, lips, tongue; difficulty breathing; leg cramps.

M

▷ montelukast sodium

(mon tell oo' kast)

Singular

PREGNANCY CATEGORY B

Drug classes

Antiasthmatic

Leukotriene receptor antagonist

Therapeutic actions

Selectively and competitively blocks the receptor that inhibits leukotriene formation, thus blocking many of the signs and symptoms of asthma—neutrophil and eosinophil migration, neutrophil and monocyte aggregation,

leukocyte adhesion, increased capillary permeability, and smooth muscle contraction. These actions contribute to inflammation, edema, mucus secretion, and bronchoconstriction associated with the signs and symptoms of asthma.

Indications

- Prophylaxis and chronic treatment of asthma in adults and children 12 mo and older
- Relief of symptoms of seasonal allergic rhinitis in adults and children 2 yr and older
- Relief of symptoms of perennial allergic rhinitis in adults and children 6 mo and older
- Prevention of exercise-induced bronchoconstriction in patients 15 yr and older
- Unlabeled uses: Chronic urticaria, atopic dermatitis, NSAID-induced urticaria

Contraindications and cautions

- Contraindicated with hypersensitivity to montelukast or any of its components; acute asthma attacks; status asthmaticus.
- Use cautiously with pregnancy and lactation.

Available forms

Tablets—10 mg; chewable tablets—4, 5 mg; granules—4 mg/packet

Dosages

Adults and patients 15 yr and older

One 10-mg tablet PO daily, taken in the evening. For exercise-induced bronchoconstriction, dose taken 2 hr before exercise and not repeated for at least 24 hr.

Pediatric patients

6 mo–23 mo (*perennial allergic rhinitis*): 1 packet (4 mg) PO per day.

12–23 mo (*asthma only*): 4-mg granules PO daily, taken in the evening.

2–5 yr: One 4-mg chewable tablet PO daily, taken in the evening.

6–14 yr: One 5-mg chewable tablet PO daily, taken in the evening.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 2.7–5.5 hr

Distribution: Crosses placenta and enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, fatigue, neuropsychiatric events
- **GI:** Nausea, diarrhea, abdominal pain, dental pain, liver impairment
- **Respiratory:** Influenza, cold, nasal congestion
- **Other:** Generalized pain, fever, rash, fatigue

Interactions

* **Drug-drug** • Decreased effects and bioavailability if taken with phenobarbital; monitor patient and adjust dosage as needed

■ Nursing considerations Assessment

- **History:** Hypersensitivity to montelukast or any of its components, acute asthma attacks, status asthmaticus, pregnancy, lactation
- **Physical:** T; orientation, reflexes; R, adventitious sounds; GI evaluation

Interventions

- Administer in the evening without regard to food.
- Ensure that drug is taken continually for optimal effect.
- Do not administer for acute asthma attack or acute bronchospasm.
- Be aware of the risk of neuropsychiatric events, including behavior and mood changes; monitor patient accordingly.
- Avoid the use of aspirin or NSAIDs in patients with known sensitivities while they are using this drug.
- ⊗ **Warning** Ensure that patient has a readily available rescue medication for acute asthma attacks or situations when a short-acting inhaled drug is needed.

Teaching points

- Take this drug regularly as prescribed; do not stop taking this drug during symptom-free periods; do not stop taking this drug

without consulting your health care provider. Continue taking any other drugs for treating your asthma that have been prescribed for you. Notify your health care provider if your asthma becomes worse.

- Do not take this drug for an acute asthma attack or acute bronchospasm; this drug is not a bronchodilator, and routine emergency procedures should be followed during acute attacks.
- If taking this drug to prevent exercise-induced bronchoconstriction, take it at least 2 hours before exercising, and do not take another dose for at least 24 hours.
- Avoid using aspirin or NSAIDs if you have a known sensitivity to these drugs. Montelukast will not prevent reactions.
- You may experience these side effects: Dizziness (use caution when driving or performing activities that require alertness); nausea, vomiting (eat frequent small meals, take drug with food); headache (analgesics may be available).
- Report fever, acute asthma attacks, flulike symptoms, lethargy, changes in behavior or mood.

DANGEROUS DRUG

▷ morphine sulfate (*mor'feen*)

Timed-release: Avinza **OND**, Kadian **OND**, MS Contin **OND**, Oramorph SR **OND**, ratio-Morphine SR (CAN) **OND**

Oral solution: MSIR, Roxanol, Roxanol T

Rectal suppositories: RMS

Injection: Astramorph PF, Duramorph, Morphine HP Injection (CAN), MOS Sulfate (CAN), PMS Morphine (CAN)

Preservative-free concentrate for microinfusion devices for intraspinal use: Infumorph, Morphine LP Injection (CAN), Morphine LP Epidural (CAN)

Liposome injection: DepoDur

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Principal opium alkaloid; acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to severe acute and chronic pain
- Preoperative medication to sedate and allay apprehension, facilitate induction of anesthesia, and reduce anesthetic dosage
- Analgesic adjunct during anesthesia
- Component of most preparations that are oral alcoholic solutions used for chronic severe pain, especially in terminal cancer patients
- Intraspinal use with microinfusion devices for the relief of intractable pain
- Treatment of pain following major surgery, ER liposome injection for single-dose administration by epidural route at the lumbar level
- Unlabeled use: Relief of pain associated with MI

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids; during labor or delivery of a premature infant (may cross immature blood-brain barrier more readily); after biliary tract surgery or surgical anastomosis; with pregnancy, labor (respiratory depression in neonate; may prolong labor).
- Use cautiously with head injury and increased intracranial pressure; acute asthma, COPD, cor pulmonale, preexisting respiratory depression, hypoxia, hypercapnia (may decrease respiratory drive and increase airway resistance); lactation (wait 4–6 hr after administration to nurse the baby); acute abdominal conditions; CV disease, supraventricular tachycardias; myxedema, seizure disorders, acute alcoholism, delirium tremens; cerebral arteriosclerosis; ulcerative colitis; fever; kyphoscoliosis; Addison's disease; prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment.

Available forms

Injection—0.5, 1, 2, 4, 5, 8, 10, 15, 25, 50 mg/mL; tablets—15, 30 mg; CR tablets **OND**—15, 30, 60, 100, 200 mg; ER tablets **OND**—15, 30, 60, 100, 200 mg; soluble tablets—10, 15, 30 mg; oral solution—20 mg/mL; 10, 20, 100 mg/5 mL; concentrated oral solution—20 mg/mL, 100 mg/5 mL; suppositories—5, 10, 20, 30 mg; SR capsules **OND**—20, 30, 50, 60, 100 mg; ER capsules **OND**: 10, 20, 30, 50, 60, 80, 90, 100, 120 mg; liposome injection—10 mg/mL

Dosages**Adults****Oral**

One-third to one-sixth as effective as parenteral administration because of first-pass metabolism; 5–30 mg every 4 hr PO. CR, ER, and SR: 30 mg every 8–12 hr PO or as directed by physician; *Kadian*: 20–100 mg PO daily—24-hr release system; *MS Contin*: 200 mg PO every 12 hr; *Avinza*: 30 mg PO daily; if opioid naive, increase by 30 mg (or lower) increments every 4 days.

IM or subcutaneous

10 mg (range, 5–20 mg) every 4 hr or as directed by physician.

IV

10 mg every 4 hr. Usual individual range is 5–15 mg; usual daily dose is 12–120 mg.

Rectal

10–20 mg every 4 hr or as directed by physician.

Epidural

Initial injection of 5 mg in the lumbar region may provide pain relief for up to 24 hr. If adequate pain relief is not achieved within 1 hr, incremental doses of 1–2 mg may be given at intervals sufficient to assess effectiveness, up to 10 mg/24 hr. For continuous infusion, initial dose of 2–4 mg/24 hr is recommended. Further doses of 1–2 mg may be given if pain relief is not achieved initially.

Liposome injection

10–15 mg by lumbar epidural injection using a catheter or needle prior to major surgery or after clamping the umbilical cord during cesarean section.

Intrathecal

Dosage is usually one-tenth that of epidural dosage; a single injection of 0.2–1 mg may provide satisfactory pain relief for up to 24 hr. Do not inject more than 2 mL of the 5-mg/10 mL ampule or more than 1 mL of the 10-mg/10 mL ampule. Use only in the lumbar area. Repeated intrathecal injections are not recommended; use other routes if pain recurs. For epidural or intrathecal dosing, use preservative-free morphine preparations only.

Pediatric patients

Do not use in premature infants.

IM, subcutaneous

0.1–0.2 mg/kg (up to 15 mg per dose) every 4 hr or as directed by physician.

IV

0.05 to 0.1 mg/kg (up to 10 mg per dose) administered slowly.

Geriatric patients or impaired adults

Use caution. Respiratory depression may occur in the elderly, the very ill, those with respiratory problems. Reduced dosage may be needed.

Epidural

Use extreme caution; injection of less than 5 mg in the lumbar region may provide adequate pain relief for up to 24 hr.

Intrathecal

Use lower dosages than recommended above for adults.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	60 min	5–7 hr
Rectal	Rapid	20–60 min	5–7 hr
Subcut.	Rapid	50–90 min	5–7 hr
IM	Rapid	30–60 min	5–6 hr
IV	Immediate	20 min	5–6 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: No further preparation needed for direct injection; dilute for infusion to a concentration of 0.1–1 mg/mL in D₅W.

Infusion: Inject slowly directly IV or into tubing of running IV, each 15 mg over 4–5 min; monitor by controlled infusion device to maintain pain control.

Incompatibilities: Do not mix with aminopylline, amobarbital, chlorothiazide, heparin, meperidine, phenobarbital, phenytoin, sodium bicarbonate, sodium iodide, thiopental.

Y-site incompatibilities: Do not give with minocycline, tetracycline.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation*, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope
- **Dermatologic:** Pruritus, urticaria, **laryngospasm, bronchospasm**, edema
- **GI:** *Nausea, vomiting*, dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis
- **GU:** Ureteral spasm, spasm of vesical sphincters, urine retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Tissue irritation and induration (subcutaneous injection)
- **Major hazards:** **Respiratory depression, apnea, circulatory depression, respiratory arrest, shock, cardiac arrest**
- **Other:** *Sweating*, physical tolerance and dependence, psychological dependence

Interactions

★ **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation or coma in patients receiving barbiturate general anesthetics • Risk of toxicity if combined with alcohol (ER forms especially likely)

★ **Drug-lab test** • Elevated biliary tract pressure (an effect of opioids) may cause increas-

es in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids; diarrhea caused by poisoning; labor or delivery of a premature infant; biliary tract surgery or surgical anastomosis; head injury and increased intracranial pressure; acute asthma, COPD, cor pulmonale, preexisting respiratory depression; acute abdominal conditions; CV disease, supraventricular tachycardias, myxedema, seizure disorders, acute alcoholism, delirium tremens; cerebral arteriosclerosis; ulcerative colitis; fever; kyphoscoliosis; Addison's disease; prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment; pregnancy; lactation
- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; urinary frequency, voiding pattern, normal output; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

⊗ **Black box warning** Caution patient not to chew or crush CR, ER, or SR preparations and ensure appropriate use of these forms.

⊗ **Black box warning** Do not substitute *Infumorph* for *Duramorph*; concentrations differ significantly and serious overdose can occur.

⊗ **Black box warning** Make sure patient is observed for at least 24 hr in a fully equipped and staffed environment if morphine is given by epidural or intrathecal route because of risk of serious adverse effects.

⊗ **Warning** Dilute and administer slowly IV to minimize likelihood of adverse effects.

• Tell patient to lie down during IV administration.

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available during IV administration.

⊗ **Warning** Use caution when injecting IM or subcutaneously into chilled areas or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated

doses, an excessive amount may be absorbed when circulation is restored.

- Reassure patients that they are unlikely to become addicted; most patients who receive opiates for medical reasons do not develop dependence syndromes.

⊗ **Black box warning** Liposome preparation is for lumbar epidural injection only; it should not be given intrathecally, IV, or IM.

Teaching points

- Take this drug exactly as prescribed. Avoid alcohol, antihistamines, sedatives, tranquilizers, and over-the-counter drugs.
- Swallow controlled-release, extended-release, or sustained-release preparations (*MS Contin*, *Oramorph SR*) whole; do not cut, crush, or chew.
- Do not take leftover medication for other disorders, and do not let anyone else take your prescription.
- You may experience these side effects: Nausea, loss of appetite (take with food, lie quietly); constipation (use laxative); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving or performing tasks that require alertness and visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath or difficulty breathing, rash.

moxifloxacin hydrochloride

(*mocks ee flox' a sin*)

Avelox, Avelox IV, Vigamox

PREGNANCY CATEGORY C

Drug classes

Antibiotic

Fluoroquinolone

Therapeutic actions

Bactericidal; interferes with DNA replication, repair, transcription, and recombination in susceptible gram-negative and gram-positive bacteria, preventing cell reproduction and leading to cell death.

Indications

- Treatment of adults with community-acquired pneumonia caused by susceptible strains of *Streptococcus pneumoniae* (including multidrug resistant strains), *Haemophilus influenzae*, *Mycoplasma pneumoniae*, *Chlamydia pneumoniae*, *Moraxella catarrhalis*, *Staphylococcus aureus*, *Klebsiella pneumoniae*
- Treatment of bacterial sinusitis caused by *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*
- Treatment of acute bacterial exacerbation of chronic bronchitis caused by *S. pneumoniae*, *H. influenzae*, *H. parainfluenzae*, *K. pneumoniae*, *S. aureus*, *M. catarrhalis*
- Treatment of uncomplicated skin and skin structure infections caused by *S. aureus* or *Streptococcus pyogenes*
- Treatment of complicated skin and skin structure infections and complicated intra-abdominal infections caused by methicillin-susceptible *S. aureus*, *E. coli*, *K. pneumoniae*, *Enterobacter cloacae*

Contraindications and cautions

- Contraindicated with allergy to fluoroquinolones, prolonged QT interval, hypokalemia, pregnancy, lactation.
- Use cautiously with hepatic impairment, seizures.

Available forms

Tablets—400 mg; injection—400 mg in 250 mL

Dosages

Adults

- *Pneumonia*: 400 mg PO or IV daily for 7–14 days.
- *Sinusitis*: 400 mg PO or IV daily for 10 days.
- *Acute exacerbation of chronic bronchitis*: 400 mg PO or IV daily for 5 days.
- *Uncomplicated skin and skin structure infections*: 400 mg PO daily for 7 days.
- *Complicated skin and skin structure infections*: 400 mg PO or IV daily for 7–21 days.
- *Complicated intra-abdominal infections*: 400 mg PO or IV for 5–14 days.

Pediatric patients

Not recommended in patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr
IV	Rapid	Minutes

Metabolism: Hepatic; $T_{1/2}$: 12–13.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Supplied in premixed 250-mL bags; do not refrigerate; single use only, discard any excess.

Infusion: Infuse over 60 min by direct infusion or into Y-site of running IV.

Compatibilities: Compatible with 0.9% sodium chloride injection, 1M sodium chloride injection, 5% or 10% dextrose injection, sterile water for injection, lactated Ringer's for injection.

Adverse effects

- **CNS:** Headache, dizziness, insomnia, fatigue, somnolence, depression, nervousness, anxiety, paresthesia
- **CV:** Palpitations, tachycardia, hypertension, hypotension, **prolonged QT interval**
- **GI:** Nausea, vomiting, dry mouth, diarrhea, anorexia, gastritis, stomatitis
- **Hematologic:** Altered PT, thrombocytopenia, eosinophilia
- **Respiratory:** Asthma, cough, dyspnea, pharyngitis, rhinitis
- **Other:** Fever, rash, sweating, photosensitivity, tendonitis, tendon rupture

Interactions

* **Drug-drug** ⊗ **Warning** Risk of severe cardiac arrhythmias if combined with any other drug known to prolong the QTc interval (quinidine, procainamide, amiodarone, sotalol, phenothiazines); avoid these combinations.

- Decreased absorption and therapeutic effectiveness of moxifloxacin if taken with sucralate, metal medications (antacids), multivitamins, didanosine chewable; moxifloxacin

should be taken 4 hr before or at least 8 hr after any of these drugs • Increased risk of seizures if fluoroquinolones are combined with NSAIDs; monitor patient closely

Nursing considerations
Assessment

- **History:** Allergy to fluoroquinolones, prolonged QTc interval, hypokalemia, hepatic impairment, seizures, lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; R, adventitious sounds; P, BP; mucous membranes, bowel sounds; LFTs, ECG, CBC

Interventions

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy as indicated for condition being treated.
- Administer oral drug 4 hr before or at least 8 hr after antacids or other anion-containing drugs.
- Do not change dosage when switching from IV to oral dose.

⊗ **Warning** Discontinue drug at any sign of hypersensitivity (rash, photophobia) or with severe diarrhea.

⊗ **Black box warning** Risk of tendonitis and tendon rupture increases, especially in patients older than age 60 yr, patients taking corticosteroids, and those who have received a kidney, heart, or lung transplant.

⊗ **Warning** Discontinue drug and monitor ECG if palpitations or dizziness occurs.

- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat culture and sensitivity tests.

Teaching points

- Take oral drug once a day for the period prescribed. If antacids are being taken, take drug 4 hours before or at least 8 hours after the antacid.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation (consult your health care provider); drowsiness, blurring of vision, dizziness (observe caution if driving or using dangerous equipment); sensitivity to the sun (avoid exposure, use a sunscreen).

- Report rash, visual changes, severe GI problems, weakness, tremors, palpitations, sensitivity to light, pain or inflammation in tendons.

muromonab-CD3

(*mew ro' mon ab*)

Orthoclone OKT3

PREGNANCY CATEGORY C

Drug classes

Immunosuppressant
Monoclonal antibody

Therapeutic actions

A murine monoclonal antibody to the antigen of human T cells; functions as an immunosuppressant by blocking T cells.

Indications

- Acute allograft rejection in renal transplant patients
- Treatment of steroid-resistant acute allograft rejection in cardiac and hepatic transplant patients

Contraindications and cautions

- Contraindicated with allergy to muromonab or any murine product; fluid overload as evidenced by chest X-ray; more than 3% weight gain in 1 wk; history of seizures.
- Use cautiously with fever (use antipyretics to decrease fever before therapy); previous administration of muromonab-CD3 (antibodies frequently develop, risks serious reactions on repeat administration); pregnancy.

Available forms

Injection—5 mg/5 mL

Dosages

Give only as an IV bolus in less than 1 min. Do not infuse or give by any other route.

Adults

5 mg/day for 10–14 days. Begin treatment once acute renal rejection is diagnosed. It is strongly recommended that methylprednisolone

sodium succinate 8 mg/kg IV be given 1–4 hr prior to muromonab-CD3.

Pediatric patients weighing 30 kg or less

Initially, 2.5 mg/day IV for 10–14 days.

Pediatric patients weighing more than 30 kg

5 mg/day IV for 10–14 days. May increase 2.5 mg/day increments if needed.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Minutes	2–7 days	7 days

Metabolism: Tissue; $T_{1/2}$: 47–100 hr

Distribution: Crosses placenta

Excretion: Unknown

IV FACTS

Preparation: Draw solution into a syringe through a low protein-binding 0.2- or 0.22- μ m filter. Discard filter and attach needle for IV bolus injection. Solution may develop fine translucent particles that do not affect its potency. Refrigerate solution; do not freeze or shake. Use immediately; discard unused portions.

Infusion: Administer as an IV bolus over less than 1 min. Do not give as an IV infusion or with other drug solutions. Flush line with saline before and after IV injection.

Incompatibilities: Do not mix with any other drug solution; do not infuse simultaneously with any other drug. If sequential infusions are required, flush line with saline before and after administering muromonab.

Adverse effects

- **CNS:** Malaise, *tremors*, coma, seizures, headache
- **GI:** *Vomiting, nausea, diarrhea*
- **Respiratory:** **Acute pulmonary edema**, *dyspnea, chest pain*, wheezing
- **Other:** Lymphomas, *increased susceptibility to infection, fever, chills*, **cytokine-release syndrome** (“flu” to shock)

Interactions

- **Drug-drug** • Reduce dosage of other immunosuppressive drugs; severe immunosup-

pression can lead to increased susceptibility to infection and increased risk of lymphomas; other immunosuppressives can be restarted about 3 days prior to cessation of muromonab

- Risk of encephalopathy and CNS effects with indomethacin

■ Nursing considerations

Assessment

- **History:** Allergy to muromonab or any murine product; fluid overload; fever; previous administration of muromonab-CD3; pregnancy; lactation
- **Physical:** T, weight; P, BP; R, adventitious sounds; chest X-ray, CBC

Interventions

- Obtain chest X-ray within 24 hr of therapy to ensure chest is clear.
- Arrange for antipyretics (acetaminophen) if patient is febrile before therapy.
- Monitor WBC levels and circulating T cells periodically during therapy.

⊗ **Black box warning** Monitor patient very closely after first dose; acetaminophen PRN should be ordered to cover febrile reactions; cooling blanket may be needed in severe cases. Equipment for intubation and respiratory support should be readily available for severe pulmonary reactions; anaphylactoid reactions may occur with any dose.

Teaching points

- There is often a severe reaction to the first dose, including high fever and chills, difficulty breathing, and chest congestion (you will be closely watched, and comfort measures will be given).
- Avoid infection; people may wear masks and rubber gloves when caring for you; visitors may be limited.
- Report chest pain, difficulty breathing, nausea, chills.

▽ mycophenolate

(my coe fen' ob late)

mycophenolate mofetil

IV injection: CellCept

mycophenolate sodium

Oral: Myfortic ORIG

PREGNANCY CATEGORY D

Drug class

Immunosuppressant

Therapeutic actions

Immunosuppressant: Inhibits T-lymphocyte activation; exact mechanism of action unknown, but binds to intracellular protein, which may prevent the generation of nuclear factor of activated T cells, and suppresses the immune activation and response of T cells; inhibits proliferative responses of T and B cells.

Indications

- Prophylaxis of organ rejection in patients receiving allogeneic renal, hepatic, and heart transplants; intended to be used concomitantly with corticosteroids and cyclosporine; *Myfortic* used for renal transplants only
- Unlabeled uses: Refractory uveitis as 2 g/day alone or in combination therapy; second-line agent for Churg-Strauss syndrome; combined with prednisolone for diffuse proliferative lupus nephritis

Contraindications and cautions

- Contraindicated with allergy to mycophenolate, pregnancy, lactation.
- Use cautiously with impaired renal function.

Available forms

Capsules—250 mg; tablets—500 mg; DR tablets ORIG—180, 360 mg (*Myfortic*); powder for oral suspension—200 mg/mL; powder for injection—500 mg/vial

Dosages

Adults

- **Renal transplantation:** 1 g bid PO or IV (administered over at least 2 hr) starting within 24 hr of transplant; 720 mg PO bid on an empty stomach (*Myfortic*).
- **Cardiac transplantation:** 1.5 g PO bid or IV (IV over at least 2 hr).

- **Hepatic transplantation:** 1 g IV bid or 1.5 g PO bid (over at least 2 hr).

Pediatric patients

- **Renal transplantation:** 600 mg/m² oral suspension PO bid (up to a maximum daily dose of 2 g/10 mL oral suspension); 400 mg/m² PO bid to a maximum 720 mg bid (*Myfortic*).

Geriatric patients

Maximum recommended dose is 720 mg PO bid (DR tablets).

Patients with severe renal impairment

Avoid doses of more than 1 g bid. Monitor patient carefully for adverse response.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	45–60 min

Metabolism: Hepatic; T_{1/2}: 17.9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute and dilute to 6 mg/mL with 5% dextrose injection. Reconstitute each 500-mg vial with 14 mL 5% dextrose injection. Gently shake. Solution should be slightly yellow without precipitates. For a 1-g dose, dilute contents of two reconstituted vials into 140 mL of D₅W; for a 1.5-g dose, dilute contents of three reconstituted vials into 210 mL of D₅W. Use caution to avoid contact with solution. If contact occurs, wash with soap and water.

Infusion: Infuse over at least 2 hr. Begin within 24 hr of transplant and continue for 14 days or less.

Incompatibilities: Do not mix with any other drugs or infusion admixtures.

Adverse effects

- **CNS:** Tremor, headache, insomnia, paresthesias
- **CV:** Chest pain, hypertension, peripheral edema
- **GI:** Hepatotoxicity, constipation, diarrhea, nausea, vomiting, anorexia

- **GU:** Renal impairment, nephrotoxicity, UTI, oliguria
- **Hematologic:** Leukopenia, anemia, hyperkalemia, hypokalemia, hyperglycemia, red blood cell aplasia
- **Other:** Abdominal pain, fever, asthenia, back pain, ascites, neoplasms, infection

Interactions

- **Drug-drug** • Decreased levels and effectiveness with cholestyramine, antacids • Decreased levels and effectiveness of theophylline, phenytoin

Nursing considerations

Assessment

- **History:** Allergy to mycophenolate; pregnancy, lactation; renal function
- **Physical:** T; skin color, lesions; BP, peripheral perfusion; liver evaluation, bowel sounds, gum evaluation; LFTs, renal function tests, CBC

Interventions

⊗ **Warning** Monitor renal and liver function before and periodically during therapy; marked decreases in function may require dosage change or discontinuation of therapy.

- Use caution; do not confuse *Myfortic* and *CellCept*.
- Prepare oral suspension by tapping closed bottle several times, adding 47 mL water to bottle, and shaking closed bottle for 1 min. Add another 47 mL water; shake for 1 min.
- Ensure that DR forms are swallowed whole; do not cut, crush, or allow patient to chew tablets.

⊗ **Black box warning** Protect patient from exposure to infections and maintain sterile technique for invasive procedures; risk for serious to life-threatening infection exists.

⊗ **Black box warning** Monitor patient for possible lymphoma development related to drug action.

- Risk of pure red blood cell aplasia; monitor patient accordingly.

Teaching points

- Avoid infection while using this drug; avoid crowds or people with infections. Notify your

health care provider immediately if you injure yourself.

- Avoid sun exposure; use sunscreen if you cannot avoid exposure.
- Have periodic blood tests to monitor your response to the drug and its effects.
- Do not discontinue this drug without consulting your health care provider. Do not cut, crush, or chew delayed-release tablets; swallow tablets whole.
- This drug should not be taken during pregnancy. If you think you are pregnant or you want to become pregnant, consult your health care provider.
- You may experience these side effects: Nausea, vomiting (take drug with food); diarrhea; headache (request analgesics).
- Report unusual bleeding or bruising, fever, sore throat, mouth sores, tiredness.

nabilone (*nab' bab lone*)

Cesamet

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug classes

Antiemetic
Cannabinoid

Therapeutic actions

A synthetic cannabinoid that interacts with the cannabinoid receptor systems in the CNS, causing an antiemetic effect as well as effects on mental state, dry mouth, and hypotension.

Indications

Treatment of nausea and vomiting associated with chemotherapy in patients who have had inadequate response to conventional antiemetic therapies

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug.
- Use cautiously with pregnancy, lactation; current or previous psychiatric disorder; current therapy with sedatives, hypnotics, or psy-

choactive drugs; history of substance abuse, hypertension, heart disease.

Available forms

Capsules—1 mg

Dosages

Adults

1–2 mg PO bid. Initial dose given 1–3 hr before chemotherapy begins. Maximum recommended dose, 6 mg/day PO, divided and given tid. May be given daily during each chemotherapy cycle and for 48 hr after last dose in cycle, if needed. Patient should be under close supervision because of risk of altered mental state.

Pediatric patients younger than 18 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2 hr

Metabolism: Hepatic; $T_{1/2}$: 2–35 hr (active metabolites)

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Drowsiness, vertigo, euphoria, ataxia, headache, difficulty concentrating, sleep disturbance, disorientation, depersonalization, vision disturbances*
- **CV:** *Orthostatic hypotension, hypotension, tachycardia, palpitations, hypertension, arrhythmia*
- **Dependence:** Risk of psychological dependence
- **GI:** *Dry mouth, nausea, anorexia, increased appetite, diarrhea, constipation*
- **Other:** Fatigue, malaise

Interactions

★ **Drug-drug** • Risk of additive hypertension, tachycardia, cardiac toxicity if combined with amphetamines, cocaine, sympathomimetics; use caution • Risk of tachycardia, drowsiness if combined with atropine, scopolamine, antihistamines, anticholinergics; use caution • Risk of tachycardia, hypertension, drowsiness if combined with amitriptyline,

amoxapine, desipramine, TCAs; use caution

- Risk of additive CNS depression if combined with barbiturates, benzodiazepines, ethanol, lithium, opioids, buspirone, antihistamines, muscle relaxants, other CNS depressants; use caution

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the drug; pregnancy, lactation; current or previous psychiatric disorders; concurrent therapy with sedatives, hypnotics, or psychoactive drugs; history of substance abuse, hypertension, heart disease
- **Physical:** Orientation, affect, reflexes; BP, standing BP, P; abdominal examination

Interventions

- Limit prescriptions to the minimum amount needed for a single chemotherapy cycle because of abuse potential.
- Warn patient about drug's profound effects on mental state and abuse potential before starting therapy. Patient should receive full information about potential drug effects; they can persist 48–72 hr after stopping drug.
- Warn patient about potential effects on mood and behavior to prevent panic if these occur.
- Patient should be supervised by a responsible adult while taking this drug; monitor patient during first round of chemotherapy to determine effects and their duration to establish guidelines for supervision. Supervision should begin again whenever dosage changes.
- Provide safety measures if dizziness and lightheadedness occur.

⊗ **Warning** Discontinue drug if psychotic reaction occurs; observe patient closely until evaluated and counseled. Patient should participate in decision about further use of drug, perhaps at a lower dosage.

Teaching points

- This drug is called a cannabinoid. It works in the brain much like marijuana. It has many of the associated mental changes and dependency issues that occur with marijuana.

- Take this drug exactly as prescribed. Take the first dose of the cycle 1–3 hours before chemotherapy starts. Take the drug every day during the chemotherapy cycle; you may need the drug for 1–2 days after the cycle to maintain relief of nausea and vomiting.
- If you miss a dose of the daily medication, take the dose as soon as you remember; then return to your usual routine. Do not double the dose.
- Be aware that the effects of this drug may continue 2–3 days after you stop taking it.
- It is not known how this drug could affect a nursing baby. If you are nursing, consult your health care provider.
- It is not known how this drug could affect a fetus. If you are pregnant or you decide to become pregnant while taking this drug, consult your health care provider.
- This drug interacts with many other drugs, and the interaction could cause serious side effects. Tell any health care provider who is taking care of you that you are taking this drug.
- Do not drink alcohol while taking this drug.
- You may experience these side effects: Dizziness, drowsiness, anxiety, disorientation, dry mouth. Do not drive a car or operate dangerous machinery while taking this drug, and avoid making any important decisions. For dry mouth, practice frequent mouth care; sucking sugarless lozenges may help.
- Report chest pain, rapid heartbeat, depression, feelings of panic, hallucinations.

▽ nabumetone

(*nab byoo' meh tone*)

Apo-Nabumetone (CAN),
Gen-Nabumetone (CAN)

PREGNANCY CATEGORY C
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Analgesic (nonopioid)
NSAID

Therapeutic actions

Analgesic, anti-inflammatory, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Acute and long-term treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis

Contraindications and cautions

- Contraindicated with significant renal impairment, allergy to NSAIDs, pregnancy, lactation.
- Use cautiously with hepatic, CV, and GI conditions.

Available forms

Tablets—500, 750 mg

Dosages

Adults

1,000 mg PO as a single dose with or without food. 1,500–2,000 mg/day have been used. May be given in divided doses.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Maximum starting dose should not exceed 750 mg daily for moderate insufficiency, 500 mg for severe insufficiency.

Pharmacokinetics

Route	Onset	Peak
Oral	30 min	30–60 min

Metabolism: Hepatic; $T_{1/2}$: 22.5–30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence
- **GU:** Dysuria, **renal impairment**

- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, anaphylactoid reactions to **fatal anaphylactic shock**

Interactions

★ **Drug-drug** • Increased risk of bleeding if combined with warfarin, aspirin

■ Nursing considerations

Assessment

- **History:** Renal impairment; impaired hearing; allergies; hepatic, CV, and GI conditions; lactation; pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events or GI bleeding; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examinations during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs; take only the prescribed dosage.
- Dizziness, drowsiness can occur (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools, chest pain.

nadolol (*nay doe' lol*)

Corgard

PREGNANCY CATEGORY C

Drug classes

Antianginal

Antihypertensive

Beta-adrenergic blocker (nonselective)

Therapeutic actions

Competitively blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, decreasing the influence of the sympathetic nervous system on these tissues and decreasing the excitability of the heart, cardiac output, oxygen consumption, renin release, and BP.

Indications

- Hypertension alone or with other drugs, especially diuretics
- Long-term management of angina pectoris
- Unlabeled use: Migraines

Contraindications and cautions

- Contraindicated with sinus bradycardia (HR less than 45 beats/min), second- or third-degree heart block (PR interval greater than 0.24 sec), cardiogenic shock, HF, asthma, COPD, lactation.
- Use cautiously with diabetes or thyrotoxicosis, pregnancy.

Available forms

Tablets—20, 40, 80, 120, 160 mg

Dosages

Adults

- **Hypertension:** Initially, 40 mg PO daily; gradually increase dosage in 40- to 80-mg increments until optimum response is achieved. Usual maintenance dose is 40–80 mg/day; up to 320 mg daily may be needed. To discontinue, reduce dosage gradually over a 1- to 2-wk period.
- **Angina:** Initially, 40 mg PO daily; gradually increase dosage in 40- to 80-mg increments at 3- to 7-day intervals until optimum

response is achieved or heart rate markedly decreases. Usual maintenance dose is 40–80 mg daily; up to 240 mg/day may be needed. Safety and efficacy of larger doses not established. To discontinue, reduce dosage gradually over 1- to 2-wk period.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal failure

CrCl (mL/min)	Dosage Intervals (hr)
More than 50	24
31–50	24–36
10–30	24–48
Less than 10	40–60

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	3–4 hr	17–24 hr

Metabolism: $T_{1/2}$: 20–24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** *Heart failure, cardiac arrhythmias*, peripheral vascular insufficiency, claudication, CVA, **pulmonary edema**, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, urinary frequency

- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory:** Bronchospasm, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated serum transaminase*

Interactions

- * **Drug-drug** • Increased effects with verapamil • Increased serum levels and toxicity of IV lidocaine, theophylline • Increased risk of orthostatic hypotension with alpha-adrenergic blockers • Increased risk of peripheral ischemia with ergotamine, dihydroergotamine • Decreased antihypertensive effects with NSAIDs, clonidine • Hypertension followed by severe bradycardia with epinephrine
- * **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure; asthma, COPD; diabetes or thyrotoxicosis; pregnancy; lactation
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- ⊗ **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult with physician about withdrawing drug if patient is to undergo surgery (controversial).

Teaching points

- Do not stop taking unless instructed to do so by your health care provider; drug must be stopped gradually to prevent serious adverse effects.

- Avoid driving or dangerous activities if dizziness, disorientation occur.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▼ nafarelin acetate (naf' a re lin)

Synarel

PREGNANCY CATEGORY X

Drug class

Gonadotropin-releasing hormone (GnRH)

Therapeutic actions

A potent agonistic analogue of GnRH, which is released from the hypothalamus to stimulate LH and FSH release from the pituitary; these hormones are responsible for regulating reproductive status. Repeated dosing abolishes the stimulatory effect on the pituitary gland, leading to decreased secretion of gonadal steroids by about 4 wk; consequently, tissues and functions that depend on gonadal steroids for their maintenance become quiescent.

Indications

- Treatment of endometriosis, including pain relief and reduction of endometriotic lesions
- Treatment of central precocious puberty in children of both sexes

Contraindications and cautions

- Contraindicated with known sensitivity to GnRH, GnRH-agonist analogues, excipients in the product; undiagnosed abnormal vaginal bleeding; pregnancy; lactation (potential androgenic effects on the fetus).
- Use cautiously with rhinitis.

Available forms

Nasal solution—2 mg/mL (200 mcg/spray)

Dosages

Adults

- **Endometriosis:** 400 mcg/day. One spray (200 mcg) into one nostril in the morning

and 1 spray into the other nostril in the evening. Start treatment between days 2 and 4 of the menstrual cycle. 800-mcg dose may be administered as 1 spray into each nostril in the morning (a total of 2 sprays) and again in the evening for patients with persistent regular menstruation after 2 months of treatment. Treatment for 6 mo is recommended. Retreatment is not recommended because safety has not been established.

Pediatric patients

- **Central precocious puberty:** 1,600 mcg/day. Two sprays (400 mcg) in each nostril in the morning and 2 sprays in each nostril in the evening; may be increased to 1,800 mcg/day. If 1,800 mcg are needed, give 3 sprays into alternating nostrils three times/day. Continue until resumption of puberty is desired.

Pharmacokinetics

Route	Onset	Peak
Nasal	Rapid	4 wk

Metabolism: $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, headache, sleep disorders, fatigue
- **Endocrine:** *Androgenic effects* (acne, edema, mild hirsutism, decrease in breast size, deepening of the voice, oily skin or hair, weight gain, clitoral hypertrophy or testicular atrophy), *hypoestrogenic effects* (flushing, sweating, vaginitis, nervousness, emotional lability)
- **GI:** Hepatic impairment
- **GU:** Fluid retention, vaginal dryness, ovarian cysts
- **Local:** *Nasal irritation*
- **Other:** Rash, pruritus; with prolonged therapy, bone density loss has been noted

■ Nursing considerations

Assessment

- **History:** Sensitivity to GnRH, GnRH-agonist analogues, excipients in the product; undi-

agnosed abnormal genital bleeding; pregnancy; lactation; rhinitis

- **Physical:** Weight; hair distribution pattern; skin color, texture, lesions; breast examination; nasal mucosa; orientation, affect, reflexes; P, auscultation, BP, peripheral edema; liver evaluation; bone density studies in long-term therapy

Interventions

- Ensure that patient is not pregnant before therapy; begin therapy for endometriosis during menstrual period, days 2–4; advise the use of barrier contraceptives.
- Store drug upright; protect from exposure to light.
- Arrange for bone age and growth velocity studies before therapy and periodically thereafter if retreatment is suggested because of return of endometriosis.
- Ensure patient has enough of the drug to prevent interruption of therapy.
- Caution patient that androgenic effects may not be reversible when the drug is withdrawn.
- Monitor nasal mucosa for signs of erosion during course of therapy.
- If a topical decongestant needs to be used, wait at least 2 hr after dosing with nafarelin.

Teaching points

- Use this drug without interruption; be sure that you have enough on hand to prevent interruption. Store the drug upright. Protect the bottle from exposure to light. Clear nasal passages by gently blowing your nose before administering drug.
- Regular menstruation should cease within 4–6 weeks of therapy. Breakthrough bleeding or ovulation may still occur.
- Consult with your health care provider if you need a topical nasal decongestant; a decongestant should be used at least 2 hours after nafarelin use.
- This drug is contraindicated during pregnancy; use a nonhormonal form of birth control during therapy. If you become pregnant, discontinue the drug and consult your health care provider immediately.
- You may experience these side effects: Masculinizing effects (acne, hair growth,

deepening of voice, oily skin or hair; may not be reversible); low estrogen effects (flushing, sweating, vaginal irritation, nervousness); nasal irritation.

- Report abnormal growth of facial hair, deepening of the voice, unusual bleeding or bruising, fever, chills, sore throat, vaginal itching or irritation, nasal irritation or burning.

DANGEROUS DRUG

nalbuphine hydrochloride

(*nal' byoo feen*)

Nubain

PREGNANCY CATEGORY B

PREGNANCY CATEGORY D
(PROLONGED USE OR WITH
HIGH DOSES AT TERM)

Drug class

Opioid agonist-antagonist analgesic

Therapeutic actions

Nalbuphine acts as an agonist at specific opioid receptors in the CNS to produce analgesia and sedation but also acts to cause hallucinations and is an antagonist at mu receptors.

Indications

- Relief of moderate to severe pain
- Preoperative analgesia, as a supplement to surgical anesthesia, and for obstetric analgesia during labor and delivery
- Unlabeled use: Prevention and treatment of intrathecal morphine-induced pruritus after cesarean section

Contraindications and cautions

- Contraindicated with hypersensitivity to nalbuphine, sulfites.
- Use cautiously with emotionally unstable patients or those with a history of opioid abuse, pregnancy prior to labor (neonatal withdrawal may occur if mothers used drug during pregnancy), labor or delivery (use with caution during delivery of premature infants, who are especially sensitive to respiratory depressant effects of opioids),

bronchial asthma, COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI when nausea and vomiting are present, biliary tract surgery (may cause spasm of the sphincter of Oddi), lactation.

Available forms

Injection—10 mg/mL, 20 mg/mL

Dosages

Adults

Usual dose is 10 mg for a 70-kg person IM, IV, or subcutaneously every 3–6 hr as needed. Individualize dosage. In nontolerant patients, the recommended single maximum dose is 20 mg, with a maximum total daily dose of 160 mg. Patients dependent on opioids may experience withdrawal symptoms with administration of nalbuphine; control by small increments of morphine by slow IV administration until relief occurs. If the previous opioid was morphine, meperidine, codeine, or another opioid with similar duration of activity, administer one-fourth the anticipated nalbuphine dose initially, and observe for signs of withdrawal. If no untoward symptoms occur, progressively increase doses until analgesia is obtained.

- **Supplement to anesthesia:** Induction—0.3–3 mg/kg IV over 10–15 min; maintenance—0.25–0.5 mg/kg IV.

Pediatric patients younger than 18 yr

Not recommended.

Patients with renal or hepatic impairment

Reduce dosage.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	2–3 min	15–20 min	3–6 hr
Subcut., IM	Less than 15 min	30–60 min	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: 5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No additional preparation is required.

Infusion: Administer by direct injection or into the tubing of a running IV.

Y-site incompatibilities: Do not give with nafcillin, ketorolac.

Adverse effects

- **CNS:** *Sedation, clamminess, sweating, headache*, nervousness, restlessness, depression, crying, confusion, faintness, hostility, unusual dreams, hallucinations, euphoria, dysphoria, unreality, *dizziness, vertigo*, floating feeling, feeling of heaviness, numbness, tingling, flushing, warmth, blurred vision
- **CV:** Hypotension, hypertension, bradycardia, tachycardia
- **Dermatologic:** Pruritus, burning, urticaria
- **GI:** Nausea, vomiting, cramps, dyspepsia, bitter taste, *dry mouth*
- **GU:** Urinary urgency
- **Respiratory:** Respiratory depression, dyspnea, asthma

Interactions

★ **Drug-drug** • Potentiation of effects with barbiturate anesthetics or other CNS depressants

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to nalbuphine, sulfites; lactation; emotional instability or history of opioid abuse; pregnancy; bronchial asthma, COPD, respiratory depression; anoxia; increased intracranial pressure; MI; biliary tract surgery
- **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; pulse, auscultation, BP; R, adventitious sounds; bowel sounds, normal output; urine output; LFTs, renal function tests

Interventions

⊗ **Warning** Taper dosage when discontinuing after prolonged use to avoid withdrawal symptoms.

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration available in case of respiratory depression.

- Reassure patient about addiction liability; most patients who receive opiates for med-

ical reasons do not develop dependence syndromes.

Teaching points

- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing tasks that require alertness), nausea, loss of appetite (lying quietly, eating frequent small meals may help).
- Report severe nausea, vomiting, palpitations, shortness of breath, or difficulty breathing.

▼ naloxone hydrochloride

(*nal ox'one*)

Narcan

PREGNANCY CATEGORY C

Drug classes

Diagnostic agent

Opioid antagonist

Therapeutic actions

Pure opioid antagonist; reverses the effects of opioids, including respiratory depression, sedation, hypotension; can reverse the psychotomimetic and dysphoric effects of opioid agonist-antagonists, such as pentazocine.

Indications

- Complete or partial reversal of opioid depression, including respiratory depression induced by opioids, including natural and synthetic narcotics, propoxyphene, methadone, nalbuphine, butorphanol, pentazocine
- Diagnosis of suspected acute opioid overdose
- Unlabeled uses: Improvement of circulation in refractory shock, reversal of alcoholic coma, dementia of Alzheimer's or schizophrenic type

Contraindications and cautions

- Contraindicated with allergy to opioid antagonists.

- Use cautiously with opioid addiction, CV disorders, pregnancy, lactation.

Available forms

Injection—0.02 mg/mL, 0.4 mg/mL

Dosages

IV administration is recommended in emergencies when rapid onset of action is required.

Adults

- **Opioid overdose:** Initial dose of 0.4–2 mg, IV. Additional doses may be repeated at 2- to 3-min intervals. If no response after 10 mg, question the diagnosis. IM or subcutaneous routes may be used if IV route is unavailable.
- **Postoperative opioid depression:** Titrate dose to patient's response. Initial dose of 0.1–0.2 mg IV at 2- to 3-min intervals until desired degree of reversal. Repeat doses may be needed within 1- to 2-hr intervals, depending on amount and type of opioid. Supplemental IM doses produce a longer-lasting effect.

Pediatric patients

- **Opioid overdose:** Initial dose is 0.01 mg/kg IV. Subsequent dose of 0.1 mg/kg may be administered if needed. May be given IM or subcutaneously in divided doses.
- **Postoperative opioid depression:** For the initial reversal of respiratory depression, inject in increments of 0.005–0.01 mg IV at 2- to 3-min intervals to the desired degree of reversal.

Pharmacokinetics

Route	Onset	Duration
IV	2 min	4–6 hr
IM, Subcut.	3–5 min	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 30–81 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute in normal saline or 5% dextrose solutions for IV infusions. The addition of 2 mg in 500 mL of solution provides a concentration of 0.004 mg/mL; titrate rate by response. Use diluted mixture within 24 hr. After that time, discard any remaining solution.

Infusion: Inject directly, or titrate rate of infusion based on response.

Incompatibilities: Do not mix naloxone with preparations containing bisulfite, metabisulfite, high-molecular-weight anions, alkaline pH solutions.

Adverse effects

- **Acute opioid abstinence syndrome:** *Nausea, vomiting, sweating, tachycardia, increased BP, tremulousness*
- **CNS:** Reversal of analgesia and excitement (postoperative use)
- **CV:** *Hypotension, hypertension*, ventricular tachycardia and **fibrillation, pulmonary edema** (postoperative use)

Nursing considerations

Assessment

- **History:** Allergy to opioid antagonists; opioid addiction; CV disorders; lactation
- **Physical:** Sweating; reflexes, pupil size; P, BP; R, adventitious sounds

Interventions

- Monitor patient continuously after use of naloxone; repeat doses may be needed, depending on duration of opioid and time of last dose.

⊗ **Warning** Maintain open airway and provide artificial ventilation, cardiac massage, vasopressor drugs if needed to counteract acute opioid overdose.

Teaching points

- Report sweating, feelings of tremulousness.

 **naltrexone hydrochloride**
(*nal trex' one*)

Depade, ReVia, Vivitrol

PREGNANCY CATEGORY C

Drug class

Opioid antagonist

Therapeutic actions

Pure opiate antagonist; markedly attenuates or completely, reversibly blocks the subjective

effects of IV opioids, including those with mixed opioid agonist-antagonist properties.

Indications

- Adjunct to treatment of alcohol or opioid dependence as part of a comprehensive treatment program
- Unlabeled uses: Treatment of postconcussional syndrome unresponsive to other treatments; eating disorders

Contraindications and cautions

- Contraindicated with allergy to opioid antagonists, acute hepatitis, liver failure.
- Use cautiously with opioid addiction (may produce withdrawal symptoms; do not administer unless patient has been opioid-free for 7–10 days); opioid withdrawal; lactation; depression, suicidal tendencies; pregnancy.

Available forms

Tablets—25, 50, 100 mg; injection—380 mg/vial

Dosages

⊗ **Warning** Give naloxone challenge before use except in patients already showing clinical signs of opioid withdrawal.

Adults

IV challenge

Draw 2 ampules of naloxone, 2 mL (0.8 mg) into a syringe. Inject 0.5 mL (0.2 mg). Leave needle in vein, and observe for 30 sec. If no signs of withdrawal occur, inject remaining 1.5 mL (0.6 mg), and observe for 20 min for signs and symptoms of withdrawal (stiffness or running nose, tearing, yawning, sweating, tremor, vomiting, piloerection, feeling of temperature change, joint or bone and muscle pain, abdominal cramps, skin crawling).

Subcutaneous challenge

Administer 2 mL (0.8 mg) naloxone, and observe for signs and symptoms of withdrawal for 20 min. If any of the signs and symptoms of withdrawal occur or if there is any doubt that the patient is opioid free, do not administer naltrexone. Confirmatory rechallenge can be done within 24 hr. Inject 4 mL IV, and observe for signs and symptoms of withdrawal. Repeat until no signs and symptoms are seen and patient is no longer at risk.

Naltrexone

- **Alcoholism:** 50 mg/day PO or 380 mg IM into upper outer quadrant of gluteal muscle once every 4 wk (*Vivitrol*). Alternate buttock with each administration.
- **Opioid dependence:** Initial dose of 25 mg PO. Observe for 1 hr; if no signs or symptoms are seen, complete dose with 25 mg. Usual maintenance dose is 50 mg/24 hr PO. Flexible dosing schedule can be used with 100 mg every other day or 150 mg every third day.

Pediatric patients

Safety has not been established in patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	60 min	24–72 hr

Metabolism: Hepatic; $T_{1/2}$: 3.9–12.9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Difficulty sleeping, anxiety, nervousness, headache, low energy*; increased energy, irritability, dizziness, blurred vision, burning, light sensitivity
- **CV:** Phlebitis, edema, increased BP, non-specific ECG changes
- **Dermatologic:** *Rash*, oily skin, pruritus, acne
- **GI:** **Hepatocellular injury**, *abdominal pain or cramps, nausea, vomiting*, loss of appetite, diarrhea, constipation
- **GU:** *Delayed ejaculation, decreased potency*; increased frequency of or discomfort with voiding
- **Respiratory:** Nasal congestion, rhinorrhea, sneezing, sore throat, excess mucus or phlegm, sinus trouble, epistaxis, injection site reaction
- **Other:** *Chills, increased thirst*; increased appetite, weight change, yawning, swollen glands, *joint and muscle pain*, injection site reaction

Interactions

★ **Drug-drug** • Decreased effectiveness of opioid analgesics or other opioid-containing preparations

■ Nursing considerations

Assessment

- **History:** Allergy to opioid antagonists; opioid addiction; opioid withdrawal; acute hepatitis, liver failure; lactation; depression, suicidal tendencies; pregnancy
- **Physical:** Sweating; skin lesions, color; reflexes, affect, orientation, muscle strength; P, BP, edema, baseline ECG; R, adventitious sounds; liver evaluation; urine screen for opioids, LFTs

Interventions

⊗ **Warning** Do not use until patient has been opioid free for 7–10 days; check urine opioid levels.

⊗ **Warning** Do not administer until patient has passed a naloxone challenge.

- Administer IM injection in the gluteal region, alternating buttocks.
- Initiate treatment slowly, and monitor until patient has been given naltrexone in the full daily dose with no signs and symptoms of withdrawal.

⊗ **Black box warning** Obtain periodic liver function tests during therapy; discontinue therapy at sign of increasing hepatic impairment (risk of hepatocellular injury).

- Do not use opioid drugs for analgesia, cough, and cold; do not use opioid antidiarrheal preparations; patient will not respond; use a nonopioid preparation.
- Ensure that patient is actively participating in a comprehensive treatment program.

Teaching points

- This drug will help facilitate abstinence from alcohol or opioids.
- This drug blocks the effects of opioids and other opiates.
- Wear or carry a medical ID tag to alert emergency medical personnel that you are taking this drug.
- Small doses of heroin or other opiate drugs will not have an effect. Self-administration of large doses of heroin or other opioids can

overcome the blockade effect but may cause death, serious injury, or coma.

- You may experience these side effects: Drowsiness, dizziness, blurred vision, anxiety (avoid driving or operating dangerous machinery); diarrhea, nausea, vomiting (take drug with food to decrease these effects); decreased sexual function.
- Report unusual bleeding or bruising; dark, tarry stools; yellowing of eyes or skin; running nose; tearing; sweating; chills; joint or muscle pain.

▷ naproxen

(*na prox' en*)

naproxen

Apo-Naproxen (CAN), Apo-Naproxen EC (CAN), Apo-Naproxen SR (CAN), EC-Naprosyn, Gen-Naproxen EC (CAN), Naprelan ^{OND}, Naprosyn, Novo-Naprox (CAN), Novo-Naprox-EC (CAN)

naproxen sodium

Aleve, Anaprox, Anaprox DS ^{OND}, Apo-Napro-Na (CAN), Apo-Napro-Na DS (CAN) ^{OND}, Midol Extended Relief, Novo Naprox Sodium (CAN), Novo Naprox Sodium DS (CAN) ^{OND}, Novo Naprox SR (CAN)

PREGNANCY CATEGORY C

Drug classes

Analgesic (nonopioid)
NSAID

Therapeutic actions

Analgesic, anti-inflammatory, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Mild to moderate pain
- Treatment of primary dysmenorrhea, rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, tendinitis, bursitis, acute gout

- OTC use: Temporary relief of minor aches and pains associated with the common cold, headache, toothache, muscular aches, backache, minor pain of arthritis, pain of menstrual cramps, reduction of fever
- Treatment of juvenile arthritis (*Naproxen*)

Contraindications and cautions

- Contraindicated with allergy to naproxen, salicylates, other NSAIDs; pregnancy; lactation.
- Use cautiously with asthma, chronic urticaria, CV dysfunction, hypertension, GI bleeding, peptic ulcer, impaired hepatic or renal function.

Available forms

Tablets—250, 375, 500 mg; 220, 275, 412.5, 500 mg (as naproxen sodium); DR tablets **ONC**—375, 500 mg; CR tablets **ONC**—375, 500 mg; suspension—125 mg/5 mL

Dosages

Do not exceed 1,250 mg/day (1,375 mg/day naproxen sodium).

Adults

- *Rheumatoid arthritis or osteoarthritis, ankylosing spondylitis:*

DR (EC-Naprosyn) **ONC**

375–500 mg PO bid.

CR (Naprelan) **ONC**

750–1,000 mg PO daily as a single dose.

Naproxen sodium

275–550 mg bid PO. May increase to 1.65 g/day for a limited period.

Naproxen tablets

250–500 mg PO bid.

Naproxen suspension

250 mg (10 mL), 375 mg (15 mL), 500 mg (20 mL) PO bid.

- *Acute gout:*

CR (Naprelan) **ONC**

1,000–1,500 mg PO daily as a single dose.

Naproxen sodium

825 mg PO followed by 275 mg every 8 hr until attack subsides.

Naproxen

750 mg PO, followed by 250 mg every 8 hr until attack subsides.

- *Mild to moderate pain:*

CR (Naprelan) **ONC**

1,000 mg PO daily as a single dose.

Naproxen sodium

550 mg PO followed by 275 mg every 6–8 hr.

Naproxen

500 mg followed by 500 mg every 12 hr or 250 mg every 6–8 hr.

OTC

200 mg PO every 8–12 hr with a full glass of liquid while symptoms persist. Do not exceed 600 mg in 24 hr.

Pediatric patients

- *Juvenile arthritis:*

Naproxen

10 mg/kg/day PO given in two divided doses.

Naproxen sodium

Safety and efficacy not established.

OTC

Do not give to children younger than 12 yr unless under advice of physician.

Geriatric patients

Do not give more than 200 mg every 12 hr PO.

Pharmacokinetics

Drug	Onset	Peak	Duration
Naproxen	1 hr	2–4 hr	7 hr or less
Naproxen sodium	1 hr	1–2 hr	7 hr or less

Metabolism: Hepatic; $T_{1/2}$: 12–15 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence
- **GU:** Dysuria, renal impairment, including renal failure, interstitial nephritis, hematuria
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, menorrhagia

- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions** to **anaphylactic shock**

Interactions

- **Drug-drug** • Increased serum lithium levels and risk of toxicity with naproxen
- **Drug-lab test** • Falsely increased values for urinary 17-ketogenic steroids; discontinue naproxen therapy for 72 hr before adrenal function tests • Inaccurate measurement of urinary 5-HIAA

■ Nursing considerations

Assessment

- **History:** Allergy to naproxen, salicylates, other NSAIDs; asthma, chronic urticaria, CV dysfunction; hypertension; GI bleeding; peptic ulcer; impaired hepatic or renal function; pregnancy; lactation
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, BP, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes; stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Give with food or after meals if GI upset occurs. Do not cut, crush, or allow patient to chew DR or CR forms.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs; take only the prescribed dosage. Do not cut, crush, or chew extended-release forms.
- Dizziness, drowsiness can occur (avoid driving or using dangerous machinery).
- Report sore throat; fever; rash; itching; weight gain; swelling in ankles or fingers; changes in vision; black, tarry stools, chest pain.

▷ naratriptan (*nar ab trip' tan*)

Amerge

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug (triptan)
Serotonin selective agonist

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients; migraine is believed to be caused by vasodilation of cranial blood vessels in these patients.

Indications

- Treatment of acute migraine attacks with or without aura

Contraindications and cautions

- Contraindicated with allergy to any triptan, active CAD, uncontrolled hypertension, cerebrovascular disease or peripheral vascular syndromes, severe renal or hepatic impairment.
- Use cautiously in the elderly; with lactation, pregnancy.

Available forms

Tablets—1, 2.5 mg

Dosages

Adults

Single dose of 1 mg PO or 2.5 mg PO; may be repeated in 4 hr if needed. Do not exceed 5 mg/24 hr.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

Contraindicated in severe renal impairment (creatinine clearance less than 15 mL/min) or severe hepatic impairment (Child-Pugh grade C). In mild or moderate renal or hepatic impairment, start with lowest dose and do not exceed 2.5 mg/24 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness*, headache, anxiety, fatigue, drowsiness, paresthesias, corneal defects
- **CV:** BP alterations, tightness or pressure in chest
- **Other:** *Neck, throat, or jaw discomfort*; generalized pain, nausea

Interactions

★ **Drug-drug** • Prolonged vasoactive reactions when taken concurrently with ergot-containing drugs; avoid this combination • Increased blood levels and prolonged effects if combined with hormonal contraceptives; monitor patient and adjust dosage as appropriate • Increased risk of serotonin syndrome if combined with SSRIs or selective norepinephrine reuptake inhibitors

■ Nursing considerations**Assessment**

- **History:** Allergy to any triptan, active CAD, uncontrolled hypertension, severe renal or hepatic impairment, pregnancy, lactation
- **Physical:** Orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure; administer with food.
- Establish safety measures if CNS or visual disturbances occur.
- Provide appropriate analgesics as needed for pain related to therapy.
- Recommend the use of barrier contraceptives to women of childbearing age; serious birth defects could occur.
- Control environment (lighting, temperature) as appropriate to help relieve migraine.
- ⊗ **Warning** Monitor BP of patients with possible coronary artery disease; discontinue

naratriptan at any sign of angina or prolonged high BP.

Teaching points

- Take drug to relieve migraine; do not use as a means of prevention. Take drug with food.
- Dosage may be repeated in 4 hours if headache returns or has not been relieved. Do not take more than 5 milligrams in one 24-hour period.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, stop taking the drug, and contact your health care provider.
- Continue to do anything that usually helps you during a migraine—adjust lighting, control noise, and so forth.
- ⊗ **Warning** Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery while taking this drug); numbness, tingling, feelings of tightness or pressure.
- Report severe pain or discomfort, visual changes, palpitations, unrelieved headache.

▷ natalizumab

(*nab tab liz' yoo mab*)

Tysabri

PREGNANCY CATEGORY C

Drug classes

Monoclonal antibody
MS drug

Therapeutic actions

Monoclonal antibody specific for the alpha-4 subunit on the surface of all leukocytes except neutrophils. Binding with this subunit inhibits adhesion of leukocytes to their counterreceptors, including those on vascular endothelium. Preventing leukocyte adhesion inhibits migration of leukocytes into inflamed tissue and may inhibit recruitment and inflammatory activity of activated immune cells. The exact mechanism of action in MS (thought

to be an autoimmune disorder) is not known, but natalizumab may prevent migration of leukocytes into the brain and reduce plaque formation.

Indications

- Monotherapy for patients with relapsing MS to delay physical disability and decrease the frequency of exacerbations; reserved for patients who have had inadequate response to or cannot tolerate other MS therapies
- Treatment of Crohn's disease in patients who have not responded to other therapies.

Contraindications and cautions

- Contraindicated with allergy to any component of the preparation, progressive multifocal leukoencephalopathy (PML) or history of it, lactation.
- Use caution with immune suppression, pregnancy.

Available forms

Single-use vials—300 mg/15 mL

Dosages

Adults

300 mg by IV infusion over 1 hr every 4 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Slow	7–8 days

Metabolism: Tissue; $T_{1/2}$: 11–15 days

Distribution: May cross placenta; may enter breast milk

Excretion: Tissue

IV FACTS

Preparation: Withdraw 15 mL of natalizumab from vial using a sterile syringe and needle. Inject drug into 100 mL 0.9% sodium chloride injection. Gently invert to mix completely. Do not shake. Inspect solution; it should be clear and free of particulates. Use immediately, or refrigerate and use within 8 hr. Do not freeze. If refrigerated, warm to room temperature before infusion.

Infusion: Infuse over approximately 1 hr. After infusion, flush with 0.9% sodium chlo-

ride solution. Observe patient during and for 1 hr after infusion to detect hypersensitivity reactions. Do not give as an IV push or bolus.

Incompatibilities: Do not mix with any other drug.

Adverse effects

- **CNS:** *Headache, depression, dizziness, suicidal ideation, tremor, rigors, PML*
- **GI:** *Gastroenteritis, abdominal discomfort, diarrhea, abnormal liver function, tooth infections*
- **GU:** *Irregular menses, dysmenorrhea, amenorrhea, urinary urgency, urinary frequency, UTI*
- **Hematologic:** *Increased levels of circulating lymphocytes, monocytes, eosinophils, basophils, nucleated RBCs*
- **Respiratory:** *Lower respiratory tract infections, tonsillitis*
- **Skin:** *Rash, pruritus, dermatitis*
- **Other:** *Infection, fatigue, arthralgia, anaphylactic reactions, infusion reaction (headache, dizziness, fatigue, urticaria, pruritus, rigors, hypersensitivity reactions), weight changes*

Interactions

★ **Drug-drug** • Increased risk of infection if combined with corticosteroids or other immune suppressants including tumor necrosis factor α (TNF- α) inhibitors; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to any component of the preparation; pregnancy, lactation; immune suppression, PML
- **Physical:** T; skin color, lesions; orientation, reflexes; R, adventitious sounds, LFTs

Interventions

⊗ **Black box warning** Be aware that drug increases the risk of PML, which can be fatal. Natalizumab is available only through the TOUCH prescribing program; patients should be monitored closely for signs of PML, and drug should be stopped immediately if they occur. Drug is available only to prescribers and patients who have entered the TOUCH program and understand risks of the drug and

need to monitor closely. Risk increases with number of infusions. There is a risk of immune reconstitution inflammatory syndrome (a severe immune reaction) in patients who developed PML and discontinued the drug.

- Withhold drug at any sign of PML (change in eyesight, thought disturbances, loss of balance or strength); an MRI will be ordered to evaluate the patient.
- Make sure patient is not immune-suppressed or taking immunosuppressants or TNF- α inhibitors.
- Refrigerate vials. Product contains no preservatives; do not use after expiration date. Protect from light. Do not freeze.
- Monitor patient during infusion and for 1 hr afterward for hypersensitivity reaction (headache, dizziness, urticaria, pruritus, rigo). Discontinue drug immediately at first sign of hypersensitivity reaction. Provide supportive care if reaction occurs after infusion.
- Do not administer drug to patient who has had a hypersensitivity reaction to it.
- Urge women of childbearing age to use barrier contraceptive; effects of this drug on a fetus are not known.
- If woman is lactating, suggest another method of feeding the baby during therapy.

Teaching points

- You must enroll in the TOUCH Prescribing Program before you can receive this drug; the program includes careful monitoring and education about the risk of a serious, viral, brain lesion from using this drug.
- This drug is given by IV infusion every 4 weeks. The infusion will take about 1 hour, and you will need to be monitored for another hour. Keep a calendar to remind you of the dates for each infusion.
- This drug should not be taken during pregnancy or when nursing a baby unless absolutely necessary; use a barrier contraceptive, effects of the drug on a fetus or nursing baby are not known.
- This drug increases your risk of infection. Contact your health care provider if fever or other signs of infection occur.
- You may experience these side effects: Headache (medication may be available to help); respiratory infection, urinary tract infection

(avoid crowded areas and people with infections, and wash your hands often); upset stomach, GI discomfort (small, frequent meals may help).

- Report fever, hives, rash, depression, any sign of infection; changes in thinking, balance, strength, or eyesight that last for several days.

DANGEROUS DRUG

 **nateglinide**
(*nab teg' lab nyde*)

Starlix

PREGNANCY CATEGORY C

Drug classes

Antidiabetic
Meglitinide

Therapeutic actions

Closes potassium channels in the beta cells of the pancreas, which causes the opening of calcium channels and a resultant increase in insulin release; highly selective for pancreatic potassium channels with little effect on the vasculature. Glucose-lowering abilities depend on the existence of functioning beta cells in the pancreas.

Indications

- Adjunct to diet and exercise to lower blood glucose in patients with type 2 diabetes mellitus whose hyperglycemia cannot be managed by diet and exercise alone
- Combination therapy with metformin or a thiazolidinedione for glycemic control in those patients with type 2 diabetes who do not receive adequate control with diet and either drug

Contraindications and cautions

- Contraindicated with hypersensitivity to the drug, diabetic ketoacidosis, type 1 diabetes, pregnancy, lactation.
- Use cautiously with hepatic impairment.

Available forms

Tablets—60, 120 mg

Dosages

Adults

120 mg PO tid taken 1–30 min before meals; 60 mg PO tid may be tried if patient is near HbA_{1c} goal.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	1 hr	4 hr

Metabolism: Hepatic; T_{1/2}: 1.5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, paresthesias, dizziness
- **Endocrine:** Hypoglycemia (low risk)
- **GI:** Nausea, diarrhea, constipation, vomiting, dyspepsia
- **Respiratory:** *URI*, sinusitis, rhinitis, bronchitis

Interactions

★ **Drug-drug** • Increased risk of hypoglycemia if taken with salicylates, NSAIDs, beta-blockers, MAOIs; monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to the drug, diabetic ketoacidosis, type 1 diabetes, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; blood glucose, LFTs, renal function tests

Interventions

- Administer drug three times a day 1–30 min before meals; if a patient skips or adds a meal, the dosage should be skipped or added appropriately.
- Monitor serum glucose levels and HbA_{1c} levels frequently to determine effectiveness of drug and dosage being used.
- Arrange for consult with dietitian to establish weight loss program and dietary control as appropriate.

- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, and hygiene.

Teaching points

- Do not discontinue this medication without consulting your health care provider.
- Take this drug 1–30 minutes before meals (three times a day); if you skip a meal, skip the dosage; if you add a meal, take your dosage before that meal also.
- Monitor blood for glucose as prescribed.
- Return for regular follow-up visits to monitor your response to the drug and possible need for dosage adjustment.
- Continue diet and exercise program established for control of diabetes.
- Know the signs and symptoms of hypoglycemia and hyperglycemia and appropriate treatment as indicated; report the incidence of either to your health care provider.
- You may experience these side effects: *Headache*, increased upper respiratory infections, nausea.
- Report fever, sore throat, unusual bleeding or bruising; severe abdominal pain.

▾ nebivolol

(*nab bev' ab loll*)

Bystolic

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Beta-adrenergic blocker

Therapeutic actions

Decreases heart rate and contractility, suppresses renin release, and vasodilates and decreases peripheral vascular resistance, all leading to decreased blood pressure and decreased cardiac output and oxygen consumption.

Indications

- Treatment of hypertension, as monotherapy or with other antihypertensives

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, severe bradycardia, heart block, cardiogenic shock, decompensated HF, sick sinus syndrome (unless a pacemaker is in place), severe hepatic impairment (Child-Pugh greater than grade B), lactation.
- Use cautiously with bronchospastic diseases, surgery, diabetes, hypoglycemia, thyroid dysfunction, renal impairment, hepatic impairment, history of anaphylactic reactions, pheochromocytoma, pregnancy.

Available forms

Tablets—2.5, 5, 10, 20 mg

Dosages

Adults

Starting dose: 5 mg/day PO; may be increased at 2-wk intervals to a maximum of 40 mg/day PO based on patient response.

Pediatric patients

Safety and efficacy not established.

Patients with severe renal impairment

If creatinine clearance is less than 30 mL/min, starting dose 2.5 mg/day PO; titrate slowly and monitor patient closely.

Patients with hepatic impairment

In moderate impairment, starting dose of 2.5 mg/day PO; titrate slowly and monitor patient closely. In severe impairment, drug not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.5–4 hr

Metabolism: Hepatic; $T_{1/2}$: Not reported

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Headache*, dizziness, insomnia
- **CV:** Chest pain, bradycardia, arrhythmias, peripheral edema, hypotension
- **GI:** Nausea, diarrhea
- **Respiratory:** Dyspnea
- **Other:** Fatigue

Interactions

★ **Drug-drug** • Risk of decreased HR and impaired conduction if combined with calcium antagonists (particularly verapamil, diltiazem), antiarrhythmics, cardiac glycosides; monitor patient closely because dosage adjustments may be needed • Risk of severe suppression of sympathetic activity if combined with other beta blockers, catecholamine-depleting drugs; avoid this combination or, if it must be used, monitor patient closely • Risk of unexpected BP response if combined with CYP2D6 inhibitors or inducers (quinidine, propafenone, fluoxetine, paroxetine); monitor patient response very closely and adjust dosage as needed • Risk of serious side effects when discontinuing combined use of clonidine and nebivolol; taper nebivolol and discontinue for several days before gradually tapering clonidine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of drug, sinus bradycardia, heart block, HF, cardiogenic shock, renal impairment, liver impairment, diabetes, bronchospastic disorders, thyroid dysfunction, pregnancy, lactation, anaphylactic reactions
- **Physical:** Orientation, affect, reflexes; P, BP, heart sounds, peripheral perfusion; R, adventitious sounds; ECG, renal function tests, LFTs, thyroid levels, blood glucose

Interventions

⊗ **Warning** Do not stop this drug abruptly after long-term therapy; hypersensitivity to catecholamines can exacerbate angina, MI, ventricular arrhythmia. Taper drug gradually over 2 wk while monitoring patient.

- Consult surgeon about withdrawing drug if patient is to have surgery (withdrawal is controversial).
- Establish safety precautions if CNS changes occur (dizziness, altered thought process).

Teaching points

- This drug may be used with other antihypertensives; follow your drug regimen carefully.

- Take this drug once a day, with or without food. Try to take it at about the same time each day.
- If you miss a dose, take the next dose as soon as you remember. Do not make up or double doses; do not take more than one dose each day.
- Do not run out of tablets, and do not stop taking this drug suddenly. If it is decided that you need to stop this drug, the dose will be tapered slowly over 1 to 2 weeks to prevent possible side effects.
- If you have diabetes, be aware that this drug may block the signs or symptoms of hypoglycemia and hyperglycemia. You will need to monitor yourself carefully while taking this drug.
- Do not drive or operate dangerous machinery until you know how this drug affects you; it may cause dizziness and loss of alertness.
- It is not known how this drug could affect an unborn fetus. You should use contraception while you are taking this drug. If you become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. Because of the risk of serious side effects in an infant, you should choose another method of feeding the baby while taking this drug.
- You may experience these side effects: Dizziness, insomnia (do not drive a car or engage in activities that require alertness if these effects occur); headache (consult your health care provider about medication to relieve headache).
- Report difficulty breathing, increasing shortness of breath, swelling in the ankles or legs, sudden weight gain, or a very slow heart rate.

nefazodone

See Appendix U, *Less commonly used drugs*.

nelarabine

See Appendix U, *Less commonly used drugs*.

nelfinavir mesylate (nell *fin'* a veer)

Viracept

PREGNANCY CATEGORY B

Drug classes

Antiviral
Protease inhibitor

Therapeutic actions

Inhibitor of the HIV-1 protease; prevents viral cleavage resulting in the production of immature, noninfectious virus. Though no controlled trials of the effectiveness of nelfinavir exist, studies may indicate effectiveness in combination with nucleoside analogues.

Indications

- Treatment of HIV infection when antiretroviral therapy is warranted in combination with nucleoside analogues or other antiretroviral drugs
- Unlabeled use: Postexposure prophylaxis following exposure to HIV

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component, concurrent use of drugs dependent on CYP3A for clearance (amiodarone, quinidine, ergot derivatives, pimozide, midazolam, triazolam, lovastatin, simvastatin).
- Use cautiously with renal and hepatic impairment, hemophilia, pregnancy, lactation.

Available forms

Tablets—250, 625 mg; powder—50 mg/g

Dosages

Adults and patients older than 13 yr

750 mg PO tid or 1,250 mg PO bid in combination with other antiretroviral drugs; do not exceed 2,500 mg/day.

Pediatric patients 2–13 yr

45–55 mg/kg PO bid or 25–35 mg/kg PO tid.

Pediatric patients younger than 2 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 3.5–5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Anxiety, depression, insomnia, myalgia, dizziness, paresthesias, **seizures**, suicide ideation
- **Dermatologic:** Dermatitis, folliculitis, fungal dermatitis, rash, sweating, urticaria
- **GI:** *Diarrhea, nausea, GI pain*, anorexia, vomiting, dyspepsia, liver enzyme elevations
- **Respiratory:** Dyspnea, pharyngitis, rhinitis, sinusitis
- **Other:** Eye disorders, sexual dysfunction

Interactions

• **Drug-drug** ☒ **Warning** Risk of severe toxic effects and life-threatening arrhythmias with rifampin, triazolam, midazolam, amiodarone, quinidine, ergot derivatives, pimozone, lovastatin, simvastatin; avoid these combinations • Decreased effectiveness with rifabutin, phenobarbital, phenytoin, dexamethasone, carbamazepine • Possible loss of effectiveness of hormonal contraceptives with nelfinavir; recommend using barrier contraceptives

• **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

• **Drug-alternative therapy** • Decreased effectiveness of nelfinavir if combined with St. John's wort

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between *Viracept* (nelfinavir) and *Viramune* (nevirapine); use caution.

Assessment

- **History:** Life-threatening allergy to any component; impaired hepatic or renal function; pregnancy, lactation; hemophilia; concurrent drug, herbal therapy use

- **Physical:** T; affect, reflexes, peripheral sensation; R, adventitious sounds; bowel sounds, liver evaluation; LFTs, renal function tests

Interventions

- Administer with meals or a light snack; powder may be mixed with a small amount of nonacidic food or beverage; use within 6 hr of mixing.
- Monitor patient for signs of opportunistic infections that will need to be treated appropriately.
- Arrange for loperamide to control diarrhea if it occurs.
- Recommend that patient use barrier contraceptives while using this drug.

Teaching points

- Take drug exactly as prescribed; take missed doses as soon as possible and return to normal schedule; do not take double doses.
- Take with meals or a light snack; do not drink grapefruit juice while using this drug.
- Powder may be mixed with water, milk, baby formula, soy milk, ice cream, pudding, or liquid dietary supplements; use within 6 hours of mixing; take in combination with nucleoside analogues. Do not reconstitute by adding water to the original container.
- These drugs are not a cure for AIDS or AIDS-related complex; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- The long-term effects of this drug are not yet known.
- This drug combination does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination; use appropriate precautions.
- Use barrier contraceptives; this drug may block the effectiveness of hormonal contraceptives.
- Avoid St. John's wort while taking this drug.
- You may experience these side effects: Nausea, loss of appetite, diarrhea (eat frequent small meals; medication is available to control diarrhea); dizziness, loss of feeling (take appropriate precautions).
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty

breathing, rash, changes in color of urine or stool.

▼ neomycin sulfate

(*nee o mye' sin*)

Mycifradin, Neo-fradin, Neo-Tabs

PREGNANCY CATEGORY D

Drug class

Aminoglycoside

Therapeutic actions

Bactericidal: Inhibits protein synthesis in susceptible strains of bacteria; functional integrity of bacterial cell membrane appears to be disrupted, causing cell death. Due to poor PO absorption, oral neomycin is used to suppress GI bacterial flora.

Indications

- Preoperative suppression of GI bacterial flora
- Adjunct treatment in hepatic coma to reduce ammonia-forming bacteria in the GI tract

Contraindications and cautions

- Contraindicated with allergy to aminoglycosides, intestinal obstruction, pregnancy, lactation.
- Use cautiously in the elderly or with any patient with diminished hearing, decreased renal function, dehydration, neuromuscular disorders (myasthenia gravis, parkinsonism, infant botulism).

Available forms

Tablets—500 mg; oral solution—125 mg/5 mL

Dosages

Adults

- *Preoperative preparation for elective colorectal surgery:* See manufacturer's recommendations for a complex 3-day regimen that includes oral erythromycin, bisacodyl, magnesium sulfate, enemas, and dietary restrictions.
- *Hepatic coma:* 4–12 g/day in divided doses for 5–6 days, as adjunct to protein-free

diet and supportive therapy, including transfusions, as needed.

Pediatric patients

- *Hepatic coma:* 50–100 mg/kg/day in divided doses for 5–6 days, as adjunct to protein-free diet and supportive therapy including transfusions, as needed.

Geriatric patients or patients with renal failure

Reduce dosage and carefully monitor serum drug levels and renal function tests throughout treatment. If this is not possible, reduce frequency of administration.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–4 hr

Metabolism: $T_{1/2}$: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

Although limited absorption occurs across the intact GI mucosa, the risk of absorption from ulcerated area requires consideration of all side effects with oral and parenteral therapy.

- **CNS:** Ototoxicity—*tinnitus, dizziness*, vertigo, deafness (partially reversible to irreversible), vestibular paralysis, confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, *numbness, tingling*, tremor, paresthesias, muscle twitching, **seizures**
- **CV:** Palpitations, hypotension, hypertension
- **GI:** Hepatic toxicity, *nausea, vomiting, anorexia*, weight loss, stomatitis, increased salivation
- **GU: Nephrotoxicity**
- **Hematologic:** *Leukemoid reaction*, agranulocytosis, granulocytosis, leukopenia, leukocytosis, thrombocytopenia, eosinophilia, pancytopenia, anemia, hemolytic anemia, increased or decreased reticulocyte count, electrolyte disturbances
- **Hypersensitivity:** Hypersensitivity reactions—*purpura, rash*, urticaria, exfoliative dermatitis, itching
- **Local:** *Pain, irritation*
- **Other:** Fever, apnea, splenomegaly, joint pain, *superinfection*

Interactions

★ **Drug-drug** • Increased ototoxic, nephrotoxic, neurotoxic effects with other aminoglycosides, potent diuretics • Increased neuromuscular blockade and muscular paralysis with anesthetics, nondepolarizing neuromuscular blocking drugs, succinylcholine, citrate-anticoagulated blood • Potential inactivation of both drugs if mixed with beta-lactam-type antibiotics • Increased bactericidal effect with penicillins, cephalosporins, carbenicillin, ticarcillin • Decreased absorption and therapeutic effects of digoxin

★ **Drug-lab test** • Falsely low serum aminoglycoside levels with penicillin or cephalosporin therapy; these antibiotics can inactivate aminoglycosides after the blood sample is drawn

■ Nursing considerations

Assessment

- **History:** Allergy to aminoglycosides; intestinal obstruction, diminished hearing, decreased renal function, dehydration, neuromuscular disorders; pregnancy, lactation
- **Physical:** Renal function, eighth cranial nerve function, state of hydration, CBC, skin color and lesions, orientation and affect, reflexes, bilateral grip strength, body weight, bowel sounds

Interventions

- Ensure that the patient is well hydrated.

Teaching points

- Report hearing changes, dizziness, severe diarrhea.

neostigmine

(*nee oh stig' meen*)

neostigmine bromide

neostigmine

methylsulfate

Prostigmin

PREGNANCY CATEGORY C

Drug classes

Antidote

Antimyasthenic

Cholinesterase inhibitor

Parasympathomimetic

Urinary tract drug

Therapeutic actions

Increases the concentration of acetylcholine at the sites of cholinergic transmission, and prolongs and exaggerates the effects of acetylcholine by reversibly inhibiting the enzyme acetylcholinesterase, causing parasympathomimetic effects and facilitating transmission at the skeletal neuromuscular junction; also has direct cholinomimetic activity on skeletal muscle; may have direct cholinomimetic activity on neurons in autonomic ganglia and the CNS.

Indications

- Prevention and treatment of postoperative distention and urinary retention
- Symptomatic control of myasthenia gravis
- Antidote for nondepolarizing neuromuscular junction blockers (tubocurarine or pancuronium) after surgery

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinesterases; adverse reactions to bromides (neostigmine bromide); intestinal or urogenital tract obstruction, peritonitis; pregnancy (may stimulate uterus and induce premature labor); lactation.
- Use cautiously with asthma, peptic ulcer, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy.

Available forms

Injection—1:1,000 (1 mg/mL), 1:2,000 (0.5 mg/mL), 1:4,000 (0.25 mg/mL); tablets—15 mg

Dosages

Adults

- *Prevention of postoperative distention and urinary retention:* 1 mL of the 1:4,000 solution (0.25 mg) neostigmine methylsulfate subcutaneously or IM as soon as possible after operation. Repeat every 4–6 hr for 2–3 days.
- *Treatment of postoperative distention:* 1 mL of the 1:2,000 solution (0.5 mg) neostig-

mine methylsulfate subcutaneously or IM, as required.

- **Treatment of urinary retention:** 1 mL of the 1:2,000 solution (0.5 mg) neostigmine methylsulfate subcutaneously or IM. If urination does not occur within 1 hr, catheterize the patient. After the bladder is emptied, continue 0.5-mg injections every 3 hr for at least five injections.
 - **Symptomatic control of myasthenia gravis:** 1 mL of the 1:2,000 solution (0.5 mg) subcutaneously or IM. Individualize subsequent doses. Should be used with atropine to counteract adverse muscarinic effects. Tablets—15–375 mg/day PO; average daily dose is 150 mg.
 - **Antidote for nondepolarizing neuromuscular blockers:** Give atropine sulfate 0.6–1.2 mg IV several min before slow IV injection of neostigmine 0.5–2 mg. Repeat as required. Total dose should usually not exceed 5 mg.
- Pediatric patients**
- **Prevention, treatment of postoperative distention and urinary retention:** Safety and efficacy not established.
 - **Symptomatic control of myasthenia gravis:** 0.01–0.04 mg/kg per dose IM, IV, or subcutaneously every 2–3 hr as needed. Tablets—2 mg/kg/day PO every 3–4 hr as needed.
 - **As antidote for nondepolarizing neuromuscular blocker:** Give 0.008–0.025 mg/kg atropine sulfate IV several min before slow IV injection of neostigmine 0.025–0.08 mg/kg.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut., IM	20–30 min	20–30 min	2.5–4 hr
IV	10–30 min	20–30 min	2.5–4 hr
Oral	20–30 min	20–30 min	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 47–60 min

Distribution: May cross placenta or enter breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is required.

Infusion: Inject slowly directly into vein or into tubing of running IV, each 0.5 mg over 1 min.

Adverse effects

- **CNS:** Seizures, dysarthria, dysphonia, drowsiness, dizziness, headache, loss of consciousness
- **CV:** *Cardiac arrhythmias, cardiac arrest*, decreased cardiac output leading to hypotension, syncope
- **Dermatologic:** Diaphoresis, flushing, rash, urticaria, anaphylaxis
- **EENT:** *Lacrimation, miosis*, spasm of accommodation, diplopia, conjunctival hyperemia
- **GI:** *Salivation, dysphagia, nausea, vomiting, increased peristalsis, abdominal cramps*, flatulence, diarrhea
- **GU:** *Urinary frequency and incontinence*, urinary urgency
- **Local:** Thrombophlebitis after IV use
- **Peripheral:** Skeletal muscle weakness, fasciculations, muscle cramps, arthralgia
- **Respiratory:** *Increased pharyngeal and tracheobronchial secretions, laryngospasm, bronchospasm*, bronchiolar constriction, dyspnea, respiratory muscle paralysis, central respiratory paralysis

Interactions

★ **Drug-drug** • Prolonged neuromuscular blockade of succinylcholine • Decreased effects and possible muscular depression with corticosteroids • Increased neuromuscular blocking effect due to aminoglycoside antibiotics

Nursing considerations

Assessment

- **History:** Hypersensitivity to anticholinesterases; adverse reactions to bromides; intestinal or urogenital tract obstruction, peritonitis; asthma, peptic ulcer, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy; lactation, pregnancy
- **Physical:** Skin color, texture, lesions; reflexes, bilateral grip strength; P, auscultation, BP; R, adventitious sounds; salivation, bowel sounds, normal output; frequency, voiding pattern, normal output; EEG, thyroid tests

Interventions

- Administer IV slowly.
- Overdose with anticholinesterase drugs can cause muscle weakness (cholinergic crisis) that is difficult to differentiate from myasthenic weakness. The administration of atropine may mask the parasympathetic effects of anticholinesterase overdose and further confound the diagnosis.

⊗ **Warning** Keep atropine sulfate readily available as an antidote and antagonist in case of cholinergic crisis or hypersensitivity reaction.

⊗ **Warning** Discontinue drug, and consult physician if excessive salivation, emesis, frequent urination, or diarrhea occurs.

- Decrease dosage if excessive sweating or nausea occurs.

Teaching points

- Take this drug exactly as prescribed; patient and a significant other should receive extensive teaching about the effects of the drug, the signs and symptoms of myasthenia gravis, the fact that muscle weakness may be related both to drug overdose and to exacerbation of the disease, and that it is important to report muscle weakness promptly to your health care provider so that proper evaluation can be made.
- You may experience these side effects: Blurred vision, difficulty with far vision, difficulty with dark adaptation (use caution while driving, especially at night, or performing hazardous tasks in reduced light); increased urinary frequency, abdominal cramps; sweating (avoid hot or excessively humid environments).
- Report muscle weakness, nausea, vomiting, diarrhea, severe abdominal pain, excessive sweating, excessive salivation, frequent urination, urinary urgency, irregular heartbeat, difficulty breathing.

nesiritide (hBNP)

See Appendix U, *Less commonly used drugs*.

nevirapine (*neb veer' ab pine*)

Viramune

PREGNANCY CATEGORY C

Drug classes

Antiviral

Nonnucleoside reverse transcriptase inhibitor

Therapeutic actions

Antiretroviral activity; binds directly to HIV-1 reverse transcriptase and blocks the replication of HIV by changing the structure of the HIV enzyme.

Indications

- Treatment of HIV-1 infection in combination with other antiretroviral drugs

Contraindications and cautions

- Contraindicated with allergy to nevirapine; lactation; moderate to severe hepatic impairment.
- Use cautiously with renal or hepatic impairment, rash, pregnancy.

Available forms

Tablets—200 mg; oral suspension—50 mg/5 mL

Dosages

Adults

200 mg PO daily for 14 days; if no rash appears, then 200 mg PO bid with other antivirals. Daily dose should not exceed 400 mg/day.

Pediatric patients 15 days and older

150 mg/m² PO once daily for 14 days, then 150 mg/m² PO bid.

Pediatric patients younger than 8 yr

May require 200 mg/m² PO bid. Do not exceed 200 mg bid.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	4 hr

Metabolism: Hepatic; $T_{1/2}$: 45 hr, then 25–30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **Dermatologic:** Stevens-Johnson syndrome, rash, toxic epidermal necrolysis
- **GI:** *Nausea, vomiting, diarrhea*, dry mouth, **hepatic impairment including hepatitis, hepatic necrosis**
- **Other:** Infection, chills, fever

Interactions

• **Drug-drug** • Avoid concurrent use with protease inhibitors, hormonal contraceptives (metabolism is increased and effectiveness decreased) • Decreased ketoconazole, itraconazole, clarithromycin, rifampin levels and effects; avoid this combination

• **Drug-alternative therapy** • Decreased effectiveness if combined with St. John's wort

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Viramune* (nevirapine) and *Viracept* (nelfinavir); use caution.

Assessment

- **History:** Allergy to nevirapine, renal or hepatic impairment, pregnancy, lactation, rash
- **Physical:** T; orientation, reflexes; peripheral perfusion; urinary output; skin color, perfusion, hydration; LFTs, renal function tests

Interventions

- Administer in combination with nucleoside analogues.

⊗ **Black box warning** Monitor renal and hepatic function tests before and during treatment. Discontinue drug at any sign of hepatic impairment; severe to life-threatening hepatotoxicity is possible. Monitor patient closely.

⊗ **Black box warning** Do not administer if severe rash occurs, especially accompa-

nied by fever, blistering, lesion, swelling, general malaise; discontinue if rash recurs on rechallenge; severe to life-threatening reactions are possible.

- Shake suspension gently before use. Rinse oral dosing cup and administer rinse to patient.

Teaching points

- Take this drug exactly as prescribed; do not take double doses if you miss a dose. Take your other HIV drugs as prescribed.
- If you are using the suspension form, shake gently before use. Dosing syringe is recommended to ensure the correct dose.
- Use some method of barrier birth control (not hormonal contraceptives) while using this medication. Severe birth defects can occur, and this drug causes loss of effectiveness of hormonal contraceptives.
- This drug does not cure HIV infection. Follow routine preventive measures and continue any other medication that has been prescribed.
- You may experience these side effects: *Nausea, vomiting, loss of appetite, diarrhea, headache, fever.*
- Report rash, any lesions or blistering, changes in color of stool or urine, fever, muscle or joint pain.

▽ niacin

(nye' ab sin)

Niacor, Niaspan, Slo-Niacin

PREGNANCY CATEGORY C

Drug classes

Antihyperlipidemic
Vitamin

Therapeutic actions

May partially inhibit the release of free fatty acids from adipose tissue and increase lipoprotein activity, which could increase the rate of triglyceride removal from plasma; these actions reduce the total LDL and triglycerides and increase HDL. Niacin also decreases serum levels of apo B and lipoprotein A.

Indications

- Adjunct to diet for treatment of adults with very high serum triglyceride levels (types IV and V hyperlipidemia) who present a risk of pancreatitis and who do not respond adequately to dietary control
- Adjunct for treatment of adults with hypercholesterolemia
- Treatment of pellagra, niacin deficiency
- **NEW INDICATION:** Reduction of risk of non-fatal MI in patients with a history of MI and hyperlipidemia
- **NEW INDICATION:** In combination with a bile acid-binding resin to slow the progression of atherosclerotic disease in patients with known CAD and hyperlipidemia

Contraindications and cautions

- Contraindicated with hepatic impairment, active peptic ulcer disease, arterial bleeding, lactation.
- Use cautiously with history of jaundice, hepatobiliary disease, peptic ulcer, high alcohol consumption, renal impairment, unstable angina, gout, recent surgery, pregnancy.

Available forms

ER tablets **OND**—500, 750, 1,000 mg; tablets—50, 100, 250, 500 mg; OTC CR tablets **OND**—250, 500, 750 mg; OTC CR capsules **OND**—250, 400 mg; OTC SR capsules **OND**—125, 500 mg

Dosages

Adults and pediatric patients older than 16 yr

Dyslipidemia: Initially, 100 mg PO tid, increased to 1,000 mg PO tid (immediate-release form); 500 mg/day PO at bedtime for 4 wk, then 1,000 mg/day PO at bedtime (extended-release form), maximum dosage is 2,000 mg/day; 1,000–2,000 mg/day PO (sustained-release form).

CAD, post MI: 500 mg/day PO at bedtime, titrated at 4-wk intervals to maximum of 1,000–2,000 mg/day.

Pellagra: 50–100 mg PO tid to maximum of 500 mg/day.

Pediatric patients 16 yr and younger

Dyslipidemia: 100–250 mg/day PO in three divided doses with meals; may be increased at 2- to 3-wk intervals to maximum of 10 mg/kg/day (immediate-release form).

Pellagra: 50–100 mg PO tid.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	45 min

Metabolism: Hepatic; T_{1/2}: Unknown

Distribution: Crosses placenta, enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, anxiety
- **CV:** Arrhythmias, hypotension
- **Dermatologic:** *Flushing*, acanthosis nigricans, dry skin, *rash*
- **GI:** *GI upset*, peptic ulcer, abnormal liver function tests, *diarrhea*, *nausea*, *vomiting*
- **Hematologic:** Hyperuricemia
- **Other:** Glucose intolerance

Interactions

★ **Drug-drug** • Increased risk of rhabdomyolysis with HMG-CoA inhibitors • Increased effectiveness of antihypertensives, vasoactive drugs • Increased risk of bleeding with anticoagulants; monitor PT and platelet counts and adjust dosage accordingly • Decreased absorption with bile acid sequestrants; separate doses by at least 4–6 hr

■ Nursing considerations

Assessment

- **History:** Hepatic impairment, active peptic ulcer disease, arterial bleeding, lactation, hepatobiliary disease, peptic ulcer, high alcohol consumption, renal impairment, unstable angina, gout, recent surgery, pregnancy
- **Physical:** Skin lesions, color, T; orientation, affect, reflexes; P, auscultation, baseline ECG, BP; liver evaluation; lipid studies, LFTs

Interventions

- Administer drug at bedtime to minimize effects of flushing.

- When flushing is persistent, recommend 325 mg aspirin taken 30 min before each scheduled dose of niacin.

⊗ **Warning** Do not substitute ER products for immediate-release products at equivalent doses. Severe hepatic toxicity has occurred.

- Ensure that patient swallows ER products whole; do not cut, crush, or allow patient to chew ER tablets or capsules.
- Avoid ingestion of hot liquids or alcohol around the time of niacin administration to minimize flushing.
- Consult with a dietitian regarding a low-cholesterol diet.
- Arrange for regular follow-up during long-term therapy.

Teaching points

- Take drug at bedtime. The dose will change each week until the desired response is achieved. Do not cut, crush, or chew extended-release forms.
- Take your bile acid sequestrant (if appropriate) 4–6 hours apart from niacin; avoid alcohol while using this medication.
- Maintain your diet and exercise program for lowering lipid level.
- You may experience these side effects: Nausea, heartburn, loss of appetite (eat frequent small meals); headache (may lessen over time; if bothersome, consult your health care provider); rash, flushing (take drug at bedtime). You may take an aspirin or nonsteroidal anti-inflammatory drug 30 minutes before each dose to reduce GI distress and flushing.
- Report unusual bleeding or bruising, palpitations, fainting, rash, fever.

niCARDipine hydrochloride

(nye *kar'* de peen)

Cardene IV, Cardene SR

PREGNANCY CATEGORY C

Drug classes

Antianginal
Antihypertensive
Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; calcium is involved in the generation of the action potential in specialized automatic and conducting cells in the heart, in arterial smooth muscle, and in excitation-contraction coupling in cardiac muscle cells. Inhibition of calcium flow results in the depression of impulse formation in specialized cardiac pacemaker cells, in slowing of the velocity of conduction of the cardiac impulse, in the depression of myocardial contractility, and in the dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac energy consumption, and increased delivery of oxygen to myocardial cells.

Indications

- Immediate-release only: Chronic stable (effort-related) angina. Use alone or with beta blockers
- Immediate-release and SR: Management of essential hypertension alone or with other antihypertensives
- IV: Short-term treatment of hypertension when oral use is not feasible

Contraindications and cautions

- Contraindicated with allergy to nicardipine, pregnancy, lactation, advanced aortic stenosis.
- Use cautiously with impaired hepatic or renal function, sick sinus syndrome, heart block (second- or third-degree), HF.

Available forms

Capsules—20, 30 mg; ER capsules—30, 45, 60 mg; injection—2.5 mg/mL; premixed bags—20 mg/200 mL, 40 mg/200 mL.

Dosages

Adults

Oral

- *Angina*: Immediate-release only—individualize dosage. Usual initial dose is 20 mg tid PO. Range, 20–40 mg tid PO. Allow at least 3 days before increasing dosage to ensure steady-state plasma levels.
- *Hypertension*: Immediate-release—initial dose, 20 mg tid PO. Range, 20–40 mg tid.

The maximum BP-lowering effect occurs in 1–2 hr. Adjust dosage based on BP response, allow at least 3 days before increasing dosage. SR—initial dose is 30 mg bid PO. Range, 30–60 mg bid.

IV

- **Hypertension:** For gradual reduction, begin infusion at 5 mg/hr. Increase by 2.5 mg/hr every 15 min to maximum of 15 mg/hr. For rapid reduction, begin infusion at 5 mg/hr. Increase by 2.5 mg/hr every 5 min to maximum of 15 mg/hr. Once BP is controlled, reduce to 3 mg/hr.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

For patients with renal impairment, adjust dosage beginning with 20 mg tid PO (immediate-release) or 30 mg bid PO (SR). For patients with hepatic impairment, starting dose 20 mg bid PO (immediate-release) with individual adjustment.

Pharmacokinetics

Route	Onset	Peak
Oral	20 min	0.5–2 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute each ampule with 240 mL of solution to a concentration of 0.1 mg/mL; store at room temperature; protect from light; stable for 24 hr.

Infusion: Slow IV infusion; begin with 5 mg/hr. Increase by 2.5 mg/hr every 5 min (rapid control) or 15 min (slow control) to maximum of 15 mg/hr. When BP is controlled, use maintenance rate of 3 mg/hr (rapid control).

Compatibilities: Compatible with dextrose 5% injection, dextrose 5% and sodium chloride 0.45% or 0.9% injection; dextrose 5% with potassium; 0.45% or 0.9% sodium chloride.

Incompatibilities: Do not mix with 5% sodium bicarbonate or lactated Ringer's.

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia*, fatigue
- **CV:** *Peripheral edema, angina*, hypotension, arrhythmias, *bradycardia, AV block, asystole*
- **Dermatologic:** *Flushing*, rash
- **GI:** *Nausea*, hepatic injury

Interactions

- **Drug-drug** • Increased serum levels and toxicity of cyclosporine

Nursing considerations Assessment

- **History:** Allergy to nicardipine, impaired hepatic or renal function, sick sinus syndrome, heart block (second- or third-degree), pregnancy, lactation, aortic stenosis
- **Physical:** Skin lesions, color, edema; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds; liver evaluation, normal GI output; LFTs, renal function tests, urinalysis

Interventions

- Monitor the patient carefully (BP, cardiac rhythm, and output) while drug is being titrated to therapeutic dose; dosage may be increased more rapidly in hospitalized patients under close supervision.
- **Warning** Monitor BP very carefully with concurrent doses of nitrates.
- Monitor cardiac rhythm regularly during stabilization of dosage and long-term therapy.
- Provide small frequent meals if GI upset occurs.

Teaching points

- Take exactly as prescribed; do not exceed the prescribed daily dose.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (monitor lighting, noise, and temperature; request medication if severe).
- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

nicotine (*nik' ob teen*)

Nicoderm CQ, Nicoderm Transdermal System, Nicotrol, Nicotrol Inhaler, Nicotrol NS

PREGNANCY CATEGORY D

Drug class

Smoking deterrent

Therapeutic actions

Nicotine acts at nicotinic receptors in the peripheral and CNS; produces behavioral stimulation and depression, cardiac acceleration, peripheral vasoconstriction, and elevated BP.

Indications

- Temporary aid to the cigarette smoker seeking to give up smoking while in a behavioral modification program under medical supervision
- Unlabeled use: Improvement of symptoms of Tourette syndrome

Contraindications and cautions

- Contraindicated with allergy to nicotine, arrhythmias, angina pectoris, pregnancy, lactation, and during the post-MI period. Inhaler is contraindicated with asthma, COPD.
- Use cautiously with hyperthyroidism, pheochromocytoma, type 2 diabetes (releases catecholamines from the adrenal medulla), hypertension, peptic ulcer disease.

Available forms

Transdermal system—7, 14, 21 mg/day; 5, 10, 15 mg/16 hr (*Nicotrol*); nasal spray—0.5 mg/actuation (10 mg/mL); inhaler—4 mg/actuation

Dosages

Adults

Topical

Apply system, 5–21 mg, once every 24 hr. Dosage is based on response and stage of withdrawal. *Nicoderm*: 21 mg/day for first 6 wk; 14 mg/day for next 2 wk; 7 mg/day for next 2 wk. *Nicotrol*: 15 mg/day for first 6 wk;

10 mg/day for next 2 wk; 5 mg/day for last 2 wk.

Nasal spray

1 spray in each nostril as needed, one to two doses each hour, up to five doses/hr and 40 doses/day.

Nasal inhaler

1 spray in each nostril, one to two doses/hr to a maximum five doses/hr or 40 doses/day. Dosage is individualized; in studies, best results were achieved by continuous, frequent puffing over 20 min. Do not use longer than 6 mo. Patients are treated for 12 wk, then weaned off the daily dose over next 6–12 wk.

Pediatric patients

Safety and efficacy in children and adolescents who smoke have not been established.

Pharmacokinetics

Route	Onset	Peak	Duration
Dermal	1–2 hr	4–6 min	4–24 hr
Nasal	Rapid	15 min	NA

Metabolism: Hepatic; $T_{1/2}$: 1–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, insomnia*, abnormal dreams, dizziness, light-headedness, sweating
- **GI:** Diarrhea, constipation, nausea, dyspepsia, abdominal pain, dry mouth
- **Local:** *Erythema, burning, pruritus* at site of patch; local edema
- **Respiratory:** Cough, pharyngitis, sinusitis
- **Other:** Backache, chest pain, asthenia, dysmenorrhea, flulike symptoms

Interactions

★ **Drug-drug** • Increased circulating levels of cortisol, catecholamines with nicotine use; smoking dosage of adrenergic agonists, adrenergic blockers may need to be adjusted according to nicotine, smoking status of patient • Smoking increases metabolism and lowers blood levels of caffeine, theophylline, imipramine, pentazocine; decreases effects of furosemide, propranolol • Cessation of smoking may decrease metabolism of propoxyphene

■ Nursing considerations**Assessment**

- **History:** Allergy to nicotine; nonsmoker; post-MI, arrhythmias, angina pectoris; hyperthyroidism, pheochromocytoma, type 2 diabetes; hypertension, peptic ulcer disease; pregnancy; lactation
- **Physical:** Orientation, affect; P, auscultation, BP; oral mucous membranes, abdominal examination; thyroid function tests

Interventions

- Protect systems from heat; slight discoloration of system is not significant.
- Apply system to nonhairy, clean, dry skin site on upper body or upper outer arm; use only when the pouch is intact; use immediately after removal from pouch; use each system only once. Remove old system before applying a new system.
- Wash hands thoroughly after application; do not touch eyes.
- Wrap used system in foil pouch of newly applied system; fold over and dispose of immediately to prevent access by pets or children.
- Apply new system after 24 hr; do not reuse same site for at least 1 wk. *Nicotrol:* Apply a new system each day after waking, and remove at bedtime.

⊗ **Warning** Handle nasal spray carefully; if it comes in contact with skin, flush immediately; dispose of bottle with cap in place.

- Ensure that patient has stopped smoking; if the patient is unable to stop smoking within the first 4 wk of therapy, drug therapy should be stopped.
- Encourage patients who have been unsuccessful at any dose to take a “therapy holiday” before trying again; counseling should explore factors contributing to their failure and other means of success.

Teaching points

- Protect systems from heat; slight discoloration of system is not significant.
- Apply system to nonhairy, clean, dry skin site on upper body or upper outer arm; use only when the pouch is intact; use immediately after removal from pouch; use each system only once. Remove old system before applying a new system.

- Wash hands thoroughly after application; do not touch eyes. Wrap used system in foil pouch of newly applied system; fold over and dispose of immediately to prevent access by pets or children.
- Apply new system after 24 hours; do not reuse same site for at least 1 week. *Nicotrol:* Apply a new system each day after waking, and remove at bedtime.
- Tilt head back to administer spray; do not sniff, swallow, or inhale while spray is administered. If spray comes in contact with skin, flush immediately; discard bottle with cap in place.
- Store reusable mouthpiece for inhaler in plastic case; wash with soap and water. Throw inhaler cartridge away out of reach of children and pets.
- Abstain from smoking.
- You may experience these side effects: Dizziness, headache, light-headedness (use caution driving or performing tasks that require alertness); nausea, vomiting, constipation or diarrhea (frequent small meals, regular mouth care may help); skin redness, swelling at application site (good skin care, switching sites daily may help).
- Report nausea and vomiting, diarrhea, cold sweat, chest pain, palpitations, burning or swelling at application site.

▼ **nicotine polacrilex
(nicotine resin complex)**

(*nik' oh teen*)

Commit, Nicorette, Nicorette DS,
Nicotine Gum

PREGNANCY CATEGORY C

Drug class

Smoking deterrent

Therapeutic actions

Acts as an agonist at nicotinic receptors in the peripheral and CNS; produces behavioral stimulation and depression, cardiac acceleration, peripheral vasoconstriction, and elevated BP.

Indications

- Temporary aid to the cigarette smoker seeking to give up smoking while in a behavioral modification program under medical supervision

Contraindications and cautions

- Contraindicated with allergy to nicotine or resin used, arrhythmias, angina pectoris, active TMJ disease, pregnancy, lactation, and during the post-MI period.
- Use cautiously with hyperthyroidism, pheochromocytoma, type 2 diabetes (releases catecholamines from the adrenal medulla), hypertension, peptic ulcer disease.

Available forms

Chewing gum—2 or 4 mg/square; lozenge—2, 4 mg

Dosages

Adults

Chewing gum

If patient smokes less than 25 cigarettes/day, start with 2 mg; if more than 25 cigarettes/day, start with 4 mg. Have patient chew one piece of gum whenever the urge to smoke occurs. Have the patient chew each piece slowly until it tingles, then place it between the cheek and gums; when tingle is gone, have patient chew gum again and repeat the process. Gum usually lasts for about 30 min to promote even, slow, buccal absorption of nicotine. Patients often require 10 pieces daily during the first month. Do not exceed 24 pieces daily. Therapy may be effective for up to 3 mo; 4–6 mo for complete cessation has been used. Should not be used for longer than 4 mo.

Lozenge

Start with 2 mg if patient first smokes more than 30 min after waking up; 4 mg if patient starts smoking within 30 min of waking. Patient must place lozenge in mouth, let dissolve over 20–30 min, and avoid eating or drinking anything other than water for 15 min before use. In week 1–6, use 1 lozenge every 1–2 hr; in week 7–9, use 1 lozenge every 2–4 hr; in week 10–12, use 1 lozenge every 4–8 hr. Do not exceed 5 lozenges in 6 hr or 20 daily.

Pediatric patients

Safety and efficacy in children and adolescents who smoke have not been established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	15–30 min

Metabolism: Hepatic; $T_{1/2}$: 30–120 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, light-headedness
- **GI:** Mouth or throat soreness; hiccups, nausea, vomiting, nonspecific GI distress, excessive salivation
- **Local:** Mechanical effects of chewing gum—traumatic injury to oral mucosa or teeth, jaw ache, eructation secondary to air swallowing

Interactions

★ **Drug-drug** • Increased circulating levels of cortisol, catecholamines with nicotine use, smoking—dosage of adrenergic agonists, adrenergic blockers may need to be adjusted according to nicotine, smoking status of patient • Smoking increases metabolism and lowers blood levels of caffeine, theophylline, imipramine, pentazocine; decreases effects of furosemide, propranolol • Cessation of smoking may decrease metabolism of propoxyphene

Nursing considerations

Assessment

- **History:** Allergy to nicotine or resin used; nonsmoker; post-MI period; arrhythmias; angina pectoris; active TMJ disease; hyperthyroidism, pheochromocytoma, type 2 diabetes; hypertension, peptic ulcer disease; pregnancy; lactation
- **Physical:** Jaw strength, symmetry; orientation, affect; P, auscultation, BP; oral mucous membranes, abdominal examination; thyroid function tests

Interventions

- Review mechanics of chewing gum with patient; patient must chew the gum slowly and intermittently to promote even, slow absorption of nicotine; discard chewed gum in wrapper to prevent access by children or pets.
- Have patient place lozenge in mouth and allow to dissolve in mouth over 20–30 min;

do not allow patient to eat or drink for 15 min before use.

- Arrange to withdraw or taper use of gum or lozenges in abstainers at 3 mo; effectiveness after that time has not been established, and patients may be using gum as substitute source for nicotine dependence.

Teaching points

- Chew one piece of gum every time you have the desire to smoke. Chew each piece slowly until it tingles. Then place the gum between the cheek and gums. When the tingle is gone, chew again and repeat the process. Do not chew more than 24 pieces of gum each day. Discard chewed gum in wrapper to prevent access by children or pets.
- Place lozenge in mouth and allow to dissolve over 20–30 minutes; do not eat or drink for 15 minutes before use. Do not use more than 5 lozenges in 6 hours or 20 in 1 day. If you remove a lozenge, wrap it up carefully to prevent access by children or pets.
- Do not consume liquids within 15 minutes before or while chewing gum or using lozenge; they may interfere with nicotine absorption.
- Abstain from smoking.
- Do not offer to nonsmokers; serious reactions can occur if used by nonsmokers.
- You may experience these side effects: Dizziness, headache, light-headedness (use caution driving or performing tasks that require alertness); nausea, vomiting, increased burping; jaw muscle ache (modify chewing technique).
- Report nausea and vomiting, increased salivation, diarrhea, cold sweat, headache, disturbances in hearing or vision, chest pain, palpitations.

▷ NIFedipine (nye fed' i peen)

Adalat CC, Adalat XL (CAN),
Afeditab CR **onc**, Apo-Nifed (CAN),
Apo-Nifed AP (CAN), Nifediac CC,
Nifedical XL, Procardia, Procardia XL

PREGNANCY CATEGORY C

Drug classes

Antianginal
Antihypertensive
Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; inhibition of transmembrane calcium flow results in the depression of impulse formation in specialized cardiac pacemaker cells, in slowing of the velocity of conduction of the cardiac impulse, in the depression of myocardial contractility, and in the dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac energy consumption, and increased delivery of oxygen to myocardial cells.

Indications

- Angina pectoris due to coronary artery spasm (Prinzmetal's variant angina)
- Chronic stable angina (effort-associated angina)
- ER preparation only: Treatment of hypertension
- Orphan drug use: Treatment of interstitial cystitis
- Unlabeled uses: Anal fissures, ureteral stones, topical use to improve wound healing, prevention of migraine, Raynaud phenomenon

Contraindications and cautions

- Contraindicated with allergy to nifedipine.
- Use cautiously with lactation, pregnancy, HF, aortic stenosis.

Available forms

ER tablets **onc**—30, 60, 90 mg; capsules—10, 20 mg

Dosages

Adults

Initial dose, 10 mg tid PO. Maintenance range, 10–20 mg tid. Higher doses (20–30 mg tid–qid) may be required, depending on patient response. Adjust over 7–14 days. More than 180 mg/day is not recommended.

ER ONC

30–60 mg PO once daily. Adjust over 7–14 days. Usual maximum dose is 90–120 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	20 min	30 min
ER	20 min	2.5–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue, nervousness*, sleep disturbances, blurred vision, *weakness, tremor, mood changes*
- **CV:** *Peripheral edema, angina*, hypotension, arrhythmias, *AV block*, asystole
- **Dermatologic:** *Flushing, rash*, dermatitis, pruritus, urticaria
- **GI:** *Nausea, diarrhea, constipation*, cramps, flatulence, hepatic injury
- **Other:** *Nasal congestion, cough*, fever, chills, shortness of breath, muscle cramps, joint stiffness, sexual difficulties

Interactions

- **Drug-drug** • Increased effects with cimetidine
- **Drug-food** • Risk of increased toxic effects; avoid use with grapefruit juice

■ Nursing considerations**Assessment**

- **History:** Allergy to nifedipine, pregnancy, lactation
- **Physical:** Skin lesions, color, edema; orientation, reflexes; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds; liver evaluation, normal GI output; LFTs

Interventions

⊗ **Warning** Monitor patient carefully (BP, cardiac rhythm, and output) while drug is being adjusted to therapeutic dose; the dosage may be increased more rapidly in hospitalized patients under close supervision. Do not exceed 30 mg/dose increases.

- Ensure that patients do not chew or divide ER tablets.
- Taper dosage of beta blockers before nifedipine therapy.
- Protect drug from light and moisture.

Teaching points

- Do not chew, cut, or crush extended-release tablets. Swallow whole.
- Avoid grapefruit juice while taking this drug; it can cause increased toxicity.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); dizziness, light-headedness, vertigo (avoid driving and operating dangerous machinery; take special precautions to avoid falling); muscle cramps, joint stiffness, sweating, sexual difficulties (reversible).
- Report irregular heartbeat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

▷ nilotinib

See Appendix U, *Less commonly used drugs*.

▷ nimodipine

See Appendix U, *Less commonly used drugs*.

▷ nisoldipine

(nye *sole'* di peen)

Sular ONC

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; inhibits transmembrane calcium flow, which results in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, depression of myocardial contractility, and dilation of coronary arteries and arterioles and peripheral arterioles; these

effects in turn lead to decreased cardiac work, decreased cardiac energy consumption.

Indications

- Essential hypertension, alone or in combination with other antihypertensives

Contraindications and cautions

- Contraindicated with allergy to nisoldipine, impaired hepatic function, sick sinus syndrome, HF, heart block (second- or third-degree).
- Use cautiously with MI or severe CAD (increased severity of disease has occurred), lactation, pregnancy.

Available forms

ER tablets **mc**—8.5, 17, 25.5, 34 mg

Dosages

Adults

Initial dose of 17 mg PO daily; increase in weekly increments of 8.5 mg/wk until BP is controlled. Usual maintenance dose is 17–34 mg PO daily. Maximum dose, 34 mg/day.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic impairment

Monitor BP very carefully. Reduced starting doses (no more than 8.5 mg) and reduced maintenance doses are recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	6–12 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 7–12 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue, lethargy*
- **CV:** *Peripheral edema, arrhythmias, MI, increased angina*
- **Dermatologic:** *Flushing, rash*
- **GI:** *Nausea, abdominal discomfort*

Interactions

★ **Drug-drug** • Possible increased serum levels and toxicity of cyclosporine • Possible increased serum levels and toxicity with cimetidine • Increased risk of toxic cardiac effects with quinidine

★ **Drug-food** • Decreased metabolism and increased risk of toxic effects if combined with grapefruit juice; avoid this combination • Excessive drug concentration if taken with a high-fat meal; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to nisoldipine, impaired hepatic function, sick sinus syndrome, heart block (second- or third-degree), lactation, HF, CAD, pregnancy
- **Physical:** Skin lesions, color, edema; P, BP; baseline ECG, peripheral perfusion, auscultation, R, adventitious sounds; liver evaluation, GI normal output; LFTs, renal function tests, urinalysis

Interventions

⊗ **Warning** Monitor patient carefully (BP, cardiac rhythm and output, angina, or MI in patients with CAD) while drug is being adjusted to therapeutic dose; dosage may be increased more rapidly in hospitalized patients under close supervision.

- Monitor BP very carefully if patient is on concurrent doses of nitrates or other antihypertensives.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- Administer drug without regard to meals. Do not cut, crush, or allow patient to chew tablets.

Teaching points

- Take this drug with meals if upset stomach occurs; do not take with high-fat meals or grapefruit juice. Do not drink grapefruit juice while using this drug.
- Swallow tablet whole; do not chew, cut, or crush.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals);

headache (monitor lighting, noise, and temperature; request medication if severe).

- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation, chest pain.

▷ nitazoxanide

See Appendix U, *Less commonly used drugs*.

▷ nitrofurantoin (nye troe fyoor an' toyn)

nitrofurantoin

Apo-Nitrofurantoin (CAN),
Furadantin, Novo-Furantoin (CAN)

nitrofurantoin macrocrystals

Macrobid, Macrochantin

PREGNANCY CATEGORY B

Drug classes

Antibacterial
Urinary tract anti-infective

Therapeutic actions

Bacteriostatic in low concentrations, possibly by interfering with bacterial carbohydrate metabolism; bactericidal in high concentrations, possibly by disrupting bacterial cell wall formation, causing cell death.

Indications

- Treatment of UTIs, including acute cystitis, caused by susceptible strains of *Escherichia coli*, *Staphylococcus aureus*, *Klebsiella*, *Enterobacter*, *Proteus*
- Prophylaxis or long-term suppression of UTIs

Contraindications and cautions

- Contraindicated with allergy to nitrofurantoin, renal impairment, pregnancy, lactation.
- Use cautiously in patients with G6PD deficiency, anemia, diabetes.

Available forms

Capsules—25, 50, 100 mg; dual-release capsules—100 mg; oral suspension—25 mg/5 mL

Dosages

Adults

50–100 mg PO qid for 10–14 days or 100 mg bid for 7 days (*Macrobid*). Do not exceed 400 mg/day.

- *Long-term suppressive therapy*: 50–100 mg PO at bedtime.

Pediatric patients

5–7 mg/kg/day in four divided doses PO. Not recommended in children younger than 1 mo.

- *Long-term suppressive therapy*: As low as 1 mg/kg/day PO in one to two doses.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30 min

Metabolism: Hepatic; $T_{1/2}$: 20–60 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Peripheral neuropathy, headache, dizziness, nystagmus, drowsiness, vertigo
- **Dermatologic:** Exfoliative dermatitis, **Stevens-Johnson syndrome**, alopecia, pruritus, urticaria, angioedema
- **GI:** *Nausea, abdominal cramps, vomiting, diarrhea, anorexia*, parotitis, pancreatitis, **hepatotoxicity**
- **Hematologic:** Hemolytic anemia in G6PD deficiency; granulocytopenia, agranulocytosis, leukopenia, thrombocytopenia, eosinophilia, megaloblastic anemia
- **Respiratory:** **Pulmonary hypersensitivity**
- **Other:** Superinfections of the GU tract; hypotension; muscular aches; *brown-rust urine*

Interactions

- *** Drug-drug** • Delayed or decreased absorption with magaldrate
- *** Drug-lab test** • False elevations of urine glucose, bilirubin, alkaline phosphatase, BUN, urinary creatinine • False-positive urine glucose when using Benedict's or Fehling's reagent

■ Nursing considerations

Assessment

- **History:** Allergy to nitrofurantoin, renal impairment, G6PD deficiency, anemia, diabetes, pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes; R, adventitious sounds; liver evaluation; CBC; LFTs, renal function tests; serum electrolytes; blood, urine glucose, urinalysis

Interventions

- Arrange for culture and sensitivity tests before and during therapy.
- Give with food or milk to prevent GI upset.
- Continue drug for at least 3 days after a sterile urine specimen is obtained.
- Monitor clinical response; if no improvement is seen or a relapse occurs, send urine for repeat culture and sensitivity.
- ⊗ **Warning** Monitor pulmonary function carefully; reactions can occur within hours or weeks of nitrofurantoin therapy.
- Arrange for periodic CBC and liver function tests during long-term therapy.

Teaching points

- Take drug with food or milk. Complete the full course of drug therapy to ensure a resolution of the infection. Take this drug at regular intervals around-the-clock; consult your nurse or pharmacist to set up a convenient schedule.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea; drowsiness, blurring of vision, dizziness (observe caution driving or using dangerous equipment); brown or yellow-rust urine (expected effect).
- Report fever, chills, cough, chest pain, difficulty breathing, rash, numbness or tingling of the fingers or toes.

▶ nitroglycerin

(nye troe *gli' ser in*)

Intravenous: generic

Spray: Nitrolingual Pumpspray

Sublingual: Gen-Nitroglycerin (CAN), Nitrostat

Sustained-release: Nitro-Time **ORC**

Topical: Nitro-Bid

Transdermal: Minitran, Nitrek, Nitro-Dur

Translingual: Nitrolingual

PREGNANCY CATEGORY C

Drug classes

Antianginal

Nitrate

Therapeutic actions

Relaxes vascular smooth muscle with a resultant decrease in venous return and decrease in arterial BP, which reduces left ventricular workload and decreases myocardial oxygen consumption.

Indications

- Sublingual, translingual preparations: Acute angina
- Oral SR, sublingual, topical, transdermal, translingual preparations: Prophylaxis of angina
- IV: Angina unresponsive to recommended doses of organic nitrates or beta blockers
- IV: Perioperative hypertension
- IV: HF associated with acute MI
- IV: To produce controlled hypotension during surgery
- Unlabeled uses: Reduction of cardiac workload in acute MI and in HF (sublingual, topical); adjunctive treatment of Raynaud's disease (topical)

Contraindications and cautions

- Contraindicated with allergy to nitrates, severe anemia, early MI, head trauma, cerebral hemorrhage, hypertrophic cardiomyopathy, pregnancy, lactation.
- Use cautiously with hepatic or renal disease, hypotension or hypovolemia, increased intracranial pressure, constrictive pericarditis, pericardial tamponade, low ventricular filling pressure or low PCWP.

Available forms

Injection for solution (requires dilution)—5 mg/mL; injection (premixed)—100, 200,

400 mcg/mL; sublingual tablets—0.3, 0.4, 0.6 mg; ER buccal tablets—2.3 mg; translingual spray—0.4 mg/spray; oral SR capsules—2.5, 6.5, 9 mg; transdermal—0.1, 0.2, 0.3, 0.4, 0.6, 0.8 mg/hr; topical ointment—2%

Dosages

Adults

IV

Initial dose, 5 mcg/min delivered through an infusion pump. Increase by 5-mcg/min increments every 3–5 min as needed. If no response at 20 mcg/min, increase increments to 10–20 mcg/min. Once a partial BP response is obtained, reduce dose and lengthen dosage intervals; continually monitor response and titrate carefully.

Sublingual

- **Acute attack:** Dissolve one tablet under tongue or in buccal pouch at first sign of anginal attack; repeat every 5 min until relief is obtained. Do not take more than three tablets/15 min. If pain continues or increases, patient should call physician or go to hospital.
- **Prophylaxis:** Use 5–10 min before activities that might precipitate an attack.

Buccal

Place tablet between the lip and gum and allow it to dissolve over 3–5 min. Do not chew or swallow the tablet. Initial dose is 1 mg every 5 hr while awake. Maintenance dose is 2 mg tid.

SR (oral) OND

Initial dose, 2.5–9 mg every 12 hr. Increase to every 8 hr as needed and tolerated. Doses as high as 26 mg given qid have been used.

Topical

Initial dose, one-half inch every 8 hr. Increase by one-half inch to achieve desired results. Usual dose is 1–2 inches every 8 hr; up to 4–5 inches every 4 hr have been used. 1 inch = 15 mg nitroglycerin.

Transdermal

Apply one patch each day. Adjust to higher doses by using patches that deliver more drug or by applying more than one patch. Apply patch to arm; remove at bedtime.

Translingual

Spray preparation delivers 0.4 mg/metered dose. At onset of attack, spray one to two metered doses into oral mucosa; no more than three doses/15 min should be used. If pain per-

sists, seek medical attention. May be used prophylactically 5–10 min before activity that might precipitate an attack.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
IV	1–2 min	3–5 min
Sublingual	1–3 min	30–60 min
Translingual spray	2 min	30–60 min
Oral, SR	20–45 min	8–12 hr
Topical ointment	30–60 min	4–8 hr
Transdermal	30–60 min	24 hr

Metabolism: Hepatic; $T_{1/2}$: 1–4 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute in 5% dextrose injection or 0.9% sodium chloride injection. Do not mix with other drugs; check the manufacturer's instructions carefully because products vary considerably in concentration and volume per vial. Use only with glass IV bottles and the administration sets provided. Protect from light and extremes of temperature.

Infusion: Do not give by IV push; regulate rate based on patient response and BP.

Incompatibilities: Do not mix in solution with other drugs.

Adverse effects

- **CNS:** Headache, apprehension, restlessness, weakness, vertigo, dizziness, faintness
- **CV:** Tachycardia, retrosternal discomfort, palpitations, **hypotension**, syncope, collapse, orthostatic hypotension, angina
- **Dermatologic:** Rash, exfoliative dermatitis, cutaneous vasodilation with flushing, pallor; perspiration, cold sweat, contact dermatitis—transdermal preparations, topical allergic reactions—topical nitroglycerin ointment
- **GI:** Nausea, vomiting, incontinence of urine and feces, abdominal pain
- **Local:** Local burning sensation at the point of dissolution (sublingual)

- **Other:** Ethanol intoxication with high-dose IV use (alcohol in diluent)

Interactions

- **Drug-drug** • Increased risk of hypertension and decreased antianginal effect with ergot alkaloids • Decreased pharmacologic effects of heparin • Risk of severe hypotension and adverse CV events with sildenafil, tadalafil, vardenafil; avoid this combination
- **Drug-lab test** • False report of decreased serum cholesterol if done by the Zlatkis-Zak color reaction

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *NitroBid* (nitroglycerin) and *Nicotrol* (nicotine); between nitroglycerin and nitroprusside; use caution.

Assessment

- **History:** Allergy to nitrates, severe anemia, early MI, head trauma, cerebral hemorrhage, hypertrophic cardiomyopathy, hepatic or renal disease, xerostomia, hypotension or hypovolemia, increased intracranial pressure, constrictive pericarditis, pericardial tamponade, low ventricular filling pressure or low PCWP, pregnancy, lactation
- **Physical:** Skin color, T, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; R, adventitious sounds; liver evaluation, normal output; LFTs, renal function tests (IV); CBC, Hgb

Interventions

- Give sublingual preparations under the tongue or in the buccal pouch. Encourage patient not to swallow. Ask patient if the tablet “fizzles” or burns. Always check the expiration date on the bottle; store at room temperature, protected from light. Discard unused drug 6 mo after bottle is opened (conventional tablets); stabilized tablets (*Nitrostat*) are less subject to loss of potency.
- Give SR preparations with water; warn the patient not to chew the tablets or capsules; do not crush these preparations.

- Administer topical ointment by applying the ointment over a 6" × 6" area in a thin, uniform layer using the applicator. Cover area with plastic wrap held in place by adhesive tape. Rotate sites of application to decrease the chance of inflammation and sensitization; close tube tightly when finished.
- Administer transdermal systems to skin site free of hair and not subject to much movement. Shave areas that have a lot of hair. Do not apply to distal extremities. Change sites slightly to decrease the chance of local irritation and sensitization. Remove transdermal system before attempting defibrillation or cardioversion. Remove old system before applying a new one.
- Administer the translingual spray directly onto the oral mucosa; preparation is not to be inhaled or swallowed.
- ⊗ **Warning** Arrange to withdraw drug gradually; 4–6 wk is the recommended withdrawal period for the transdermal preparations.

Teaching points

- For sublingual tablets, place tablet under your tongue or in your cheek; do not chew or swallow the tablet; the tablet should burn or “fizzle” under the tongue. Take the nitroglycerin before chest pain begins, when you anticipate that your activities or situation may precipitate an attack. Sit or lie down before taking nitroglycerin. You may repeat your dose every 5 minutes for a total of three tablets. If the pain is still not relieved, contact emergency medical services. Do not buy large quantities; this drug does not store well. Keep the drug in a dark, dry place, in a dark-colored glass bottle with a tight lid; do not combine with other drugs.
- For buccal tablets, place tablet between your lip and gum and allow it to dissolve over 3–5 minutes. Do not chew or swallow the tablet.
- Do not chew or crush the timed-release preparations; take on an empty stomach.
- Spread a thin layer of topical ointment on the skin using the applicator. Do not rub or massage the area. Cover with plastic wrap held in place with adhesive tape. Wash your hands after application. Keep the tube tightly closed. Rotate the sites frequently to prevent local irritation.

- To use transdermal systems, you may need to shave an area for application. Apply to a slightly different area each day. Remove the old system before you apply a new one. Use care if changing brands; each system has a different concentration. Remove the old system before applying a new system.
- Spray translingual spray directly onto oral mucous membranes; do not inhale or swallow. Use 5–10 minutes before activities that you anticipate will precipitate an attack.
- You may experience these side effects: Dizziness, light-headedness (may be transient; change positions slowly); headache (lie down in a cool environment and rest; over-the-counter preparations may not help); flushing of the neck or face (transient).
- Report blurred vision, persistent or severe headache, rash, more frequent or more severe angina attacks, fainting.

nitroprusside sodium

(nye troe pruss' ide)

Nipride (CAN), Nitropress

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Vasodilator

Therapeutic actions

Acts directly on vascular smooth muscle to cause vasodilation (arterial and venous) and reduce BP. Mechanism involves interference with calcium influx and intracellular activation of calcium. CV reflexes are not inhibited and reflex tachycardia, increased renin release occur.

Indications

- Hypertensive crises for immediate reduction of BP
- Production of controlled hypotension during anesthesia to reduce bleeding in surgical procedures
- Acute HF
- Unlabeled uses: Acute MI, with dopamine; left ventricular failure, with oxygen, morphine, loop diuretic

Contraindications and cautions

- Contraindicated with treatment of compensatory hypertension; to produce controlled hypotension during surgery with known inadequate cerebral circulation; emergency use in moribund patients; acute HF with peripheral vascular disease.
- Use cautiously with hepatic, renal insufficiency (drug decomposes to cyanide, which is metabolized by the liver and kidneys to thiocyanate ion); hypothyroidism (thiocyanate inhibits the uptake and binding of iodine); pregnancy; lactation.

Available forms

Powder for injection—50 mg/vial

Dosages

Administer only by continuous IV infusion with sterile D₅W.

Adults and pediatric patients

In patients not receiving antihypertensive medication, the average dose is 3 mcg/kg/min (range 0.3–10 mcg/kg/min). At this rate, diastolic BP is usually lowered by 30%–40% below pretreatment diastolic levels. Use smaller doses in patients on antihypertensive medication. Do not exceed infusion rate of 10 mcg/kg/min. If this rate of infusion does not reduce BP within 10 min, discontinue administration.

Geriatric patients or patients with renal impairment

Use with caution and in initial low dosage. The elderly may be more sensitive to the hypotensive effects.

Pharmacokinetics

Route	Onset	Duration
IV	1–2 min	1–10 min

Metabolism: Hepatic; T_{1/2}: 2 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve contents of 50-mg vial in 2–3 mL of D₅W. Dilute the prepared stock solution in 250–1,000 mL of D₅W, and promptly wrap container in aluminum foil or other

opaque material to protect from light; the administration set tubing does not need to be covered. Observe solution for color changes. Freshly prepared solution has a faint brown tint; discard it if highly colored (blue, green, or dark red). If properly protected from light, reconstituted solution is stable for 24 hr. Do not use the infusion fluid for administration of any other drugs. Do not infuse undiluted solution.

Infusion: Infuse slowly to reduce likelihood of adverse effects; use an infusion pump, microdrip regulator, or similar device to allow precise control of flow rate; carefully monitor BP and regulate dose based on response.

Incompatibilities: Do not mix in solution with any other drugs.

Adverse effects

- **CNS:** *Apprehension, headache, restlessness, muscle twitching, dizziness*
- **CV:** *Retrosternal pressure, palpitations, hypotension, bradycardia, tachycardia, ECG changes*
- **Cyanide toxicity:** Increasing tolerance to drug and metabolic acidosis are early signs, followed by dyspnea, headache, vomiting, dizziness, ataxia, loss of consciousness, imperceptible pulse, absent reflexes, widely dilated pupils, pink skin color, distant heart sounds, shallow breathing (seen in overdose)
- **Dermatologic:** *Diaphoresis, flushing*
- **Endocrine:** Hypothyroidism
- **GI:** *Nausea, vomiting, abdominal pain*
- **Hematologic:** Methemoglobinemia, antiplatelet effects
- **Local:** Irritation at injection site

■ Nursing considerations

Assessment

- **History:** Hepatic or renal insufficiency, hypothyroidism, pregnancy, lactation
- **Physical:** Reflexes, affect, orientation, pupil size; BP, P, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds; LFTs, renal and thyroid function tests, blood acid–base balance

Interventions

- Monitor injection site carefully to prevent extravasation.

⊗ **Black box warning** Do not let BP drop too rapidly; do not lower systolic BP below 60 mm Hg. Monitor BP closely.

⊗ **Warning** Provide amyl nitrate inhalation, materials to make 3% sodium nitrite solution, sodium thiosulfate on standby in case of overdose of nitroprusside and depletion of the patient's body stores of sulfur occur, leading to cyanide toxicity.

⊗ **Black box warning** Monitor blood acid–base balance (metabolic acidosis is early sign of cyanide toxicity), serum thiocyanate levels daily during prolonged therapy, especially in patients with renal impairment.

Teaching points

- Anticipate frequent monitoring of blood pressure, blood tests, checks of IV dosage and rate.
- Report pain at injection site, chest pain.

▽ nizatidine

(nigh za' ti deen)

Apo-Nizatidine (CAN), Acid, Acid AR, Acid Pulvules, Gen-Nizatidine (CAN), PMS-Nizatidine (CAN)

PREGNANCY CATEGORY B

Drug class

Histamine-2 (H₂) antagonist

Therapeutic actions

Inhibits the action of histamine at the H₂ receptors of the parietal cells of the stomach, inhibiting basal gastric acid secretion and gastric acid secretion that is stimulated by food, caffeine, insulin, histamine, cholinergic agonists, gastrin, and pentagastrin. Total pepsin output also is reduced.

Indications

- Short-term and maintenance treatment of duodenal ulcer
- Short-term treatment of benign gastric ulcer
- GERD

- OTC: Prevention of heartburn, acid indigestion, and sour stomach brought on by eating
- Unlabeled uses: Prevention of olanzapine-related weight gain; prevention of NSAID-related ulcers

Contraindications and cautions

- Contraindicated with allergy to nizatidine, lactation.
- Use cautiously with impaired renal or hepatic function, pregnancy.

Available forms

Capsules—150, 300 mg; OTC tablets—75 mg; oral solution—15 mg/mL

Dosages

Adults

- *Active duodenal ulcer*: 300 mg PO daily at bedtime. 150 mg PO bid may be used. Most ulcers heal in 4 wk.
- *Maintenance of healed duodenal ulcer*: 150 mg PO daily at bedtime.
- *GERD*: 150 mg PO bid.
- *Benign gastric ulcer*: 150 mg PO bid or 300 mg daily at bedtime.
- *Prevention of heartburn, acid indigestion*: 75 mg PO 30–60 min before food or beverages that cause the problem, taken with water.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal impairment

For creatinine clearance 20–50 mL/min, use 150 mg/day PO for active ulcer; 150 mg every other day for maintenance. For creatinine clearance less than 20 mL/min, use 150 mg PO every other day for active ulcer; 150 mg PO every 3 days for maintenance.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	0.5–3 hr

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, somnolence, headache, confusion, hallucinations*, peripheral neuropathy; symptoms of brainstem dysfunction (dysarthria, ataxia, diplopia)
- **CV:** Cardiac arrhythmias, **cardiac arrest**
- **GI:** *Diarrhea*, hepatitis, pancreatitis, hepatic fibrosis
- **Hematologic:** Neutropenia, agranulocytosis, increases in plasma creatinine, serum transaminase
- **Other:** *Impotence*, gynecomastia, rash, arthralgia, myalgia

Interactions

★ **Drug-drug** • Increased serum salicylate levels with aspirin

★ **Drug-lab test** • False-positive tests for urobilinogen

■ Nursing considerations

Assessment

- **History:** Allergy to nizatidine, impaired renal or hepatic function, pregnancy, lactation
- **Physical:** Skin lesions; orientation, affect; P, baseline ECG; liver evaluation, abdominal examination, normal output; CBC, LFTs, renal function tests

Interventions

- Administer drug at bedtime.
- Decrease doses in renal and hepatic impairment.
- Switch to oral solution if swallowing is difficult.
- Arrange for regular follow-up, including blood tests to evaluate effects.

Teaching points

- Use oral solution if prescribed; may be stored at room temperature.
- Take over-the-counter drug 30–60 minutes before the food or beverage that causes the problem; take with water.
- Take drug at bedtime. Therapy may continue for 4–6 weeks or longer.
- Take antacids exactly as prescribed, being careful of the times of administration. Do not take over-the-counter drugs, and avoid alcohol. Many over-the-counter drugs contain ingredients that might interfere with this drug's effectiveness.

- Tell all health care providers, including dentists, that you are taking this drug. Dosage and timing of all your medications must be coordinated. If anything about the drugs that you are taking changes, consult your health care providers.
- Have regular medical follow-up visits to evaluate drug response.
- Report sore throat, fever, unusual bruising or bleeding, tarry stools, confusion, hallucinations, dizziness, muscle or joint pain.

DANGEROUS DRUG

norepinephrine bitartrate (levarterenol)
(*nor ep i nef' rin*)

Levophed

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic agonist
Beta₁-adrenergic agonist
Cardiac stimulant
Sympathomimetic
Vasopressor

Therapeutic actions

Vasopressor and cardiac stimulant; effects are mediated by alpha₁- or beta₁-adrenergic receptors in target organs; potent vasoconstrictor (alpha effect) acting in arterial and venous beds; potent positive inotropic agent (beta₁ effect), increasing the force of myocardial contraction and increasing coronary blood flow.

Indications

- Restoration of BP in controlling certain acute hypotensive states (pheochromocytectomy, sympathectomy, poliomyelitis, spinal anesthesia, MI, septicemia, blood transfusion, and drug reactions)
- Adjunct in the treatment of cardiac arrest and profound hypotension

Contraindications and cautions

- Contraindicated with hypovolemia (not a substitute for restoration of fluids, plasma, electrolytes, and should not be used when

there are blood volume deficits except as an emergency measure to maintain coronary and cerebral perfusion until blood volume replacement can be effected; if administered continuously to maintain BP when there is hypovolemia, perfusion of vital organs may be severely compromised and tissue hypoxia may result); general anesthesia with halogenated hydrocarbons or cyclopropane; profound hypoxia or hypercarbia; mesenteric or peripheral vascular thrombosis (risk of extending the infarct).

- Use cautiously with pregnancy, lactation.

Available forms

Injection—1 mg/mL (as base)

Dosages

Individualize infusion rate based on response.

Adults

- *Restoration of BP in acute hypotensive states:* Add 4 mL of the solution (1 mg/mL) to 1,000 mL of 5% dextrose solution for a concentration of 4 mcg base/mL. Initially, give 8–12 mcg base per min. Adjust dose gradually to maintain desired BP (usually 80–100 mm Hg systolic). Average maintenance dose is 2–4 mcg base/min. Occasionally enormous daily doses are needed (68 mg base/day). Continue the infusion until adequate BP and tissue perfusion are maintained without therapy. Treatment may be required up to 6 days (vascular collapse due to acute MI). Reduce infusion gradually.
- *Adjunct in cardiac arrest:* Administer IV during cardiac resuscitation to restore and maintain BP after effective heartbeat and ventilation established. Dosages are similar to those used in acute hypotensive states.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	1–2 min

Metabolism: Neural; T_{1/2}: Unknown**Distribution:** Crosses placenta**Excretion:** Urine

IV FACTS

Preparation: Dilute drug in 5% dextrose solution in distilled water or 5% dextrose in saline solution; these dextrose solutions protect against oxidation. Do not administer in saline solution alone.

Infusion: Infusion rate is determined by response with constant BP monitoring; check manufacturer's insert for detailed guidelines.

Incompatibilities: Do not mix with blood products, aminophylline, amobarbital, lidocaine, pentobarbital, phenobarbital, phenytoin, secobarbital, sodium bicarbonate, thiopental.

Adverse effects

- **CNS:** Headache
- **CV:** Bradycardia, hypertension

Interactions

★ **Drug-drug** • Increased hypertensive effects with TCAs (imipramine), reserpine, methyl dopa • Decreased vasopressor effects with phenothiazines

■ Nursing considerations

Assessment

- **History:** Hypovolemia, general anesthesia with halogenated hydrocarbons or cyclopropane, profound hypoxia or hypercarbia, mesenteric or peripheral vascular thrombosis, lactation, pregnancy
- **Physical:** Weight; skin color, T, turgor; P, BP; R, adventitious sounds; urine output; serum electrolytes, ECG

Interventions

- Give whole blood or plasma separately, if indicated.
- Administer IV infusions into a large vein, preferably the antecubital fossa, to prevent extravasation.
- Do not infuse into femoral vein in elderly patients or those suffering from occlusive vascular disease (atherosclerosis, arteriosclerosis, diabetic endarteritis, Buerger's disease); occlusive vascular disease is more likely to occur in lower extremity.
- Avoid catheter tie-in technique, if possible, because stasis around tubing may lead to high local concentrations of drug.

- Monitor BP every 2 min from the start of infusion until desired BP is achieved, then monitor every 5 min if infusion is continued.

- Monitor infusion site for extravasation.

⊗ **Black box warning** Provide phenolamine on standby in case extravasation occurs (5–10 mg phenolamine in 10–15 mL saline should be used to infiltrate the affected area).

⊗ **Warning** Do not use drug solutions that are pink or brown; drug solutions should be clear and colorless.

Teaching points

Because norepinephrine is used only in acute emergency situations, patient teaching will depend on patient's awareness and will relate mainly to patient's status and to monitoring being done, rather than specifically to therapy with norepinephrine.

norethindrone acetate

(*nor eth in' drone*)

Aygestin

PREGNANCY CATEGORY X

Drug classes

Hormone
Progesterin

Therapeutic actions

Progesterone derivative. Progesterone transforms proliferative endometrium into secretory endometrium; inhibits the secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; and inhibits spontaneous uterine contraction. Progestins have varying profiles of estrogenic, antiestrogenic, anabolic, and androgenic activity.

Indications

- Treatment of amenorrhea, abnormal uterine bleeding due to hormonal imbalance
- Treatment of endometriosis
- Base: Component of some hormonal contraceptive preparations

Contraindications and cautions

- Contraindicated with allergy to progestins; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage or history of these conditions; hepatic disease; carcinoma of the breast or genital organs; undiagnosed vaginal bleeding; missed abortion; pregnancy; lactation.
- Use cautiously with epilepsy, migraine, asthma, cardiac dysfunction, or renal impairment.

Available forms

Tablets—5 mg

Dosages

Administer orally only.

Adults

- *Amenorrhea; abnormal uterine bleeding:* 2.5–10 mg PO for 5–10 days during second half of the theoretical menstrual cycle.
- *Endometriosis:* 5 mg/day PO for 2 wk. Increase in increments of 2.5 mg/day every 2 wk until 15 mg/day is reached. May be maintained for 6–9 mo or until breakthrough bleeding demands temporary termination.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic; $T_{1/2}$: Unknown**Distribution:** Crosses placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** Sudden, partial, or complete loss of vision; proptosis; diplopia; migraine; precipitation of acute intermittent porphyria; mental depression; pyrexia; insomnia; somnolence
- **CV:** Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, **pulmonary embolism**, thromboembolic and thrombotic disease, increased BP
- **Dermatologic:** *Rash with or without pruritus, acne, melasma or chloasma, alopecia, hirsutism, photosensitivity*
- **GI:** Cholestatic jaundice, nausea

- **GU:** *Breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, changes in cervical erosion and cervical secretions, breast tenderness and secretion*
- **Other:** *Decreased glucose tolerance, fluid retention, edema, increase in weight*

Interactions

- **Drug-lab test** • Inaccurate tests of hepatic and endocrine function

Nursing considerations**Assessment**

- **History:** Allergy to progestins; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage; hepatic disease; carcinoma of the breast or genital organs; undiagnosed vaginal bleeding; missed abortion; pregnancy; lactation; epilepsy, migraine; asthma; cardiac dysfunction, or renal impairment
- **Physical:** Skin color, lesions, turgor; hair; breasts; pelvic examination; orientation, affect; ophthalmologic examination; P, auscultation, peripheral perfusion, edema; R, adventitious sounds; liver evaluation; LFTs, renal function tests, glucose tolerance, Papanicolaou (Pap) test

Interventions

- Arrange for pretreatment and periodic (at least annual) history and physical, including BP, breasts, abdomen, pelvic organs, and a Pap test.
- Warn patient prior to therapy to prevent pregnancy and to obtain frequent medical follow-up care.
- **Warning** Use caution when administering drug to ensure preparation ordered is the one being used; norethindrone acetate is approximately twice as potent as norethindrone.
- **Warning** Discontinue medication and consult physician if sudden, partial, or complete loss of vision occurs; if papilledema or retinal vascular lesions are present, discontinue drug.
- **Warning** Discontinue medication and consult physician at sign of thromboembolic disease—leg pain, swelling, peripheral perfusion changes, shortness of breath.

Teaching points

- Take drugs in accordance with a marked calendar.
- Avoid pregnancy; serious fetal abnormalities or fetal death could occur.
- You may experience these side effects: Sensitivity to light (avoid exposure to the sun; use sunscreen and protective clothing); dizziness, sleeplessness, depression (use caution driving or performing tasks that require alertness); skin rash, color changes, loss of hair; fever; nausea.
- Report pain or swelling and warmth in the calves, acute chest pain or shortness of breath, sudden severe headache or vomiting, dizziness or fainting, numbness or tingling in the arm or leg.

▼ norfloxacin
(*nor flox' a sin*)

Apo-Norflox (CAN), CO-Norfloxacin (CAN), Noroxin

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Fluoroquinolone
Urinary tract anti-infective

Therapeutic actions

Bactericidal; interferes with DNA replication in susceptible gram-negative bacteria, leading to cell death.

Indications

- For the treatment of adults with UTIs caused by susceptible bacteria, including *Escherichia coli*, *Proteus mirabilis*, *Klebsiella pneumoniae*, *Enterobacter cloacae*, *Proteus vulgaris*, *Providencia rettgeri*, *Morganella morganii*, *Proteus aeruginosa*, *Citrobacter freundii*, *Staphylococcus aureus*, *S. epidermidis*, group D streptococci
- Uncomplicated urethral and cervical gonorrhea caused by *Neisseria gonorrhoeae*
- Prostatitis caused by *E. coli*
- **NEW INDICATION:** Unlabeled uses: GI infections, traveler's diarrhea

Contraindications and cautions

- Contraindicated with allergy to norfloxacin, nalidixic acid, or cinoxacin; lactation; history of tendonitis or tendon rupture.
- Use cautiously in patients with renal impairment, seizures, pregnancy.

Available forms

Tablets—400 mg

Dosages

Adults

- **Uncomplicated UTIs:** 400 mg every 12 hr PO for 7–10 days. Maximum dose, 800 mg/day.
- **Uncomplicated cystitis due to E. coli, K. pneumoniae, or P. mirabilis:** 400 mg every 12 hr PO for 3 days.
- **Complicated UTI:** 400 mg PO every 12 hr for 10–21 days.
- **Uncomplicated gonorrhea:** 800 mg PO as a single dose.
- **Prostatitis:** 400 mg every 12 hr PO for 28 days.

Pediatric patients

Not recommended; produced lesions of joint cartilage in immature experimental animals.

Geriatric patients or patients with impaired renal function

For creatinine clearance of 30 mL/min or less use 400 mg/day, PO for 7–10 days.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–3 hr

Metabolism: Hepatic; T_{1/2}: 3–4.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, dizziness, insomnia, fatigue, somnolence, depression, blurred vision
- **CV:** Prolonged QT interval
- **GI:** Nausea, vomiting, dry mouth, diarrhea, abdominal pain, dyspepsia, flatulence, constipation, heartburn
- **Hematologic:** Elevated BUN, AST, ALT, serum creatinine and alkaline phosphatase; decreased WBC count, neutrophil count, Hct
- **Other:** Fever, rash, photosensitivity, tendonitis, tendon rupture

Interactions

★ **Drug-drug** • Decreased therapeutic effect with iron salts, sucralfate • Decreased absorption with antacids • Increased serum levels and toxic effects of theophyllines, cyclosporine • Increased risk of QT prolongation with other drugs that prolong QT interval

★ **Drug-alternative therapy** • Increased risk of severe photosensitivity reactions if combined with St. John's wort therapy

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Noroxin* (norfloxacin) and *Neurontin* (gabapentin); use caution.

Assessment

- **History:** Allergy to norfloxacin, nalidixic acid, or cinoxacin; renal impairment; seizures; pregnancy; lactation
- **Physical:** Skin color; lesions; T; orientation, reflexes, affect; mucous membranes, bowel sounds; LFTs, renal function tests

Interventions

⊗ **Black box warning** Risk of tendonitis and tendon rupture is increased, especially in patients older than 60 yr; patients who have undergone kidney, heart, or lung transplant; and those taking corticosteroids.

- Arrange for culture and sensitivity tests before therapy.
- Administer drug 1 hr before or 2 hr after meals or ingestion of milk or dairy products. Give with a glass of water.
- Ensure that patient is well hydrated.
- Administer antacids, multivitamins, and other products containing iron or zinc at least 2 hr after dosing.
- Monitor clinical response; if no improvement is seen or a relapse occurs, send urine for repeat culture and sensitivity.

Teaching points

- Take drug on an empty stomach, 1 hour before or 2 hours after meals, milk, or dairy products. If an antacid is needed, do not take it within 2 hours of the norfloxacin dose.
- Drink plenty of fluids.

- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation; drowsiness, blurring of vision, dizziness (observe caution driving or using dangerous equipment).
- Report rash, visual changes, severe GI problems, weakness, tremors, tendon pain, severe diarrhea.

▽ norgestrel

(*nor jess' trel*)

PREGNANCY CATEGORY X

Drug classes

Hormonal contraceptive

Hormone

Progestin

Therapeutic actions

Progestational agent; the endogenous female progestin, progesterone, transforms proliferative endometrium into secretory endometrium; inhibits the secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; and inhibits spontaneous uterine contractions. The primary mechanism by which norgestrel prevents conception is not known, but progestin-only hormonal contraceptives alter the cervical mucus, exert a progestational effect on the endometrium that interferes with implantation, and in some patients, suppress ovulation.

Indications

- Prevention of pregnancy using hormonal contraceptives; somewhat less efficacious (3 pregnancies per 100 woman years) than the combined estrogen/progestin hormonal contraceptives (about 1 pregnancy per 100 woman years, depending on formulation)

Contraindications and cautions

- Contraindicated with allergy to progestins, tartrazine; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage, or history of these conditions; CAD; hepatic disease; carcinoma of the breast or genital organs, undiagnosed vaginal bleeding,

missed abortion; as a diagnostic test for pregnancy; pregnancy (fetal abnormalities—masculinization of the female fetus, congenital heart defects, and limb reduction defects); lactation.

- Use cautiously with epilepsy, migraine, asthma, cardiac dysfunction, or renal impairment.

Available forms

Tablets—0.075 mg

Dosages

Adults

Administer daily, starting on the first day of menstruation. Take one tablet, PO, at the same time each day, every day of the year. Missed dose: one tablet—take as soon as remembered, then take the next tablet at regular time; two consecutive tablets—take one of the missed tablets, discard the other, and take daily tablet at usual time; three consecutive tablets—discontinue immediately and use additional form of birth control until menses or pregnancy is ruled out.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Neuro-ocular lesions, mental depression, migraine, *changes in corneal curvature*, contact lens intolerance
- **CV:** *Thrombophlebitis*, *thrombosis*, **pulmonary embolism**, coronary thrombosis, **MI**, cerebral thrombosis, Raynaud's disease, arterial thromboembolism, renal artery thrombosis, **cerebral hemorrhage**, hypertension
- **Dermatologic:** Rash with or without pruritus, acne, melasma
- **GI:** Gallbladder disease, liver tumors, hepatic lesions, *nausea*, *vomiting*, abdominal cramps, bloating, cholestatic jaundice
- **GU:** *Breakthrough bleeding*, *spotting*, *change in menstrual flow*, *amenorrhea*,

changes in cervical erosion and cervical secretions, endocervical hyperplasia, vaginal candidiasis

- **Other:** *Breast tenderness and secretion*, *enlargement*; fluid retention, edema, increase or decrease in weight

Interactions

- **Drug-drug** • Decreased effectiveness of hormonal contraceptives with barbiturates, hydantoin, carbamazepine, rifampin, griseofulvin, penicillins, tetracyclines; use alternate form of birth control if these drugs are needed
- **Drug-alternative therapy** • Decreased effectiveness if taken with St. John's wort

Nursing considerations

Assessment

- **History:** Allergy to progestins, tartrazine; thrombophlebitis, thromboembolic disorders, cerebral hemorrhage; CAD; hepatic disease; carcinoma of the breast or genital organs, undiagnosed vaginal bleeding, missed abortion; epilepsy, migraine, asthma, cardiac dysfunction, or renal impairment; pregnancy; lactation
- **Physical:** Skin color, lesions, turgor; hair; breasts; pelvic examination; orientation, affect; ophthalmologic examination; P, auscultation, peripheral perfusion, edema; R, adventitious sounds; liver evaluation; LFTs, renal function tests, glucose tolerance, Papanicolaou (Pap) test, pregnancy test

Interventions

- Arrange for pretreatment and periodic (at least annual) history and physical, including BP, breasts, abdomen, pelvic organs, and a Pap test.
- Start no earlier than 4 wk postpartum for postpartum use.
- ⊗ **Warning** Discontinue medication and consult physician if sudden, partial, or complete loss of vision occurs; if papilledema or retinal vascular lesions are present on examination, discontinue.
- ⊗ **Warning** Discontinue drug and consult physician at any sign of thromboembolic disease—leg pain, swelling, peripheral perfusion changes, shortness of breath.

Teaching points

- Take exactly as prescribed at intervals not exceeding 24 hours. Take at bedtime or with a meal to establish a routine; medication must be taken daily for prevention of pregnancy; if you miss one tablet, take as soon as remembered, then take the next tablet at regular time. If you miss two consecutive tablets, take one of the missed tablets, discard the other, and take daily tablet at usual time. If you miss three consecutive tablets, discontinue immediately, and use another method of birth control until your cycle starts again. It is a good idea to use an additional method of birth control if any tablets are missed.
- Discontinue drug and consult your health care provider if you decide to become pregnant. It may be suggested that you use a nonhormonal form of birth control for a few months before becoming pregnant.
- Do not take this drug during pregnancy; serious fetal abnormalities have been reported. If you think that you are pregnant, consult your health care provider immediately.
- Tell all health care providers, including dentists, that you take this drug. If other medications are prescribed, they may decrease the effectiveness of hormonal contraceptives and an additional method of birth control may be needed.
- You may experience these side effects: Sensitivity to light (avoid exposure to the sun; use sunscreen and protective clothing); dizziness, sleeplessness, depression (use caution driving or performing tasks that require alertness); rash, skin color changes, loss of hair; fever; nausea; breakthrough bleeding or spotting (transient); intolerance to contact lenses due to corneal changes.
- Report pain or swelling and warmth in the calves, acute chest pain or shortness of breath, sudden severe headache or vomiting, dizziness or fainting, visual disturbances, numbness or tingling in the arm or leg, breakthrough bleeding or spotting that lasts into the second month of therapy.

nortriptyline hydrochloride

(*nor trip' ti leen*)

Apo-Nortriptyline (CAN), Aventyl, Gen-Nortriptyline (CAN), Pamelor, ratio-Nortriptyline (CAN)

PREGNANCY CATEGORY D

Drug class

TCA (secondary amine)

Therapeutic actions

Mechanism of action unknown; the TCAs are structurally related to the phenothiazine antipsychotic drugs (eg, chlorpromazine), but inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; sedating; the relationship of these effects to clinical efficacy is unknown.

Indications

- Relief of symptoms of depression (endogenous depression most responsive)
- Unlabeled uses: Treatment of panic disorders (25–75 mg/day), premenstrual depression (50–125 mg/day), dermatologic disorders (75 mg/day), chronic pain, headache prophylaxis

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr, pregnancy (limb reduction abnormalities), lactation.
- Use cautiously with EST (increased hazard with TCAs); preexisting CV disorders (possibly increased risk of serious CVS toxicity); angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm (anticholinergic effects may exacerbate these conditions); seizure disorders; hyperthyroidism (predisposes to CVS toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients

(schizophrenic or paranoid patients may exhibit a worsening of psychosis); bipolar disorder (may shift to hypomanic or manic phase); elective surgery (discontinued as long as possible before surgery).

Available forms

Capsules—10, 25, 50, 75 mg; solution—10 mg/5 mL

Dosages

Adults

25 mg tid–qid PO. Begin with low dosage and gradually increase as required and tolerated. Doses of more than 150 mg/day are not recommended.

Pediatric patients 12 yr and older

30–50 mg/day PO in divided doses.

Pediatric patients younger than 12 yr

Not recommended.

Geriatric patients

30–50 mg/day PO in divided doses.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	2–4 wk

Metabolism: Hepatic; $T_{1/2}$: 18–28 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects* (dry mouth, blurred vision, disturbance of accommodation for near vision, mydriasis, increased IOP), *confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, **seizures**, speech blockage, dysarthria

- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, MI, arrhythmias, heart block, precipitation of heart failure, **stroke**

- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; inappropriate ADH secretion

- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis; elevated transaminase, altered alkaline phosphatase

- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; increased or decreased libido; impotence

- **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia; purpura; thrombocytopenia; leukopenia

- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, facial, tongue), drug fever

- **Withdrawal:** Symptoms with abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise

- **Other:** Nasal congestion, excessive appetite, weight gain or loss; sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug–drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine • Altered response, including arrhythmias and hypertension with sympathomimetics • Risk of severe hypertension with clonidine • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths when MAOIs are given with TCAs *Note:* MAOIs and TCAs have been used successfully in some patients resistant to therapy with single agents; however, case reports indicate that the combination can cause serious and potentially fatal adverse effects.

Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous

24 hr or scheduled within 48 hr; pregnancy; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric disorders; bipolar disorder; elective surgery

- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

⊗ **Black box warning** Limit access to drug by depressed and potentially suicidal patients; risk of suicidality in children and adolescents and young adults. Monitor accordingly.

- When doses larger than 100 mg/day are given, plasma levels of nortriptyline should be monitored and maintained in the range of 50–150 ng/mL.
- Give major portion of dose at bedtime if drowsiness or severe anticholinergic effects occur.
- Reduce dosage if minor side effects develop; discontinue if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.

Teaching points

- Take drug exactly as prescribed; do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid alcohol, other sleep-inducing, or over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments if possible.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; use safety measures if severe; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals, perform frequent mouth care, suck sugarless candy); nightmares, in-

ability to concentrate, confusion; changes in sexual function.

- Report dry mouth, difficulty in urination, excessive sedation, thoughts of suicide.

▽ nystatin

(nye stat' in)

Oral, oral troche: Candistatin (CAN), Mycostatin, Nilstat, ratio-Nystatin (CAN)

Vaginal preparations: Mycostatin

Topical application: Mycostatin, Nilstat

PREGNANCY CATEGORY C

Drug class

Antifungal

Therapeutic actions

Fungicidal and fungistatic: Binds to sterols in the cell membrane of the fungus with a resultant change in membrane permeability, allowing leakage of intracellular components and causing cell death.

Indications

- Oral: Treatment of oropharyngeal candidiasis
- Troche: Treatment of oral candidiasis
- Vaginal: Local treatment of vaginal candidiasis (moniliasis)
- Topical applications: Treatment of cutaneous or mucocutaneous mycotic infections caused by *Candida albicans* and other *Candida* species

Contraindications and cautions

- Contraindicated with allergy to nystatin or components used in preparation.
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—500,000 units; suspension—100,000 units/mL; vaginal tablets—100,000 units; troche—200,000 units; topical cream, ointment, powder—100,000 units/g

Dosages

Adults

Vaginal preparations

1 tablet (100,000 units) or 1 applicator of cream (100,000 units) daily—bid for 2 wk.

Topical

- **Vaginal preparations:** Apply to affected area two to three times daily until healing is complete.
- **Topical foot powder:** For fungal infections of the feet, dust powder on feet and in shoes and socks.

Adults and pediatric patients except infants

Oral

- **Tablets:** 500,000–1,000,000 units tid. Continue for at least 48 hr after clinical cure.
- **Troche:** Dissolve 1–2 tablets in mouth four to five times/day for up to 14 days.
- **Suspension:** 400,000–600,000 units four times/day for 14 days and for at least 48 hr after symptoms subside.

Pharmacokinetics

No general systemic absorption

Excretion: Feces, unchanged (oral use)

Adverse effects

Oral

- **GI:** Nausea, vomiting, diarrhea, GI distress
- ### Vaginal
- **Local:** Irritation, vulvovaginal burning
- ### Topical
- **Local:** Local irritation

■ Nursing considerations

Assessment

- **History:** Allergy to nystatin or components used in preparation, pregnancy, lactation
- **Physical:** Skin color, lesions, area around lesions; bowel sounds; culture of area involved

Interventions

- Culture fungus before therapy.
- Have patient retain oral suspension in mouth as long as possible before swallowing. Paint suspension on each side of the mouth. Continue local treatment for at least 48 hr after clinical improvement is noted.

- Prepare nystatin in the form of frozen flavored popsicles to improve oral retention of the drug for local application.
- Administer nystatin troche orally for the treatment of oral candidiasis; have patient dissolve 1–2 tablets in mouth.
- Insert vaginal suppositories high into the vagina. Have patient remain recumbent for 10–15 min after insertion. Provide sanitary napkin to protect clothing from stains.
- Clean affected area before topical application, unless otherwise indicated.
- Monitor response to drug therapy. If no response is noted, arrange for further cultures to determine causative organism.
- Ensure that patient receives the full course of therapy to eradicate the fungus and to prevent recurrence.
- Discontinue topical or vaginal administration if rash or sensitivity occurs.

Teaching points

- Take the full course of drug therapy even if symptoms improve. Continue during menstrual period if vaginal route is being used. Long-term use of the drug may be needed; beneficial effects may not be seen for several weeks. Vaginal suppositories should be inserted high into the vagina.
- Use appropriate hygiene measures to prevent reinfection or spread of infection.
- This drug is for the fungus being treated; do not self-medicate other problems.
- Refrain from sexual intercourse or advise partner to use a condom to avoid reinfection; use a sanitary napkin to prevent staining of clothing with vaginal use.
- You may experience these side effects: Nausea, vomiting, diarrhea (oral use); irritation, burning, stinging (local use).
- Report worsening of condition; local irritation, burning (topical application); rash, irritation, pelvic pain (vaginal use); nausea, GI distress (oral administration).

 **octreotide acetate**
(ok tree' oh tide)

Sandostatin, Sandostatin LAR Depot

PREGNANCY CATEGORY B

Drug classes

Antidiarrheal
Hormone

Therapeutic actions

Mimics the natural hormone somatostatin; suppresses secretion of serotonin, gastrin, vasoactive intestinal peptide, insulin, glucagon, secretin, motilin, and pancreatic polypeptide; also suppresses growth hormone and decreases splanchnic blood flow.

Indications

- Symptomatic treatment of patients with metastatic carcinoid tumors to suppress or inhibit the associated severe diarrhea and flushing episodes
- Treatment of the profuse watery diarrhea associated with vasoactive intestinal polypeptide tumors (VIPomas)
- Reduction of growth hormone blood levels in patients with acromegaly not responsive to other treatment
- Unlabeled uses: GI fistula, variceal bleeding, diarrheal states, pancreatic fistulas, IBS, dumping syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to octreotide or any of its components.
- Use cautiously with renal impairment, thyroid disease, diabetes mellitus, pregnancy, lactation.

Available forms

Injection—0.05, 0.1, 0.2, 0.5, 1 mg/mL; depot injection—10, 20, 30 mg/5 mL.

Dosages**Adults**

Subcutaneous injection is the route of choice. Initial dose is 50 mcg subcutaneously two to three times daily; the number of injections is increased based on response, usually bid–tid. IV bolus injections have been used in emergency situations—not recommended. Depot injection: Do not administer IV or subcutaneously; inject intragluteally at 4-wk intervals. Patients should be stabilized on subcutaneous octreotide for at least 2 wk before switching to long-acting depot.

- **Carcinoid tumors:** First 2 wk of therapy: 100–600 mcg/day subcutaneously in two to four divided doses (mean daily dosage, 300 mcg).
- **VIPomas:** 200–300 mcg subcutaneously in two to four divided doses during initial 2 wk of therapy to control symptoms. Range, 150–750 mcg subcutaneously; doses above 450 mcg are usually not required. Depot injection: 20 mg IM every 4 wk.
- **Acromegaly:** 50 mcg tid subcutaneously, adjusted up to 100–500 mcg tid. Withdraw for 4 wk once yearly. Depot injection: 20 mg IM intragluteally once every 4 wk; after 2–3 mo, reevaluate patient to adjust dosage as needed.

Pediatric patients

Safety and efficacy for depot injection not established.

- **GI tumors:** 1–10 mcg/kg/day subcutaneously.

Geriatric patients or patients with renal impairment

Half-life may be prolonged; adjust dosage.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Rapid	15 min

Metabolism: Hepatic; $T_{1/2}$: 1.5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Anxiety, *headache, dizziness, light-headedness*, fatigue, seizures, depression, drowsiness, vertigo, hyperesthesia, irritability, forgetfulness, malaise, nervousness, visual disturbances
- **CV:** Shortness of breath, hypertension, thrombophlebitis, ischemia, heart failure, palpitations, *bradycardia*
- **Dermatologic:** *Flushing*, edema, hair loss, thinning of skin, skin flaking, bruising, pruritus, rash
- **Endocrine:** *Hyperglycemia, hypoglycemia*, galactorrhea, clinical hypothyroidism
- **GI:** *Nausea, vomiting, diarrhea, abdominal pain, loose stools*, fat malabsorption, constipation, flatulence, hepatitis, rectal

spasm, GI bleeding, heartburn, cholelithiasis, dry mouth, burning mouth

- **Local:** *Injection site pain*
- **Musculoskeletal:** Asthenia, weakness, leg cramps, muscle pain, joint pain, backache
- **Respiratory:** Rhinorrhea

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Sandostatin* (octreotide) and *Sandimmune* (cyclospone); use caution.

Assessment

- **History:** Hypersensitivity to octreotide or any of its components; renal impairment; thyroid disease, diabetes mellitus; lactation
- **Physical:** Skin lesions, hair; reflexes, affect; BP, P, orthostatic BP; abdominal examination, liver evaluation, mucous membranes; renal and thyroid function tests, blood glucose, electrolytes

Interventions

- Administer by subcutaneous injection; avoid multiple injections in the same site within short periods.
- Administer depot injection by deep IM intragluteal injection; avoid deltoid injections. Administer LAR depot immediately after mixing.
- ⊗ **Warning** Monitor patients with renal function impairment closely; reduced dosage may be necessary.
- Store ampules in the refrigerator; may be at room temperature on day of use. Do not use if particulates or discoloration are observed.
- Monitor patient closely for endocrine reactions—blood glucose alterations, thyroid hormone changes, growth hormone level.
- Arrange for baseline and periodic gallbladder ultrasound to detect cholelithiasis.
- Monitor blood glucose, especially at start of therapy, to detect hypoglycemia or hyperglycemia. Patients with diabetes will require close monitoring.
- Arrange to withdraw the drug for 4 wk (8 wk for depot injection) once yearly when treating acromegaly.

Teaching points

- This drug must be injected. You and a significant other can be instructed in the procedure of subcutaneous injections. Review technique and process periodically. Do not use the same site for repeated injections; rotate injection sites. Dispose of needles and syringes properly. Dosage will be adjusted based on your response. Depot injection must be given IM once every 4 weeks.
- Arrange for periodic medical examinations, including blood tests and gallbladder tests.
- You may experience these side effects: Headache, dizziness, light-headedness, fatigue (avoid driving or performing tasks that require alertness); nausea, diarrhea, abdominal pain (eat frequent small meals; maintain nutrition); flushing, dry skin, flaking of skin (skin care may prevent breakdown); pain at the injection site.
- Report sweating, dizziness, severe abdominal pain, fatigue, fever, chills, infection, or severe pain at injection sites.

▷ ofatumumab

See Appendix U, *Less commonly used drugs*.

▷ ofloxacin

(*ob'flox' a sin*)

Floxin, Floxin Otic, Ocuflax

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Fluoroquinolone

Therapeutic actions

Bactericidal; interferes with DNA replication in susceptible gram-positive and gram-negative bacteria, preventing cell reproduction.

Indications

- Acute bacterial exacerbations of COPD, community-acquired pneumonia caused by *Haemophilus influenzae*, *Streptococcus pneumoniae*
- Acute, uncomplicated urethral and cervical gonorrhea due to *Neisseria gonorrhoeae*, nongonococcal urethritis, and cervicitis due

to *Chlamydia trachomatis*, mixed infections due to both

- Uncomplicated skin and soft tissue infections due to *Staphylococcus aureus*, *Streptococcus pyogenes*, *Proteus mirabilis*
- Uncomplicated UTIs caused by *Citrobacter diversus*, *Enterobacter aerogenes*, *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, and *P. mirabilis* caused by *C. trachomatis* and *N. gonorrhoeae*
- Complicated UTIs caused by *C. diversus*, *E. coli*, *K. pneumoniae*, *P. aeruginosa*, *P. mirabilis*
- Oral: Primary treatment of PID; complicated UTIs due to susceptible bacteria, including *E. coli*, *K. pneumoniae*, *P. mirabilis*, *C. diversus*, or *P. aeruginosa*
- Prostatitis due to *E. coli*
- Ophthalmic solution: Treatment of ocular infections caused by susceptible organisms
- Orphan drug use: Treatment of bacterial corneal ulcers
- Otic: Otitis externa (patients 6 mo and older), chronic suppurative otitis media (patients 12 yr and older), acute otitis media (patients 1 yr and older); once daily treatment of swimmer's ear (otitis externa) caused by *E. coli*, *P. aeruginosa*, *S. aureus* (adults and children 6 mo and older)

Contraindications and cautions

- Contraindicated with allergy to fluoroquinolones, lactation, prolonged QT interval
- Use cautiously with renal impairment, seizures, pregnancy.

Available forms

Ophthalmic solution—3 mg/mL (0.3%); tablets—200, 300, 400 mg; otic solution—0.3%

Dosages

Adults

- *Uncomplicated UTIs*: 200 mg every 12 hr PO for 3–7 days.
- *Complicated UTIs*: 200 mg bid PO for 10 days.
- *Bacterial exacerbations of COPD, community-acquired pneumonia*: 400 mg every 12 hr PO for 10 days.

- *Mild to moderate skin infections*: 400 mg every 12 hr PO for 10 days.
- *Prostatitis*: 300 mg every 12 hr PO for 6 wk.
- *Acute, uncomplicated gonorrhea*: 400 mg PO as a single dose.
- *Cervicitis, urethritis*: 300 mg every 12 hr PO for 7 days.
- *Ocular infections*: 1–2 drops per eye as indicated.
- *Otic infections*: 10 drops in affected ear tid for 10–14 days.
- *Swimmer's ear*: 10 drops (1.5 mg) in affected ear, once daily for 7 days.
- *Chronic suppurative otitis media*: 10 drops in affected ear bid for 14 days.

Pediatric patients younger than 18 yr

Systemic

Not recommended; produced lesions of joint cartilage in immature experimental animals.

Otic

1 yr—younger than 12 yr:

- *Swimmer's ear, acute otitis media with tympanostomy tubes*: 5 drops in affected ear bid for 10 days.

12 yr and older:

- *Swimmer's ear*: 10 drops in affected ear bid for 10 days.
 - *Chronic otitis media*: 10 drops in affected ear bid for 14 days.
- 6 mo–13 yr:
- *Swimmer's ear*: 5 drops (0.75 mg) in affected ear once daily for 7 days.

Geriatric patients or patients with impaired renal function

For creatinine clearance 20–50 mL/min, use a 24-hr interval; for creatinine clearance less than 20 mL/min, use a 24-hr interval and half the recommended dose.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	9 hr

Metabolism: Hepatic; T_{1/2}: 5–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** *Headache*, dizziness, *insomnia*, fatigue, somnolence, depression, blurred vision
- **CV:** QT-interval prolongation
- **GI:** *Nausea*, vomiting, dry mouth, *diarrhea*, abdominal pain
- **Hematologic:** Elevated BUN, AST, ALT, serum creatinine and alkaline phosphatase; decreased WBC count, neutrophil count, Hct
- **Other:** Fever, rash, *photosensitivity*; ocular burning, tendinitis, tendon rupture

Interactions

★ **Drug-drug** • Decreased therapeutic effect with iron salts, zinc, sucralfate • Decreased absorption with antacids • Increased risk of prolonged QT interval if combined with other drugs that prolong QT interval, antiarrhythmics

★ **Drug-alternative therapy** • Increased risk of severe photosensitivity reactions if combined with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to fluoroquinolones, renal impairment, seizures, lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; mucous membranes, bowel sounds; LFTs, renal function tests

Interventions

⊗ **Black box warning** Fluoroquinolones are associated with increased risk of tendinitis and tendon rupture; risk is higher in patients older than 60 yr, women, and patients with kidney, heart, or lung transplants.

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy for 2 days after the signs of infection have disappeared.
- Administer oral drug 1 hr before or 2 hr after meals with a glass of water.
- Ensure that patient is well hydrated.
- Administer antacids at least 2 hr before or after dosing.
- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat culture and sensitivity tests.

Teaching points

- Take oral drug on an empty stomach, 1 hour before or 2 hours after meals. If an antacid is needed, do not take it within 2 hours of ofloxacin dose.
- Use eye or ear drops as instructed; keep tip away from surfaces; wash hands before administering.
- Avoid St. John's wort while taking this drug.
- Drink plenty of fluids.
- Avoid prolonged exposure to sunlight.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation; drowsiness, blurring of vision, dizziness (use caution if driving or using dangerous equipment).
- Report rash, visual changes, severe GI problems, weakness, tremors, tendon pain.

▽ olanzapine

(ob lan' za peen)

Zyprexa, Zyprexa IntraMuscular, Zyprexa Zydys, Zyprexa Relprevv

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dopaminergic blocker

Therapeutic actions

Mechanism of action not fully understood; blocks dopamine receptors in the brain, depresses the RAS; blocks serotonin receptor sites; anticholinergic, antihistaminic (H₁), and alpha-adrenergic blocking activity may contribute to some of its therapeutic (and adverse) actions; produces fewer extrapyramidal effects than most antipsychotics.

Indications

- Treatment of schizophrenia
- Treatment of acute mixed or manic episodes associated with bipolar 1 disorder and maintenance of bipolar 1 disorder as monotherapy, or combined with lithium or valproate
- Treatment of agitation associated with schizophrenia and bipolar 1 mania (injection)

Contraindications and cautions

- Contraindicated with allergy to olanzapine, myeloproliferative disorders, severe CNS depression, comatose states, lactation.
- Use cautiously in elderly or debilitated patients or with CV or cerebrovascular disease, dehydration, seizure disorders, Alzheimer's disease, prostate enlargement, narrow-angle glaucoma, history of paralytic ileus or breast cancer, pregnancy, phenylketonuria (if using orally disintegrating tablets, contain phenylalanine).

Available forms

Tablets—2.5, 5, 7.5, 10, 15, 20 mg; orally disintegrating tablets—5, 10, 15, 20 mg; powder for injection—10 mg; powder for suspension—210, 300, 405 mg/vial

Dosages

Adults

- **Schizophrenia:** Initially, 5–10 mg PO daily, increase to 10 mg PO daily within several days; may be increased by 5 mg/day at 1-wk intervals to achieve desired effect. Do not exceed 20 mg/day.
- **Bipolar mania:** 10–15 mg/day PO; adjust at 5-mg intervals as needed, not less than every 24 hr. Maximum dose, 20 mg/day. For maintenance, 5–20 mg/day PO. The initial dose is 10 mg of olanzapine when combined with lithium or valproate.
- **Agitation:** 10 mg IM; range 5–10 mg IM; dose may be repeated in 2 hr if needed; safety of giving more than 30 mg/24 hr not established.
- **Long-acting injection (Zyprexa Relprevv):** 150, 210, or 300 mg IM every 2 wk or 300 or 405 mg IM every 4 wk; establish dosage based on patient response.

Pediatric patients 13–17 yr

- **Schizophrenia, bipolar disorder:** Initially, 2.5–5 mg/day PO; titrate to target dose of 10 mg/day.

Pediatric patients younger than 13 yr

Safety and efficacy not established.

Geriatric patients

5 mg IM.

Debilitated patients

Start with initial dose of 5 mg; 2.5 mg IM. For long-acting injection (*Zyprexa Relprevv*), start with 150 mg IM every 4 wk.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	6 hr	Weeks
IM	Rapid	15–45 min	Weeks

Metabolism: Hepatic; $T_{1/2}$: 30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Somnolence, dizziness*, nervousness, headache, akathisia, personality disorders, tardive dyskinesia, **neuroleptic malignant syndrome**
- **CV:** *Orthostatic hypotension*, peripheral edema, tachycardia
- **GI:** *Constipation*, abdominal pain
- **Respiratory:** Cough, pharyngitis
- **Other:** *Fever*; weight gain, joint pain, development of diabetes mellitus, increased lipid levels

Interactions

- *** Drug-drug** • Increased risk of orthostatic hypotension with antihypertensives, alcohol, benzodiazepines; avoid use of alcohol and use caution with antihypertensives • Increased risk of seizures with anticholinergics, CNS drugs
- May decrease effectiveness of levodopa, dopamine agonists
- Decreased effectiveness with rifampin, omeprazole, carbamazepine, smoking
- Increased risk of toxicity with fluvoxamine

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Zyprexa* (olanzapine) and *Zyrtec* (cetirizine); use caution.

Assessment

- **History:** Allergy to olanzapine, myeloproliferative disorders, severe CNS depression, comatose states, history of seizure disorders,

lactation, CV or cerebrovascular disease, dehydration, Alzheimer's disease, prostate enlargement, narrow-angle glaucoma, history of paralytic ileus or breast cancer, elderly or debilitated, pregnancy

- **Physical:** T, weight; reflexes, orientation, IOP, ophthalmologic examination; P, BP, orthostatic BP, ECG; R, adventitious sounds; bowel sounds, normal output, liver evaluation; prostate palpation, normal urine output; CBC, urinalysis, LFTs, renal function tests

Interventions

- Do not dispense more than 1-wk supply at a time.
- Peel back foil on blister pack of disintegrating tablets; do not push through foil; use dry hands to remove tablet and place in mouth.
- Prepare solution for immediate-release IM injection using 2.1 mL sterile water for injection. Resulting solution contains 5 mg/mL. Solution should be clear yellow. Use within 1 hr of reconstitution. Discard any unused portion.
- Use special care to distinguish short-term IM form from long-term form (*Zyprexa Relprevv*).
- Dilute *Zyprexa Relprevv* only with the diluent provided. Ensure that patient is enrolled in *Zyprexa Relprevv* Patient Care Program. Monitor patient for at least 3 hr after injection.
- Monitor for the many possible drug interactions before beginning therapy.

⊗ **Black box warning** Risk of death is increased when drug is used to treat elderly patients with dementia-related psychosis; drug is not approved for this use.

⊗ **Black box warning** There is risk of severe sedation, including coma and delirium, after each injection of *Zyprexa Relprevv*. Patient must be observed for at least 3 hr after each injection, with ready access to emergency services. Because of risk, drug is available only through *Zyprexa Relprevv* Patient Care Program.

- Ensure that long-term injection (*Zyprexa Relprevv*) is given IM; long-term form is not to be used IV or subcutaneously.
- Encourage patient to void before taking the drug to help decrease anticholinergic effects of urinary retention.

- Monitor for elevations of temperature and differentiate between infection and neuroleptic malignant syndrome.
- Monitor adolescents carefully because of increased risk of sedation, weight gain, and lipid abnormalities.
- Monitor for orthostatic hypotension and provide appropriate safety measures as needed.
- Monitor patient regularly for signs and symptoms of diabetes mellitus; monitor lipid and triglyceride levels.

Teaching points

- Take this drug exactly as prescribed; do not change dose without consulting your health care provider.
- Peel back foil on blister pack of disintegrating tablets; do not push through foil; use dry hands to remove tablet, place entire tablet in mouth.
- This drug cannot be taken during pregnancy. If you think you are pregnant or wish to become pregnant, contact your health care provider.
- You may experience these side effects: Drowsiness, dizziness, sedation, seizures (avoid driving, operating machinery, or performing tasks that require concentration); dizziness, faintness on arising (change positions slowly, use caution); increased salivation (if bothersome, contact your health care provider); constipation (consult your health care provider for appropriate relief measures); fast heart rate (rest and take your time if this occurs); weight gain (monitor weight and discuss with health care provider).
- Report lethargy, weakness, fever, sore throat, malaise, mouth ulcers, and flulike symptoms.

olmesartan medoxomil (ol ma sar' tan)

Benicar

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Angiotensin II receptor antagonist
Antihypertensive

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the vascular smooth muscle and adrenal gland; this action blocks the vasoconstricting effect of the renin-angiotensin system as well as the release of aldosterone leading to decreased BP; may prevent the vessel remodeling associated with the development of atherosclerosis.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- **NEW INDICATION:** Unlabeled use: Prevention of migraines

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, pregnancy (use during the second or third trimester can cause injury or death to the fetus), lactation.
- Use cautiously with renal impairment, hypovolemia, salt depletion.

Available forms

Tablets—5, 20, 40 mg

Dosages**Adults**

20 mg/day PO as a once-daily dose; may titrate to 40 mg/day if needed after 2 wk.

Pediatric patients 6–16 yr

- *Weighing 35 kg or more:* 20 mg/day PO initially; then titrate to maximum dose of 40 mg/day PO.
- *Weighing 20 to less than 35 kg:* 10 mg/day PO initially; then titrate to maximum dose of 20 mg/day PO.

Pediatric patients younger than 6 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr

Metabolism: Hydrolyzed in GI tract; $T_{1/2}$: 13 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness, syncope, muscle weakness
- **CV:** Hypotension, tachycardia
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea*, constipation, dry mouth, dental pain
- **Hematologic:** Increased CPK, hyperglycemia, hypertriglyceridemia
- **Respiratory:** *URI symptoms, bronchitis, cough*, sinusitis, rhinitis, pharyngitis
- **Other:** *Back pain, flulike symptoms*, fatigue, hematuria, arthritis, **angioedema**

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to any component of the drug, pregnancy, lactation, hepatic or renal impairment, hypovolemia, salt depletion, angioedema
- **Physical:** Skin lesions, turgor; body T; reflexes, affect; BP; R, respiratory auscultation; LFTs, renal function tests, serum electrolytes

Interventions

- Administer without regard to meals.
- If child is unable to swallow tablets, ask pharmacist to prepare a suspension form.
- ⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy. Suggest the use of barrier birth control while using olmesartan; fetal injury and deaths have been reported.
- Find an alternate method of feeding the infant if given to a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.
- ⊗ **Warning** Alert the surgeon and mark the patient's chart with notice that olmesartan is being taken. The blockage of the renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.

- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea; excessive hypotension can occur.

Teaching points

- Take drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while using this drug; if you become pregnant or desire to become pregnant, consult your health care provider.
- Take special precautions to maintain your fluid intake and provide safety precautions in any situation that might cause a loss of fluid volume—excessive perspiration, dehydration, vomiting, diarrhea; excessive hypotension can occur.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult a dietitian to maintain nutrition); symptoms of upper respiratory tract, cough (do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy, swelling.

▾ olsalazine sodium

See Appendix U, *Less commonly used drugs*.

▾ omalizumab

See Appendix U, *Less commonly used drugs*.

▾ omega-3-acid ethyl esters

(*oh may gab-three-ass' id*)

Lovaza

PREGNANCY CATEGORY C

Drug classes

Lipid-lowering drug
Omega-3 fatty acid

Therapeutic actions

Inhibits liver enzyme systems leading to a decrease in the synthesis of triglycerides in the liver, lowering serum triglyceride levels.

Indications

- As an adjunct to diet to reduce very high (greater than 500 mg/dL) triglyceride levels in adult patients

Contraindications and cautions

- Contraindicated with known allergy to any component of the capsule.
- Use caution with known sensitivity to fish products, pregnancy, lactation.

Available forms

Capsules—1 g

Dosages

Adults

4 g/day PO taken as a single dose (4 capsules) or divided into two doses—2 capsules PO bid.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	Unknown

Metabolism: $T_{1/2}$: Unknown

Distribution: May cross placenta; may pass into breast milk

Excretion: Tissues

Adverse effects

- **CV:** Angina
- **GI:** Taste perversion, dyspepsia, *eructation*
- **Other:** Pain, back pain, rash, flulike symptoms, *infection*

Interactions

★ **Drug-drug** • Potential risk for increased bleeding if combined with anticoagulants; monitor patient closely and adjust anticoagulant dosage if needed

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Omacor* (the former trade name of omega-3-acid ethyl esters) and *Amicar* (amino caproic acid). Although the name of omega-3-acid esters has been changed to *Lovaza*, confusion may still occur; use caution.

Assessment

- **History:** Allergy to any component of the tablet, sensitivity to fish products, pregnancy, lactation
- **Physical:** T; abdominal examination; skin color, lesions; triglyceride levels

Interventions

- Reserve use for patients with very high triglyceride levels; obtain baseline level and periodically monitor levels.
- Assess patient for any potential underlying causes for elevated triglycerides.
- Ensure that patient continues diet and exercise program to control lipids.
- Suggest the use of contraceptive measures; it is not known if this drug could affect a fetus.
- Suggest another method of feeding the baby if a woman is nursing; it is not known if this drug crosses into breast milk.
- Encourage frequent small meals if GI effects are uncomfortable.

Teaching points

- Take this drug in one dose of four capsules, or you can take two doses of two capsules each. You can take this drug with meals.
- If you miss a dose of the daily medication, take it as soon as you remember and then return to your normal schedule. Do not make up doses. Do not take more than four capsules in one day.
- You should continue your dietary and exercise program to control your lipid levels.
- You may be asked to have periodic blood tests to evaluate the effects of this drug on your body.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, an-

other method of feeding the baby should be selected.

- It is not known how this drug could affect a fetus, if you are pregnant or decide to become pregnant while on this drug, consult your health care provider; use of contraceptive measures is advised while you are on this drug.
- You may experience these side effects: Taste changes, GI upset, frequent burping (this may stop after you have used the drug for awhile; frequent small meals may help); rash, fever, flulike symptoms (consult your health care provider; analgesics may be available to help).
- Report chest pain, severe headache, swelling, difficulty breathing.

▼ omeprazole

(*oh me' pray zol*)

Losec (CAN) **OND**, Prilosec **OND**,
Prilosec OTC **OND**, Zegerid
(with sodium bicarbonate) **OND**

PREGNANCY CATEGORY C

Drug classes

Antisecretory drug

Proton pump inhibitor

Therapeutic actions

Gastric acid-pump inhibitor: Suppresses gastric acid secretion by specific inhibition of the hydrogen-potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step of acid production.

Indications

- Short-term treatment of active duodenal ulcer
- Treatment of heartburn or symptoms of GERD
- Short-term treatment of active benign gastric ulcer
- GERD, severe erosive esophagitis, poorly responsive symptomatic GERD
- Long-term therapy: Treatment of pathologic hypersecretory conditions (Zollinger-Ellison's

syndrome, multiple adenomas, systemic mastocytosis)

- Eradication of *Helicobacter pylori* with amoxicillin or metronidazole and clarithromycin
- *Prilosec OTC*: Treatment of frequent heartburn (2 or more days per week)
- *Zegerid* oral suspension: Reduction of risk of upper GI bleeding in critically ill patients; includes sodium bicarbonate
- Unlabeled use: Posterior laryngitis

Contraindications and cautions

- Contraindicated with hypersensitivity to omeprazole or its components.
- Use cautiously because of possible increased risk of *Clostridium difficile* infection.
- Use cautiously with pregnancy, lactation.

Available forms

DR capsules **ORAC**—10, 20, 40 mg; DR tablets **ORAC**—20 mg (OTC); powder for oral suspension—20, 40 mg/packet (*Zegerid*); capsules **ORAC**—20, 40 mg (*Zegerid*)

Dosages

Adults

- *Active duodenal ulcer*: 20 mg PO daily for 2–8 wk. Should not be used for maintenance therapy.
- *Active gastric ulcer*: 40 mg PO daily for 4–8 wk.
- *Severe erosive esophagitis or poorly responsive GERD*: 20 mg PO daily for 4–8 wk. Do not use as maintenance therapy. An additional 4–8 wk course can be considered if needed.
- *Pathologic hypersecretory conditions*: Individualize dosage. Initial dose is 60 mg PO daily. Doses up to 120 mg tid have been used. Administer daily amounts greater than 80 mg in divided doses.
- *Frequent heartburn (2 or more days per week)*: 20 mg (*Prilosec OTC* tablet) PO once daily before eating in the morning for 14 days. May repeat the 14-day course every 4 mo.
- *Upper GI bleeding in critically ill patients*: 40 mg PO followed by 40 mg PO in 6–8 hr on day 1; then 40 mg/day for up to 14 days (*Zegerid*).

Pediatric patients 2 yr and older

- *GERD or other acid-related disorder*: 5 mg daily if patient weighs 5–10 kg; 10 mg if patient weighs 11 to less than 20 kg; 20 mg if 20 kg or more.

Pediatric patients younger than 2 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	0.5–3.5 hr

Metabolism: Hepatic; $T_{1/2}$: 0.5–1 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** *Headache, dizziness*, asthenia, vertigo, insomnia, apathy, anxiety, paresthesias, dream abnormalities
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea, vomiting*, constipation, dry mouth, tongue atrophy
- **Respiratory:** *URI symptoms*, cough, epistaxis
- **Other:** Cancer in preclinical studies, back pain, fever, decreased bone density, bone fractures

Interactions

★ **Drug-drug** ⊗ **Warning** Increased serum levels and potential increase in toxicity of benzodiazepines, phenytoin, warfarin; if these combinations are used, monitor patient closely. • Administration with clopidagrel can lead to therapeutic failure of clopidagrel; avoid this combination • Decreased absorption with sucralfate; give these drugs at least 30 min apart

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to omeprazole or any of its components, pregnancy, lactation
- **Physical:** Skin lesions; T; reflexes, affect; urinary output, abdominal examination; respiratory auscultation

Interventions

- Administer before meals. Caution patient to swallow capsules whole—not to open, chew, or crush them. If using oral suspension, empty packet into a small cup containing 2 tbsp of water. Stir and have patient drink immediately; fill cup with water and have patient drink this water. Do not use any other diluent.
- Be aware that patient may be at increased risk for hip, wrist, and spine fracture; weigh benefits and risks before use.
- ⊗ **Warning** Arrange for further evaluation of patient after 8 wk of therapy for GERD; not intended for maintenance therapy. Symptomatic improvement does not rule out gastric cancer, which did occur in preclinical studies.
- Administer antacids with, if needed.
- If patient cannot swallow *Prilosec* capsules, contents of capsule may be added to or sprinkled on 1 tablespoon applesauce. Mix capsule contents into applesauce and have patient swallow immediately without chewing pellets. Follow with a glass of water.
- *Zegerid* capsules should not be opened and contents should not be sprinkled on applesauce. Use suspension if swallowing is difficult.

Teaching points

- Take the drug before meals. Swallow the capsules whole; do not chew, open, or crush them. If using the oral suspension, empty packet into a small cup containing 2 tablespoons of water. Stir and drink immediately; fill cup with water and drink the water. Do not use any other liquid or food to dissolve the packet. This drug will need to be taken for up to 8 weeks (short-term therapy) or for a prolonged period (more than 5 years in some cases).
- If you take *Prilosec* capsules and cannot swallow them whole, capsule contents may be added to or sprinkled on 1 tablespoon of applesauce. Mix with applesauce, swallow immediately without chewing pellets, and follow with a glass of water. *Zegerid* capsules should not be opened or added to food.
- Have regular medical follow-up visits.
- You may experience these side effects: Dizziness (avoid driving or performing hazardous tasks); headache (request medications); nau-

sea, vomiting, diarrhea (maintain proper nutrition); symptoms of URI, cough (do not self-medicate; consult your health care provider if uncomfortable).

- Report severe headache, worsening of symptoms, fever, chills, severe diarrhea.

ondansetron hydrochloride

(on *dan'* sab tron)

Zofran, Zofran ODT, Zuplenz

PREGNANCY CATEGORY B

Drug class

Antiemetic

Therapeutic actions

Blocks specific receptor sites (5-HT₃), which are associated with nausea and vomiting in the chemoreceptor trigger zone, centrally and at specific sites peripherally. It is not known whether its antiemetic actions are from actions at the central, peripheral, or combined sites.

Indications

- Parenteral and oral: Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy in patients older than 6 mo
- Prevention of postoperative nausea and vomiting—to prevent further episodes or, when postoperative nausea and vomiting must be avoided (oral), prophylactically (parenteral) in patients older than 1 mo
- Prevention of nausea and vomiting associated with radiotherapy
- Unlabeled uses: Treatment of nausea and vomiting associated with acetaminophen poisoning, prostacyclin therapy

Contraindications and cautions

- Contraindicated with allergy to ondansetron.
- Use cautiously with pregnancy, lactation, hepatic impairment.

Available forms

Tablets—4, 8, 24 mg; orally disintegrating tablets—4, 8 mg; oral solution—4 mg/5 mL;

oral soluble film—4, 8 mg; injection—2 mg/mL, 32 mg/50 mL

Dosages

Adults

Parenteral

- **Prevention of chemotherapy-induced nausea and vomiting:** Three 0.15 mg/kg doses IV. First dose is given over 15 min, beginning 30 min before chemotherapy; subsequent doses are given at 4 and 8 hr, or a single 32-mg dose is infused over 15 min beginning 30 min before the start of the chemotherapy.

Oral

- **Prevention of nausea and vomiting associated with cancer chemotherapy:** 8 mg PO 30 min prior to chemotherapy, then 8 mg 8 hr later; give 8 mg every 12 hr for 1–2 days after completion of chemotherapy. For highly emetogenic chemotherapy, give 24 mg PO 30 min before starting chemotherapy.
- **Prevention of nausea and vomiting associated with radiotherapy:** 8 mg PO tid. For total-body radiotherapy, administer 1–2 hr before radiation each day. For single high-dose radiotherapy to abdomen, give 1–2 hr before radiotherapy, then every 8 hr for 1–2 days after completion of therapy. For daily fractionated radiotherapy to abdomen, give 1–2 hr before therapy, then every 8 hr for each day therapy is given.

Parenteral or oral

- **Prevention of postoperative nausea and vomiting:** 4 mg undiluted IV, preferably over 2–5 min, or as a single IM dose immediately before induction of anesthesia or 16 mg PO 1 hr before anesthesia.

Pediatric patients

- **Prevention of chemotherapy-induced nausea and vomiting:**

Parenteral

6 mo–18 yr: Three doses of 0.15 mg/kg IV over 15 min given 30 min before the start of the chemotherapy, then 4 and 8 hr later.

Oral

12 yr and older: Same as adult.

4–11 yr: 4 mg PO 30 min prior to chemotherapy, 4 mg at 4 and 8 hr, then 4 mg PO tid for 1–2 days after completion of chemotherapy.

Younger than 4 yr: Safety and efficacy not established.

- **Prevention of postoperative nausea and vomiting:**

1 mo–12 yr: 0.1 mg/kg IV if patient weighs less than 40 kg or a single dose of 4 mg IV if more than 40 kg, preferably given 2–5 min before or following induction of anesthesia. Infuse over at least 30 sec.

Patients with hepatic impairment

Maximum daily dose of 8 mg IV or PO.

Pharmacokinetics

Route	Onset	Peak
Oral	30–60 min	1.7–2.2 hr
IV	Immediate	Immediate

Metabolism: Hepatic; $T_{1/2}$: 3.5–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute in 50 mL of 5% dextrose injection or 0.9% sodium chloride injection; stable for 48 hr at room temperature after dilution.

Infusion: Infuse slowly over 15 min diluted or 2–5 min undiluted.

Compatibilities: May be diluted with 0.9% sodium chloride injection, 5% dextrose injection; 5% dextrose and 0.45% sodium chloride injection; 3% sodium chloride injection.

Incompatibilities: Do not mix with alkaline solutions.

Adverse effects

- **CNS:** Headache, dizziness, drowsiness, shivers, malaise, fatigue, weakness, myalgia
- **CV:** Chest pain, hypotension
- **Dermatologic:** Pruritus
- **GI:** Abdominal pain, constipation, liver impairment, diarrhea
- **GU:** Urinary retention
- **Local:** Pain at injection site

Interactions

- **Drug-food** • Increased extent of absorption if taken orally with food

■ Nursing considerations**Assessment**

- **History:** Allergy to ondansetron, pregnancy, lactation, nausea and vomiting
- **Physical:** Skin color and texture; orientation, reflexes, bilateral grip strength, affect; P, BP; abdominal examination; urinary output; ECG

Interventions

- Ensure that the timing of drug doses corresponds to that of the chemotherapy or radiation.
- Administer oral drug for 1–2 days following completion of chemotherapy or radiation.
- For *Zofran ODT*, peel foil backing of one blister and remove tablet gently. Do not push tablet through the foil backing. Immediately place tablet on tongue, where it will dissolve in seconds, and have patient swallow it with saliva.

Teaching points

- Take oral drug for 1–2 days following chemotherapy or radiation therapy to maximize prevention of nausea and vomiting. Take the drug every 8 hours around-the-clock for best results.
- For *Zofran ODT*, peel foil backing of one blister and remove tablet gently. Do not push tablet through the foil backing. Immediately place tablet on tongue, where it will dissolve in seconds, and swallow with saliva.
- You may experience these side effects: Weakness, dizziness (change position slowly to avoid injury); dizziness, drowsiness (do not drive or perform tasks that require alertness).
- Report continued nausea and vomiting, pain at injection site, chest pain, palpitations.

DANGEROUS DRUG**▶ opium preparations***(ob' pee um)*

Camphorated tincture: Paregoric

Deodorized tincture: Opium Tincture, Deodorized

PREGNANCY CATEGORY C**CONTROLLED SUBSTANCE C-III
(PAREGORIC)****CONTROLLED SUBSTANCE C-II
(OPIUM TINCTURE, DEODORIZED)****Drug classes**

Antidiarrheal

Opioid agonist analgesic

Therapeutic actions

Activity is primarily due to morphine content; acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins); inhibits peristalsis and diarrhea by producing spasm of GI tract smooth muscle.

Indications

- Antidiarrheal
- Unlabeled uses: Neonatal abstinence syndrome, management of short-bowel syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning (before toxins are eliminated), pregnancy, labor or delivery (opioids given to mother can cause respiratory depression of neonate; premature infants are at special risk; may prolong labor), bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, kyphoscoliosis, acute alcoholism, increased intracranial pressure, lactation.
- Use cautiously with acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment.

Available forms

Liquid—2 mg morphine equivalent/5 mL (*Paregoric*); 10 mg/mL (*Opium Tincture, Deodorized*)

Dosages

⊗ **Warning** Caution: *Opium Tincture, Deodorized*, contains 25 times more morphine than *Paregoric*. Do not confuse dosage; severe toxicity can occur.

Adults

Paregoric

5–10 mL PO daily–qid (5 mL is equivalent to 2 mg morphine).

Opium Tincture, Deodorized

0.6 mL qid. Maximum, 6 mL/day.

Pediatric patients

Contraindicated in premature infants.

Paregoric

0.25–0.5 mL/kg PO daily–qid.

Geriatric patients or impaired adults

⊗ **Warning** Use caution; respiratory depression may occur in the elderly, the very ill, those with respiratory problems. Reduced dosage may be necessary.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	0.5–1 hr	3–7 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation*, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope, circulatory depression, **shock, cardiac arrest**
- **Dermatologic:** Pruritus, urticaria, edema, hemorrhagic urticaria (rare)
- **GI:** *Nausea, vomiting, sweating*, dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility with chronic ulcerative colitis

- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Respiratory:** Suppression of cough reflex, respiratory depression, apnea, **respiratory arrest, laryngospasm, bronchospasm**
- **Other:** Physical tolerance and dependence, psychological dependence

Interactions

- **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation or coma with barbiturate general anesthetics
- **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase determinations 24 hr after administration

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Paregoric* (camphorated tincture of opium) and *Opium Tincture, Deodorized*; use caution.

Assessment

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, bronchial asthma, COPD, cor pulmonale, respiratory depression, kyphoscoliosis, acute alcoholism, increased intracranial pressure, acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment, pregnancy, lactation
- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; LFTs, renal and thyroid function tests

Interventions

- Give to lactating women 4–6 hr before the next feeding to minimize the amount in milk.
- Reassure patient that addiction is unlikely; most patients who receive opiates for medical reasons do not develop dependence syndromes.

Teaching points

- Take this drug exactly as prescribed.
- Do not take leftover medication for other disorders, and do not let anyone else take the prescription.
- You may experience these side effects: Nausea, loss of appetite (take with food and lie quietly; eat frequent small meals); constipation (use a laxative); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness, visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath, or difficulty breathing.

▷ oprelvekin

See Appendix U, *Less commonly used drugs*.

▷ orlistat (ore' lab stat)

Alli, Xenical

PREGNANCY CATEGORY B

Drug classes

Lipase inhibitor
Weight loss drug

Therapeutic actions

Synthetic derivative of lipostatin, a naturally occurring lipase inhibitor or so-called fat blocker. Binds to gastric and pancreatic lipase to prevent the digestion of fats. When taken with fat-containing foods, the fat passes through the intestines unchanged and is not absorbed.

Indications

- Treatment of obesity as part of weight loss program that includes diet and exercise

Contraindications and cautions

- Contraindicated with hypersensitivity to orlistat, pregnancy, lactation, chronic malabsorption syndrome.
- Use cautiously with impaired hepatic function, biliary obstruction, pancreatic disease.

Available forms

Capsules—60 (*Alli*), 120 mg (*Xenical*)

Dosages

Adults

120 mg tid PO with each main meal containing fat. For OTC use, 60 mg PO with each meal containing fat, not exceeding 3 capsules/day.

Pediatric patients 12 yr and older

120 mg PO tid with fat-containing meals; OTC not for use in children.

Pediatric patients younger than 12 yr

Safety and efficacy not established.

Pharmacokinetics

Not absorbed systemically

Adverse effects

- **Dermatologic:** *Rash, dry skin*
- **GI:** *Dry mouth, nausea, flatulence, loose stools, oily stools, fecal incontinence or urgency, severe liver injury*
- **Other:** Vitamin deficiency of fat-soluble vitamins (A, D, E, K)

Interactions

- *** Drug-drug** • Decreased absorption of fat-soluble vitamins • Additive lipid-lowering effects with pravastatin; monitor patient response
- Increased risk of bleeding related to decreased vitamin K; when taking with oral anticoagulants, monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to orlistat, impaired hepatic or pancreatic function, pregnancy, biliary obstruction, lactation, LFTs
- **Physical:** Weight, T, skin rash, lesions; liver evaluation; LFTs

Interventions

- Be aware that patient may be at increased risk for severe liver injury; monitor liver enzymes before and periodically during therapy.
- Ensure that patient is participating in a weight-loss diet and exercise program.
- Administer with meals.
- Arrange for administration of fat-soluble vitamins. Do not administer with orlistat; separate doses.

- Provide sugarless lozenges and frequent mouth care if dry mouth is a problem.
- Ensure ready access to bathroom facilities if diarrhea occurs.

⊗ **Warning** Counsel patient about the use of barrier contraceptives while using this drug; pregnancy should be avoided because of the possible risk to the fetus.

Teaching points

- Take this drug with meals that contain fat. Do not take the drug if you do not eat a meal. This drug is not a substitute for a reduced-calorie diet.
- You may need to take a vitamin supplement while you are using this drug. Take the supplement at least 2 hours before or after taking orlistat.
- Do not take this drug during pregnancy. If you think that you are pregnant or you wish to become pregnant, consult your health care provider.
- You may experience these side effects: Dry mouth (suck sugarless lozenges and perform frequent mouth care), nausea, loose stools, flatulence (stay close to the bathroom; this may pass in time).
- Report rash, glossy tongue, vision changes, bruising, changes in stool or urine color.

▽ **orphenadrine citrate**
(or *fen' a dreen*)

Banflex, Flexon, Norflex

PREGNANCY CATEGORY C

Drug class

Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Precise mechanisms not known; acts in the CNS; does not directly relax tense skeletal muscles; does not directly affect the motor endplate or motor nerves.

Indications

- Relief of discomfort associated with acute, painful musculoskeletal conditions; as an adjunct to rest, physical therapy, and other measures

- Unlabeled use: 100 mg at bedtime for the treatment of leg cramps

Contraindications and cautions

- Contraindicated with hypersensitivity to orphenadrine, glaucoma, pyloric or duodenal obstruction, stenosing peptic ulcers, achalasia, cardiospasm (megaesophagus), prostatic hypertrophy, bladder neck obstruction, myasthenia gravis, lactation.
- Use cautiously with cardiac decompensation, coronary insufficiency, cardiac arrhythmias, hepatic or renal impairment, pregnancy, allergy to sulfites with some products.

Available forms

SR tablets **ORC**—100 mg; injection—30 mg/mL; tablets—100 mg

Dosages

Adults

60 mg IV or IM. May repeat every 12 hr. Inject IV over 5 min. Alternatively, give 100 mg PO every morning and evening.

Pediatric patients

Safety and efficacy not established; not recommended.

Geriatric patients

Use caution and regulate dosage carefully; patients older than 60 yr frequently develop increased sensitivity to adverse CNS effects of anticholinergic drugs.

Pharmacokinetics

Route	Onset	Peak	Duration
IM, IV	Rapid	2 hr	4–6 hr
Oral	Rapid	2 hr	4–6 hr

Metabolism: Hepatic; T_{1/2}: 14 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

▽ **IV FACTS**

Preparation: No further preparation is required.

Infusion: Administer slowly IV, each 60 mg over 5 min.

Adverse effects

- **CNS:** *Weakness, headache, dizziness, confusion* (especially in elderly), hallucinations, drowsiness, memory loss, psychosis, agitation, nervousness, delusions, delirium, paranoia, euphoria, depression, paresthesia, blurred vision, pupil dilation, increased intraocular tension
- **CV:** *Tachycardia*, palpitation, transient syncope, hypotension, orthostatic hypotension
- **Dermatologic:** Urticaria, other dermatoses
- **GI:** *Dry mouth, gastric irritation, vomiting, nausea, constipation*, dilation of the colon, paralytic ileus
- **GU:** *Urinary hesitancy and retention*, dysuria, difficulty achieving or maintaining an erection
- **Other:** *Flushing, decreased sweating*, elevated temperature, muscle weakness, cramping

Interactions

- *** Drug-drug** • Additive anticholinergic effects with other anticholinergic drugs • Additive adverse CNS effects with phenothiazines
- Possible masking of the development of persistent extrapyramidal symptoms, tardive dyskinesia in long-term therapy with phenothiazines, haloperidol

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to orphenadrine, glaucoma, pyloric or duodenal obstruction, stenosing peptic ulcers, achalasia, cardiospasm, prostatic hypertrophy, bladder neck obstruction, myasthenia gravis, cardiac dysfunction, hepatic or renal impairment, lactation, pregnancy
- **Physical:** Weight; T; skin color; lesions; orientation, affect, reflexes, bilateral grip strength, vision examination with tonometry; P, BP, orthostatic BP, auscultation; bowel sounds, normal output, liver evaluation; prostate palpation, normal output, voiding pattern; urinalysis, CBC with differential, LFTs, renal function tests, ECG

Interventions

- Ensure that patient is supine during IV injection and for at least 15 min thereafter;

assist patient from the supine position after treatment.

- Ensure that patients swallow SR tablets whole, and do not cut, crush, or chew them.
- **⊗ Warning** Decrease or discontinue drug temporarily if dry mouth is so severe that swallowing or speaking becomes difficult.
- **⊗ Warning** Give with caution, reduce dosage in hot weather; drug interferes with sweating and body's ability to thermoregulate in hot environments.
- Arrange for analgesics if headache occurs (adjunct for relief of muscle spasm).

Teaching points

- Swallow sustained-release tablets whole; do not cut, crush, or chew them.
- Do not consume alcohol while using this drug.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving or engaging in activities that require alertness and visual acuity); dry mouth (suck on sugarless lozenges or ice chips); nausea (eat frequent small meals); difficulty urinating (empty your bladder just before taking the medication); constipation (increase fluid and fiber intake and exercise regularly); headache (request medication).
- Report dry mouth, difficult urination, constipation, headache, or GI upset that persists; rash or itching; rapid heart rate or palpitations; mental confusion; eye pain; fever; sore throat; bruising.

▷ oseltamivir phosphate*(oz el tam' ah ver)*

Tamiflu

PREGNANCY CATEGORY C**Drug classes**

Antiviral

Neuraminidase inhibitor

Therapeutic actions

Selectively inhibits influenza virus neuraminidase; by blocking the actions of this enzyme, there is decreased viral release from

infected cells, increased formation of viral aggregates, and decreased spread of the virus.

Indications

- Treatment of uncomplicated acute illness due to influenza virus (A or B) in adults and children who have been symptomatic for 2 days or less
- Prevention of naturally occurring influenza A and B in adults and children in close contact with the flu
- Unlabeled use: Treatment and prevention of H1N1 influenza A (swine flu)

Contraindications and cautions

- Contraindicated with allergy to any component of the drug.
- Use cautiously with pregnancy, lactation, asthma, COPD.

Available forms

Capsules—30, 45, 75 mg; powder for oral suspension—12 mg/mL

Dosages

Adults and patients 13 yr and older

- **Treatment:** 75 mg PO bid for 5 days, starting within 2 days of the onset of symptoms.
- **Prevention:** 75 mg/day PO for at least 10 days; begin treatment within 2 days of exposure.

Pediatric patients 1–12 yr

- **Treatment:** 30–75 mg PO bid for 5 days based on weight—use suspension.
- **Prevention:** If patient weighs 15 kg or less, 30 mg/day PO; if 15–23 kg, 45 mg/day PO; if 23–40 kg, 60 mg/day PO; if more than 40 kg, 75 mg/day PO. Continue for 10 days.

Pediatric patients 6–11 mo

- **Treatment:** 25 mg PO bid.
- **Prevention:** 25 mg/day PO for 10 days.

Pediatric patients 3–5 mo

- **Treatment:** 20 mg PO bid.
- **Prevention:** 20 mg/day PO for 10 days.

Pediatric patients younger than 3 mo

- **Treatment:** 12 mg PO bid.
- **Prevention:** Not recommended.

Patients with renal impairment

For creatinine clearance of 30 mL/min or less, use 75 mg/day PO for 5 days, 75 mg PO every other day for prophylaxis.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2.5–6 hr

Metabolism: Hepatic; $T_{1/2}$: 6–10 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **GI:** *Nausea*, vomiting, *diarrhea*, *anorexia*
- **Respiratory:** Cough, *rhinitis*, bronchitis
- **Other:** Risk of self-injury and delirium, particularly in children

■ Nursing considerations

Assessment

- **History:** Allergy to any components of the drug, COPD, asthma, pregnancy, lactation
- **Physical:** T; orientation, reflexes; R, adventitious sounds; bowel sounds

Interventions

- Administer within 2 days of the onset of flu symptoms.
- Encourage patient to complete full 5-day course of therapy; advise patient that treatment does not decrease the risk of transmission of the flu to others.
- Start dosage for prevention within 2 days of exposure and continue for at least 10 days.
- Prepare solution by adding 23 mL of water to bottle containing powder; shake well for 15 sec. Shake solution well before each dose. The reconstituted oral suspension should be used within 10 days of preparation.
- Monitor children for self-injury, delirium.

Teaching points

- Take the full course of therapy as prescribed; be advised that this drug does not decrease the risk of transmitting the virus to others.
- Shake solution well before each use; store in refrigerator.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea; headache, dizziness (use caution if driving an automobile or operating dangerous machinery).

- Report severe diarrhea, severe nausea, worsening of respiratory symptoms.

oxacillin sodium (*ox a sill' in*)

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Penicillinase-resistant penicillin

Therapeutic actions

Bactericidal: Inhibits cell wall synthesis of sensitive organisms, causing cell death.

Indications

- Infections due to penicillinase-producing staphylococci; may be used to initiate treatment when a staphylococci infection is suspected

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, or other allergens.
- Use cautiously with renal disorders, pregnancy, lactation (may cause diarrhea or candidiasis in infants).

Available forms

Powder for injection—500 mg; 1, 2 g

Dosages

Maximum recommended dosage is 6 g/day.

Adults and pediatric patients weighing 40 kg or more

250–500 mg every 4–6 hr IM or IV. Up to 1 g every 4–6 hr in severe infections.

Pediatric patients weighing less than 40 kg

Neonates weighing less than 2 kg: 25–50 mg/kg every 12 hr IV or IM.

Neonates weighing 2 kg or more: 25–50 mg/kg every 8 hr IV.

Children weighing less than 40 kg: 50–100 mg/kg/day IV or IM in equally divided doses every 4–6 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Rapid	30–60 min	4–6 hr
IV	Rapid	15 min	Length of infusion

Metabolism: Hepatic; $T_{1/2}$: 0.5–1 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute for direct IV administration to a maximum concentration of 1 g/10 mL using sodium chloride injection or sterile water for injection. For IV infusion: Reconstituted solution may be diluted with compatible IV solution: 0.9% sodium chloride injection, 5% dextrose in water or in normal saline, 10% D-fructose in water or in normal saline, lactated Ringer's solution, lactated potassic saline injections, 10% invert sugar in water or in normal saline, 10% invert sugar plus 0.3% potassium chloride in water, Travert's 10% Electrolyte 1, 2, or 3. 0.5–40 mg/mL solutions are stable for up to 12 hr at room temperature. Discard after that time.

Infusion: Give by direct administration slowly to avoid vein irritation, each 1 g over 10 min; infusion—up to 6 hr.

Incompatibilities: Do not mix in the same IV solution as other antibiotics.

Adverse effects

- **CNS:** Lethargy, hallucinations, **seizures**
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth*, “furry” or black “hairy” tongue, *nausea, vomiting, diarrhea*, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, nonspecific hepatitis
- **GU:** Nephritis—oliguria, proteinuria, hematuria, casts, azotemia, pyuria
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time (more common than with other penicillinase-resistant penicillins)
- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis*, thrombosis at injection site

- **Other:** *Superinfections*, sodium overload leading to heart failure

Interactions

- * **Drug-drug** • Decreased effectiveness with tetracyclines • Inactivation of aminoglycosides in parenteral solutions with oxacillin
- * **Drug-lab test** • False-positive Coombs' test with IV oxacillin

■ Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, or other allergens; renal disorders; pregnancy; lactation
- **Physical:** Culture infection; skin color, lesions; R, adventitious sounds; bowel sounds; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

⊗ **Warning** Patients taking this drug are at increased risk for infections by multiple drug-resistant organisms; weigh risks and benefits before use.

- Culture infection before treatment; reculture if response is not as expected.
- Continue therapy for at least 2 days after infection has disappeared, usually 7–10 days.
- Reconstitute for IM use to a dilution of 250 mg/1.5 mL using sterile water for injection or sodium chloride injection. Discard after 3 days at room temperature or after 7 days if refrigerated.
- Reconstituted oral solution is stable 3 days at room temperature, 14 days refrigerated.

⊗ **Warning** Keep epinephrine, IV fluids, vasopressors, bronchodilators, oxygen, and emergency equipment readily available in case of serious hypersensitivity reaction.

Teaching points

- You may experience these side effects: Upset stomach, nausea, diarrhea (eat frequent small meals), mouth sores (perform frequent mouth care), pain at the injection site.
- Report difficulty breathing, rashes, severe diarrhea, severe pain at injection site, mouth sores.
- Finish entire course of therapy as prescribed.

▷ oxaliplatin

See Appendix U, *Less commonly used drugs*.

▷ oxandrolone

(*ox an' drob lone*)

Oxandrin

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-III

Drug classes

Anabolic steroid
Hormone

Therapeutic actions

Testosterone analogue with androgenic and anabolic activity; promotes body tissue-building processes; reverses catabolic or tissue-depleting processes; increases Hgb and red cell mass.

Indications

- Relief of bone pain accompanying osteoporosis
- Adjunctive therapy to promote weight gain after weight loss following extensive surgery, chronic infections, trauma
- Offset protein catabolism associated with prolonged use of corticosteroids
- Orphan drug uses: Short stature associated with Turner's syndrome, HIV wasting syndrome, and HIV-associated muscle weakness
- Unlabeled use: Alcoholic hepatitis

Contraindications and cautions

- Contraindicated with known sensitivity to anabolic steroids; prostate, breast cancer; BPH; pituitary insufficiency; MI (contraindicated because of effects on cholesterol); nephrosis; liver disease; hypercalcemia; pregnancy, lactation.
- Use cautiously with HF; cardiac, renal, or liver disease; epilepsy; migraines; diabetes.

Available forms

Tablets—2.5 mg, 10 mg

Dosages**Adults**

2.5 mg PO bid–qid; up to 20 mg has been used to achieve the desired effect; 2–4 wk needed to evaluate response.

Pediatric patients

Give a total daily dose of 0.1 mg/kg or less or 0.045 mg/lb or less PO; may be repeated intermittently.

Pharmacokinetics

Route	Onset
Oral	Slow

Metabolism: Hepatic; $T_{1/2}$: 9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Excitation, insomnia, chills, toxic confusion*
- **Endocrine:** *Virilization: Prepubertal males*—phallic enlargement, hirsutism, increased skin pigmentation; *postpubertal males*—inhibition of testicular function, gynecomastia, testicular atrophy, priapism, baldness, epididymitis, change in libido; *females*—hirsutism, hoarseness, deepening of the voice, clitoral enlargement, menstrual irregularities, baldness; decreased glucose tolerance
- **GI:** Hepatotoxicity, peliosis, **hepatitis** with **liver failure or intra-abdominal hemorrhage**; **liver cell tumors**, sometimes malignant, *nausea, vomiting, diarrhea, abdominal fullness, loss of appetite, burning of tongue*
- **GU:** Possible increased risk of prostatic hypertrophy, carcinoma in geriatric patients
- **Hematologic:** *Blood lipid changes*; iron deficiency anemia, hypercalcemia, altered serum cholesterol levels; *retention of sodium, chloride, water*; potassium, phosphates and calcium
- **Other:** *Acne*, premature closure of the epiphyses, edema

Interactions

★ **Drug-drug** • Potentiation of oral anticoagulants with anabolic steroids • Decreased

need for insulin, oral hypoglycemia drugs with anabolic steroids

★ **Drug-lab test** • Altered glucose tolerance tests • Decrease in thyroid function tests (may persist for 2–3 wk after stopping therapy) • Increased creatinine, creatinine clearance, which may last for 2 wk after therapy

Nursing considerations**Assessment**

- **History:** Sensitivity to anabolic steroids; prostate or breast cancer; BPH; pituitary insufficiency; MI; nephrosis; liver disease; hypercalcemia; pregnancy; lactation; HF; renal, cardiac, or liver disease, epilepsy, diabetes, migraines
- **Physical:** Skin color, texture; hair distribution pattern; affect, orientation; abdominal examination, liver evaluation; serum electrolytes and cholesterol levels, glucose tolerance tests, thyroid function tests, long-bone X-ray (in children)

Interventions

- Administer with food if GI upset or nausea occurs.
- ⊗ **Warning** Monitor effect on children with long-bone X-rays every 3–6 mo; discontinue drug well before the bone age reaches the norm for the patient's chronologic age because effects may continue for 6 mo after therapy.
- Ensure that women of childbearing age are not pregnant and understand the need to use contraceptives to prevent pregnancy.
- Monitor patient for edema; arrange for diuretic therapy.
- ⊗ **Black box warning** Monitor liver function and serum electrolytes periodically, and consult with physician for corrective measures; risk of peliosis hepatitis, liver cell tumors.
- ⊗ **Black box warning** Measure cholesterol levels periodically in patients who are at high risk for CAD; lipid level may increase.
- Monitor diabetic patients closely because glucose tolerance may change. Adjustments may be needed in insulin, oral hypoglycemic dosage, and diet.

Teaching points

- Take drug with food if nausea or GI upset occurs.

- Diabetic patients need to monitor urine or blood sugar closely because glucose tolerance may change; report any abnormalities to your health care provider for corrective action.
- These drugs do not enhance athletic ability but do have serious effects. They should not be used for increasing muscle strength.
- Periodic blood tests will be needed to monitor drug effects on your body.
- This drug cannot be taken during pregnancy; serious adverse effects can occur. Using barrier contraceptives is advised.
- You may experience these side effects: Nausea, vomiting, diarrhea, burning of the tongue (eat frequent small meals); body hair growth, baldness, deepening of the voice, decrease in libido, impotence (most reversible); excitation, confusion, insomnia (avoid driving, performing tasks that require alertness); swelling of the ankles, fingers (request medication).
- Report ankle swelling, skin color changes, severe nausea, vomiting, hoarseness, body hair growth, deepening of the voice, acne, menstrual irregularities.

oxaprozin

(oks a pro' zin)

oxaprozin

Apo-Oxaprozin (CAN), Daypro

oxaprozin potassium

Daypro ALTA

PREGNANCY CATEGORY C

Drug classes

Analgesic (nonopioid)

Antipyretic

NSAID

Therapeutic actions

Inhibits prostaglandin synthetase to cause antipyretic and anti-inflammatory effects; the exact mechanism of action is not known.

Indications

- Acute or long-term use in the management of signs and symptoms of osteoarthritis, rheumatoid arthritis, and juvenile rheumatoid arthritis

Contraindications and cautions

- Contraindicated with significant renal impairment, lactation, treatment of perioperative pain following CABG surgery.
- Use cautiously with impaired hearing, allergies, hepatic, CV, and GI conditions, pregnancy.

Available forms

Caplets, tablets—600 mg; tablets—678 mg (*Daypro ALTA* equivalent to 600 mg oxaprozin)

Dosages

Adjust to the lowest effective dose to minimize side effects. Maximum daily dose, 1,800 mg or 26 mg/kg, whichever is lower. Maximum dose for *Daypro ALTA* is 1,200 mg/day.

Adults

- **Osteoarthritis:** 1,200 mg PO once daily; use initial dose of 600 mg with low body weight or milder disease.
- **Rheumatoid arthritis:** 1,200 mg PO once daily.

Pediatric patients 6–16 yr

- **Juvenile rheumatoid arthritis (non-ALTA product only):** 600–1,200 mg/day PO based on body weight.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	3–5 hr	24–36 hr
<i>Daypro ALTA</i>	Unknown	2 hr	Unknown

Metabolism: Hepatic; $T_{1/2}$: 42–50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, somnolence, insomnia, fatigue, tiredness, dizziness, tinnitus, ophthalmic effects
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** Nausea, dyspepsia, GI pain, diarrhea, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

■ Nursing considerations

Assessment

- **History:** Renal impairment; impaired hearing; allergies; hepatic, CV, and GI conditions; lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

⊗ **Black box warning** Drug is contraindicated for treatment of perioperative pain associated with CABG surgery.

- Administer drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs.
- Dizziness, drowsiness can occur (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black tarry stools.

▷ oxazepam

(ox a' ze pam)

Apo-Oxazepam (CAN)

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Anxiolytic

Benzodiazepine

Therapeutic actions

Exact mechanisms not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; main sites of action may be the limbic system and reticular formation; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter; anxiolytic effects occur at doses well below those needed to cause sedation, ataxia.

Indications

- Management of anxiety disorders or for short-term relief of symptoms of anxiety; anxiety associated with depression also is responsive
- Management of anxiety, tension, agitation, and irritability in older patients
- Alcoholics with acute tremulousness, inebriation, or anxiety associated with alcohol withdrawal

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, tartrazine (in the tablets); psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication with depression of vital signs; pregnancy (risk of congenital malformations, neonatal withdrawal syndrome); labor and delivery (“floppy infant” syndrome); lactation (may cause infants to become lethargic and lose weight).
- Use cautiously with impaired liver or renal function, debilitation.

Available forms

Capsules—10, 15, 30 mg

Dosages

Increase dosage gradually to avoid adverse effects.

Adults

10–15 mg PO or up to 30 mg PO tid–qid, depending on severity of symptoms of anxiety. The higher dosage range is recommended in alcoholics.

Pediatric patients 6–12 yr

Dosage not established.

Geriatric patients or patients with debilitating disease

Initially, 10 mg PO tid. Gradually increase to 15 mg PO tid–qid if needed and tolerated.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 5–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness* (initially), *sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation*, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms, mild paradoxical excitatory reactions during first 2 wk of treatment, visual and auditory disturbances, diplopia, nystagmus, depressed hearing
- **CV:** Bradycardia, tachycardia, **CV collapse**, hypertension and hypotension, palpitations, edema
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **GI:** *Constipation, diarrhea, dry mouth*, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders
- **GU:** *Incontinence, urinary retention*, changes in libido, menstrual irregularities
- **Hematologic:** Elevations of blood enzymes, hepatic impairment, blood dyscrasias: Agranulocytosis, leukopenia
- **Other:** *Nasal congestion, hiccups, fever, diaphoresis*, paresthesias, muscular disturbances, gynecomastia, drug dependence with withdrawal syndrome when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)

Interactions

• **Drug-drug** • Increased CNS depression with alcohol or other CNS depressants • Decreased

sedation when given to heavy smokers of cigarettes or if taken concurrently with theophyllines

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines, tartrazine; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; labor and delivery; lactation; impaired liver or renal function, debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

⊗ **Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy.

Teaching points

- Take this drug exactly as prescribed; do not stop taking drug (during long-term therapy) without consulting health care provider.
- You may experience these side effects: Drowsiness, dizziness (may lessen; avoid driving or engaging in other dangerous activities); GI upset (take with food); depression, dreams, emotional upset, crying.
- Report severe dizziness, weakness, drowsiness that persists, palpitations, swelling of the extremities, visual changes, difficulty voiding, rash or skin lesion.

▽ oxcarbazepine (oks car baz' e peen)

Trileptal

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not understood; anti-epileptic activity may be related to its ability

to block voltage-sensitive sodium channels, increase potassium conductance, and affect high-voltage activated calcium channels, leading to enhanced membrane stability.

Indications

- As monotherapy or adjunct therapy in the treatment of partial seizures in adults and children 4 yr and older
- Adjunct therapy for children 2 yr and older with epilepsy
- Unlabeled use: Alternative treatment of bipolar disorder, diabetic neuropathy

Contraindications and cautions

- Contraindicated with hypersensitivity to carbamazepine or oxcarbazepine; lactation.
- Use cautiously in the elderly and with hyponatremia, renal or hepatic impairment, pregnancy.

Available forms

Tablets—150, 300, 600 mg; suspension—60 mg/mL

Dosages

Adults

- *Adjunctive therapy*: 300 mg PO bid, may be increased to a total of 1,200 mg PO bid if clinically needed.
- *Conversion to monotherapy*: 300 mg PO bid started while reducing the dose of other antiepileptics; other drugs should be reduced over 3–6 wk while increasing oxcarbazepine over 2–4 wk to maximum of 2,400 mg/day (in divided doses).
- *Starting as monotherapy*: Start with 300 mg PO bid and increase by 300 mg/day every third day until the desired dose of 1,200 mg/day is reached. Some patients may benefit from doses as high as 2,400 mg/day but should be carefully monitored.

Pediatric patients 2–16 yr

- *Adjunctive therapy*
4–16 yr: 8–10 mg/kg/day PO given in two equally divided doses not to exceed 600 mg/day. Achieve the target dose over 2 wk. Suggested target dosages follow:

Weight (kg)	Dosage (mg/day)
20–29	900
29.1–39	1,200
More than 39	1,800

2–4 yr and more than 20 kg: 8–10 mg/kg/day PO not to exceed 600 mg/day.

2–4 yr and less than 20 kg: 16–20 mg/kg/day PO not to exceed 600 mg/day.

- *Monotherapy for partial seizures in epileptic children 4–16 yr*: 8–10 mg/kg/day PO in two divided doses. If the patient is taking another antiepileptic, slowly withdraw that drug over 3–6 wk. Then, increase the oxcarbazepine in 10 mg/kg/day increments at weekly intervals to the desired level. If the patient is not taking another antiepileptic, increase the dose by 5 mg/kg/day every third day to the recommended dosage. Recommended dosages by weight:

Weight (kg)	Dosage (mg/day)
20	600–900
25–30	900–1,200
35–40	900–1,500
45	1,200–1,500
50–55	1,200–1,800
60–65	1,200–2,100
70 or more	1,500–2,100

Geriatric patients or patients with renal impairment

Use caution, drug may cause confusion, agitation. For creatinine clearance less than 30 mL/min, initiate dosage at one-half the usual starting dose for the indication; increase slowly until desired clinical response is seen; monitor patient carefully.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr, then 9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS**: *Dizziness, drowsiness, unsteadiness, disturbance of coordination, confusion, headache, fatigue, visual hallucinations,*

depression with agitation, behavioral changes in children, suicidal ideation

- **CV:** *Hypotension, hypertension, bradycardia, tachycardia*, atrial fibrillation
- **GI:** *Nausea, vomiting*, gastric distress, abdominal pain, diarrhea, increased liver enzymes
- **GU:** *Impaired fertility*; hematuria, dysuria, priapism, renal calculi
- **Metabolic and nutritional:** Respiratory acidosis, hyperkalemia, *hyponatremia*, thirst
- **Respiratory: Pulmonary edema**, pleural effusion, hypoventilation, *hypoxia*, dyspnea, **bronchospasm**
- **Other:** Fever, hypovolemia, sweating, rigors, acne, alopecia, anaphylactic reactions, angioedema

Interactions

★ **Drug-drug** • Possible decreased oxcarbazepine effectiveness if combined with phenytoin, carbamazepine, phenobarbital, valproic acid, verapamil; if these combinations are used, monitor patient closely • Decreased effectiveness of felodipine if combined with oxcarbazepine • Decreased effectiveness of hormonal contraceptives if combined with oxcarbazepine; suggest the use of barrier contraceptives if this combination is used • Increased serum levels and risk of toxicity of phenytoin, phenobarbital; if this combination is used, monitor patient closely for signs of toxicity and arrange to decrease drug dosage as needed • Possible increased sedation if combined with alcohol; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to carbamazepine or oxcarbazepine; hyponatremia; serious dermatologic reactions; renal or hepatic impairment; pregnancy, lactation
- **Physical:** T; skin color, lesions; orientation, affect, reflexes; P; BP; perfusion; ECG; R, adventitious sounds; bowel sounds, normal output; normal urinary output, voiding pattern; LFTs, renal function tests; serum sodium

Interventions

⊗ **Warning** Monitor serum sodium prior to and periodically during therapy with ox-

carbazepine; serious hyponatremia can occur. Signs and symptoms of hyponatremia include nausea, malaise, headache, lethargy, confusion, and decreased sensation.

- Investigate if patient has a history of hypersensitivity to carbamazepine. Stop drug if signs or symptoms of hypersensitivity occur.
- Give drug with food or milk to prevent GI upset. Arrange for patient to have small, frequent meals if GI upset occurs.

⊗ **Warning** Arrange to reduce dosage or discontinue oxcarbazepine, or substitute other antiepileptic, gradually. Abrupt discontinuation of antiepileptic may precipitate status epilepticus.

- Monitor patient carefully when converting to monotherapy from combined therapy or when adding oxcarbazepine to an established regimen.
- Monitor patient for changes in behavior, depression, suicidality.
- Ensure ready access to bathroom facilities if GI effects occur.
- Establish safety precautions if CNS changes occur (use side rails, accompany patient when ambulating).
- Arrange for appropriate counseling for women of childbearing age who wish to become pregnant; using barrier contraceptives is recommended while using this drug.
- Offer support and encouragement for dealing with epilepsy and adverse drug effects; arrange for consultation with support groups for patients with epilepsy as needed.

Teaching points

- Take this drug exactly as prescribed.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Avoid the use of alcohol, sleep-inducing, or over-the-counter drugs while you are using this drug; these could cause dangerous effects. If you think that you need one of these preparations, consult your health care provider.
- Use only barrier contraceptives; if you wish to become pregnant while you are taking this drug, you should consult your health care provider. Hormonal contraceptives may be ineffective.

- Blood tests to measure your blood sodium levels will be needed periodically while you are using this drug.
- Wear or carry a medical alert tag at all times so that any emergency medical personnel taking care of you will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving a car or performing other tasks requiring alertness or visual acuity if this occurs); GI upset (take the drug with food or milk and eat frequent small meals).
- Report bruising, unusual bleeding, abdominal pain, yellowing of the skin or eyes, pale-colored feces, darkened urine, impotence, severe central nervous system disturbances, edema, fever, chills, thirst, pregnancy, thoughts of suicide.

oxybutynin chloride (ox i byoo' ti nin)

Apo-Oxybutynin (CAN), Ditropan XL **oac**, Gelnique, Gen-Oxybutynin (CAN), Oxytrol, PMS-Oxybutynin (CAN)

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Urinary antispasmodic

Therapeutic actions

Acts directly to relax smooth muscle and inhibits the effects of acetylcholine at muscarinic receptors; reported to be less potent an anticholinergic than atropine but more potent as antispasmodic and devoid of antinicotinic activity at skeletal neuromuscular junctions or autonomic ganglia.

Indications

- Relief of symptoms of bladder instability associated with voiding in patients with uninhibited neurogenic and reflex neurogenic bladder
- ER tablets: Treatment of signs and symptoms of overactive bladder (incontinence,

urgency, frequency); treatment of pediatric patients 6 yr and older with symptoms of detrusor overactivity associated with a neurological condition, such as spina bifida (*Ditropan XL*)

Contraindications and cautions

- Contraindicated with allergy to oxybutynin, pyloric or duodenal obstruction, obstructive intestinal lesions or ileus, intestinal atony, megacolon, colitis, obstructive uropathies, glaucoma, myasthenia gravis, CV instability in acute hemorrhage, urinary retention.
- Use cautiously with hepatic, renal impairment; pregnancy; lactation.

Available forms

Tablets—5 mg; syrup—5 mg/5 mL; ER tablets **oac**—5, 10, 15 mg; transdermal patch—3.9 mg/day; topical gel—100 mg/mL

Dosages

Adults

5 mg PO bid or tid. Maximum dose is 5 mg qid. ER tablets—5 mg PO daily, up to a maximum of 30 mg/day; transdermal patch—1 patch applied to dry, intact skin on the abdomen, hip, or buttock every 3–4 days (twice weekly); topical gel—apply 1 mL to thigh, abdomen, or upper arm once every 24 hr.

Pediatric patients older than 5 yr

5 mg PO bid. Maximum dose is 5 mg tid.

Pediatric patients older than 6 yr

ER tablets: 5 mg PO daily. Dosage may be adjusted in 5-mg increments up to maximum of 20 mg/day.

Impaired geriatric patients

2.5 mg PO bid or tid.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	3–6 hr	6–10 hr
Transdermal	24–48 hr	Varies	96 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, dizziness, blurred vision*, dilatation of the pupil, cycloplegia, increased ocular tension, weakness, headache
- **CV:** Tachycardia, palpitations, hypertension
- **GI:** *Dry mouth, nausea*, vomiting, constipation, bloated feeling
- **GU:** *Urinary hesitancy*, retention, impotence
- **Hypersensitivity:** Allergic reactions including urticaria, dermal effect
- **Other:** *Decreased sweating*, heat prostration in high environmental temperatures secondary to loss of sweating

Interactions

★ **Drug-drug** • Decreased effectiveness of phenothiazines with oxybutynin • Decreased effectiveness of haloperidol and development of tardive dyskinesia • Increased toxicity if combined with amantadine, nitrofurantoin

■ Nursing considerations

Assessment

- **History:** Allergy to oxybutynin, intestinal obstructions or lesions, intestinal atony, obstructive uropathies, glaucoma, myasthenia gravis, CV instability in acute hemorrhage, hepatic or renal impairment, pregnancy, lactation
- **Physical:** Skin color, lesions; T; orientation, affect, reflexes; ophthalmologic examination, ocular pressure measurement; P, rhythm, BP; bowel sounds, liver evaluation; LFTs, renal function tests, cystometry

Interventions

- Arrange for cystometry and other diagnostic tests before and during treatment.
- Arrange for ophthalmologic examination before therapy and periodically during therapy.
- Do not cut, crush, or allow patient to chew ER tablets.
- Apply gel to thigh, abdomen, or upper arm once daily; rotate sites.

Teaching points

- Take this drug as prescribed; do not cut, crush, or chew ER tablets.
- If using the transdermal patch, apply to dry, intact skin on the abdomen, hip, or buttock

every 3–4 days (twice weekly). Remove the old system before applying a new one. Select a new site for application of each new system.

- If using the topical gel, apply 1 mL to thigh, abdomen, or upper arm once every 24 hours. Rotate application sites.
- Periodic bladder examinations will be needed during this treatment to evaluate therapeutic response.
- You may experience these side effects: Dry mouth (suck sugarless lozenges and use frequent mouth care); GI upset; blurred vision; drowsiness (avoid driving or performing tasks that require alertness); decreased sweating (avoid high temperatures; serious complications can occur because you will be heat intolerant).
- Report blurred vision, fever, rash, nausea, vomiting.

⚠ DANGEROUS DRUG

➤ oxycodone hydrochloride

(*ox i koe' done*)

M-oxy, OxyContin ^{ORIG}, OxyFAST, OxyIR, Roxicodone, Roxicodone Intensol, Supeudol (CAN)

PREGNANCY CATEGORY B

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to moderately severe pain
- CR tablets: Management of moderate to severe pain when a continuous, around-the-clock analgesic is needed for an extended period of time

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids; diarrhea caused by poisoning (before toxins are eliminated); pregnancy (readily crosses placenta; neonatal withdrawal); labor or delivery (opioids given to the mother can cause respiratory depression in neonate; premature infants are at special risk; may prolong labor); bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia; kyphoscoliosis; acute alcoholism, increased intracranial pressure, lactation.
- Use cautiously with acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment.

Available forms

Immediate-release capsules—5 mg; immediate-release tablets—5, 10, 15, 20, 30 mg; CR tablets **o/c**—10, 15, 20, 30, 40, 60, 80, 160 mg; oral solution—5 mg/5 mL; solution concentrate—20 mg/mL

Dosages

Individualize dosage.

Adults

5 mg PO every 6 hr. *OxyIR*, *OxyFAST*, 5 mg every 3–6 hr. CR (*OxyContin*), 10–20 mg PO every 12 hr.

- **Breakthrough pain:** Immediate-release (*OxyIR*): 5 mg PO every 4 hr.

Pediatric patients

CR is not recommended for pediatric patients. Regular and immediate-release dosage should be individualized based on patient's age and size.

Geriatric patients or impaired adults

Use caution. Respiratory depression may occur in the elderly, the very ill, or those with respiratory problems.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	1 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation*, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope, circulatory depression, **shock, cardiac arrest**
- **Dermatologic:** Pruritus, urticaria, edema, hemorrhagic urticaria (rare)
- **GI:** *Nausea, vomiting, sweating* (more common in ambulatory patients and those without severe pain), dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis
- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Respiratory:** Suppression of cough reflex, respiratory depression, apnea, **respiratory arrest, laryngospasm, bronchospasm**
- **Other:** Physical tolerance and dependence, psychological dependence

Interactions

- **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation or coma in patients receiving barbiturate general anesthetics, protease inhibitors
- **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase; determinations for 24 hr after administration

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, pregnancy, labor or delivery, bronchial asthma, COPD, cor

pulmonale, respiratory depression, kyphoscoliosis, acute alcoholism, increased intracranial pressure, acute abdominal conditions, CV disease, myxedema, seizure disorders, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment, lactation

- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; P; auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

- Administer to nursing women 4–6 hr before the next feeding to minimize amount in milk.
- Do not crush, break, or allow patient to chew CR preparations.
- Administer immediate-release preparations to cover breakthrough pain.

⊗ **Black box warning** *OxyFAST* and *Roxicodone Intensol* are highly concentrated preparations. Use extreme care.

⊗ **Black box warning** Be aware that this drug has abuse potential, and monitor patients accordingly.

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available during parenteral administration.

- Reassure patient that addiction is unlikely; most patients who receive opiates for medical reasons do not develop dependence syndromes.

Teaching points

- Take drug exactly as prescribed. Do not crush, break, or chew controlled-release preparations.
- Do not take any leftover medication for other disorders, and do not let anyone else take the prescription.
- You may experience these side effects: Nausea, loss of appetite (take with food; lie quietly; eat frequent small meals); constipation (use a laxative); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving,

performing other tasks that require alertness, visual acuity).

- Report severe nausea, vomiting, constipation, shortness of breath, or difficulty breathing.

oxymetazoline

(*ox i met az' ob leen*)

Afrin No Drip 12-Hour, Afrin Severe Congestion with Menthol, Afrin 12-Hour Original, Afrin 12-Hour Original Pump Mist, Dristan 12 Hr Nasal, Duramist Plus, Genasal, Nasal Relief, Neo-Synephrine 12 Hour Extra Moisturizing, Nostrilla 12-Hour Nasal, Vicks Sinex 12-Hour Long Acting

PREGNANCY CATEGORY C

Drug class

Nasal decongestant

Therapeutic actions

Acts directly on alpha receptors to produce vasoconstriction of arterioles in nasal passages, which produces a decongestant response; no effect on beta receptors.

Indications

- Topical: Symptomatic relief of nasal and nasopharyngeal mucosal congestion due to colds, hay fever, or other respiratory allergies

Contraindications and cautions

- Contraindicated with allergy to oxymetazoline, angle-closure glaucoma, anesthesia with cyclopropane or halothane, thyrotoxicosis, diabetes, hypertension, CV disorders, women in labor whose BP exceeds 130/80.
- Use cautiously with angina, arrhythmias, prostatic hypertrophy, unstable vasomotor syndrome, lactation.

Available forms

Nasal spray or solution—0.05%

Dosages

Adults and patients older than 6 yr

Two to three sprays of 0.05% solution in each nostril bid morning and evening or every 10–12 hr for up to 3 days.

Pharmacokinetics

Route	Onset	Duration
Nasal	5–10 min	6–10 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

Systemic effects are less likely with topical administration than with systemic administration, but because systemic absorption can take place, the systemic effects should be considered:

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, symptoms of paranoid schizophrenia*
- **CV:** Arrhythmias, hypertension resulting in intracranial hemorrhage, **CV collapse** with hypotension, palpitations, tachycardia, precordial pain in patients with ischemic heart disease
- **GI:** *Nausea, vomiting, anorexia*
- **GU:** Constriction of renal blood vessels, *dysuria, vesical sphincter spasm* resulting in difficult and painful urination, urinary retention with prostatism
- **Local:** *Rebound congestion* with topical nasal application
- **Other:** *Pallor, respiratory difficulty, orofacial dystonia, sweating*

Interactions

* **Drug-drug** • Severe hypertension with MAOIs, TCAs • Additive effects and increased risk of toxicity if taken with urinary alkalinizers • Decreased vasopressor response with reserpine, methyl dopa, urinary acidifiers

■ Nursing considerations**Assessment**

- **History:** Allergy to oxymetazoline; angle-closure glaucoma; anesthesia with cyclopropane or halothane; thyrotoxicosis, diabetes, hypertension, CV disorders; prostatic hypertrophy, unstable vasomotor syndrome; lactation, pregnancy

- **Physical:** Skin color, T; orientation, reflexes, peripheral sensation, vision; P, BP, auscultation, peripheral perfusion; R, adventitious sounds; urinary output pattern, bladder percussion, prostate palpation; nasal mucous membrane evaluation

Interventions

⊗ **Warning** Monitor CV effects carefully; patients with hypertension may experience changes in BP because of the additional vasoconstriction. If a nasal decongestant is needed, pseudoephedrine is the drug of choice.

Teaching points

- Do not exceed recommended dose. Use proper administration technique for topical nasal application. Avoid prolonged use because underlying medical problems can be disguised. Do not use longer than 3 days.
- Rebound congestion may occur when this drug is stopped; drink plenty of fluids, use a humidifier, and avoid smoke-filled areas to help decrease problems.
- You may experience these side effects: Dizziness, tremor, weakness, restlessness, light-headedness (avoid driving or operating dangerous equipment); urinary retention (void before taking drug).
- Report nervousness, palpitations, sleeplessness, sweating.

▷ oxymetholone

(ox i meth' oh lone)

Anadrol-50

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-III

Drug classes

Anabolic steroid
Hormone

Therapeutic actions

Testosterone analogue with androgenic and anabolic activity; promotes body tissue-building processes and reverses catabolic or tissue-depleting processes; increases Hgb and red cell mass.

Indications

- Anemias caused by deficient red cell production
- Acquired or congenital aplastic anemia
- Myelofibrosis and hypoplastic anemias due to myelotoxic drugs
- Unlabeled use: HIV-associated wasting

Contraindications and cautions

- Contraindicated with known sensitivity to oxymetholone or anabolic steroids, prostate or breast cancer, BPH, pituitary insufficiency, MI, nephrosis, liver disease, hypercalcemia, pregnancy, lactation.
- Use cautiously with diabetes; seizure disorders; migraines; hepatic, cardiac, or renal disease; HF.

Available forms

Tablets—50 mg

Dosages

Adults and children

1–5 mg/kg/day PO. Usual effective dose is 1–2 mg/kg/day. Give for a minimum trial of 3–6 mo. Following remission, patients may be maintained without the drug or on a lower daily dose. Continuous therapy is usually needed in cases of congenital aplastic anemia.

Pediatric patients

Use with extreme caution due to risk of serious disruption of growth and development; weigh benefits and risks.

Pharmacokinetics

Route	Onset
Oral	Rapid

Metabolism: Hepatic; $T_{1/2}$: 9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Excitation, insomnia*, chills, toxic confusion
- **Endocrine:** *Virilization: Prepubertal males*—phallic enlargement, hirsutism, increased skin pigmentation; *postpubertal males*—inhibition of testicular function, gynecomastia, testicular atrophy, priapism, baldness, epididymitis, change in libido;

females—hirsutism, hoarseness, deepening of the voice, clitoral enlargement, menstrual irregularities, baldness; decreased glucose tolerance

- **GI:** Hepatotoxicity, peliosis, **hepatitis with liver failure or intra-abdominal hemorrhage; liver cell tumors**, sometimes malignant and fatal, *nausea, vomiting, diarrhea, abdominal fullness, loss of appetite, burning of tongue*
- **GU:** Possible increased risk of prostatic hypertrophy, carcinoma in geriatric patients
- **Hematologic:** *Blood lipid changes:* Decreased HDL and sometimes increased LDL; iron deficiency anemia; hypercalcemia; altered serum cholesterol levels; *retention of sodium, chloride, water*; potassium, phosphates, and calcium
- **Other:** *Acne*, premature closure of the epiphyses, edema

Interactions

- *** Drug-drug** • Potentiation of oral anti-coagulants with anabolic steroids • Decreased need for insulin, oral hypoglycemia drugs
- *** Drug-lab test** • Altered glucose tolerance tests • Decrease in thyroid function tests, which may persist for 2–3 wk after therapy • Increased creatinine, decreased creatinine clearance, which may last for 2 wk after therapy

Nursing considerations

Assessment

- **History:** Known sensitivity to oxymetholone or anabolic steroids; prostate or breast cancer; BPH; pituitary insufficiency; MI; nephrosis; liver disease; hypercalcemia; pregnancy; lactation, HF; cardiac, renal, or hepatic disease; migraines; seizures; diabetes
- **Physical:** Skin color, texture; hair distribution pattern; affect, orientation; abdominal examination, liver evaluation; serum electrolytes and cholesterol levels, glucose tolerance tests, thyroid function tests, long-bone X-ray (in children)

Interventions

- Administer with food if GI upset or nausea occurs.

⊗ **Warning** Monitor effect on children with long-bone X-rays every 3–6 mo; discontinue drug well before the bone age reaches the norm for the patient's chronologic age because effects may continue for 6 mo after therapy.

- Monitor for edema; arrange for diuretic therapy as needed.

⊗ **Black box warning** Monitor liver function, serum electrolytes during therapy, and consult with physician for corrective measures; peliosis hepatis, liver cell tumors can occur.

⊗ **Black box warning** Measure cholesterol levels in patients who are at high risk for CAD; lipid levels may increase.

- Caution patients that this drug cannot be used during pregnancy; advise patient to use barrier contraceptives.
- Monitor patients with diabetes closely because glucose tolerance may change. Adjust insulin, oral hypoglycemic dosage, and diet.

Teaching points

- Take with food if nausea or GI upset occurs.
- Patients with diabetes need to monitor urine sugar closely because glucose tolerance may change; report any abnormalities to your health care provider, so corrective action can be taken.
- This drug cannot be taken during pregnancy; use barrier contraceptives while using this drug.
- These drugs do not enhance athletic ability but do have serious effects and should not be used for increasing muscle strength.
- You may experience these side effects: Nausea, vomiting, diarrhea, burning of the tongue (eat frequent small meals); body hair growth, baldness, deepening of the voice, decrease in libido, impotence (most reversible); excitation, confusion, insomnia (avoid driving, performing tasks that require alertness); swelling of the ankles, fingers (request medication).
- Report ankle swelling, skin color changes, severe nausea, vomiting, hoarseness, body hair growth, deepening of the voice, acne, menstrual irregularities in women.

DANGEROUS DRUG

oxymorphone hydrochloride

(*ox i mor' fone*)

Opana, Opana ER 

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts as agonist at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to moderately severe acute pain (immediate-release form)
- Parenterally (injection only) for preoperative medication, support of anesthesia, obstetric analgesia
- Relief of moderate to severe pain in patients who need around-the-clock opioid treatment for extended time (ER form)
- Relief of anxiety in patients with pulmonary edema associated with left ventricular dysfunction (parenteral)
- Relief of moderate to severe pain

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning (before toxins are eliminated), pregnancy (readily crosses placenta; neonatal withdrawal), labor or delivery (opioids given to the mother can cause respiratory depression of neonate; premature infants are at special risk; may prolong labor), bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, kyphoscoliosis, acute alcoholism, increased intracranial pressure, lactation.
- Use cautiously with acute abdominal conditions, CV disease, supraventricular tachycardias, myxedema, seizure disorders,

delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment.

Available forms

Injection—1 mg/mL; tablets—5, 10 mg; ER tablets **ORF**—5, 7.5, 10, 15, 20, 30, 40 mg

Dosages

Adults

Oral

For immediate-release form, 10–20 mg PO every 4–6 hr. For ER tablets, 5 mg PO every 12 hr; may be increased in 5- to 10-mg increments every 3–7 days to cover pain.

IV

Initially, 0.5 mg.

Subcutaneous or IM

Initially, 1–1.5 mg every 4–6 hr as needed. For analgesia during labor, 0.5–1 mg IM.

Pediatric patients

Safety and efficacy not established for children younger than 18 yr.

Geriatric patients or impaired adults

Use caution; respiratory depression may occur in the elderly, the very ill, and those with respiratory problems.

Patients with renal impairment

For creatinine clearance of less than 50 mL/min, use ER tablets at lowest possible dose.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral (ER)	15–30 min	60 min	8–10 hr
Oral (immediate-release)	5–10 min	1 hr	3–6 hr
IV	5–10 min	15–60 min	3–6 hr
IM, Subcut.	10–15 min	30–60 min	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: 7–9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation needed.

Infusion: Inject slowly over 5 min directly into vein or into tubing of running IV.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances*
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope, circulatory depression, **shock, cardiac arrest**
- **Dermatologic:** Pruritus, urticaria, edema, hemorrhagic urticaria (rare)
- **GI:** *Nausea, vomiting, sweating* (more common in ambulatory patients and those without severe pain), dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis
- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Pain at injection site, tissue irritation and induration (subcutaneous injection)
- **Respiratory:** Suppression of cough reflex, respiratory depression, apnea, **respiratory arrest, laryngospasm, bronchospasm**
- **Other:** Physical tolerance and dependence, psychological dependence

Interactions

• **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation or coma in patients receiving barbiturate general anesthetics or other CNS depressants • Risk of severe increase in serum drug level and potentially fatal overdose if combined with alcohol; avoid this combination

• **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase; determinations for 24 hr after administration of opioids

Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids, diarrhea caused by poisoning, pregnancy, labor or delivery, bronchial asthma, COPD, cor pulmonale, respiratory depression,

kyphoscoliosis, acute alcoholism, increased intracranial pressure, acute abdominal conditions, CV disease, myxedema, seizure disorders, delirium tremens, cerebral arteriosclerosis, ulcerative colitis, fever, Addison's disease, prostatic hypertrophy, urethral stricture, recent GI or GU surgery, toxic psychosis, renal or hepatic impairment

- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

⊗ **Black box warning** Make sure that patient swallows ER tablets whole. Cutting, crushing, or chewing them could cause rapid release and fatal overdose.

⊗ **Black box warning** Note that ER form has abuse potential; monitor patient accordingly. Drug is indicated only for around-the-clock use over an extended time. Drug is not to be given PRN.

⊗ **Black box warning** Patient must not consume alcohol in any form while taking oxycodone to avoid risk of serious increase in serum drug level and potentially fatal overdose.

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available during parenteral administration.

⊗ **Warning** Use caution when injecting subcutaneously into chilled areas of the body or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.

- Reassure patient that addiction is unlikely; most patients who receive opiates for medical reasons do not develop dependence syndromes.
- Give to breast-feeding women 4–6 hr before the next feeding to minimize amount in milk; use is generally not advised in breast-feeding women because of risk of respiratory depression in the baby.

Teaching points

- Take this drug exactly as prescribed. If taking ER tablets, swallow them whole; do not cut, crush, or chew them.
- Do not consume alcohol or take medications that contain alcohol while taking oxycodone; doing so increases the risk of serious or fatal reactions.
- Do not take leftover medication for other disorders, and do not let anyone else take the prescription.
- You may experience these side effects: Nausea, loss of appetite (take drug with food and lie quietly; eat frequent small meals); constipation (use a laxative); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness, visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath or difficulty breathing.

⚠ DANGEROUS DRUG

▽ oxytocin

(*ox i toe' sin*)

Pitocin

PREGNANCY CATEGORY X

Drug classes

Hormone

Oxytocic

Therapeutic actions

Synthetic form of an endogenous hormone produced in the hypothalamus and stored in the posterior pituitary; stimulates the uterus, especially the gravid uterus just before parturition, and causes myoepithelium of the lacteal glands to contract, which results in milk ejection in lactating women.

Indications

- Antepartum: To initiate or improve uterine contractions to achieve early vaginal delivery; stimulation or reinforcement of labor in selected cases of uterine inertia; management of inevitable or incomplete abortion; second trimester abortion

- Postpartum: To produce uterine contractions during the third stage of labor and to control postpartum bleeding or hemorrhage
- Lactation deficiency
- Unlabeled uses: To evaluate fetal distress (oxytocin challenge test), treatment of breast engorgement

Contraindications and cautions

- Contraindicated with significant cephalopelvic disproportion, unfavorable fetal positions or presentations, obstetric emergencies that favor surgical intervention, prolonged use in severe toxemia, uterine inertia, hypertonic uterine patterns, induction or augmentation of labor when vaginal delivery is contraindicated, previous cesarean section, pregnancy.
- Use cautiously with renal impairment.

Available forms

Injection—10 units/mL

Dosages

Adjust dosage based on uterine response.

Adults

- **Induction or stimulation of labor:** Initial dose of no more than 0.5–2 milliunits/min (0.0005–0.002 units/min) by IV infusion through an infusion pump. Increase the dose in increments of no more than 1–2 milliunits/min at 30- to 60-min intervals until a contraction pattern similar to normal labor is established. Rates exceeding 9–10 milliunits/min are rarely required. Discontinue in event of uterine hyperactivity, fetal distress.
- **Control of postpartum uterine bleeding:**

IV

Add 10–40 units to 1,000 mL of a nonhydrating diluent, infuse at a rate to control uterine atony.

IM

Administer 10 units after delivery of the placenta.

- **Treatment of incomplete or inevitable abortion:** IV infusion of 10 units of oxytocin with 500 mL physiologic saline solution or 5% dextrose in physiologic saline infused at a rate of 10–20 milliunits (20–40 drops)/min. Do not exceed 30 units in 12 hr because of risk of water intoxication.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	60 min
IM	3–5 min	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 1–6 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add 1 mL (10 units) to 1,000 mL of 0.9% aqueous sodium chloride or other IV fluid; the resulting solution will contain 10 milliunits/mL (0.01 units/mL).

Infusion: Infuse via constant infusion pump to ensure accurate control of rate; rate determined by uterine response; begin with 1–2 mL/min and increase at 15- to 60-min intervals.

Compatibilities: Compatible at a concentration of 5 units/L in dextrose–Ringer's combinations; dextrose–lactated Ringer's combinations; dextrose–saline combinations; dextrose 2%, 5%, and 10% in water; fructose 10% in water; Ringer's injection; lactated Ringer's injection; sodium chloride 0.45% and 0.9% injection; and 1/6M sodium lactate.

Incompatibilities: Do not combine in solution with fibrinolytic or heparin.

Adverse effects

- **CV:** Cardiac arrhythmias, PVCs, hypertension, subarachnoid hemorrhage
- **Fetal effects:** Fetal bradycardia, neonatal jaundice, low Apgar scores
- **GI:** Nausea, vomiting
- **GU:** Postpartum hemorrhage, uterine rupture, pelvic hematoma, uterine hypertonicity, spasm, tetanic contraction, rupture of the uterus with excessive dosage or hypersensitivity
- **Hypersensitivity: Anaphylactic reaction**
- **Other:** Maternal and fetal deaths when used to induce labor or in first or second stages of labor; **afibrinogenemia**; **severe water intoxication** with seizures and coma, **maternal death** (associated with slow oxytocin infusion over 24 hr; oxytocin has antidiuretic effects)

■ Nursing considerations

Assessment

- **History:** Significant cephalopelvic disproportion, unfavorable fetal positions or presentations, severe toxemia, uterine inertia, hypertonic uterine patterns, previous cesarean section
- **Physical:** Fetal heart rate (continuous monitoring is recommended); fetal positions; fetal-pelvic proportions; uterine tone; timing and rate of contractions; breast examination; orientation, reflexes; P, BP, edema; R, adventitious sounds; CBC, bleeding studies, urinary output

Interventions

⊗ **Black box warning** Reserve for medical use, not elective induction.

- Ensure fetal position and size and absence of complications that are contraindicated with oxytocin before therapy.

⊗ **Warning** Ensure continuous observation of patient receiving IV oxytocin for induction or stimulation of labor; fetal monitoring is preferred. A physician should be immediately available to deal with complications if they arise.

- Regulate rate of oxytocin delivery to establish uterine contractions that are similar to normal labor; monitor rate and strength of contractions; discontinue drug and notify physician at any sign of uterine hyperactivity or spasm.

⊗ **Warning** Monitor maternal BP during oxytocin administration; discontinue drug and notify physician with any sign of hypertensive emergency.

- Monitor neonate for jaundice.

Teaching points

- The patient receiving parenteral oxytocin is usually receiving it as part of an immediate medical situation, and the drug teaching should be incorporated into the teaching about delivery. The patient needs to know the name of the drug and what she can expect after it is administered.

DANGEROUS DRUG

▷ paclitaxel

(*pak leb tax' ell*)

Abraxane, Onxol, Taxol

PREGNANCY CATEGORY D

Drug class

Antimitotic
Antineoplastic

Therapeutic actions

Inhibits the normal dynamic reorganization of the microtubule network that is essential for dividing cells; leads to cell death in rapidly dividing cells.

Indications

- *Onxol* and *Taxol*: Treatment of metastatic carcinoma of the ovary after failure of first-line or subsequent therapy
- *Abraxane*, *Onxol*, and *Taxol*: Treatment of breast cancer after failure of combination therapy
- *Taxol*: First-line treatment of non-small-cell lung cancer
- *Taxol*: Second-line treatment of AIDS-related Kaposi's sarcoma
- Unlabeled uses: Treatment of advanced head and neck cancer, previously untreated extensive-stage small-cell lung cancer, adenocarcinoma of the upper GI tract, hormone-refractory prostate cancer, leukemias

Contraindications and cautions

- Contraindicated with hypersensitivity to paclitaxel or drug formulated with polyoxyethylated castor oil, bone marrow depression, severe neurologic toxicity, lactation, pregnancy.
- Use cautiously with cardiac conduction defects, severe hepatic impairment.

Available forms

Injection—6 mg/mL; powder for injection—100 mg

Dosages

Adults

- *Ovarian cancer*: In previously untreated patients, 135 mg/m² IV over 24 hr or

175 mg/m² IV over 3 hr every 3 wk followed by 75 mg/m² IV cisplatin (*Taxol* only). In previously treated patients, 135 mg/m² or 175 mg/m² IV over 3 hr every 3 wk. Do not repeat the IV until the neutrophil count is at least 1,500 cells/mm³ and platelet count is at least 100,000 cells/mm³.

- **Breast cancer:** 175 mg/m² IV over 3 hr every 3 wk for four courses after failure of chemotherapy (*Taxol* only); 175 mg/m² IV over 3 hr every 3 wk after initial chemotherapy failure or relapse within 6 mo; or 260 mg/m² IV over 30 min every 3 wk (*Abraxane*).
- **AIDS-related Kaposi's sarcoma:** 135 mg/m² IV over 3 hr every 3 wk or 100 mg/m² IV over 3 hr every 2 wk. Do not administer *Taxol* if neutrophil count is less than 1,000 cells/mm³.
- **Non-small-cell-lung cancer:** 135 mg/m² IV over 24 hr followed by 75 mg/m² cisplatin IV every 3 wk. Reduce dose by 20% if neutrophil count is less than 500 cells/mm³ for a week or longer.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	6–12 hr

Metabolism: Hepatic; T_{1/2}: 13–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile

IV FACTS

Preparation: Use extreme caution when handling drug; dilute before infusion in 0.9% sodium chloride, 5% dextrose injection, 5% dextrose and 0.9% sodium chloride injection, 5% dextrose in Ringer's injection to a concentration of 0.3–1.2 mg/mL; stable at room temperature for 27 hr. Refrigerate unopened vials; avoid use of PVC infusion bags and tubing.

Infusion: Administer over 3 hr or 24 hr through an in-line filter not greater than 0.22 mcg. Do not use a filter with *Abraxane*.

Y-site compatibility: May be given with fluconazole.

Adverse effects

- **CNS:** Peripheral sensory neuropathy, mild to severe
- **CV:** Bradycardia, hypotension, severe CV events
- **GI:** *Nausea, vomiting*, mucositis, anorexia, elevated liver enzymes
- **Hematologic: Bone marrow depression, infection**
- **Other: Hypersensitivity reactions, myalgia, arthralgia, alopecia**

Interactions

★ **Drug-drug** • Increased myelosuppression with cisplatin • Increased paclitaxel effects with ketoconazole, verapamil, diazepam, quinidine, dexamethasone, cyclosporine, teniposide, etoposide, vincristine, testosterone

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Taxol* (paclitaxel) and *Taxotere* (docetaxel). Serious adverse effects can occur; use extreme caution.

Assessment

- **History:** Hypersensitivity to paclitaxel, castor oil; bone marrow depression; cardiac conduction defects; severe hepatic impairment; pregnancy; lactation
- **Physical:** Neurologic status, T; P, BP, peripheral perfusion; skin color, texture, hair distribution; abdominal examination, mucous membranes; LFTs, renal function tests, CBC

Interventions

⊗ **Black box warning** Do not administer drug unless blood counts are within acceptable parameters.

⊗ **Warning** Handle drug with great care; gloves are recommended. If drug comes in contact with skin, wash immediately with soap and water.

⊗ **Black box warning** When using *Onxol* or *Taxol*, premedicate with one of the following drugs to prevent severe hypersensitivity reactions: Oral dexamethasone 20 mg, 12 hr and 6 hr before paclitaxel, 10 mg if AIDS-related Kaposi's sarcoma; diphenhydramine

50 mg IV 30–60 min before paclitaxel; and cimetidine 300 mg IV or ranitidine 50 mg IV 30–60 min before paclitaxel.

- Monitor BP and pulse during administration.
- Obtain blood counts before and at least monthly during treatment.
- Monitor patient's neurologic status frequently during treatment.
- Advise patient to avoid pregnancy; serious fetal harm can occur; advise using barrier contraceptives.

Teaching points

- This drug must be given over a 30-minute, 3-hour, or 24-hour period once every 3 weeks. Mark a calendar noting drug days.
- Have regular blood tests and neurologic examinations while receiving this drug.
- Avoid pregnancy while you are taking this drug, serious fetal harm can occur; using barrier contraceptives is advised.
- You may experience these side effects: Nausea and vomiting (if severe, request antiemetics; frequent small meals also may help); weakness, lethargy (frequent rest periods will help); increased susceptibility to infection (avoid crowds and exposure to diseases); numbness and tingling in the fingers or toes (avoid injury to these areas; use care with tasks requiring precision); loss of hair (obtain a wig or other head covering; keep the head covered at extremes of temperature).
- Report severe nausea and vomiting; fever, chills, sore throat; unusual bleeding or bruising; numbness or tingling in your fingers or toes; chest pain.

palifermin

See Appendix U, *Less commonly used drugs*.

paliperidone

(*pal ab peer' ab dohn*)

Invega **OND**, Invega Sustenna

PREGNANCY CATEGORY C

Drug classes

Atypical antipsychotic
Benzisoxazole

Therapeutic actions

Mechanism of action not completely understood; is the major active metabolite of risperidone. Blocks dopamine and serotonin receptors in the brain and depresses the RAS. Antihistaminic and alpha-adrenergic blocking activity may contribute to some therapeutic and adverse effects.

Indications

- Treatment of schizophrenia; acute and long-term maintenance treatment of schizophrenia; as monotherapy or as adjunct to mood stabilizers or antidepressants
- **NEW INDICATION:** Acute treatment of Schizoaffective disorder as monotherapy or with antidepressant or mood stabilizers (oral only)

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug or to risperidone, lactation, and in elderly patients with dementia-related psychosis.
- Use cautiously with prolonged QT interval and with other drugs that prolong QT interval; pregnancy; history of arrhythmias, GI disorders, seizures, hypotension; diabetes mellitus; CV disease; renal impairment; risk of aspiration; and in elderly patients.

Available forms

ER tablets **OND**—1.5, 3, 6, 9 mg; injection—39/0.25 mL, 78 mg/0.25 mL, 117 mg/0.75 mL, 156 mg/mL, 234 mg/1.5 mL

Dosages

Adults

- *Schizophrenia and Schizoaffective disorder:* 6 mg/day PO in the morning; may be adjusted to a maximum 12 mg/day PO if warranted and tolerated by the patient. Increases of 3 mg/day at intervals of at least 5 days are suggested.
- *Schizophrenia:* Parenteral—234 mg IM, followed by 156 mg IM in 1 wk, both injections in the deltoid. 117 mg IM 1 wk later in gluteal or deltoid site. Maintenance dose—

39–234 mg IM once per month in deltoid or gluteal site.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

In mild renal impairment (creatinine clearance 50–80 mL/min), maximum dosage 6 mg/day; or 156 mg IM, followed by 117 mg IM in 1 wk (both in deltoids), then monthly injections of 78 mg IM in deltoid or gluteal site. In severe renal impairment (creatinine clearance 10–50 mL/min), maximum dosage 3 mg/day. IM route not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Gradual	24 hr

Metabolism: Hepatic; $T_{1/2}$: 23 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, akathisia, somnolence, dystonia, extrapyramidal disorders, hypertonia, tremor, parkinsonism, anxiety, blurred vision, tardive dyskinesia*
- **CV:** *Tachycardia, arrhythmia, palpitations, hypotension, orthostatic hypotension, prolonged QT interval*
- **GI:** *Dyspepsia, nausea, dry mouth, salivary hypersecretion*
- **Respiratory:** Cough
- **Other:** Fever, fatigue, pain, **increased mortality in geriatric patients with dementia-related psychosis, neuroleptic malignant syndrome**, hyperglycemia, hyperprolactinemia

Interactions

• **Drug-drug** • Risk of increased CNS depression if combined with alcohol and other central-acting depressants; use caution if this combination cannot be avoided • Potential for decreased effectiveness of levodopa or dopamine agonist; monitor patient closely and adjust dosage as needed • Risk of severe orthostatic hypotension if combined with other drugs that cause orthostatic hypotension; monitor patient closely and adjust dosage as needed • Increased risk of prolonged QT interval if used with other

drugs that prolong QT interval; monitor ECG before and periodically during therapy

Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of paliperidone or risperidone; pregnancy; lactation; dementia-related psychosis in elderly patients; prolonged QT interval or use of other drugs known to prolong it; history of arrhythmias, GI disorders, hypotension, or seizures; diabetes mellitus; CV disease; renal impairment; risk of aspiration
- **Physical:** Orientation, affect, reflexes; BP, standing BP, P; renal function tests; blood glucose; ECG

Interventions

⊗ **Black box warning** Avoid use in elderly patients with dementia-related psychosis; increased risk of CV death. Drug is not approved for this use.

- Limit amount of drug dispensed to patients with suicidal ideation.
- Do not cut, crush, or allow patient to chew tablets; give with adequate liquids to ensure swallowing.
- Advise patient that the tablet matrix is insoluble and that it is normal to see tablets in the stool.
- Monitor patient's body temperature, and rule out infection if fever occurs; risk of neuroleptic malignant hyperthermia.
- Monitor patient regularly for hyperglycemia.
- Advise patient to avoid excessive heat and dehydration, which could aggravate orthostatic hypotension.
- Advise patient to use contraception while on this drug; advise nursing mothers to find another method of feeding the baby while on this drug.

Teaching points

- Take this drug in the morning; swallow tablet whole with a full glass of water. Do not cut, crush, or chew the tablet. If you miss a dose, do not double the following dose; instead, take a dose as soon as you remember and continue with your usual dose the following morning.
- Do not be concerned if you see tablets in your stool. This drug is in a matrix system that

allows slow release throughout the day; the matrix will pass in your stool.

- This drug enters breast milk and could have effects on a nursing baby; if you are nursing a baby you should find another method of feeding the baby while you are on this drug.
- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult with your health care provider; use of contraception is advised.
- This drug interacts with some other drugs and could cause serious side effects; tell any health care provider who is taking care of you that you are on this drug.
- Avoid drinking alcoholic beverages while on this drug.
- You may experience these side effects: Impaired judgment, thinking, or motor skills, (do not drive a car or operate any dangerous machinery while on this drug, and avoid making any important decisions until you are sure how this drug is affecting you), low blood pressure on standing (stand up slowly, make sure you are steady before moving, avoid excessive heat exposure and dehydration).
- Report fever; suicidal thoughts; severe dizziness; increased thirst, hunger, or urination; anxiety; rapid or irregular heartbeat.

palivizumab

(*pa live ab zoo' mab*)

Synagis

PREGNANCY CATEGORY C

Drug classes

Antiviral

Monoclonal antibody

Therapeutic actions

A murine and human monoclonal antibody produced by recombinant DNA technology specific to an antigenic site of the RSV; has neutralizing effects on the RSV.

Indications

- Prevention of serious lower respiratory tract disease caused by RSV in pediatric patients at high risk for RSV disease

Contraindications and cautions

- Contraindicated with allergy to palivizumab or any murine product.
- Use cautiously with fever (antipyretics should be used to decrease fever before beginning therapy); previous administration of palivizumab (antibodies frequently develop, causing a risk of serious reactions on repeat administration); pregnancy, history of bleeding disorders.

Available forms

Injection—50 mg/0.5 mL, 100 mg/mL

Dosages

Administer IM only.

Pediatric patients

15 mg/kg IM as a single injection, once a month during RSV season, with first dose given before start of RSV season. Give injection preferably in anterolateral aspect of thigh; do not use gluteal muscle because of risk of damaging sciatic nerve.

Pharmacokinetics

Route	Onset	Peak
IM	Slow	2–7 days

Metabolism: Tissue; $T_{1/2}$: 18 days

Excretion: Unknown

Adverse effects

- **CNS:** Malaise
- **GI:** Nausea, vomiting, gastroenteritis
- **Respiratory:** URI, pharyngitis, otitis media
- **Other:** Increased susceptibility to infection; **risk of severe anaphylactoid reaction**, especially with repeated administrations, *fever, chills*

Interactions

- **Drug-drug** ☒ **Warning** Reduce dosage of other immunosuppressive agents; severe immunosuppression can lead to increased susceptibility to infection and increased risk of lymphomas.

■ Nursing considerations

Assessment

- **History:** Allergy to palivizumab or any murine product; previous administration of palivizumab; bleeding disorders
- **Physical:** T, body weights; P, BP; R, adventitious sounds; CBC

Interventions

- Monitor WBC levels and circulating T cells periodically during therapy.
- Monitor for any sign of RSV infection; do not use during acute RSV infection, use only for prophylaxis.
- Protect patient from exposure to infections and maintain sterile technique for invasive procedures.
- Arrange for nutritional consult if nausea and vomiting are persistent.

Teaching points

- Protect your child from exposure to infection while he is using this drug; people may wear masks and rubber gloves when caring for your child; visitors may have to be limited.
- Report fever, fussiness, other infections; difficulty breathing.

▶ palonosetron hydrochloride

(pal on os' e tron)

Aloxi

PREGNANCY CATEGORY B

Drug classes

Antiemetic

Selective serotonin receptor antagonist

Therapeutic actions

Selectively binds to serotonin receptors in the CTZ, blocking the nausea and vomiting caused by the release of serotonin by mucosal cells during chemotherapy, radiotherapy, or surgical invasion, an action that stimulates the CTZ and causes nausea and vomiting.

Indications

- Prevention of acute and delayed nausea and vomiting associated with initial and repeat

courses of moderately and highly emetogenic chemotherapy

- Prevention of postoperative nausea and vomiting for up to 24 hr after surgery (IV)

Contraindications and cautions

- Contraindicated with allergy to palonosetron or any of its components.
- Use cautiously with known prolonged QT interval or high risk for prolongation of QT interval (hypokalemia, hypomagnesemia, diuretic use, antiarrhythmic use) pregnancy, lactation.

Available forms

Injection—0.25 mg/5 mL; capsules—0.5 mg

Dosages

Adults

- *Chemotherapy-induced nausea and vomiting:* 0.25 mg IV as a single dose over 30 sec, given 30 min before the start of chemotherapy, or 0.5 mg PO 1 hr before start of chemotherapy.
- *Postoperative nausea and vomiting:* 0.075 mg IV as a single dose over 10 sec, given immediately before induction of anesthesia.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	End of infusion
Oral	Rapid	5 hr

Metabolism: Hepatic; $T_{1/2}$: 40 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: No further preparation is needed; solution should be clear and free of particulate matter before use. Store at room temperature; protect from light.

Infusion: Infuse over 30 sec (chemotherapy-induced nausea and vomiting) or over 10 sec (postoperative nausea and vomiting); flush the infusion line with normal saline before and after administration.

Compatibilities: Do not mix in solution with any other drugs.

Adverse effects

- **CNS:** *Headache*, somnolence, drowsiness, sedation, paresthesia, anxiety, insomnia
- **CV:** Tachycardia, bradycardia, hypotension, other arrhythmias, vein distention
- **GI:** Diarrhea, *constipation*, abdominal pain, dyspepsia, dry mouth, hiccups, flatulence
- **Other:** Fever, pruritus, flulike symptoms, fatigue

■ Nursing considerations

Assessment

- **History:** Allergy to palonosetron, pregnancy, lactation, electrolyte abnormality, risk for prolonged QT interval
- **Physical:** Orientation, reflexes, affect; skin evaluation; cardiac rhythm, P, BP; bowel sounds; T

Interventions

- Provide mouth care and sugarless lozenges to suck to help alleviate nausea and dry mouth.
- Establish safety precautions (side rails, assistance with ambulation, proper lighting) if CNS or visual effects occur.
- Provide appropriate analgesics for headache.

Teaching points

- This drug is given IV or orally just before you receive your chemotherapy or before surgery. It will help decrease nausea and vomiting.
- You may experience these side effects: Lack of sleep, drowsiness (use caution if driving or performing tasks that require alertness); constipation; headache (appropriate medication will be provided).
- Report severe headache, fever, numbness or tingling, severe constipation, dizziness.

pamidronate disodium

(*pab mib' dro nate*)

Aredia

PREGNANCY CATEGORY D

Drug classes

Bisphosphonate
Calcium regulator

Therapeutic actions

Slows normal and abnormal bone resorption without inhibiting bone formation and mineralization.

Indications

- Treatment of hypercalcemia associated with malignancy
- Treatment of moderate to severe Paget's disease
- Treatment of osteolytic lesions in breast cancer patients receiving chemotherapy and hormonal therapy
- Treatment of osteolytic bone lesions of multiple myeloma
- Unlabeled uses: Postmenopausal osteoporosis, hyperparathyroidism, prostatic carcinoma, immobilization-related hypercalcemia to prevent fractures and bone pain, osteoporosis with spinal cord injury

Contraindications and cautions

- Contraindicated with allergy to pamidronate disodium or bisphosphonates.
- Use cautiously with renal failure, enterocolitis, pregnancy, lactation.

Available forms

Powder for injection—30, 90 mg; injection—3, 6, 9 mg/mL

Dosages

Adults

- **Hypercalcemia:** 60–90 mg IV given over 4–24 hr as a single dose. Do not exceed 90 mg in a single dose.
- **Paget's disease:** 30 mg/day IV as a 4-hr infusion on 3 consecutive days for a total dose of 90 mg. Do not exceed 90 mg in a single dose.
- **Osteolytic bone lesions:** 90 mg IV as a 2-hr infusion every 3–4 wk. For bone lesions caused by multiple myeloma, give as 4-hr infusion once monthly. Do not exceed 90 mg in single dose.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Do not exceed single dose of 90 mg.

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	72 hr

Metabolism: Hepatic; $T_{1/2}$: 1.6 hr, then 27.3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute by adding 10 mL sterile water for injection to each vial; allow drug to dissolve. For treatment of malignancy-associated hypercalcemia, may be further diluted in 1,000 mL sterile 0.45% or 0.9% sodium chloride or 5% dextrose injection; stable for 24 hr at room temperature.

Infusion: Infuse over 2–24 hr (90-mg dose); over 4 hr (30–60-mg dose).

Incompatibilities: Do not mix with calcium-containing infusions, such as Ringer's; give in a single IV infusion and keep line separate from all other drugs.

Adverse effects

- **CNS:** Headache, insomnia
- **GI:** Nausea, diarrhea
- **Musculoskeletal:** Increased or recurrent bone pain at pagetic sites, focal osteomalacia, osteonecrosis of the jaw (cancer patients)
- **Other:** Fever, fatigue

■ Nursing considerations**Assessment**

- **History:** Allergy to pamidronate disodium or any bisphosphonates, renal failure, enterocolitis, lactation
- **Physical:** Skin lesions, color, T; muscle tone, bone pain; bowel sounds; urinalysis, serum calcium

Interventions

- Provide saline hydration before administration.
- Monitor serum calcium levels before, during, and after therapy. Consider retreatment

if hypercalcemia recurs, but allow at least 7 days between treatments.

- Do not give foods high in calcium, vitamins with mineral supplements, or antacids high in metals within 2 hr of dosing.
 - Advise a dental examination and completion of any needed preventive care before beginning therapy in cancer patients. Avoid any dental work during therapy.
 - Maintain adequate nutrition, particularly intake of calcium and vitamin D.
 - Monitor patients with renal impairment carefully; arrange for reduction of dosage if glomerular filtration rate is reduced.
- ⊗ **Warning** Keep calcium readily available in case hypocalcemic tetany develops.

Teaching points

- Do not take foods high in calcium, antacids, or vitamins with minerals within 2 hours of receiving this drug.
- You should have a dental examination and complete any needed dental care before beginning therapy if you are being treated for cancer.
- You may experience these side effects: Nausea, diarrhea, recurrent bone pain.
- Report twitching, muscle spasms, dark urine, severe diarrhea.

▶ pancrelipase

(pan kre ly' pase)

Creon Delayed-Release Capsules **OND**; Kutrase; Lipram-UL12, 18, 20; Palcaps 10, 20 **OND**; PAN-2400 Caps; Pancrease MT 4 **OND**, 10 **OND**, 16 **OND**, 20 **OND**; Pancrecarb MS-4 **OND**, MS-8 **OND**, MS-16 **OND**; Pangestyme CN-10, 20; Pangestyme EC; Pangestyme MT 16; Pangestyme UL 12, 18, 20; Panocaps **OND**, Panocaps MT 16 **OND**, Panocaps MT 20 **OND**, Panokase Tab, Ultrase Capsules, Ultrase MT 12, 18, 20; Viokase 8, 16; Zenpep **OND**

PREGNANCY CATEGORY C

Drug class

Digestive enzyme

Therapeutic actions

Replacement of pancreatic enzymes: Helps to digest and absorb fat, proteins, and carbohydrates.

Indications

- Replacement therapy in patients with deficient exocrine pancreatic secretions, cystic fibrosis, chronic pancreatitis, postpancreatectomy, ductal obstructions, pancreatic insufficiency, steatorrhea or malabsorption syndrome, and postgastrectomy
- Presumptive test for pancreatic function

Contraindications and cautions

- Contraindicated with allergy to any component, pork products; acute pancreatitis; acute exacerbations of chronic pancreatitis.
- Use cautiously with pregnancy, lactation.

Available forms

Capsules—4,000, 5,000, 8,000, 12,000, 16,000, 18,000, 20,000 units; DR capsules **OND**—4,000, 5,000, 6,000, 8,000, 10,000, 12,000, 16,000, 18,000, 20,000, 24,000 units; tablets—8,000, 16,000 units; DR capsules (*Zenpep*) **OND**—5,000, 10,000, 15,000, 20,000 units

Dosages**Adults****Capsules and tablets**

4,000–20,000 units PO with each meal and with snacks, usually 1–3 capsules or tablets before or with meals and snacks. May be increased to 8 capsules or tablets in severe cases. 500 units/kg/meal to maximum of 2,500 units/kg/meal (*Zenpep*). Patients with pancreatectomy or obstruction, 8,000–16,000 units PO lipase at 2-hr intervals, may be increased to 64,000–88,000 units.

Pediatric patients 7–12 yr

4,000–12,000 units PO lipase with each meal and with snacks.

Pediatric patients 4 yr to younger than 12 yr

500 units/kg/meal to maximum of 2,500 units/kg/meal (*Zenpep*).

Pediatric patients 1–6 yr

4,000–8,000 units PO lipase with each meal and 4,000 units with snacks.

Pediatric patients 1 to younger than 4 yr

1,000 units/kg/meal to maximum of 2,500 units/kg/meal (*Zenpep*).

Pediatric patients 6 mo–1 yr

2,000 units lipase PO per meal; 2,000–4,000 units per feeding (*Zenpep*).

Pharmacokinetics

Generally no systemic absorption.

Adverse effects

- **GI:** *Nausea, abdominal cramps, diarrhea*
- **GU:** Hyperuricosuria, hyperuricemia with extremely high doses
- **Hypersensitivity:** Asthma with inhalation of fine-powder concentrates in sensitized individuals

■ Nursing considerations**Assessment**

- **History:** Allergy to any component, pork products; pregnancy; lactation
- **Physical:** R, adventitious sounds; abdominal examination, bowel sounds; pancreatic function tests

Interventions

- Administer before or with meals and snacks.
- **⊗ Warning** Dosages above recommended range may result in colonic strictures, especially in patients with cystic fibrosis.
- Be aware that *Zenpep* is not interchangeable with other pancrelipase preparations. Be aware that most products are not interchangeable.
- Do not crush or let patient chew the enteric-coated capsules; drug will not survive acid environment of the stomach.

Teaching points

- Take drug before or with meals and snacks.
- Do not crush or chew the enteric-coated capsules; swallow whole. *Zenpep* capsules may be opened and sprinkled on food if swallowing capsule is difficult.

- You may experience these side effects: Abdominal discomfort, diarrhea.
- Report joint pain, swelling, soreness; difficulty breathing; GI upset.

▷ panitumumab

See Appendix U, *Less commonly used drugs*.

▷ pantoprazole

(*pan toe' pray zol*)

Panto IV (CAN), Pantoloc (CAN),
Protonix ORC, Protonix IV

PREGNANCY CATEGORY B

Drug classes

Antisecretory drug
Proton pump inhibitor

Therapeutic actions

Gastric acid-pump inhibitor: Suppresses gastric acid secretion by specific inhibition of the hydrogen-potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step of acid production.

Indications

- Oral: Short-term (8 wk or less) and long-term treatment of GERD
- Maintenance healing of erosive esophagitis
- Long-term treatment of pathological hypersecretory conditions
- IV: Short-term (7–10 days) treatment of GERD in patients unable to continue oral therapy
- IV: Treatment of pathological hypersecretory conditions associated with Zollinger-Ellison syndrome and other neoplastic conditions
- Unlabeled use: Treatment of duodenal ulcer

Contraindications and cautions

- Contraindicated with hypersensitivity to any proton pump inhibitor or any drug components.
- Use cautiously because of possible increased risk of *Clostridium difficile* infection.
- Use cautiously with pregnancy, lactation.

Available forms

DR tablet ORC—20, 40 mg; granules for oral suspension—40 mg/packet; powder for injection—40 mg/vial

Dosages

Adults

40 mg PO daily for maintenance healing of erosive esophagitis for 8 wk or less. The 8-wk course may be repeated if healing has not occurred; give continually for hypersecretory disorders; 40 mg/day IV for 7–10 days. Up to 240 mg/day PO or IV has been used for severe hypersecretory syndromes.

Pediatric patients younger than 18 yr

Safety and efficacy not established.

Patients with hepatic impairment

Use caution and monitor patient closely.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	3–5 hr
IV	Rapid	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Reconstitute with 10 mL 0.9% sodium chloride; may then be further diluted with 100 mL 5% dextrose injection, 0.9% sodium chloride injection or lactated Ringer's, final concentration 0.4 mg/mL; reconstituted solution can be stored 2 hr, dilution up to 12 hr at room temperature. Avoid use of spiked IV system adapters with vials.

Infusion: Infuse over at least 15 min using in-line filter.

Incompatibilities: Do not mix with or administer through the same line as other IV solutions.

Adverse effects

- **CNS:** *Headache, dizziness*, asthenia, vertigo, insomnia, apathy, anxiety, paresthesias, dream abnormalities
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin

- **GI:** *Diarrhea, abdominal pain, nausea, vomiting*, constipation, dry mouth, tongue atrophy
- **Respiratory:** *URI symptoms*, cough, epistaxis, pneumonia
- **Other:** Cancer in preclinical studies, back pain, fever, vitamin B₁₂ deficiency, loss of bone density, bone fractures

Interactions

- **Drug-drug** • Fewer drug interactions reported than with other proton pump inhibitors

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any proton pump inhibitor or any drug components, pregnancy, lactation
- **Physical:** Skin lesions; T; reflexes, affect; urinary output, abdominal examination; respiratory auscultation

Interventions

- Administer once or twice a day. Caution patient to swallow tablets whole; not to cut, chew, or crush.
- ⊗ **Warning** Arrange for further evaluation of patient after 4 wk of therapy for gastroesophageal reflux disorders. Symptomatic improvement does not rule out gastric cancer; gastric cancer did occur in preclinical studies.
- ⊗ **Warning** Patient may be at risk for loss of bone density and fractures; monitor accordingly and weigh risks and benefits.
- Maintain supportive treatment as appropriate for underlying problem.
- Switch patients on IV therapy to oral dosage as soon as possible.
- Provide additional comfort measures to alleviate discomfort from GI effects and headache.

Teaching points

- Take the drug once or twice a day. Swallow the tablets whole—do not chew, cut, or crush them.
- Arrange to have regular medical follow-up care while you are using this drug.
- Maintain all of the usual activities and restrictions that apply to your condition. If this becomes difficult, consult your health care provider.

- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (consult your health care provider if these become bothersome; medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important; consult a dietitian to maintain nutrition; stay near a bathroom); symptoms of upper respiratory tract infection, cough (this is a drug effect; do not self-medicate; consult your health care provider if this becomes uncomfortable).
- Report severe headache, worsening of symptoms, fever, chills, blurred vision, periorbital pain.

▽ paricalcitol

See Appendix U, *Less commonly used drugs*.

▽ paroxetine (*pab rox' a teen*)

paroxetine hydrochloride

Apo-Paroxetine (CAN), CO Paroxetine (CAN), Gen-Paroxetine (CAN), Novo-Paroxetine (CAN), Paxil, Paxil CR **OND**, ratio-Paroxetine (CAN)

paroxetine mesylate

Pexeva

PREGNANCY CATEGORY D

Drug class

Antidepressant

Therapeutic actions

Potentiates serotonergic activity in the CNS, resulting in antidepressant effect.

Indications

- Treatment of major depressive disorder
- Treatment of OCD
- Treatment of panic disorders
- Treatment of social anxiety disorder (social phobia)
- Treatment of generalized anxiety disorder

- Treatment of PTSD
- Treatment of PMDD
- Unlabeled uses: Treatment of hot flashes, diabetic neuropathy, traumatic brain injury, pruritus, stuttering; smoking cessation; prevention of migraines

Contraindications and cautions

- Contraindicated with use of MAOI or thioridazine.
- Use cautiously in the elderly; with renal or hepatic impairment, pregnancy, lactation, suicidal patients.

Available forms

Tablets—10, 20, 30, 40 mg; CR tablets **OND**—12.5, 25, 37.5 mg; suspension—10 mg/5 mL

Dosages

Adults

- **Depression:** 20 mg/day PO as a single daily dose. Range, 20–50 mg/day. Or 25–62.5 mg/day CR tablet.
- **OCD:** 20 mg/day PO as a single dose, may increase in 10-mg/day increments; do not exceed 60 mg/day.
- **Panic disorder:** 10 mg/day, increase in increments of 10 mg/wk; usual range, 10–60 mg/day. Or 12.5–75 mg/day CR tablet; do not exceed 75 mg/day.
- **Social anxiety disorder:** 20 mg/day PO as a single dose in the morning. Or, 12.5 mg/day PO CR form. May increase up to 60 mg/day or 37.5 mg/day CR form.
- **Generalized anxiety disorder:** 20 mg/day PO as a single daily dose. Range, 20–50 mg/day.
- **PMDD:** 12.5 mg/day PO as a single dose in the morning. Range, 12.5–25 mg/day. May be given daily or just during the luteal phase of the cycle.
- **PTSD:** 20 mg/day as a single dose. Range, 20–50 mg/day PO.
- **Switching to or from an MAOI:** At least 14 days should elapse between discontinuation of MAOI and initiation of paroxetine therapy; similarly, allow 14 days between discontinuing paroxetine and beginning MAOI.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal or hepatic impairment

10 mg/day PO; do not exceed 40 mg/day. Or 12.5 mg/day CR tablet; do not exceed 50 mg/day.

Pharmacokinetics

Route	Onset
Oral	Slow

Metabolism: Hepatic; $T_{1/2}$: 24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, dizziness, insomnia, tremor, nervousness, headache, anxiety, paresthesia, blurred vision*
- **CV:** Palpitations, vasodilation, orthostatic hypotension, hypertension
- **Dermatologic:** *Sweating, rash, redness*
- **GI:** *Nausea, dry mouth, constipation, diarrhea, anorexia, flatulence, vomiting*
- **GU:** *Ejaculatory disorders, male genital disorders, urinary frequency*
- **Respiratory:** Yawns, pharyngitis, cough
- **Other:** *Asthenia*

Interactions

- *** Drug-drug** • Increased paroxetine levels and toxicity with cimetidine, MAOIs • Decreased therapeutic effects of phenytoin, digoxin • Decreased effectiveness of paroxetine with phenobarbital, phenytoin • Increased serum levels and possible toxicity of procyclidine, tryptophane, warfarin • Risk of serotonin syndrome (hypertension, hyperthermia, mental status changes) if used with other SSRIs
- *** Drug-alternative therapy** • Increased sedative-hypnotic effects with St. John's wort

Nursing considerations

Assessment

- **History:** Hypersensitivity to paroxetine, renal or hepatic impairment, seizure disorder, pregnancy, lactation
- **Physical:** Orientation, reflexes; P, BP, perfusion; R, adventitious sounds; bowel sounds, normal output; urinary output; liver evaluation; LFTs, renal function tests

Interventions

⊗ **Black box warning** Be alert for increased suicidality in children, adolescents, and young adults; monitor accordingly.

- Administer once a day in the morning.
- Shake suspension well before using.
- Ensure that patient swallows CR tablets whole; do not cut, crush, or chew.
- Limit amount of drug given to potentially suicidal patients.
- Abruptly discontinuing the drug may result in discontinuation symptoms (agitation, palpitations); consider tapering.
- Advise patient to avoid using if pregnant or lactating.

Teaching points

- Take this drug exactly as directed and as long as directed. Shake suspension well before using. Swallow controlled-release tablets whole; do not cut, crush, or chew.
- Abruptly stopping the drug without tapering the dose may cause symptoms including agitation and palpitations.
- This drug should not be taken during pregnancy or when nursing a baby; using barrier contraceptives is advised.
- You may experience these side effects: Drowsiness, dizziness, tremor (use caution and avoid driving or performing other tasks that require alertness); GI upset (frequent small meals, frequent mouth care may help); alterations in sexual function.
- Report severe nausea, vomiting; palpitations; blurred vision; excessive sweating; thoughts of suicide.

▷ pazopanib

See Appendix U, *Less commonly used drugs*.

▷ pegaptanib

See Appendix U, *Less commonly used drugs*.

▷ pegaspargase

See Appendix U, *Less commonly used drugs*.

▷ pegfilgrastim (G-CSF conjugate)

(*peg fill grass' stim*)

Neulasta

PREGNANCY CATEGORY C

Drug class

Colony-stimulating factor

Therapeutic actions

Covalent conjugate of the human granulocyte colony-stimulating factor (filgrastim) produced by recombinant DNA technology; has a longer duration of action than filgrastim; increases the production of neutrophils within the bone marrow with little effect on the production of other hematopoietic cells.

Indications

- To decrease the incidence of infection in patients with nonmyeloid malignancies receiving myelosuppressive anticancer drugs associated with a significant incidence of severe febrile neutropenia

Contraindications and cautions

- Contraindicated with hypersensitivity to *Escherichia coli* products, filgrastim.
- Use cautiously with sickle cell disease, pregnancy, lactation.

Available forms

Injection—10 mg/mL in prefilled syringes

Dosages

Adults

6 mg subcutaneously as a single dose once per chemotherapy cycle. Do not give in the period 14 days before and 24 hr after administration of cytotoxic chemotherapy.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Peak	Duration
Subcut.	8 hr	Varies

Metabolism: Unknown; $T_{1/2}$: 15–80 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

Adverse effects

- **CNS:** *Headache, generalized weakness, fatigue, dizziness, insomnia*
- **Dermatologic:** *Alopecia, rash, mucositis*
- **GI:** *Nausea, vomiting, stomatitis, anorexia, diarrhea, constipation, taste perversion, dyspepsia, abdominal pain*
- **Respiratory:** **Acute respiratory distress syndrome**
- **Other:** **Splenic rupture**, aggravation of sickle cell disease, *fever, arthralgia, peripheral edema, myalgia, bone pain, granulocytopenic allergic reactions (anaphylaxis, rash, urticaria), increased LDH, alkaline phosphatase, uric acid*

Interactions

★ **Drug-drug** • Risk of increased effects if combined with lithium; if this combination is used, monitor neutrophil counts frequently

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Neulasta* (pegfilgrastim) and *Neumega* (oprelvekin); use caution.

Assessment

- **History:** Hypersensitivity to *E. coli* products, filgrastim; sickle cell disease; pregnancy, lactation
- **Physical:** Skin color, lesions, hair; T; orientation, affect; abdominal examination, status of mucous membranes; CBC, platelets

Interventions

- Obtain CBC and platelet count prior to and twice weekly during therapy.
- ⊗ **Warning** Administer no earlier than 24 hr after cytotoxic chemotherapy and not in the period of 14 days before the administration of chemotherapy.
- Give one injection with each course of chemotherapy.
- Store in refrigerator; allow to warm to room temperature before use; if syringe is at room

temperature for 48 hr or longer, discard. Use each syringe for one dose.

- Do not shake syringe before use. Protect syringe from light. Make sure the syringe is free of particulate matter and that the solution is not discolored before using.
- Monitor patient for any sign of infection and arrange for appropriate treatment.
- Protect patient from exposure to infection.
- Provide appropriate comfort and supportive measures for headache, bone pain, or GI discomfort.
- Arrange for patient to obtain wig or other head covering if alopecia occurs; cover head at extremes of temperature.
- Arrange for small frequent meals if nausea and vomiting are a problem.
- Offer support and encouragement to deal with pain, discomfort, and hair loss.

Teaching points

- This drug will be given by subcutaneous injection once with each cycle of your chemotherapy.
- Avoid exposure to infection while you are receiving this drug (avoid crowds and people with known infections).
- Keep appointments for frequent blood tests to evaluate effects of drug on your blood count.
- You may experience these side effects: Bone pain (analgesia may be ordered), nausea and vomiting (eat frequent small meals), loss of hair (you may want to arrange for appropriate head covering; it is very important to cover head in extreme temperatures).
- Report fever, chills, severe bone pain, sore throat, weakness, pain or swelling at injection site.

Levatol

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Beta-adrenergic blocker

Therapeutic actions

Competitively blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, reducing the influence of the sympathetic nervous system on these tissues; decreasing the excitability of the heart, cardiac output, and release of renin; and lowering BP.

Indications

- Treatment of mild to moderate hypertension, alone or as part of combination therapy

Contraindications and cautions

- Contraindicated with sinus bradycardia, bronchial asthma, second- or third-degree heart block, cardiogenic shock, HF, lactation.
- Use cautiously with renal failure, diabetes or thyrotoxicosis, asthma, COPD, impaired hepatic function, pregnancy.

Available forms

Tablets—20 mg

Dosages

Adults

Usual starting dose, maintenance dose, and dose used in combination with other antihypertensives: 20 mg PO daily. Doses of 40–80 mg

daily have been used but with no additional antihypertensive effect.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–3 hr	20 hr

Metabolism: Hepatic; T_{1/2}: 5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** *Bradycardia, HF, cardiac arrhythmias, sinoatrial or AV nodal block, tachycardia*, peripheral vascular insufficiency, claudication, **stroke, pulmonary edema**, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute hepatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination, renal arterial thrombosis
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance, development of ANA*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH

Interactions

• **Drug-drug** • Increased effects and adverse effects with verapamil, other calcium channel blockers • Decreased effects with epinephrine • Increased risk of peripheral ischemia, even gangrene, with ergot alkaloids (dihydroergotamine, ergotamine) • Prolonged hypoglycemic effects of insulin • Increased first-dose response to prazosin • Paradoxical hypertension when clonidine is given with beta-blockers; increased rebound hypertension when clonidine is discontinued in patients on beta-blockers • Decreased hypertensive effect if given with NSAIDs (piroxicam, indomethacin, ibuprofen) • Decreased bronchodilator effects of theophylline and decreased bronchial and cardiac effects of sympathomimetics with penbutolol

• **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, heart block, cardiogenic shock, HF, renal failure, diabetes or thyrotoxicosis, asthma or COPD, impaired hepatic function, lactation, pregnancy
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- Give drug once a day. Monitor response and maintain at lowest possible dose.

⊗ **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias; taper drug gradually over 2 wk with monitoring).

- Consult with surgeon about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Do not stop taking this drug unless instructed to do so by your health care provider.
- Avoid driving or dangerous activities if dizziness or drowsiness occurs.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▷ penicillamine

See Appendix U, *Less commonly used drugs*.

▷ penicillin G benzathine

(*pen i sill' in*)

Bicillin L-A, Permapen

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Penicillin antibiotic

Therapeutic actions

Bactericidal: Inhibits synthesis of cell wall of sensitive organisms, causing cell death.

Indications

- Severe infections caused by sensitive organisms (streptococci)
- URI caused by sensitive streptococci
- Treatment of syphilis, bejel, congenital syphilis, pinta, yaws
- Prophylaxis of rheumatic fever and chorea

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, or other allergens.
- Use cautiously with renal disorders, pregnancy, lactation (may cause diarrhea or candidiasis in the infant).

Available forms

Injection—600,000, 1.2 million, 2.4 million units/dose

Dosages

Adults

- *Streptococcal infections (including otitis media, URIs of mild to moderate severity):* 1.2 million units IM as a single dose.
- *Early syphilis:* 2.4 million units IM as a single dose.
- *Syphilis lasting longer than 1 yr:* 7.2 million units given as 2.4 million units IM weekly for 3 wk.
- *Yaws, bejel, pinta:* 1.2 million units IM as a single dose.

- *Erysipeloid*: 1.2 million units IM as a single dose.
- *Prophylaxis of rheumatic fever or chorea*: 1.2 million units IM every month; alternatively, 600,000 units every 2 wk.

Pediatric patients

- *Streptococcal infections (including otitis media, URIs of mild to moderate severity): Children weighing less than 60 lb*: 300,000–600,000 units IM as a single injection. *Older children*: 900,000 units IM as a single injection.
- *Congenital syphilis: Children younger than 2 yr*: 50,000 units/kg body weight. *Children 2 to 12 yr*: Adjust dosage based on adult schedule.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Slow	12–24 hr	Days

Metabolism: Hepatic; $T_{1/2}$: 30–60 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black “hairy” tongue, nausea, vomiting, diarrhea*, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, nonspecific hepatitis
- **GU:** Nephritis
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time (more common than with other penicillinase-resistant penicillins)
- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis*, thrombosis at injection site, Jarisch-Herxheimer reaction when used to treat syphilis
- **Other:** *Superinfections*, sodium overload, leading to heart failure

Interactions

- *** Drug-drug** • Decreased effectiveness of penicillin G benzathine with tetracyclines
- Inactivation of parenteral aminoglycosides (amikacin, gentamicin, kanamycin, neomy-

cin, tobramycin); separate administration times

■ Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, other allergens; renal disorders; pregnancy, lactation
- **Physical:** Culture infection; skin color, lesions; R, adventitious sounds; bowel sounds: CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

⊗ **Warning** Drug is not for IV use. Do not inject or admix with other IV solutions. Inadvertent IV administration has caused cardiorespiratory arrest and death.

- Culture infection before beginning treatment; reculture if response is not as expected.
- Give by IM route only.
- Continue therapy for at least 2 days after infection has disappeared, usually 7–10 days.
- Give IM injection in upper outer quadrant of the buttock. In infants and small children, the midlateral aspect of the thigh may be preferred.

Teaching points

- You will need to receive a full course of drug therapy.
- You may experience these side effects: Nausea, vomiting, diarrhea, mouth sores, pain at injection sites.
- Report difficulty breathing, rashes, severe diarrhea, severe pain at injection site, mouth sores, unusual bleeding or bruising.

▽ penicillin G potassium

(pen i sill' in)

penicillin G potassium (aqueous)

Pfizerpen

penicillin G sodium

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Penicillin antibiotic

Therapeutic actions

Bactericidal: Inhibits synthesis of cell wall of sensitive organisms, causing cell death.

Indications

- Treatment of severe infections caused by sensitive organisms—streptococci, pneumococci, staphylococci, *Neisseria gonorrhoeae*, *Treponema pallidum*, meningococci, *Actinomyces israelii*, *Clostridium perfringens* and tetani, *Leptotrichia buccalis* (Vincent's disease), *Spirillum minus* or *Streptobacillus moniliformis*, *Listeria monocytogenes*, *Fusobacterium fusiformis*, *Pasteurella multocida*, *Erysipelothrix insidiosa*, *Escherichia coli*, *Enterobacter aerogenes*, *Alcaligenes faecalis*, *Salmonella*, *Shigella*, *Proteus mirabilis*, *Corynebacterium diphtheriae*, *Bacillus anthracis*
- Treatment of syphilis, gonococcal infections
- Unlabeled use: Treatment of Lyme disease

Contraindications and cautions

- Contraindicated with allergy to penicillins, cephalosporins, imipenem, beta-lactamase inhibitors, other allergens.
- Use cautiously with renal disease, pregnancy, lactation (may cause diarrhea or candidiasis in the infant).

Available forms

Injection—1, 2, 3 million units/50 mL; powder for injection—5, 20 million units/vial

Dosages

Adults

- *Meningococcal meningitis*: 1–2 million units every 2 hr IM or by continuous IV infusion of 20–30 million units/day.
- *Actinomycosis*: 1–6 million units/day IM in divided doses every 4–6 hr for 6 wk or IV for cervicofacial cases; 10–20 million units/day IV for thoracic and abdominal diseases.
- *Clostridial infections*: 20 million units/day in divided doses every 4–6 hr IM or IV with antitoxin therapy.

- *Fusospirochetal infections (Vincent's disease)*: 5–10 million units/day IM or IV in divided doses every 4–6 hr.
- *Rat-bite fever*: 12–20 million units/day IM or IV in divided doses every 4–6 hr for 3–4 wk.
- *Listeria infections*: 15–20 million units/day IM or IV in divided doses every 4–6 hr for 2 or 4 wk (meningitis or endocarditis, respectively).
- *Pasteurella infections*: 4–6 million units/day IM or IV in divided doses every 4–6 hr for 2 wk.
- *Erysipeloid endocarditis*: 12–20 million units/day IM or IV in divided doses every 4–6 hr for 4–6 wk.
- *Diphtheria (adjunctive therapy with antitoxin to prevent carrier state)*: 2–3 million units/day IM or IV in divided doses every 4–6 hr for 10–12 days.
- *Anthrax*: Minimum of 5 million units/day IM or IV in divided doses.
- *Serious streptococcal infections*: 5–24 million units/day in divided doses every 4–6 hr.
- *Syphilis*: 18–24 million units/day IV every 4–6 hr for 10–14 days followed by benzathine penicillin G 2.4 million units IM weekly for 3 wk.
- *Gonorrhea*: 10 million units/day IV every 4–6 hr until improvement occurs.

Pediatric patients

- *Meningitis*: 250,000 units/kg/day IM or IV in divided doses every 4 hr for 7–14 days.
- *Streptococcal infections*: 150,000 units/kg/day IV or IM every 4–6 hr.
Infants older than 7 days: 75,000 units/kg/day IV in divided doses every 8 hr.
- *Meningitis*: 200,000–300,000 units/kg/day IV every 6 hr.
Infants younger than 7 days: 50,000 units/kg/day IV in divided doses every 12 hr.
- *Group B streptococcus*: 100,000 units/kg/day IV.

Pharmacokinetics

Route	Onset	Peak
IM, IV	Rapid	15–30 min

Metabolism: Hepatic; $T_{1/2}$: 30–60 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare solution using sterile water for injection, isotonic sodium chloride injection, or 5% dextrose injection. Loosen powder in vial; reconstitute with vial held horizontally. Shake vigorously. Do not use with carbohydrate solutions at alkaline pH; do not refrigerate powder; sterile solution is stable for 1 wk refrigerated. IV solutions are stable at 24 hr at room temperature. Discard solution after 24 hr.

Infusion: Administer doses of 10–20 million units by slow infusion.

Incompatibilities: Do not mix with aminoglycosides, amphotericin B, bleomycin, chlorpromazine, cytarabine, hydroxyzine, methylprednisolone, prochlorperazine, promethazine.

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black “hairy” tongue, nausea, vomiting, diarrhea, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, non-specific hepatitis*
- **GU:** Nephritis—oliguria, proteinuria, hematuria, casts, azotemia, pyuria
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time
- **Hypersensitivity reactions:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis, thrombosis at injection site, Jarisch-Herxheimer reaction when used to treat syphilis*
- **Other:** *Superinfections; sodium overload, leading to HF*

Interactions

* **Drug-drug** • Decreased effectiveness of penicillin G with tetracyclines • Inactivation of parenteral aminoglycosides (amikacin, gentamicin, kanamycin, neomycin, streptomycin, tobramycin)

* **Drug-lab test** • False-positive Coombs' test (IV)

Nursing considerations

Assessment

- **History:** Allergy to penicillins, cephalosporins, imipenem, beta-lactamase inhibitors, other allergens, renal disease, lactation, pregnancy
- **Physical:** Culture infection; skin rashes, lesions; R, adventitious sounds; bowel sounds, normal output; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis; skin test with benzylpenicilloyl-polylysine if hypersensitivity reactions to penicillin have occurred

Interventions

- Culture infection before beginning treatment; reculture if response is not as expected.
- Use the smallest volume possible for IM injection to avoid pain and discomfort.
- Continue treatment for 48–72 hr after the patient is asymptomatic.
- ⊗ **Warning** Monitor serum electrolytes and cardiac status if penicillin G is given by IV infusion. Sodium or potassium preparations have been associated with severe electrolyte imbalances.
- Explain the reason for parenteral administration; offer support and encouragement to deal with therapy.
- ⊗ **Warning** Keep epinephrine, IV fluids, vasopressors, bronchodilators, oxygen, and emergency equipment readily available in case of serious hypersensitivity reaction.
- Arrange for corticosteroids or antihistamines for skin reactions.

Teaching points

- This drug must be given by injection for severe infections.
- You may experience these side effects: Upset stomach, nausea, vomiting (eat frequent small meals); sore mouth (frequent mouth care may help); diarrhea; pain or discomfort at the injection site.
- Report unusual bleeding, sore throat, rash, hives, fever, severe diarrhea, difficulty breathing.

▷ penicillin G procaine (penicillin G procaine, aqueous, APPG)

(pen i *sill'* in)

Wycillin

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Penicillin (long-acting, parenteral)

Therapeutic actions

Bactericidal: Inhibits cell wall synthesis of sensitive organisms, causing cell death.

Indications

- Treatment of moderately severe infections caused by sensitive organisms—streptococci, pneumococci, staphylococci, meningococci, *Actinomyces israelii*, *Clostridium perfringens* and *tetani*, *Leptotrichia buccalis* (Vincent's disease), *Spirillum minus*, *Streptobacillus moniliformis*, *Listeria monocytogenes*, *Pasteurella multocida*, *Erysipelothrix insidiosa*, *Escherichia coli*, *Enterobacter aerogenes*, *Alcaligenes faecalis*, *Salmonella*, *Shigella*, *Proteus mirabilis*, *Corynebacterium diphtheriae*, *Bacillus anthracis*
- Treatment of specific STDs

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, procaine, or other allergens.
- Use cautiously with renal disorders, pregnancy, lactation (may cause diarrhea or candidiasis in the infant).

Available forms

Injection—600,000 units/dose, 1,200,000 units/dose

Dosages

Adults

- *Moderately severe infections caused by sensitive strains of streptococci, pneumococci, staphylococci:* Minimum of 600,000–1 million units/day IM.

- *Bacterial endocarditis (group A streptococci):* 600,000–1 million units/day IM.
- *Fusospirochetal infections:* 600,000–1 million units/day IM.
- *Rat-bite fever:* 600,000–1 million units/day IM.
- *Erysipeloid:* 600,000–1 million units/day IM.
- *Diphtheria:* 300,000–600,000 units/day IM with antitoxin.
- *Diphtheria carrier state:* 300,000 units/day IM for 10 days.
- *Anthrax:* 600,000–1 million units/day IM.
- *Syphilis (negative spinal fluid):* 600,000 units/day IM for 8 days.
- *Late syphilis:* 600,000 units/day for 10–15 days.
- *Neurosyphilis:* 2.4 million units/day IM with 500 mg probenecid PO qid for 10–14 days, followed by 2.4 million units IM benzathine penicillin G following completion of treatment regimen.

Pediatric patients

- *Congenital syphilis in patients weighing less than 32 kg:* 50,000 units/kg per day IM for 10 days.
- *Group A streptococcal and staphylococcal pneumonia in patients weighing less than 27 kg:* 300,000 units/day/IM.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Varies	4 hr	15–20 hr

Metabolism: Hepatic; $T_{1/2}$: 30–60 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black "hairy" tongue, nausea, vomiting, diarrhea,* abdominal pain, bloody diarrhea, enterocolitis, pseudo-membranous colitis, nonspecific hepatitis
- **GU:** Nephritis—oliguria, proteinuria, hematuria, casts, azotemia, pyuria
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time

- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis*, thrombosis at injection site, Jarisch-Herxheimer reaction when used to treat syphilis
- **Other:** *Superinfections*; sodium overload, leading to HF

Interactions

- *** Drug-drug** • Decreased effectiveness of penicillin G procaine with tetracyclines • Inactivation of parenteral aminoglycosides (amikacin, gentamicin, kanamycin, neomycin, streptomycin, tobramycin)

■ Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, procaine, other allergens, renal disorders, pregnancy, lactation
- **Physical:** Culture infection; skin color, lesions; R, adventitious sounds; bowel sounds: CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

- Culture infection before beginning treatment; reculture if response is not as expected.
- Administer by IM route only.
- Continue therapy for at least 2 days after infection has disappeared, usually 7–10 days.
- Administer IM injection in upper outer quadrant of the buttock. In infants and small children, the midlateral aspect of the thigh may be preferred.

Teaching points

- This drug can be given only by IM injection.
- You may experience these side effects: Nausea, vomiting, diarrhea, mouth sores, pain at injection sites.
- Report difficulty breathing, rashes, severe diarrhea, severe pain at injection site, mouth sores, unusual bleeding or bruising.

▷ penicillin V (penicillin V potassium)

(*pen i sill' in*)

Apo-Pen-VK (CAN),
Nu-Pen-VK (CAN), Veetids

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Penicillin (acid stable)

Therapeutic actions

Bactericidal: Inhibits cell wall synthesis of sensitive organisms, causing cell death.

Indications

- Mild to moderately severe infections caused by sensitive organisms—streptococci, pneumococci, staphylococci, fusospirochetes
- Unlabeled uses: Prophylactic treatment of children with sickle cell anemia, mild to moderate anaerobic infections, Lyme disease, postexposure anthrax prophylaxis

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, or other allergens.
- Use cautiously with renal disorders, pregnancy, lactation (may cause diarrhea or candidiasis in the infant).

Available forms

Tablets—250, 300, 500 mg; powder for oral solution—125, 250, 300 mg/5 mL

Dosages

Adults and patients older than 12 yr

- *Fusospirochetal infections*: 250–500 mg every 6–8 hr PO.
- *Streptococcal infections (including otitis media, URIs of mild to moderate severity, scarlet fever, erysipelas)*: 125–250 mg every 6–8 hr PO for 10 days.
- *Pneumococcal infections*: 250–500 mg every 6 hr PO until afebrile for 48 hr.
- *Staphylococcal infections of skin and soft tissues*: 250–500 mg every 6–8 hr PO.

- *Prevention of recurrence of rheumatic fever/chorea*: 125–250 mg twice daily.
- *Lyme disease*: 500 mg PO qid for 10–20 days.
- *Mild, uncomplicated cutaneous anthrax*: 200–500 mg PO qid.

Adults and patients older than 9 yr

- *Anthrax prophylaxis*: 7.5 mg/kg PO qid.

Pediatric patients younger than 12 yr

15–62.5 mg/kg/day PO given every 6–8 hr. Calculate doses according to weight.

- *Sickle cell anemia as prophylaxis of S. pneumoniae septicemia*: 250 mg PO bid; 3 mo–5 yr: 125 mg PO bid.
- *Mild, uncomplicated cutaneous anthrax in children older than 2 yr*: 25–50 mg/kg daily in two or four divided doses.

Pediatric patients younger than 9 yr

- *Anthrax prophylaxis*: 50 mg/kg/day PO in four divided doses.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	60 min

Metabolism: Hepatic; $T_{1/2}$: 30 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black “hairy” tongue, nausea, vomiting, diarrhea*, abdominal pain, bloody diarrhea, enterocolitis, pseudo-membranous colitis, nonspecific hepatitis
- **GU:** Nephritis—oliguria, proteinuria, hematuria, casts, azotemia, pyuria
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time
- **Hypersensitivity reactions:** *Rash, fever, wheezing, anaphylaxis* (sometimes fatal)
- **Other:** *Superinfections*; sodium overload leading to HF; potassium poisoning—hyperreflexia, coma, cardiac arrhythmias, **cardiac arrest** (potassium preparations)

Interactions

★ **Drug-drug** • Decreased effectiveness with tetracyclines

Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, or other allergens; renal disorders; pregnancy; lactation
- **Physical:** Culture infection; skin color, lesions; R, adventitious sounds; bowel sounds; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

- Culture infection before beginning treatment; reculture if response is not as expected.
- Continue therapy for at least 2 days after infection has disappeared, usually 7–10 days.
- Do not administer oral drug with milk, fruit juices, or soft drinks; a full glass of water is preferred; this oral penicillin is less affected by food than other penicillins.

Teaching points

- Avoid self-treating other infections with this antibiotic because it is specific for the infection being treated. Complete the full course of drug therapy.
- Take drug with water; do not take with milk, fruit juice, or soft drinks.
- You may experience these side effects: Nausea, vomiting, diarrhea, mouth sores.
- Report difficulty breathing, rashes, severe diarrhea, mouth sores, unusual bleeding, or bruising.

▽ pentamidine isethionate

(pen ta' ma deen ess thye' oh nate)

Parenteral: Pentacarinat, Pentam 300

Inhalation: NebuPent

PREGNANCY CATEGORY C

Drug class

Antiprotozoal

Therapeutic actions

Antiprotozoal activity in susceptible *Pneumocystis carinii* pneumonia infections; mechanism of action is not fully understood, but the drug interferes with nuclear metabolism and inhibits the synthesis of DNA, RNA, phospholipids, and proteins, which lead to cell death.

Indications

- Treatment of *P. carinii* pneumonia, especially in patients who do not respond to therapy with the less toxic trimethoprim-sulfamethoxazole combination (injection)
- Inhalation: Prevention of *P. carinii* pneumonia in high-risk, HIV-infected patients
- Unlabeled use (injection): Treatment of trypanosomiasis, visceral leishmaniasis

Contraindications and cautions

If the diagnosis of *P. carinii* pneumonia has been confirmed, there are no absolute contraindications to the use of this drug.

- Contraindicated with history of anaphylactic reaction to inhaled or parenteral pentamidine isethionate (inhalation therapy), lactation.
- Use cautiously with hypotension, hypertension, hypoglycemia, hyperglycemia, hypocalcemia, leukopenia, thrombocytopenia, anemia, hepatic or renal impairment, pregnancy.

Available forms

Injection—300 mg/vial; powder for injection—300 mg; aerosol—300 mg

Dosages**Adults and pediatric patients****Parenteral**

4 mg/kg once a day for 14–21 days by deep IM injection or IV infusion over 60 min.

Inhalation

300 mg once every 4 wk administered through the *Respigard II* nebulizer.

Pharmacokinetics

Route	Onset
IM	Slow
Inhalation	Rapid

Metabolism: $T_{1/2}$: 6.4–9.4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare solution by dissolving contents of 1 vial in 3–5 mL of sterile water for injection or 5% dextrose injection; do not use saline for reconstitution. Dilute the calculated dose further in 50–250 mL of 5% dextrose solution; solutions of 1 and 2.5 mg/mL in 5% dextrose are stable at room temperature for up to 24 hr. Protect from light.

Infusion: Infuse the diluted solution over 60–120 min.

Y-site incompatibility: Do not mix with foscarnet or fluconazole.

Adverse effects**Parenteral**

- **CV:** *Hypotension*, tachycardia
- **GI:** *Nausea, anorexia*
- **GU:** *Elevated serum creatinine, acute renal failure*
- **Hematologic:** *Leukopenia, hypoglycemia*, thrombocytopenia, hypocalcemia, elevated LFTs
- **Local:** *Pain, abscess at injection site*
- **Other:** **Stevens-Johnson syndrome**, *fever, rash, severe hypotension*, hypoglycemia, and cardiac arrhythmias

Inhalation

- **CNS:** *Fatigue, dizziness*, headache, tremors, confusion, anxiety, memory loss, seizures, insomnia, drowsiness
- **CV:** Tachycardia, hypotension, hypertension, palpitations, syncope, vasodilatation
- **GI:** *Metallic taste in mouth, anorexia, nausea, vomiting*, gingivitis, dyspepsia, oral ulcer, gastritis, hypersalivation, dry mouth, melena, colitis, abdominal pain
- **Respiratory:** *Shortness of breath, cough, pharyngitis, congestion*, **bronchospasm**, rhinitis, laryngitis, **laryngospasm**, hyperventilation, pneumothorax
- **Other:** *Rash, night sweats, chills*

■ Nursing considerations

Assessment

- **History:** History of anaphylactic reaction to inhaled or parenteral pentamidine isethionate, hypotension, hypertension, hypoglycemia, hyperglycemia, hypocalcemia, leukopenia, thrombocytopenia, anemia, hepatic or renal impairment, pregnancy, lactation
- **Physical:** Skin lesions, color; T; reflexes, affect (inhalation); BP, P, baseline ECG; BUN, serum creatinine, blood glucose, CBC, platelet count, LFTs, serum calcium

Interventions

⊗ **Warning** Monitor patient closely during administration; fatalities have been reported.

- Arrange for these tests to be performed before, during, and after therapy: Daily BUN, daily serum creatinine, daily blood glucose; regular CBC, platelet counts, LFTs, serum calcium; periodic ECG.

⊗ **Warning** Position patient in supine position before parenteral administration to protect patient if BP changes.

- Reconstitute for inhalation: Dissolve contents of 1 vial in 6 mL of sterile water for injection. Use only sterile water. Saline cannot be used, precipitates will form. Place entire solution in nebulizer reservoir. Solution is stable for 48 hr in original vial at room temperature if protected from light. Do not mix with other drugs.
- Administer inhalation using the *Respirgard II* nebulizer. Deliver the dose using a flow rate of 5–7 L/min and an air or oxygen source set at 40–50 PSI until the chamber is empty (30–45 min).
- For IM use: Prepare IM solution by dissolving contents of 1-g vial in 3 mL of sterile water for injection; protect from light. Discard any unused portions. Inject deeply into large muscle group. Inspect injection site regularly; rotate injection sites.
- Instruct patient and significant other in the reconstitution of inhalation solutions and administration for outpatient use.

Teaching points

- Parenteral drug can be given only IV or IM and must be given every day. Inhalation drug must be given using the *Respirgard II* nebulizer. Prepare the solution as instructed by

your health care provider, using only sterile water for injection. Protect the medication from exposure to light. Use freshly reconstituted solution. The drug must be used once every 4 weeks. Prepare a calendar with drug days marked as a reminder. Do not mix any other drugs in the nebulizer.

- Have frequent blood tests and blood pressure checks because this drug may cause many changes in your body.
- You may feel weak and dizzy with sudden position changes; take care to change position slowly.
- If using the inhalation, metallic taste and GI upset may occur. Frequent small meals and mouth care may help.
- Report pain at injection site, confusion, hallucinations, unusual bleeding or bruising, weakness, fatigue.

⚠ DANGEROUS DRUG

▶ **pentazocine**
(*pen taz' ob seen*)

pentazocine hydrochloride with naloxone hydrochloride, 0.5 mg

pentazocine lactate

Parenteral: Talwin

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-IV

P

Drug class

Opioid agonist-antagonist analgesic

Therapeutic actions

Pentazocine acts as an agonist at specific (κ) opioid receptors in the CNS to produce analgesia, sedation; acts as an agonist at sigma opioid receptors to cause dysphoria, hallucinations; acts at mu opioid receptors to antagonize the analgesic and euphoric activities of some other opioid analgesics. Has lower abuse potential than morphine, other pure opioid agonists; the oral preparation contains the opioid antagonist naloxone, which has poor bioavailability when given orally and does

not interfere with the analgesic effects of pentazocine but serves as a deterrent to the unintended IV injection of solutions made from the oral tablets.

Indications

- Oral and parenteral: Relief of moderate to severe pain
- Parenteral: Preanesthetic medication and as supplement to surgical anesthesia

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, sulfites (oral and parenteral), naloxone (oral form); pregnancy (neonatal withdrawal); lactation.
- Use cautiously with physical dependence on an opioid analgesic (can precipitate a withdrawal syndrome); bronchial asthma, COPD, cor pulmonale, respiratory depression, anoxia, increased intracranial pressure; acute MI with hypertension, left ventricular failure or nausea and vomiting; renal or hepatic impairment; labor or delivery (opioids given to the mother can cause neonatal respiratory depression; premature infants are especially at risk; may prolong labor).

Available forms

Injection—30 mg/mL

Dosages

Adults

Oral

Initially, 50 mg every 3–4 hr. Increase to 100 mg if needed. Do not exceed a total dose of 600 mg/24 hr.

Parenteral

30 mg IM, subcutaneously, or IV. May repeat every 3–4 hr. Doses exceeding 30 mg IV or 60 mg IM or subcutaneously are not recommended. Do not exceed 360 mg/24 hr. Give subcutaneously only when necessary; repeat injections should be given IM.

- *Patients in labor*: A single 30-mg IM dose is most common. A 20-mg IV dose given 2–3 times at 2- to 3-hr intervals relieves pain when contractions become regular.

Pediatric patients younger than 12 yr

Not recommended.

Geriatric patients or impaired adults

Use caution; respiratory depression may occur in the very ill, and those with respiratory problems. Dosage may need to be reduced. Avoid long-term use for pain due to risk of falls, fractures, confusion, dependency, and withdrawal.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral, IM, Subcut.	15–30 min	1–3 hr	3 hr
IV	2–3 min	15 min	3 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: No further preparation is required.

Infusion: Inject directly into vein or into tubing of actively running IV; infuse slowly, each 5 mg over 1 min.

Incompatibilities: Do not mix in same syringe as barbiturates; precipitate will form.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances*
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope, circulatory depression, **shock, cardiac arrest**
- **Dermatologic:** Pruritus, urticaria, edema
- **GI:** *Nausea, vomiting, sweating* (more common in ambulatory patients and those without severe pain), dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis

- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Pain at injection site, tissue irritation and induration (subcutaneous injection)
- **Respiratory:** Suppression of cough reflex, respiratory depression, apnea, respiratory arrest, **laryngospasm, bronchospasm**
- **Other:** Physical tolerance and dependence, psychological dependence (**the oral form has been especially abused in combination with tripeleminamine—“Ts and Blues”—with serious and fatal consequences;** addition of naloxone to oral formulation may decrease this abuse)

Interactions

• **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation, or coma with barbiturate general anesthetics • Precipitation of withdrawal syndrome in patients previously given other opioid analgesics, including morphine, methadone (note that this applies to the parenteral preparation without naloxone and to the oral preparation that includes naloxone)

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids, naloxone (oral form), sulfites (oral and parenteral); physical dependence on an opioid analgesic; pregnancy; labor or delivery; lactation; respiratory disease; anoxia; increased intracranial pressure; acute MI; renal or hepatic impairment
- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect, pupil size; P, auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency and pattern of voiding, normal output; LFTs, renal function tests, CBC with differential

Interventions

⊗ **Black box warning** Be aware that pentazocine/naloxone combination is for oral use only; drug can be lethal if injected.

- Do not mix parenteral pentazocine in same syringe as barbiturates; precipitate will form.

⊗ **Warning** Keep opioid antagonist, equipment for assisted or controlled respiration readily available during parenteral administration.

⊗ **Warning** Use caution when injecting subcutaneously into chilled areas of the body or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.

⊗ **Warning** Withdraw drug gradually if it has been given for 4 or 5 days, especially to emotionally unstable patients or those with a history of drug abuse; a withdrawal syndrome sometimes occurs in these circumstances.

- Reassure patient that addiction is unlikely; most patients who receive opiates for medical reasons do not develop dependence syndromes.

Teaching points

- Take drug exactly as prescribed.
- Avoid alcohol, antihistamines, sedatives, tranquilizers, and over-the-counter drugs while taking this drug.
- Do not take any leftover medication for other disorders, and do not let anyone else take the prescription.
- You may experience these side effects: Nausea, loss of appetite (take drug with food, lie quietly, eat frequent small meals); constipation (a laxative may help); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving or performing other tasks that require alertness, visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath or difficulty breathing.

▷ **pentetate calcium trisodium (Ca-DTPA), pentetate zinc trisodium (Zn-DTPA)**

DANGEROUS DRUG**pentobarbital
(pentobarbital sodium)***(pen toe bar' bi tal)*

Nembutal

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-II

Drug classes

Antiepileptic

Barbiturate

Hypnotic

Sedative or hypnotic

Therapeutic actions

General CNS depressant; barbiturates inhibit impulse conduction in the ascending RAS, depress the cerebral cortex, alter cerebellar function, depress motor output, and can produce excitation, sedation, hypnosis, anesthesia, and deep coma; at anesthetic doses, has antiseizure activity.

Indications

- Sedative
- Preanesthetic in pediatric patients
- Antiepileptic, in anesthetic doses, for emergency control of certain acute seizure episodes (eg, status epilepticus, eclampsia, meningitis, tetanus, toxic reactions to strychnine or local anesthetics)

Contraindications and cautions

- Contraindicated with hypersensitivity to barbiturates, manifest or latent porphyria, marked liver impairment, nephritis, severe respiratory distress, previous addiction to sedative-hypnotic drugs, pregnancy (fetal damage, neonatal withdrawal syndrome), lactation.
- Use cautiously with acute or chronic pain (paradoxical excitement or masking of important symptoms), seizure disorders (abrupt discontinuation of daily doses can result in status epilepticus), fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, status asthmaticus, shock, uremia.

Available forms

Injection—50 mg/mL

Dosages**Adults**

Use only when prompt action is imperative.

IV: Give by slow IV injection, not to exceed 50 mg/min. Initial dose is 100 mg in a 70-kg adult. Wait at least 1 min for full effect. Base dosage on response. Additional small increments may be given up to a total of 200–500 mg. Minimize dosage in seizure states to avoid compounding the depression that may follow seizures.

IM: Inject deeply into a muscle mass. Usual adult dose is 150–200 mg. Do not exceed a volume of 5 mL at any site due to tissue irritation.

Pediatric patients

Use caution; barbiturates may produce irritability, aggression, inappropriate tearfulness. IV: Reduce initial adult dosage on basis of age, weight, and patient's condition.

IM: Dosage frequently ranges from 25–80 mg or 2–6 mg/kg. Do not exceed 100 mg.

Geriatric patients or those with debilitating disease

Reduce dosage and monitor closely. May produce excitement, depression, or confusion.

Pharmacokinetics

Route	Onset	Duration
IM, IV	Rapid	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 15–50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is required.

Infusion: Infuse slowly, each 50 mg over 1 min; monitor patient response to dosage.

Incompatibilities: Do not combine with chlorpheniramine, codeine, ephedrine, erythromycin, hydrocortisone, insulin, norepinephrine, penicillin G, potassium, phenytoin, promazine, vancomycin.

Adverse effects

- **CNS:** *Somnolence, agitation, confusion, hyperkinesia, ataxia, vertigo, CNS depression, nightmares, lethargy, residual sedation (hangover), paradoxical excitement, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, thinking abnormality*
- **CV:** *Bradycardia, hypotension, syncope*
- **GI:** *Nausea, vomiting, constipation, diarrhea, epigastric pain*
- **Hypersensitivity:** Rashes, angioneurotic edema, serum sickness, morbilliform rash, urticaria; rarely, exfoliative dermatitis, **Stevens-Johnson syndrome**
- **Local:** *Pain, tissue necrosis at injection site, gangrene; arterial spasm with inadvertent intra-arterial injection; thrombophlebitis; permanent neurologic deficit if injected near a nerve*
- **Respiratory:** *Hypoventilation, apnea, respiratory depression, laryngospasm, bronchospasm, circulatory collapse*
- **Other:** Tolerance, psychological and physical dependence; **withdrawal syndrome**

Interactions

• **Drug-drug** • Increased CNS depression with alcohol • Decreased effects of these drugs: Oral anticoagulants, corticosteroids, hormonal contraceptives and estrogens, beta-adrenergic blockers (especially propranolol, metoprolol), theophylline, metronidazole, doxycycline, phenylbutazones, quinidine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to barbiturates, manifest or latent porphyria, marked liver impairment, nephritis, severe respiratory distress, previous addiction to sedative-hypnotic drugs, acute or chronic pain, seizure disorders, pregnancy, lactation, fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, shock, uremia
- **Physical:** Weight; T; skin color, lesions, injection site; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, blood and urine glucose, BUN

Interventions

⊗ **Warning** Do not administer intra-arterially; may produce arteriospasm, thrombosis, or gangrene.

- Administer IV doses slowly.
- Administer IM doses deep in a muscle mass.

⊗ **Warning** Do not use parenteral form if solution is discolored or contains a precipitate.

⊗ **Warning** Monitor injection sites carefully for irritation and extravasation (IV use); solutions are alkaline and very irritating to the tissues.

- Monitor P, BP, and respiration carefully during IV administration.

⊗ **Warning** Taper dosage gradually after repeated use, especially in patients with epilepsy.

Teaching points

- This drug will make you drowsy and less anxious.
- Do not try to get up after you have received this drug (request assistance to sit up or move about).

▷ pentosan polysulfate sodium

See Appendix U, *Less commonly used drugs*.

▷ pentostatin (2' deoxycoformycin [DCF])

See Appendix U, *Less commonly used drugs*.

Apo-Pentoxifylline SR (CAN) ^{ONC},
Nu-Pentoxifylline SR (CAN) ^{ONC},
ratio-Pentoxifylline (CAN), Trental ^{ONC}

PREGNANCY CATEGORY C

Drug classes

Hemorrhologic drug
Xanthine

Therapeutic actions

Reduces RBC aggregation and local hyperviscosity; decreases platelet aggregation; decreases fibrinogen concentration in the blood; precise mechanism of action is not known.

Indications

- Intermittent claudication, to improve function and symptoms
- Unlabeled use: Cerebrovascular insufficiency to improve psychopathologic symptoms, diabetic vascular disease, aphthous stomatitis

Contraindications and cautions

- Contraindicated with allergy to pentoxifylline or methylxanthines (eg, caffeine, theophylline; drug is a dimethylxanthine derivative); recent cerebral or retinal hemorrhage.
- Use cautiously with pregnancy, lactation.

Available forms

ER tablets —400 mg

Dosages**Adults**

400 mg tid PO with meals. Decrease to 400 mg bid if adverse side effects occur. Continue for at least 8 wk.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

If creatinine clearance is more than 50 mL/min, give usual dosage every 8–12 hr; if creatinine clearance is 10–50 mL/min, give usual dosage every 12–24 hr; if creatinine clearance is less than 10 mL/min, give usual dosage every 24 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	60 min

Metabolism: Hepatic; $T_{1/2}$: 0.4–1.6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, headache*, tremor, anxiety, confusion

- **CV:** Angina, chest pain, arrhythmia, hypotension, dyspnea
- **Dermatologic:** Brittle fingernails, pruritus, rash, urticaria
- **GI:** *Dyspepsia, nausea*, vomiting
- **Hematologic:** Pancytopenia, purpura, thrombocytopenia

Interactions

- *** Drug-drug** • Increased therapeutic and toxic effects of theophylline when combined; monitor closely and adjust dosage as needed

■ Nursing considerations Assessment

- **History:** Allergy to pentoxifylline or methylxanthines, pregnancy, lactation
- **Physical:** Skin color, T; orientation, reflexes; P, BP, peripheral perfusion; CBC

Interventions

- Monitor patient for angina and arrhythmias.
- Administer drug with meals.
- Caution patient to swallow tablets whole and not to cut, crush, or chew them.

Teaching points

- Take drug with meals. Swallow tablets whole; do not cut, crush, or chew.
- This drug helps the signs and symptoms of claudication, but additional therapy is sometimes needed.
- Dizziness may occur as a result of therapy; avoid driving and operating dangerous machinery; take precautions to prevent injury.
- Report chest pain, flushing, loss of consciousness, twitching, numbness, and tingling.

▽ perindopril erbumine
(*pur in' dob pril*)

Aceon

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Renin, synthesized by the kidneys, is released into the circulation where it acts on a plasma precursor to produce angiotensin I, which is converted by ACE to angiotensin II—a potent vasoconstrictor that also causes release of aldosterone from the adrenals. Perindopril blocks the conversion of angiotensin I to angiotensin II, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensive
- Treatment of patients with stable coronary artery disease to reduce the risk of CV mortality and nonfatal MI

Contraindications and cautions

- Contraindicated with allergy to any ACE inhibitor, pregnancy, history of ACE inhibitors—associated angioedema.
- Use cautiously with impaired renal function, HF, salt or volume depletion, lactation.

Available forms

Tablets—2, 4, 8 mg

Dosages

Adults

Hypertension: 4 mg PO daily; may be titrated to a maximum of 16 mg/day.

CV disease: 4 mg/day PO for 2 wk; increase to a maintenance dose of 8 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Maximum daily dosage should not exceed 8 mg/day.

Geriatric patients older than 70 yr with stable CV disease

2 mg/day PO for first wk; increase to 4 mg/day PO for second wk. Maintenance dose is 8 mg/day PO.

Patients with renal impairment

For creatinine clearance greater than 30 mL/min, give initial dose of 2 mg/day PO. Maxi-

mum dose, 8 mg/day. For creatinine clearance of 30 mL/min or less, do not administer drug.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	3–7 hr

Metabolism: Hepatic; $T_{1/2}$: 30–120 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, insomnia, fatigue, paresthesias*
- **CV:** *Orthostatic hypotension, tachycardia, angina pectoris, MI, Raynaud's syndrome, HF (severe hypotension in salt- or volume-depleted patients)*
- **GI:** *Gastric irritation, nausea, diarrhea, aphthous ulcers, peptic ulcers, dysgeusia, cholestatic jaundice, hepatocellular injury, anorexia, constipation*
- **GU:** *Proteinuria, renal insufficiency, renal failure, polyuria, oliguria, frequency of urination*
- **Hematologic:** *Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, pancytopenia, hyperkalemia*
- **Other:** *Angioedema (particularly of the face, extremities, lips, tongue, larynx; death has been reported with **airway obstruction**—greater risk in black patients); cough, muscle cramps, impotence*

Interactions

★ **Drug-drug** • Decreased antihypertensive effects if taken with indomethacin • Risk of increased lithium levels if taken with potassium-sparing diuretics

■ Nursing considerations

Assessment

- **History:** Allergy to any ACE inhibitor; impaired renal function; HF; salt or volume depletion; pregnancy, lactation ACE inhibitor—associated angioedema
- **Physical:** Skin color, lesions, turgor; T; P; BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Warning** Keep epinephrine readily available in case of angioedema of the face or neck region; if patient has difficulty breathing, consult with physician and administer epinephrine as appropriate.

⊗ **Warning** Alert surgeon and mark the patient's chart with notice that perindopril is being taken. The angiotensin II formation subsequent to compensatory renin release during surgery will be blocked. Hypotension may be reversed with volume expansion.

- Monitor patients on diuretic therapy for excessive hypotension; the diuretic can be stopped 2–3 days before beginning therapy with perindopril and reintroduced slowly, monitoring patient response.
- Monitor patient closely in any situation that may lead to a fall in BP secondary to reduction in fluid volume—excessive perspiration and dehydration, vomiting, diarrhea—as excessive hypotension may occur.
- Arrange for reduced dosage in patients with impaired renal function.

⊗ **Black box warning** Caution patient that this drug can cause serious fetal injury; advise using barrier contraceptives.

Teaching points

- Take this drug once a day; it may be taken with meals. Do not stop taking the medication without consulting your health care provider.
- Use caution with any condition that may lead to a drop in blood pressure—diarrhea, sweating, vomiting, dehydration. If lightheadedness or dizziness should occur, consult your health care provider.
- Do not use potassium supplements or salt substitutes containing potassium while taking this drug.
- Avoid the use of over-the-counter medications while you are on this drug—especially avoid cough, cold, or allergy medications that may contain ingredients that will interact with this drug. If you feel that you need one of these preparations, consult your health care provider.
- Avoid pregnancy while using this drug; serious fetal injury could occur. Using barrier contraceptives is advised; if pregnancy

should occur, stop drug and notify your health care provider.

- You may experience these side effects: GI upset, loss of appetite, change in taste perception (these may be limited effects that will pass; taking the drug with meals may help); mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, lightheadedness (this usually passes after the first few days of therapy; if it occurs, change position slowly and limit your activities to ones that do not require alertness and precision); headache, fatigue, sleeplessness.
- Report mouth sores, sore throat, fever, chills, swelling of the hands, feet, irregular heart-beat, chest pains, swelling of the face, eyes, lips, tongue, difficulty breathing.

▽ **phenazopyridine hydrochloride (phenylazodiaminopyridine hydrochloride)**
(*fen az oh peer' i deen*)

Azo-Standard, Baridium, Geridium, Phenazo (CAN), Prodiem, Pyridium, Pyridium Plus, Urogesic, UTI Relief

PREGNANCY CATEGORY B

Drug class

Urinary analgesic

Therapeutic actions

An azo dye that is excreted in the urine and exerts a direct topical analgesic effect on urinary tract mucosa; exact mechanism of action is not understood.

Indications

- Symptomatic relief of pain, urgency, burning, frequency, and discomfort related to irritation of the lower urinary tract mucosa caused by infection, trauma, surgery, endoscopic procedures, passage of sounds or catheters

Contraindications and cautions

- Contraindicated with allergy to phenazopyridine, renal insufficiency.
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—95, 97.2, 100, 200 mg

Dosages**Adults**

200 mg PO tid after meals. Do not exceed 2 days if used with antibacterial agent.

Pediatric patients 6–12 yr

12 mg/kg/day divided into three doses PO for no longer than 2 days.

Geriatric patients and patients with renal impairment

Do not give to patients with renal insufficiency. A yellowish tinge to skin or sclera may indicate drug accumulation due to impaired renal excretion; discontinue therapy if yellowing of skin or eyes occurs.

Pharmacokinetics

Route	Onset
Oral	Rapid

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **Dermatologic:** *Rash*, yellowish tinge to skin or sclera, pruritus
- **GI:** *GI disturbances*
- **Hematologic:** Methemoglobinemia, hemolytic anemia
- **Other:** Renal and hepatic toxicity, *yellow-orange discoloration of urine*

Interactions

★ **Drug-lab test** • Interference with colorimetric laboratory test procedures

■ Nursing considerations**Assessment**

- **History:** Allergy to phenazopyridine, renal insufficiency, pregnancy
- **Physical:** Skin color, lesions; urinary output; normal GI output, bowel sounds, liver palpation; urinalysis, LFTs, renal function tests, CBC

Interventions

- Give after meals to avoid GI upset.

- Warn patient drug may stain contact lenses.
- Do not give longer than 2 days if being given with antibacterial agent for treatment of UTI.
- Alert patient that urine may turn reddish-orange and may stain fabric.

⊗ **Warning** Discontinue drug if skin or sclera become yellowish, a sign of drug accumulation.

Teaching points

- Take drug after meals to avoid GI upset.
- Urine may be reddish-orange (normal effect; urine may stain fabric). Contact lenses may be permanently stained.
- Report yellowish staining of skin or eyes, headache, unusual bleeding or bruising, fever, sore throat.

▽ phenelzine sulfate

(*fen'el zeen*)

Nardil

PREGNANCY CATEGORY C

Drug classes

Antidepressant
MAOI

Therapeutic actions

Irreversibly inhibits MAO, an enzyme that breaks down biogenic amines, such as epinephrine, norepinephrine, and serotonin, thus allowing these biogenic amines to accumulate in neuronal storage sites. According to the biogenic amine hypothesis, this accumulation of amines is responsible for the clinical efficacy of MAOIs as antidepressants.

Indications

- Treatment of patients with depression characterized as atypical, nonendogenous, or neurotic; patients who are unresponsive to other antidepressive therapy; and patients in whom other antidepressive therapy is contraindicated
- Unlabeled uses: Treatment of bulimia, PTSD, chronic migraine not responsive to standard treatment, social anxiety disorders

Contraindications and cautions

- Contraindicated with hypersensitivity to any MAOI, pheochromocytoma, HF, history of liver disease or abnormal LFTs, severe renal impairment, confirmed or suspected cerebrovascular defect, CV disease, hypertension, history of headache, suicidal ideation.
- Use cautiously with seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients (agitated or schizophrenic patients may show excessive stimulation; bipolar patients may shift to hypomanic or manic phase); patients scheduled for elective surgery; pregnancy; lactation.

Available forms

Tablets—15 mg

Dosages**Adults**

Initially, 15 mg PO tid. Increase dosage to at least 60 mg/day at a rapid pace consistent with patient tolerance. Many patients require therapy at 60 mg/day for at least 4 wk before response. Some patients may require 90 mg/day. After maximum benefit is achieved, reduce dosage slowly over several weeks. Maintenance may be 15 mg/day or every other day.

Pediatric patients younger than 16 yr

Not recommended.

Geriatric patients

Patients older than 60 yr are more prone to develop adverse effects; adjust dosage accordingly.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	1 hr	48–96 hr

Metabolism: Hepatic; $T_{1/2}$: 12 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** *Dizziness, vertigo, headache, overactivity, hyperreflexia, tremors, muscle twitching, mania, hypomania, jitteriness,*

confusion, memory impairment, insomnia, weakness, fatigue, drowsiness, restlessness, overstimulation, increased anxiety, agitation, blurred vision, sweating, akathisia, ataxia, coma, euphoria, neuritis, repetitious babbling, chills, glaucoma, nystagmus, suicidal thoughts

- **CV: Hypertensive crises** (sometimes fatal, sometimes with intracranial bleeding, usually attributable to ingestion of contraindicated food or drink containing tyramine; see drug-food interactions below; symptoms include some or all of the following: Occipital headache, which may radiate frontally; palpitations; neck stiffness or soreness; nausea; vomiting; sweating; dilated pupils; photophobia; tachycardia or bradycardia; chest pain); *orthostatic hypotension, sometimes associated with falling; disturbed cardiac rate and rhythm, palpitations, tachycardia*
- **Dermatologic:** Minor skin reactions, spider telangiectases, photosensitivity
- **GI:** *Constipation, diarrhea, nausea, abdominal pain, edema, dry mouth, anorexia, weight changes*
- **GU:** Dysuria, incontinence, urinary retention, sexual disturbances
- **Other:** Hematologic changes, black tongue, hypernatremia

Interactions

*** Drug-drug ⊗ Warning** Hypertensive crisis, coma, severe seizures with TCAs (eg, imipramine, desipramine). Note: MAOIs and TCAs have been used successfully in some patients resistant to therapy with single agents; however, case reports indicate that the combination can cause serious and potentially fatal side effects.

- Increased sympathomimetic effects (hypertensive crisis) with sympathomimetic drugs (norepinephrine, epinephrine, dopamine, dobutamine, levodopa, ephedrine, carbamazepine), amphetamines, other anorexiant, local anesthetic solutions containing sympathomimetic
- Additive hypoglycemic effect with insulin, oral sulfonylureas
- Increased hypotensive effects with beta blockers, anesthetics, thiazide diuretics
- Increased risk of

adverse interaction with meperidine, dextromethorphan • Risk of serotonin syndrome if combined with SSRIs or other serotonergic agents

★ **Drug-food** ⊗ **Warning** Tyramine (and other pressor amines) contained in foods are normally broken down by MAO enzymes in the GI tract; in the presence of MAOIs, these vasopressors may be absorbed in high concentrations; in addition, tyramine releases accumulated norepinephrine from nerve terminals; thus, hypertensive crisis may occur when the following foods that contain tyramine or other vasopressors are ingested by a patient on an MAOI: Dairy products (blue, camembert, cheddar, mozzarella, parmesan, romano, roquefort, Stilton cheeses; sour cream; yogurt); meats, fish (liver, pickled herring, fermented sausages—bologna, pepperoni, salami; caviar; dried fish; other fermented or spoiled meat or fish); undistilled beverages (imported beer, ale; red wine, especially Chianti; sherry; coffee, tea, colas containing caffeine; chocolate drinks); fruits and vegetables (avocado, fava beans, figs, raisins, bananas); yeast extracts; soy sauce; chocolate

★ **Drug-alternative therapy** • May cause headaches, manic episodes if combined with ginseng therapy

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any MAOI; pheochromocytoma; HF; abnormal LFTs; severe renal impairment; cerebrovascular defect; CV disease, hypertension; history of headache; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric disorder; elective surgery; pregnancy, lactation; suicidal ideation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision; P, BP, orthostatic BP, auscultation, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; thyroid palpation; LFTs, renal and thyroid function tests, urinalysis, CBC, ECG, EEG

Interventions

⊗ **Black box warning** Be aware of an increased risk of suicidality in children, ado-

lescents, and young adults; monitor patients accordingly.

- Limit amount of drug that is available to suicidal patients.
- Monitor BP and orthostatic BP carefully; arrange for more gradual increase in dosage in patients who show tendency for hypotension.
- ⊗ **Warning** Have periodic LFTs during therapy; discontinue drug at first sign of hepatic impairment or jaundice.
- ⊗ **Warning** Discontinue drug and monitor BP carefully if patient reports unusual or severe headache.
- ⊗ **Warning** Keep phentolamine or another alpha-adrenergic blocking drug readily available in case hypertensive crisis occurs.
- Provide a diet that is low in tyramine-containing foods.

Teaching points

- Take drug exactly as prescribed. Do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid ingestion of tyramine-containing foods while you are taking this drug and for 2 weeks afterward (patient and significant other should receive a list of such foods).
- Avoid alcohol; other sleep-inducing drugs; all over-the-counter drugs, including nose drops, cold and hay fever remedies; and appetite suppressants. Many of these contain substances that could cause serious or even life-threatening problems.
- You may experience these side effects: Dizziness, weakness or fainting when arising from a horizontal or sitting position (transient; change position slowly); drowsiness, blurred vision (reversible; if severe, avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite (frequent small meals, frequent mouth care may help); memory changes, irritability, emotional changes, nervousness (reversible).
- Report headache, rash, darkening of the urine, pale stools, yellowing of the eyes or skin, fever, chills, sore throat, thoughts of suicide, and any other unusual symptoms.

DANGEROUS DRUG**phenobarbital**(fee noe **bar'** bi tal)**phenobarbital**Oral preparations: Bellatal,
Solfoton**phenobarbital sodium**Parenteral: Luminal Sodium,
PMS-Phenobarbital (CAN)

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Antiepileptic

Barbiturate (long acting)

Hypnotic

Sedative

Therapeutic actions

General CNS depressant; barbiturates inhibit impulse conduction in the ascending RAS, depress the cerebral cortex, alter cerebellar function, depress motor output, and can produce excitation, sedation, hypnosis, anesthesia, and deep coma; at subhypnotic doses, has anti-seizure activity, making it suitable for long-term use as an antiepileptic.

Indications

- Oral or parenteral: Sedative
- Oral or parenteral: Hypnotic, treatment of insomnia for up to 2 wk
- Oral: Long-term treatment of generalized tonic-clonic and cortical focal seizures
- Oral: Emergency control of certain acute seizures (eg, those associated with status epilepticus, eclampsia, meningitis, tetanus, and toxic reactions to strychnine or local anesthetics)
- Parenteral: Preanesthetic
- Parenteral: Treatment of generalized tonic-clonic and cortical focal seizures
- Parenteral: Emergency control of acute seizures (tetanus, eclampsia, epilepticus)

Contraindications and cautions

- Contraindicated with hypersensitivity to barbiturates, manifest or latent porphyria, marked liver impairment, nephritis, severe respiratory distress, previous addiction to sedative-hypnotic drugs (may be ineffective and may contribute to further addiction), pregnancy (fetal damage, neonatal withdrawal syndrome).
- Use cautiously with acute or chronic pain (drug may cause paradoxical excitement or mask important symptoms); seizure disorders (abrupt discontinuation of daily doses can result in status epilepticus); lactation (secreted in breast milk; drowsiness in nursing infants); fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, status asthmaticus, shock, uremia, impaired liver or renal function, debilitation.

Available forms

Tablets—15, 16, 30, 60, 90, 100 mg; capsules—16 mg; elixir—15 mg/5 mL, 20 mg/5 mL; injection—30, 60, 65, 130 mg/mL

Dosages**Adults****Oral**

- *Sedation*: 30–120 mg/day in two to three divided doses. No more than 400 mg per 24 hr.
- *Hypnotic*: 100–200 mg at bedtime.
- *Antiepileptic*: 60–200 mg/day.

IM or IV

- *Sedation*: 30–120 mg/day IM or IV in two to three divided doses.
- *Preoperative sedation*: 100–200 mg IM, 60–90 min before surgery.
- *Hypnotic*: 100–320 mg IM or IV.
- *Acute seizures*: 200–320 mg IM or IV repeated in 6 hr if needed.

Pediatric patients**Oral**

- *Sedation*: 2 mg/kg/dose PO tid. 8–32 mg/dose.
- *Hypnotic*: Determine dosage using age and weight charts.
- *Antiepileptic*: 3–6 mg/kg/day.

IM or IV

- *Preoperative sedation*: 1–3 mg/kg IM or IV 60–90 min before surgery.

- **Antiepileptic:** 4–6 mg/kg/day for 7–10 days to a blood level of 10–15 mcg/mL or 10–15 mg/kg/day IV or IM.
- **Status epilepticus:** 15–20 mg/kg IV over 10–15 min.

Geriatric patients or patients with debilitating disease or renal or hepatic impairment

Reduce dosage and monitor closely—may produce excitement, depression, or confusion.

Pharmacokinetics

Route	Onset	Duration
Oral	30–60 min	10–16 hr
IM, Subcut.	10–30 min	4–6 hr
IV	5 min	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 79 hr; 110 hr (children)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is needed.

Infusion: Infuse very slowly, each 60 mg over 1 min, directly IV or into tubing or running IV; inject partial dose and observe for response before continuing. It may require at least 15 min to achieve peak levels in brain tissue. Avoid overdosing by observing effects before continued dosing.

Incompatibilities: Do not combine with chlorpromazine, ephedrine, hydralazine, hydrocortisone, hydroxyzine, insulin, levorphanol, meperidine, morphine, norepinephrine, pentazocine, procaine, promethazine, streptomycin, vancomycin.

Adverse effects

- **CNS:** *Somnolence, agitation, confusion, hyperkinesia, ataxia, vertigo, CNS depression, nightmares, lethargy, residual sedation (hangover), paradoxical excitement, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, thinking abnormality*
- **CV:** *Bradycardia, hypotension, syncope*
- **GI:** *Nausea, vomiting, constipation, diarrhea, epigastric pain*

- **Hypersensitivity:** Rashes, angioneurotic edema, serum sickness, morbiliform rash, urticaria; rarely, exfoliative dermatitis, **Stevens-Johnson syndrome**
- **Local:** *Pain, tissue necrosis at injection site, gangrene; arterial spasm with inadvertent intra-arterial injection; thrombophlebitis; permanent neurologic deficit if injected near a nerve*
- **Respiratory:** **Hypoventilation, apnea, respiratory depression, laryngospasm, bronchospasm, circulatory collapse**
- **Other:** Tolerance, psychological and physical dependence, **withdrawal syndrome**

Interactions

★ **Drug-drug** • Increased serum levels and therapeutic and toxic effects with valproic acid • Increased CNS depression with alcohol • Increased risk of neuromuscular excitation and hypotension with barbiturate anesthetic • Decreased effects of the following drugs: theophyllines, oral anticoagulants, beta blockers, doxycycline, corticosteroids, hormonal contraceptives and estrogens, metronidazole, phenylbutazones, quinidine, felodipine, fenopropfen

Nursing considerations

Assessment

- **History:** Hypersensitivity to barbiturates, manifest or latent porphyria, marked liver impairment, nephritis, severe respiratory distress, previous addiction to sedative-hypnotic drugs, pregnancy, acute or chronic pain, seizure disorders, lactation, fever, hyperthyroidism, diabetes mellitus, severe anemia, cardiac disease, shock, uremia, impaired liver or renal function, debilitation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, blood and urine glucose, BUN

Interventions

- ⊗ **Black box warning** Risk of suicidal ideation is increased; monitor patient accordingly.
- Monitor patient responses, blood levels (as appropriate) if any interacting drugs listed above are given with phenobarbital; suggest

alternative means of contraception to women using hormonal contraceptives.

⊗ **Warning** Do not give intra-arterially; may produce arteriospasm, thrombosis, or gangrene.

- Administer IV doses slowly at no more than 60 mg/min.
- Administer IM doses deep in a large muscle mass (gluteus maximus, vastus lateralis) or other areas where there is little risk of encountering a nerve trunk or major artery.

⊗ **Warning** Monitor injection sites carefully for irritation, extravasation (IV use). Solutions are alkaline and very irritating to the tissues. Inject 0.5% procaine at affected site if extravasation occurs; apply heat to area.

- Monitor P, BP, and respiration carefully during IV administration.
- Arrange for periodic lab tests of hematopoietic, renal, and hepatic systems during long-term therapy.

⊗ **Warning** Taper dosage gradually after repeated use, especially in patients with epilepsy. When changing from one antiepileptic to another, taper dosage of the drug being discontinued while increasing the dosage of the replacement drug.

Teaching points

- This drug will make you drowsy and less anxious; do not try to get up after you have received this drug (request assistance to sit up or move around).
- Take this drug exactly as prescribed; this drug is habit forming; its effectiveness in facilitating sleep disappears after a short time.
- Do not take this drug longer than 2 weeks (for insomnia), and do not increase the dosage without consulting your health care provider.
- Do not reduce the dosage or discontinue this drug (when used for epilepsy); abrupt discontinuation could result in a serious increase in seizures.
- Wear a medical alert tag so that emergency medical personnel will know you have epilepsy and are taking this medication.

- Avoid pregnancy while taking this drug; use a means of contraception other than hormonal contraceptives.
- You may experience these side effects: Drowsiness, dizziness, hangover, impaired thinking (may lessen after a few days; avoid driving or engaging in dangerous activities); GI upset (take drug with food); dreams, nightmares, difficulty concentrating, fatigue, nervousness (reversible).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, fever, sore throat, mouth sores, easy bruising or bleeding, nosebleed, petechiae, pregnancy, thoughts of suicide.

DANGEROUS DRUG

▷ phentolamine mesylate

(*fen tole' a meen*)

OraVerse, Rogitine (CAN)

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic blocker

Diagnostic agent

Therapeutic actions

Competitively blocks postsynaptic alpha₁-adrenergic receptors, decreasing sympathetic tone on the vasculature, dilating blood vessels, and lowering arterial BP (no longer used to treat essential hypertension because it also blocks presynaptic alpha₂-adrenergic receptors that are believed to mediate a feedback inhibition of further norepinephrine release; this accentuates the reflex tachycardia caused by the lowering of BP); use of phentolamine injection as a test for pheochromocytoma depends on the premise that a greater BP reduction will occur with pheochromocytoma than with other etiologies of hypertension.

Indications

- Pheochromocytoma: Prevention or control of hypertensive episodes that may result from stress or manipulation during preoperative preparation and surgical excision

- Pharmacologic test for pheochromocytoma (urinary assays of catecholamines, other biochemical tests have largely supplanted the phentolamine test)
- Prevention and treatment of dermal necrosis and sloughing following IV administration or extravasation of norepinephrine or dopamine
- **NEW INDICATION:** Reversal of soft-tissue anesthesia (*OraVerse*)
- Unlabeled use: Treatment of hypertensive crises secondary to interactions between MAOIs and sympathomimetic amines, or secondary to rebound hypertension on withdrawal of clonidine, propranolol, or other antihypertensives

Contraindications and cautions

- Contraindicated with hypersensitivity to phentolamine or related drugs, evidence of CAD (MI, angina, coronary insufficiency).
- Use cautiously with pregnancy, lactation.

Available forms

Powder for injection—5 mg; injection—0.4 mg/1.7 mL

Dosages

Adults

- *Prevention or control of hypertensive episodes in pheochromocytoma:* For use in preoperative reduction of elevated BP, inject 5 mg IV or IM 1–2 hr before surgery. Repeat if necessary. Administer 5 mg IV during surgery as indicated to control paroxysms of hypertension, tachycardia, respiratory depression, seizures, or other effects of epinephrine toxicity.
- *Prevention of tissue necrosis and sloughing following extravasation of IV dopamine:* Infiltrate 10–15 mL of 0.9% sodium chloride injection containing 5–10 mg of phentolamine mesylate.
- *Prevention of tissue necrosis and sloughing following extravasation of IV norepinephrine:* 10 mg phentolamine added to each liter of IV fluids containing norepinephrine.
- *Diagnosis of pheochromocytoma:* See the manufacturer’s recommendations. This test should be used only to confirm evidence and after the risks have been carefully considered.
- *Reversal of soft-tissue anesthesia:* 0.2–0.8 mg, based on amount of local anesthetic

administered, injected into anesthetized area (*OraVerse*).

Pediatric patients

- *Prevention or control of hypertensive episodes in pheochromocytoma:* For use in preoperative reduction of elevated BP, inject 1 mg IV or IM 1–2 hr before surgery. Repeat if necessary. Administer 1 mg IV during surgery as indicated to control paroxysms of hypertension, tachycardia, respiratory depression, seizures.
- *Prevention of tissue necrosis and sloughing following extravasation of IV dopamine:* Use 0.1–0.2 mg/kg up to maximum of 10 mg.
- *Reversal of soft-tissue anesthesia:* 6 yr and older weighing more than 30 kg, use adult dose with a maximum dose of 0.4 mg; 6 yr and older weighing 15–30 kg, maximum dose of 0.2 mg; younger than 6 yr, safety and efficacy not established (*OraVerse*).

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Rapid	20 min	30–45 min
IV	Immediate	2 min	15–30 min

Metabolism: Unknown; T_{1/2}: 19 min

Distribution: Unknown

Excretion: Urine

IV FACTS

Preparation: Reconstitute by adding 1 mL of sterile water for injection to the vial, producing a solution of 5 mg/mL.

Infusion: Inject slowly directly into vein or into tubing of actively running IV, each 5 mg over 1 min.

Adverse effects

- **CNS:** *Weakness, dizziness*
- **CV:** *Acute and prolonged hypotensive episodes, orthostatic hypotension, MI, cerebrovascular spasm, cerebrovascular occlusion, tachycardia, arrhythmias*
- **GI:** *Nausea, vomiting, diarrhea*
- **Other:** *Flushing, nasal stuffiness*

Interactions

★ **Drug-drug** • Decreased vasoconstrictor and hypertensive effects of epinephrine, ephedrine

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to phentolamine or related drugs, evidence of CAD, pregnancy
- **Physical:** Orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; bowel sounds, normal output

Interventions

- Administer *OraVerse* following the dental procedure, using same locations as local anesthetic.
- Change positions slowly.
- Monitor BP response and HR carefully.

Teaching points

- Report dizziness, palpitations.

DANGEROUS DRUG**phenylephrine hydrochloride***(fen ill ef' rin)***Parenteral:** Neo-Synephrine**Oral:** AH-chew D, Sudafed PE**Oral drops:** Little Colds

Decongestant for Infants & Children, PediaCare Children's Decongestant

Topical OTC nasal**decongestants:** Little Noses

Gentle Formula, Neo-Synephrine, Rhinall, Vicks Sinex Ultra Fine Mist

Strips: Sudafed PE Quick-Dissolve, Thin Strips Decongestant; Triaminic Thin Strips Cold**Ophthalmic preparations****(0.12% solutions are OTC):**

AK-Dilate, Mydrfrin, Neo-Synephrine, Relief

PREGNANCY CATEGORY C**Drug classes**

Alpha-adrenergic agonist

Nasal decongestant

Ophthalmic vasoconstrictor or mydriatic

Sympathomimetic amine

Vasopressor

Therapeutic actions

Powerful postsynaptic alpha-adrenergic receptor stimulant that causes vasoconstriction and increased systolic and diastolic BP with little effect on the beta receptors of the heart. Topical application causes vasoconstriction of the mucous membranes, which in turn relieves pressure and promotes drainage of the nasal passages. Topical ophthalmic application causes contraction of the dilator muscles of the pupil (mydriasis), vasoconstriction, and increased outflow of aqueous humor.

Indications**Parenteral**

- Treatment of vascular failure in shock, shocklike states, drug-induced hypotension, or hypersensitivity
- To overcome paroxysmal supraventricular tachycardia
- To prolong spinal anesthesia
- Vasoconstrictor in regional anesthesia
- To maintain an adequate level of BP during spinal and inhalation anesthesia

Nasal solution and oral

- Symptomatic relief of nasal and nasopharyngeal mucosal congestion due to the common cold, sinusitis, hay fever, or other respiratory allergies
- Adjunctive therapy of middle ear infections by decreasing congestion around the eustachian ostia

Ophthalmic solution

- 10% solution: Decongestant and vasoconstrictor and for pupil dilation in uveitis, wide-angle glaucoma, and surgery
- 2.5% solution: Decongestant and vasoconstrictor and for pupil dilation in uveitis, open-angle glaucoma in conjunction with miotics, refraction, ophthalmoscopic examination, diagnostic procedures, and before intraocular surgery
- 0.12% solution: Decongestant to provide temporary relief of minor eye irritations caused by hay fever, colds, dust, wind, smog, or hard contact lenses

Contraindications and cautions

- Contraindicated with hypersensitivity to phenylephrine or sulfites; severe hypertension, ventricular tachycardia; narrow-angle glaucoma.
- Use cautiously with thyrotoxicosis, diabetes, hypertension, CV disorders; prostatic hypertrophy, unstable vasomotor syndrome; lactation, pregnancy.

Available forms

Chewable tablets—10 mg; tablets—10 mg; oral drops—2.5 mg/mL, 7.5 mg/5 mL; strips—1.25, 2.5, 10 mg; nasal solution—0.125%, 0.25%, 0.5%, 1%; ophthalmic solution—0.12%, 2.5%, 10%; injection—10 mg/mL

Dosages

Parenteral preparations may be given IM, subcutaneously, by slow IV injection, or as a continuous IV infusion of dilute solutions; for supraventricular tachycardia and emergency use, give by direct IV injection.

Adults

Parenteral

- *Mild to moderate hypotension (adjust dosage on basis of BP response):* 1–10 mg subcutaneously or IM; do not exceed an initial dose of 5 mg. A 5-mg IM dose should raise BP for 1–2 hr. Or for IV use, 0.1–0.5 mg IV. Initial dose should not exceed 0.5 mg. Do not repeat more often than every 10–15 min. 0.5 mg IV should raise the pressure for 15 min.
- *Severe hypotension and shock:* For continuous infusion, add 10 mg to 500 mL of dextrose injection or sodium chloride injection. Start infusion at 100–180 mcg/min (based on a drop factor of 20 drops/mL; this would be 100–180 drops/min). When BP is stabilized, maintain at 40–60 mcg/min. If prompt vasopressor response is not obtained, add 10-mg increments to infusion bottle.
- *Spinal anesthesia:* 2–3 mg subcutaneously or IM 3–4 min before injection of spinal anesthetic.
- *Hypotensive emergencies during anesthesia:* Give 0.2 mg IV. Do not exceed 0.5 mg/dose.
- *Prolongation of spinal anesthesia:* Addition of 2–5 mg to the anesthetic solution increases the duration of motor block by as much as 50%.

- *Vasoconstrictor for regional anesthesia:* 1:20,000 concentration (add 1 mg of phenylephrine to every 20 mL of local anesthetic solution).
- *Paroxysmal supraventricular tachycardia:* Rapid IV injection (within 20–30 sec) is recommended. Do not exceed an initial dose of 0.5 mg. Subsequent doses should not exceed the preceding dose by more than 0.1–0.2 mg and should never exceed 1 mg. Use only after other treatments have failed.

Nasal solution

- *Nasal congestion:* 2–3 sprays or drops of the 0.25% or 0.5% solution in each nostril every 3–4 hr. In severe cases, the 0.5% or 1% solution may be needed; 10 mg PO bid–qid.

Ophthalmic solution

- *Vasoconstriction and pupil dilation:* 1 drop of 2.5% or 10% solution on the upper limbus. May be repeated in 1 hr. Precede instillation with a local anesthetic to prevent tearing and dilution of the drug solution.
- *Uveitis to prevent posterior synechiae:* 1 drop of the 2.5% or 10% solution on the surface of the cornea with atropine.
- *Glaucoma:* 1 drop of 2.5% or 10% solution on the upper surface of the cornea repeated as often as necessary and in conjunction with miotics in patients with wide-angle glaucoma.
- *Intraocular surgery:* 2.5% or 10% solution may be instilled in the eye 30–60 min before the operation.
- *Refraction:* 1 drop of a cycloplegic drug followed in 5 min by 1 drop of phenylephrine 2.5% solution and in 10 min by another drop of the cycloplegic.
- *Ophthalmoscopic examination:* 1 drop of 2.5% phenylephrine solution in each eye. Mydriasis is produced in 15–30 min and lasts for 4–6 hr.
- *Minor eye irritation:* 1–2 drops of the 0.12% solution in eye bid–qid as needed.

Oral

- *Nasal congestion:* 1 to 2 tablets every 4 hr. Strips: 1 strip every 4 hr; do not exceed 6 strips in 24 hr. Place 1 strip on tongue and let dissolve. Liquid: 10 mL every 6 hr.

Pediatric patients

Parenteral

- *Hypotension during spinal anesthesia:* 0.5–1 mg/25 lb subcutaneously or IM.

Nasal solution• **Nasal congestion:**

2–6 yr: 2–3 drops of 0.125% solution in each nostril every 4 hr, prn.

Older than 6 yr: 2–3 sprays of the 0.25% solution in each nostril no more than every 4 hr.

Ophthalmic solution

- **Refraction:** 1 drop of atropine sulfate 1% in each eye. Follow in 10–15 min with 1 drop of phenylephrine 2.5% solution and in 5–10 min with a second drop of atropine. Eyes will be ready for refraction in 1–2 hr.

Oral• **Nasal congestion:**

Children 2–5 yr: 1 dropperful (5 mL or 2.5 mg) of 0.25% oral drops every 4 hr; do not exceed 6 doses (30 mL) in 24 hr.

Children 6–11 yr: 1 tablet every 4 hr.

Geriatric patients

These patients are more likely to experience adverse reactions; use with caution.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	15–20 min
IM, Subcut.	10–15 min	30–120 min

Topical form is generally not absorbed systemically.

Metabolism: Hepatic and tissue; $T_{1/2}$: 47–100 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

IV FACTS

Preparation: Inject directly for emergency use as a 1 mg/mL solution; dilute phenylephrine 1 mg/L is compatible with dextrose-Ringer's combinations; dextrose-lactated Ringer's combinations; dextrose-saline combinations; dextrose 2.5%, 5%, and 10% in water; Ringer's injection; lactated Ringer's injection; 0.45% and 0.9% sodium chloride injection; 1/6 M sodium lactate injection.

Infusion: Give single dose over 20–30 sec to 1 min. Determine actual rate of continuous infusion using an infusion pump by patient

response. For infusion, add 10 mg phenylephrine to 500 mg of diluent.

Adverse effects

Adverse effects are less likely with topical administration.

Systemic administration

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, symptoms of paranoid schizophrenia*
- **CV: Cardiac arrhythmias**
- **GI:** *Nausea, vomiting, anorexia*
- **GU:** Constriction of renal blood vessels and *decreased urine formation* (initial parenteral administration), *dysuria, vesical sphincter spasm* resulting in difficult and painful urination, urinary retention in males with prostatism
- **Local:** Necrosis and sloughing if extravasation occurs with IV use
- **Other:** *Pallor, respiratory difficulty, orofacial dystonia, sweating*

Nasal solution

- **EENT:** *Blurred vision, ocular irritation, tearing, photophobia*
- **Local:** *Rebound congestion, local burning and stinging, sneezing, dryness, contact dermatitis*

Ophthalmic solutions

- **CNS:** *Headache, browache, blurred vision, photophobia, difficulty with night vision, pigmentary (adrenochrome) deposits in the cornea, conjunctiva, or lids if applied to damaged cornea*
- **Local:** *Transitory stinging on initial instillation*
- **Other:** Rebound miosis, decreased mydriatic response in older patients; significant BP elevation in compromised elderly patients with cardiac problems

Interactions

- **Drug-drug** ⊗ **Warning** Severe headache, hypertension, hyperpyrexia, possibly resulting in hypertensive crisis with MAOIs (isocarboxazid, phenelzine, tranylcypromine). Do

not administer sympathomimetic amines to patients on MAOIs.

• Increased sympathomimetic effects with TCAs (eg, imipramine) • Excessive hypertension with furazolidone • Decreased antihypertensive effect of methyldopa • Potential for serious arrhythmias with halogenated hydrocarbon anesthetics

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to phenylephrine; severe hypertension, ventricular tachycardia; narrow-angle glaucoma; thyrotoxicosis; diabetes; CV disorders; prostatic hypertrophy; unstable vasomotor syndrome; pregnancy; lactation; sulfite sensitivity
- **Physical:** Skin color, T; orientation, reflexes, affect, peripheral sensation, vision, pupils; BP, P, auscultation, peripheral perfusion; R, adventitious sounds; urinary output, bladder percussion, prostate palpation; ECG

Interventions

⊗ **Warning** Protect parenteral solution from light; do not administer unless solution is clear; discard unused portion.

⊗ **Warning** Keep an alpha-adrenergic blocking agent readily available in case of severe reaction or overdose.

⊗ **Warning** Infiltrate area of extravasation with phentolamine (5–10 mg in 10–15 mL of saline), using a fine hypodermic needle; usually effective if area is infiltrated within 12 hr of extravasation.

- Monitor P, BP continuously during parenteral administration.
- Ensure that patient is hydrated during therapy.
- Do not administer ophthalmic solution that has turned brown or contains precipitates; prevent prolonged exposure to air and light.
- Administer ophthalmic solution as follows: Have patient lie down or tilt head backward and look at ceiling. Hold dropper above eye; drop medicine inside lower lid while patient is looking up. Do not touch dropper to eye, fingers, or any surface. Have patient keep eye open and avoid blinking for at least 30 sec. Apply gentle pressure with fingers to inside corner of the eye for about 1 min. Caution

patient not to close eyes tightly and not to blink more often than usual.

- Do not administer other eye drops for at least 5 min after phenylephrine.
- Do not administer nasal decongestant for longer than 3–5 days.
- Do not administer ophthalmic solution for longer than 72 hr.
- Monitor BP and cardiac response regularly in patients with any CV disorders.
- Use topical anesthetics if ophthalmic preparations are painful and burning.
- Monitor CV effects carefully; patients with hypertension who take this drug may experience changes in BP because of the additional vasoconstriction. If a nasal decongestant is needed, pseudoephedrine is the drug of choice.

Teaching points

- Do not exceed recommended dose. Demonstrate proper use of topical nasal and ophthalmic preparations to your health care provider.
- Avoid prolonged use, because underlying medical problems can be disguised. Usual limit is 3–5 days for nasal decongestant, 72 hours for ophthalmic preparations.
- You may experience these side effects: Dizziness, drowsiness, fatigue, apprehension (use caution if driving or performing tasks that require alertness); *nasal solution*—burning or stinging when first used (transient); *ophthalmic solution*—slight stinging when first used (usually transient); blurring of vision.
- Report nervousness, palpitations, sleeplessness, sweating; *ophthalmic solution*—severe eye pain, vision changes, floating spots, eye redness or sensitivity to light, headache.

▽ **phenytoin**
(diphenylhydantoin,
phenytoin sodium)
(*fen' i toe in*)

Dilantin-125, Dilantin Infatab,
Dilantin Injection, Phenytek

PREGNANCY CATEGORY D

Drug classes

Antiarrhythmic, group 1b
Antiepileptic
Hydantoin

Therapeutic actions

Has antiepileptic activity without causing general CNS depression; stabilizes neuronal membranes and prevents hyperexcitability caused by excessive stimulation; limits the spread of seizure activity from an active focus; also effective in treating cardiac arrhythmias, especially those induced by cardiac glycosides; antiarrhythmic properties are very similar to those of lidocaine; both are class IB antiarrhythmics.

Indications

- Control of grand mal (tonic-clonic) and psychomotor seizures
- Prevention and treatment of seizures occurring during or following neurosurgery
- Parenteral administration: Control of status epilepticus of the grand mal type
- Unlabeled uses: Antiarrhythmic, particularly in arrhythmias induced by cardiac glycosides (IV preparations); treatment of trigeminal neuralgia (tic douloureux); rectal administration

Contraindications and cautions

- Contraindicated with hypersensitivity to hydantoins, sinus bradycardia, sinoatrial block, Stokes-Adams syndrome, pregnancy (data suggest an association between antiepileptic use and an elevated incidence of birth defects; however, do not discontinue antiepileptic therapy in pregnant women who are receiving such therapy to prevent major seizures; stopping drug is likely to precipitate status epilepticus, with attendant hypoxia and risk to both mother and fetus), lactation.
- Use cautiously with acute intermittent porphyria, hypotension, severe myocardial insufficiency, diabetes mellitus, hyperglycemia.

Available forms

Chewable tablets—50 mg; oral suspension—125 mg/5 mL; ER capsules—30, 100, 200, 300 mg; injection—50 mg/mL

Dosages**Adults*****Phenytoin sodium, parenteral***

- *Status epilepticus*: 10–15 mg/kg by slow IV. For maintenance, 100 mg PO or IV every 6–8 hr. Higher doses may be required. Do not exceed an infusion rate of 50 mg/min. Follow each IV injection with an injection of sterile saline through the same needle or IV catheter to avoid local venous irritation by the alkaline solution. Continuous IV infusion is not recommended.
- *Neurosurgery (prophylaxis)*: 100–200 mg IM every 4 hr during surgery and the postoperative period (IM route is not recommended because of erratic absorption, pain, and muscle damage at the injection site).
- *IM therapy in a patient previously stabilized on oral dosage*: Increase dosage by 50% over oral dosage. When returning to oral dosage, decrease dose by 50% of the original oral dose for 1 wk to prevent excessive plasma levels due to continued absorption from IM tissue sites. Avoid IM route of administration if possible due to erratic absorption and pain and muscle damage at injection site.

Phenytoin and phenytoin sodium, oral

Individualize dosage. Determine serum levels for optimal dosage adjustments. The clinically effective serum level is usually between 10 and 20 mcg/mL.

- *Loading dose (hospitalized patients without renal or liver disease)*: Initially, 1 g of phenytoin capsules (phenytoin sodium, prompt) is divided into three doses (400 mg, 300 mg, 300 mg) and given every 2 hr. Normal maintenance dosage is then instituted 24 hr after the loading dose with frequent serum determinations.
- *No previous treatment*: Start with 100 mg tid PO. Satisfactory maintenance dosage is usually 300–400 mg/day. An increase to 600 mg/day may be needed.
- *Single daily dosage (phenytoin sodium, extended)*: If seizure control is established with divided doses of three 100-mg extended phenytoin sodium capsules per day, once-a-day dosage with 300 mg PO may be considered. Do not use prompt phenytoin

capsules, suspension, or chewable tablets for once-daily dosing.

Pediatric patients

Phenytoin sodium, parenteral

• **Status epilepticus:** Administer phenytoin IV. Determine dosage according to weight in proportion to dose for a 70-kg adult (see adult dosage earlier on this page; see Appendix I, *Calculating pediatric dosages*). Pediatric dosage may be calculated on the basis of 250 mg/m². Dosage for infants and children also may be calculated on the basis of 10–15 mg/kg, given in divided doses of 5–10 mg/kg. For neonates, 15–20 mg/kg in divided doses of 5–10 mg/kg is recommended.

Phenytoin and phenytoin sodium, oral

Children not previously treated: Initially, 5 mg/kg/day in two to three equally divided doses. Subsequent dosage should be individualized to a maximum of 300 mg/day. Daily maintenance dosage is 4–8 mg/kg. Children older than 6 yr may require the minimum adult dose of 300 mg/day.

Geriatric patients and patients with hepatic impairment

Use caution and monitor for early signs of toxicity; phenytoin is metabolized in the liver.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	2–12 hr	6–12 hr
IV	1–2 hr	Rapid	12–24 hr

Metabolism: Hepatic; T_{1/2}: 6–24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Administration by IV infusion is not recommended because of low solubility of drug and likelihood of precipitation; however, this may be feasible if proper precautions are observed. Use suitable vehicle of 0.9% sodium chloride or lactated Ringer's injection, appropriate concentration (less than 6.7 mg/mL); prepare immediately before administration, and use an in-line filter.

⊗ **Black box warning** Drug must be administered slowly; for adults, do not exceed 50 mg/min; for neonates, do not exceed 1–3 mg/kg min.

Infusion: Infuse slowly in small increments, each 25–50 mg over 1–5 min; infuse flush immediately after drug to reduce the risk of damage to vein and tissues.

Incompatibilities: Do not combine with other medications in solution.

Y-site incompatibility: Do not give with amphotericin B, ciprofloxacin, clarithromycin, diltiazem, enalaprilat, fentanyl, gatifloxacin, heparin, heparin with hydrocortisone, hydromorphone, linezolid, methadone, morphine, potassium, propofol, sufentanil, theophylline, vitamin B complex with C.

Adverse effects

Some adverse effects are related to plasma concentrations, as follows:

Plasma Concentration	Adverse Effects
5–10 mcg/mL	Some therapeutic effects
10–20 mcg/mL	Usual therapeutic range
More than 20 mcg/mL	Far-lateral nystagmus risk
More than 30 mcg/mL	Ataxia is usually seen
More than 40 mcg/mL	Significantly diminished mental capacity

- **CNS:** *Nystagmus, ataxia, dysarthria, slurred speech, mental confusion, dizziness, drowsiness, insomnia, transient nervousness, motor twitches, fatigue, irritability, depression, numbness, tremor, headache, photophobia, diplopia, conjunctivitis, suicidal ideation*
- **CV: CV collapse,** hypotension (when administered rapidly IV; not to exceed 50 mg/min)
- **Dermatologic:** Dermatologic reactions, scarlatiniform, morbilliform, maculopapular, urticarial and nonspecific rashes; serious and sometimes fatal dermatologic reactions—**bullous, exfoliative, or purpuric dermatitis, lupus erythematosus, and Stevens-Johnson syndrome,** toxic epidermal necrolysis, hirsutism, alopecia, coarsening of the facial features, enlargement of the lips, Peyronie's disease
- **GI:** *Nausea, vomiting, diarrhea, constipation, gingival hyperplasia, toxic hepatitis,*

liver damage, sometimes fatal; hypersensitivity reactions with hepatic involvement, including hepatocellular degeneration and fatal hepatocellular necrosis

- **GU:** Nephrosis
- **Hematologic: Hematopoietic complications**, sometimes fatal: thrombocytopenia, leukopenia, granulocytopenia, agranulocytosis, pancytopenia; macrocytosis and megaloblastic anemia that usually respond to folic acid therapy; eosinophilia, monocytosis, leukocytosis, simple anemia, hemolytic anemia, aplastic anemia, hyperglycemia
- **IV use complications:** Hypotension, transient hyperkinesia, drowsiness, nystagmus, circumoral tingling, vertigo, nausea, CV collapse, CNS depression
- **Respiratory:** Pulmonary fibrosis, acute pneumonitis
- **Other:** Lymph node hyperplasia, sometimes progressing to **frank malignant lymphoma**, monoclonal gammopathy and multiple myeloma (prolonged therapy), polyarthropathy, osteomalacia, weight gain, chest pain, periarteritis nodosa

Interactions

• **Drug-drug** • Increased pharmacologic effects with allopurinol, benzodiazepines, chloramphenicol, cimetidine, disulfiram, ethanol (acute ingestion), isoniazid, metronidazole, miconazole, omeprazole, phenacemide, phenylbutazone, sulfonamides, trimethoprim • Complex interactions and effects when phenytoin and valproic acid are given together; phenytoin toxicity with apparently normal serum phenytoin levels; decreased plasma levels of valproic acid; breakthrough seizures when the two drugs are given together • Decreased pharmacologic effects with antineoplastics, diazoxide, ethanol (chronic ingestion), folic acid, loxapine, nitrofurantoin, pyridoxime, sucralfate, rifampin, theophylline (applies only to oral hydantoins, absorption of which is decreased) • Increased pharmacologic effects and toxicity with amiodarone, chloramphenicol, fluconazole, isoniazid • Increased pharmacologic effect of primidone • Increased hepatotoxicity with acetaminophen • Decreased pharmacologic effects of amiodarone, cardiac

glycosides, corticosteroids, cyclosporine, disopyramide, doxycycline, estrogens, furosemide, haloperidol, levodopa, methadone, metyrapone, mexiletine, phenothiazide, sulfonyleureas, hormonal contraceptives, quinidine, atracurium, pancuronium, vecuronium, carbamazepine, diazoxide • Severe hypotension and bradycardia when IV phenytoin is given with dopamine

• **Drug-lab test** • Interference with the metyrapone and the 1-mg dexamethasone tests for at least 7 days

• **Drug-food** • Enteral tube feedings may delay absorption of drug. Provide a 2-hr window between *Dilantin* doses and tube feedings

Nursing considerations

Assessment

- **History:** Hypersensitivity to hydantoins, sinus bradycardia, AV heart block, Stokes-Adams syndrome, acute intermittent porphyria, hypotension, severe myocardial insufficiency, diabetes mellitus, hyperglycemia, pregnancy, lactation
- **Physical:** T; skin color, lesions; lymph node palpation; orientation, affect, reflexes, vision examination; P, BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; periodontal examination; LFTs, urinalysis, CBC and differential, blood proteins, blood and urine glucose, EEG, ECG

Interventions

- Use only clear parenteral solutions; a faint yellow color may develop, but this has no effect on potency. If the solution is refrigerated or frozen, a precipitate might form, but it will dissolve if the solution is allowed to stand at room temperature. Do not use solutions that have haziness or a precipitate.

⊗ **Black box warning** Administer IV slowly to prevent severe hypotension and venous irritation; the margin of safety between full therapeutic and toxic doses is small. Continually monitor patient's cardiac rhythm and check BP frequently and regularly during IV infusion. Suggest use of fosphenytoin sodium if IV route is needed.

- Monitor injection sites carefully; drug solutions are very alkaline and irritating.

⊗ **Warning** Monitor for therapeutic serum levels of 10–20 mcg/mL.

- Give oral drug with or without food in a consistent manner. Give with food if patient complains of GI upset.
- Recommend that the oral phenytoin prescription be filled with the same brand each time; differences in bioavailability have been documented.
- Suggest that adult patients who are controlled with 300-mg extended phenytoin capsules try once-a-day dosage to increase compliance and convenience.
- ⊗ **Warning** Reduce dosage, discontinue phenytoin, or substitute other antiepileptic gradually; abrupt discontinuation may precipitate status epilepticus.
- Phenytoin is ineffective in controlling absence (petit mal) seizures. Patients with combined seizures will need other medication for their absence seizures.
- ⊗ **Warning** Discontinue drug if rash, depression of blood count, enlarged lymph nodes, hypersensitivity reaction, signs of liver damage, or Peyronie's disease (induration of the corpora cavernosa of the penis) occurs. Institute another antiepileptic promptly.
- Monitor hepatic function periodically during long-term therapy; monitor blood counts and urinalysis monthly.
- Monitor blood or urine sugar of patients with diabetes mellitus regularly. Adjustment of dosage of hypoglycemic patients may be needed because antiepileptic may inhibit insulin release and induce hyperglycemia.
- Monitor patient for suicidality, thoughts of suicide; patient may be at increased risk.
- ⊗ **Warning** Have lymph node enlargement occurring during therapy evaluated carefully. Lymphadenopathy that simulates Hodgkin's lymphoma has occurred. Lymph node hyperplasia may progress to lymphoma.
- Monitor blood proteins to detect early malfunction of the immune system (eg, multiple myeloma).
- Arrange instruction in proper oral hygiene technique for long-term patients to prevent development of gum hyperplasia.

Teaching points

- Take this drug exactly as prescribed, with food to reduce GI upset, or without food—

but maintain consistency in the manner in which you take it. Be especially careful not to miss a dose if you are on once-a-day therapy.

- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Maintain good oral hygiene (regular brushing and flossing) to prevent gum disease; arrange frequent dental checkups to prevent serious gum disease.
- Arrange for frequent checkups to monitor your response to this drug.
- Monitor your blood or urine sugar regularly, and report any abnormality to your health care provider if you have diabetes.
- This drug is not recommended for use during pregnancy. It is advisable to use some form of contraception other than hormonal contraceptives.
- Wear or carry a medical alert tag so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or performing other tasks requiring alertness or visual acuity; alcohol may intensify these effects); GI upset (take drug with food, eat frequent small meals).
- Report rash, severe nausea or vomiting, drowsiness, slurred speech, impaired coordination (ataxia), swollen glands, bleeding, swollen or tender gums, yellowish discoloration of the skin or eyes, joint pain, unexplained fever, sore throat, unusual bleeding or bruising, persistent headache, malaise, any indication of an infection or bleeding tendency, abnormal erection, pregnancy, thoughts of suicide.

pilocarpine hydrochloride

See Appendix U, *Less commonly used drugs*.

pimozide

See Appendix U, *Less commonly used drugs*.

pindolol*(pin' doe lole)*

Apo-Pindol (CAN), Gen-Pindolol (CAN), Nu-Pindol (CAN), Visken

PREGNANCY CATEGORY B

Drug classes

Antihypertensive

Beta-adrenergic blocker (nonselective)

Therapeutic actions

Competitively blocks beta-adrenergic receptors but also has some intrinsic sympathomimetic activity; however, the mechanism by which it lowers BP is unclear, because it only slightly decreases resting cardiac output and inconsistently affects plasma renin levels.

Indications

- Management of hypertension, alone or with other drugs, especially diuretics
- Unlabeled uses: Treatment of fibromyalgia; prevention of migraine; traumatic brain injury

Contraindications and cautions

- Contraindicated with sinus bradycardia, second- or third-degree heart block, cardiogenic shock, HF, bronchial asthma, severe COPD, pregnancy (embryotoxic in preclinical studies), lactation.
- Use cautiously with diabetes, thyrotoxicosis.

Available forms

Tablets—5, 10 mg

Dosages**Adults**

Initially, 5 mg PO bid. Adjust dosage as needed in increments of 10 mg/day at 3- to 4-wk intervals to a maximum of 60 mg/day. Usual maintenance dose is 5 mg tid.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Urine**Adverse effects**

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** *Dizziness*, vertigo, tinnitus, *fatigue*, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** *Bradycardia*, *HF*, *cardiac arrhythmias*, *sinoatrial or AV nodal block*, *tachycardia*, peripheral vascular insufficiency, claudication, **stroke**, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain*, *flatulence*, *constipation*, *diarrhea*, *nausea*, *vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence*, *decreased libido*, Peyronie's disease, dysuria, nocturia, urinary frequency
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance*, *development of ANAs*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH

Interactions

- *** Drug-drug** • Increased effects with verapamil • Decreased effects with indomethacin, ibuprofen, naproxen, piroxicam, sulindac
- Prolonged hypoglycemic effects of insulin
- Peripheral ischemia possible if pindolol combined with ergot alkaloids
- Initial hypertensive episode followed by bradycardia with epinephrine
- Increased first-dose response to prazosin
- Increased serum levels and toxic effects with lidocaine
- Paradoxical hypertension when clonidine is given with beta blockers; increased

rebound hypertension when clonidine is discontinued in patients on beta-blockers • Decreased bronchodilator effects of theophyllines
 * **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between pindolol and Plendil (felodipine); use caution.

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, HF, diabetes, thyrotoxicosis, asthma, pregnancy, lactation
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function, blood and urine glucose

Interventions

- ⊗ **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult with surgeon about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Do not stop taking this drug unless instructed to do so by your health care provider. The drug cannot be stopped suddenly; it needs to be tapered down.
- Avoid driving or dangerous activities if you are drowsy or dizzy.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

⚠ DANGEROUS DRUG

▶ **pioglitazone**
 (pie oh *glit'* ah zohn)

Actos, Apo-Pioglitazone (CAN),
 ratio-Pioglitazone (CAN)

PREGNANCY CATEGORY C

Drug classes

Antidiabetic
 Thiazolidinedione

Therapeutic actions

Resensitizes tissues to insulin; stimulates insulin receptor sites to lower blood glucose and improve the action of insulin; decreases hepatic gluconeogenesis and increases insulin-dependent muscle glucose uptake.

Indications

- Monotherapy as an adjunct to diet and exercise to improve glucose control in patients with type 2 diabetes
- As part of combination with a sulfonylurea, metformin, or insulin when diet, exercise plus a single agent alone does not result in adequate glycemic control in type 2 diabetes
- **NEW INDICATION:** Unlabeled uses: Polycystic ovarian syndrome; prevention of stent restenosis

Contraindications and cautions

- Contraindicated with allergy to any thiazolidinedione, type 1 diabetes, ketoacidosis, New York Heart Association Class III or IV HF, lactation.
- Use cautiously with advanced heart disease, liver failure, pregnancy.

Available forms

Tablets—15, 30, 45 mg

Dosages

Adults

15–30 mg daily as a single oral dose; if adequate response is not seen, dosage may be increased to a maximum 45 mg daily PO.

- **Combination therapy with sulfonylurea or metformin:** 15–30 mg daily PO added to the established dose of the other agent; if hypoglycemia occurs, reduce the dose of the other agent.
- **Combination therapy with insulin:** Initiate pioglitazone at 15 or 30 mg while maintaining insulin dose. Decrease insulin dose by 10%–25% if hypoglycemic or if glucose is less than 100 mg/dL.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Use caution and monitor patient closely. Do not administer if ALT exceeds 2.5 times the upper limit of normal.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 3–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, pain, myalgia*
- **CV:** Fluid retention, HF
- **Endocrine:** **Hypoglycemia, hyperglycemia, aggravated diabetes**
- **GI:** Diarrhea, liver injury
- **Respiratory:** Sinusitis, URI, rhinitis
- **Other:** *Infections, fatigue*, tooth disorders

Interactions

- * **Drug-drug** • Decreased effectiveness of hormonal contraceptives, which may result in ovulation and risk of pregnancy; suggest the use of an alternative method of birth control or consider a higher dose of the contraceptive
- * **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has been reported between *Actos* (pioglitazone) and *Actonel* (risedronate); use caution.

Assessment

- **History:** Allergy to any thiazolidinedione, type 1 diabetes, ketoacidosis, serious hepatic impairment, advanced heart disease, pregnancy, lactation
- **Physical:** T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation; LFTs, blood glucose, CBC

Interventions

- Monitor baseline LFTs before beginning therapy and periodically during therapy.
- Monitor urine or blood glucose levels frequently to determine effectiveness of drug and dosage being used.

⊗ **Black box warning** Thiazolidinediones cause or worsen HF in some patients, and pioglitazone is not recommended for patients with symptomatic heart failure (contraindicated in New York Heart Association Class III and IV HF). After starting or increasing pioglitazone, watch carefully for signs or symptoms of HF. If they develop, manage HF according to current standards of care. Pioglitazone may be reduced or discontinued.

- Administer without regard to meals.
- Arrange for consultation with dietitian to establish weight loss program and dietary control as appropriate.
- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.

Teaching points

- Do not discontinue this medication without consulting your health care provider; continue with your diet and exercise program for diabetes control.
- Take this drug without regard to meals. If a dose is missed, it may be taken at the next scheduled time. If dose is missed for an entire day, do not take a double dose the next day.
- Monitor urine or blood very closely for glucose and ketones as prescribed while adjusting to drug.
- Use barrier contraceptives if currently using hormonal contraceptives; these contraceptives may be ineffective if combined with pioglitazone.
- Report fever, sore throat, unusual bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions, swelling, difficulty breathing.

piroxicam

(peer ox' i kam)

Apo-Piroxicam (CAN), Feldene,
Gen-Piroxicam (CAN)

PREGNANCY CATEGORY C

Drug class

NSAID (oxicam derivative)

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Relief of the signs and symptoms of acute and chronic rheumatoid arthritis and osteoarthritis
- Unlabeled uses: Dysmenorrhea, postoperative and postpartum pain

Contraindications and cautions

- Contraindicated with hypersensitivity to piroxicam or any other NSAID, for perioperative pain in CABG surgery, lactation.
- Use cautiously in the elderly and with renal, hepatic, CV, GI conditions; pregnancy; HE.

Available forms

Capsules—10, 20 mg

Dosages

Adults

Single daily dose of 20 mg PO. Dose may be divided. Steady-state blood levels are not achieved for 7–12 days. Therapeutic response occurs early but progresses over several wk; do not evaluate for 2 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, dizziness, somnolence, insomnia, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** Nausea, dyspepsia, GI pain, diarrhea, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, aplastic anemia, thrombocytopenia, agranulocytosis, granulocytopenia, decreased Hgb or Hct, bone marrow depression, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema, anaphylactoid reactions to anaphylactic shock

Interactions

★ **Drug-drug** • Increased serum lithium levels and risk of toxicity • Decreased antihypertensive effects of beta blockers • Decreased therapeutic effects with cholestyramine

■ Nursing considerations

Assessment

- **History:** Allergies; renal, hepatic, CV, GI conditions; history of ulcers; pregnancy; lactation
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV event, GI bleeding; monitor accordingly.

- Give drug with food or milk if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures (gastric lavage, induction of emesis, supportive therapy).

Teaching points

- Take drug with food or meals if GI upset occurs.

- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black, tarry stools.

pitavastatin

(*pih ta' vah sta' tin*)

Livalo

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic

HMG-CoA reductase inhibitor

Therapeutic actions

Inhibits HMG-CoA reductase, the enzyme that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs (associated with increased risk of CAD), and increased serum HDLs (associated with decreased CAD risk); increases hepatic LDL recapture sites and enhances reuptake and catabolism of LDL; lowers triglyceride levels.

Indications

- As adjunctive therapy to exercise and diet to reduce elevated total cholesterol, LDLs, apolipoprotein B, and triglycerides and increase HDL in patients with primary hyperlipidemia and mixed dyslipidemia

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, active liver disease, concurrent use of cyclosporine, pregnancy, lactation.
- Use cautiously with advanced age, renal impairment, hypothyroidism, concurrent use of fibrates.

Available forms

Tablets—1, 2, 4 mg

Dosages

Adults

Starting dosage, 2 mg/day PO; may increase to a maximum of 4 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with moderate to end-stage renal impairment on hemodialysis

1 mg/day PO; maximum dosage is 2 mg/day. Do not give to patients with severe renal impairment not yet on dialysis.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces

Adverse effects

- **CNS:** Headache
- **GI:** Liver enzyme abnormalities, diarrhea, constipation
- **Respiratory:** Nasal pharyngitis
- **Other:** **Rhabdomyolysis**, *back pain*, myalgia, flulike symptoms, rash

Interactions

- *** Drug-drug** • Increased serum levels and risk of toxicity with cyclosporine, lopinavir/ritonavir; avoid these combinations • Increased serum levels and risk of toxic effects with erythromycin; limit dosage to 1 mg/day if this combination is used • Increased serum levels and risk of toxic effects with rifampin; limit dosage to 2 mg/day if this combination is used • Potential increased risk of myopathy if taken with fibrates, niacin; if this combination is used, monitor patient closely and use caution • Increased risk of liver damage if taken with large amounts of alcohol; monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, active liver disease, renal impairment,

hypothyroidism, history of other drugs being used

- **Physical:** Weight; reflexes; R; LFTs, lipid profile

Interventions

- Obtain LFTs before beginning therapy, at 12 wk following start of therapy or with dosage elevations, then semiannually.
- Administer at any time of day, without regard to food.
- Ensure that patient continues a diet and exercise program.
- Suggest the use of contraceptive measures for women of childbearing age.
- Advise patient to select another method of feeding the baby if nursing.
- Advise patient to promptly notify health care provider if unexplained muscle pain, tenderness, or weakness occurs.

Teaching points

- Take this drug once a day without regard to food, exactly as prescribed.
- Continue the diet and exercise program prescribed for lowering your lipid levels.
- If you miss a dose, take the next dose as soon as you remember. Do not take more than the prescribed amount each day.
- This drug could harm a fetus; the use of contraceptive measures is recommended. If you become pregnant or wish to become pregnant, consult your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for serious adverse effects in an infant, you should use another method of feeding the baby while you are taking this drug.
- You will need periodic blood tests to monitor your lipid levels and your liver.
- You may experience these side effects: Headache, muscle aches, runny nose.
- Report unexplained muscle pain, tenderness, or weakness; fever; changes in color of urine or stool.

▶ plasma kallikrein inhibitor

See Appendix U, *Less commonly used drugs*.

▶ plasma protein fraction

Plasmanate, Plasma-Plex, Plasmatein, Protenate

PREGNANCY CATEGORY C

Drug classes

Blood product
Plasma protein

Therapeutic actions

Maintains plasma colloid osmotic pressure and carries intermediate metabolites in the transport and exchange of tissue products; important in the maintenance of normal blood volume.

Indications

- Supportive treatment of shock due to burns, trauma, surgery, and infections
- Hypoproteinemia—nephrotic syndrome, hepatic cirrhosis, toxemia of pregnancy, postoperative patients, tuberculous patients, acute respiratory distress syndrome (ARDS), renal dialysis
- Acute liver failure
- Sequestration of protein-rich fluids
- Hyperbilirubinemia and erythroblastosis fetalis as an adjunct to exchange transfusions

Contraindications and cautions

- Contraindicated with allergy to albumin, severe anemia, cardiac failure, normal or increased intravascular volume, current use of cardiopulmonary bypass.
- Use cautiously with hepatic or renal failure, pregnancy.

Available forms

Injection—5%

Dosages

Administer by IV infusion only. Contains 130–160 mEq sodium/L. Do not give more than 250 g in 48 hr; if it seems that more is required, patient probably needs whole blood or plasma.

Adults

- *Hypovolemic shock:* 250–500 mL as an initial dose. Do not exceed 10 mL/min. Adjust dosage based on patient response. Do not

exceed 5–8 mL/min as plasma volume approaches normal.

- **Hypoproteinemia:** Daily doses of 1,000–1,500 mL are appropriate. Do not exceed 5–8 mL/min. Adjust infusion rate based on patient response.

Pediatric patients

- **Hypovolemic shock:** Infuse a dose of 6.6–33 mL/kg at 5–10 mL/min. Dose may be repeated depending on patient's response.

Pharmacokinetics

Route	Duration
IV	Stays in the intravascular space

Metabolism: $T_{1/2}$: Unknown

Excretion: Unknown

IV FACTS

Preparation: No further preparation required; discard within 4 hr of entering a bottle; store at room temperature; do not use if there is sediment in the bottle. Do not freeze.

Infusion: Regulate based on patient response. Do not exceed 10 mL/min.

Compatibilities: Administer in combination with or through the same administration set as the usual IV solutions of saline or carbohydrates.

Incompatibilities: Do not use with alcohol or protein hydrolysates; precipitates may form.

Adverse effects

- **CV:** *Hypotension*, HF, **pulmonary edema following rapid infusion**
- **Hypersensitivity:** Fever, chills, changes in BP, flushing, nausea, vomiting, changes in respiration, rashes

■ Nursing considerations

Assessment

- **History:** Allergy to albumin, severe anemia, cardiac failure, normal or increased intravascular volume, current use of cardiopulmonary bypass, renal or hepatic failure, pregnancy
- **Physical:** Skin color, lesions; T; P, BP, peripheral perfusion; R, adventitious sounds; LFTs, renal function tests, Hct, serum electrolytes

Interventions

- Administer by IV infusion only, without regard to blood group or type.
- Consider the need for whole blood based on the patient's clinical condition; this infusion only provides symptomatic relief of the patient's hypoproteinemia.
- Monitor BP during infusion; discontinue if hypotension occurs.
- **⊗ Warning** Stop infusion if headache, flushing, fever, or changes in BP occur. Arrange to treat reaction with antihistamines. If a plasma protein is still needed, try material from a different lot number.
- Monitor patient's clinical response and adjust infusion rate accordingly.

Teaching points

- Rate will be adjusted based on your response, so constant monitoring is needed.
- Report headache, nausea, vomiting, difficulty breathing, back pain.

▷ plerixafor

See Appendix U, *Less commonly used drugs*.

▷ polidocanol

See Appendix U, *Less commonly used drugs*.

▷ poly-L-lactic acid

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ polymyxin B sulfate (*pol i mix' in*)

PREGNANCY CATEGORY C

Drug class

Antibiotic

Therapeutic actions

Bactericidal: Has surfactant (detergent) activity that allows it to penetrate and disrupt the cell membranes of susceptible gram-negative

bacteria, causing cell death; not effective against *Proteus* species.

Indications

- Acute infections caused by susceptible strains of *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Escherichia coli*, *Aerobacter aerogenes*, *Klebsiella pneumoniae* when less toxic drugs are ineffective or contraindicated
- Intrathecal: Meningeal infections caused by *P. aeruginosa*

Contraindications and cautions

- Contraindicated with allergy to polymyxins (polymyxin B, colistin, colistimethate).
- Use cautiously with renal disease, pregnancy, lactation.

Available forms

Injection—500,000 units/vial

Dosages

Adults

IV

15,000–25,000 units/kg/day may be given every 12 hr. Do not exceed 25,000 units/kg/day.

IM

25,000–30,000 units/kg/day divided and given at 4- to 6-hr intervals.

Intrathecal

50,000 units once daily for 3–4 days; then 50,000 units every other day for at least 2 wk after cultures of CSF are negative, and glucose content is normal.

Pediatric patients

IV

Infants: Up to 40,000 units/kg/day.

Older than 2 yr: Use adult dosage.

IM

Infants: Up to 40,000 units/kg/day; doses as high as 45,000 units/kg/day have been used in cases of sepsis caused by *P. aeruginosa*.

Older than 2 yr: Use adult dosage.

Intrathecal

Younger than 2 yr: 20,000 units once daily for 3–4 days or 25,000 units once every other day. Continue with 25,000 units once every other day for at least 2 wk after cultures of CSF are negative and glucose content is normal.

Older than 2 yr: Use adult dosage.

Geriatric patients or patients with renal failure

Reduce dosage from the recommended dose, and follow renal function tests during therapy.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	Unknown
IM	Gradual	2 hr

Metabolism: $T_{1/2}$: 4.3–6 hr

Distribution: Does not cross placenta

Excretion: Urine

IV FACTS

Preparation: Dissolve 500,000 units in 300–500 mL of D₅W. Dissolve 500,000 units in 2 mL sterile distilled water or sodium chloride injection, or 1% procaine hydrochloride solution; refrigerate and discard any unused portion after 72 hr.

Infusion: Administer by continuous IV drip using an infusion pump.

Incompatibilities: Do not mix with amphotericin B, chloramphenicol, heparin, magnesium sulfate, tetracycline.

Adverse effects

- **CNS:** Neurotoxicity—*facial flushing, dizziness, ataxia, drowsiness, paresthesias*
- **Dermatologic:** Rash, urticaria
- **GU: Nephrotoxicity**
- **Local:** *Pain at IM injection site; thrombophlebitis at IV injection sites*
- **Respiratory:** **Apnea** (high dosage)
- **Other:** Drug fever, superinfections

Interactions

★ **Drug-drug** • Increased neuromuscular blockade, apnea, and muscular paralysis when given with nondepolarizing neuromuscular blocking drugs • Increased risk of respiratory paralysis and renal impairment when given with aminoglycosides

Nursing considerations

Assessment

- **History:** Allergy to polymyxins, renal disease, lactation

- **Physical:** Site of infection, skin color, lesions; orientation, reflexes, speech; R; urinary output; urinalysis, serum creatinine, renal function tests

Interventions

⊗ **Black box warning** Monitor the patient's renal function carefully. Be aware that neurotoxicity can result in respiratory paralysis; monitor accordingly.

- Store drug solutions in refrigerator, and discard any unused portion after 72 hr.
- For intrathecal use: Dissolve 500,000 units in 10 mL sterile physiologic saline for a concentration of 50,000 units/mL.
- Culture infection before beginning therapy.
- Monitor renal function tests during therapy.
- Monitor for superinfection.
- Do not use IM route routinely; severe pain occurs at injection site.

Teaching points

- You may experience these side effects: Vertigo, dizziness, drowsiness, slurring of speech (avoid driving or using hazardous equipment); numbness, tingling of the tongue, extremities (decrease the dosage); superinfections (frequent hygiene measures will help; request medications); burning, stinging, blurring of vision (ophthalmic; transient).
- Report difficulty breathing, rash or skin lesions, pain at injection site or IV site, change in urinary voiding patterns, fever, flulike symptoms, changes in vision, severe stinging or itching (ophthalmic).

▶ poractant alfa (DDPC, natural lung surfactant; porcine origin)

(*poor ak' tant*)

Curosurf

PREGNANCY CATEGORY NR

Drug class

Lung surfactant

Therapeutic actions

A natural porcine compound containing lipids and apoproteins that reduce surface tension and allow expansion of the alveoli; replaces the surfactant missing in the lungs of neonates suffering from RDS.

Indications

- Rescue treatment of infants who have developed RDS
- Unlabeled uses: Severe meconium aspiration syndrome; respiratory failure caused by group B streptococcal infection in neonates

Contraindications and cautions

- Because poractant is used as an emergency drug in acute respiratory situations, the benefits usually outweigh any possible risks.
- Use cautiously with any known family history of allergy to porcine products.

Available forms

Suspension for intratracheal instillation: 1.5, 3 mL

Dosages

⊗ **Warning** Accurate determination of birth weight is essential for determining appropriate dosage. Poractant is instilled into the trachea using a catheter inserted into the endotracheal tube.

Administer entire contents of vial (2.5 mL/kg birth weight) intratracheally, giving one-half of the dose into each bronchi. Administer the first dose as soon as possible after the diagnosis of RDS is made and when the patient is on the ventilator. Up to 2 subsequent doses of 1.25 mL/kg birth weight at 12-hr intervals may be needed. Maximum total dose is 5 mL/kg (sum of initial and 2 repeat doses).

Pharmacokinetics

Route	Onset	Peak
Intratracheal	Immediate	3 hr

Metabolism: Normal surfactant metabolic pathways; $T_{1/2}$: 25 hr

Distribution: Lung tissue

Excretion: Unknown

Adverse effects

- **CNS:** Seizures
- **CV: Patent ductus arteriosus, intraventricular hemorrhage, hypotension, bradycardia, flushing**
- **Hematologic:** *Hyperbilirubinemia, thrombocytopenia*
- **Respiratory: Pneumothorax, pulmonary air leak,** pulmonary hemorrhage (more often seen with infants weighing less than 700 g), *apnea*, pneumomediastinum, emphysema, endotracheal tube blockage, oxygen desaturation
- **Other:** *Sepsis, nonpulmonary infections*

■ Nursing considerations

Assessment

- **History:** Time of birth, exact birth weight
- **Physical:** T, color; R, adventitious sounds, oximeter, endotracheal tube position and patency, chest movement; ECG, P, BP, peripheral perfusion, arterial pressure (desirable); oxygen saturation, blood gases, CBC; muscular activity, facial expression, reflexes

Interventions

- Arrange for appropriate assessment and monitoring of critically ill infant.
- Monitor ECG and transcutaneous oxygen saturation continually during administration.
- Ensure that endotracheal tube is in the correct position, with bilateral chest movement and lung sounds.
- Arrange for staff to preview teaching videotape, available from the manufacturer, before regular use to cover all of the technical aspects of administration.
- Suction the infant immediately before administration, but do not suction for 2 hr after administration unless clinically necessary.
- Warm vial to room temperature before using, up to 24 hr. No other warming methods should be used. Gently turn vial upside down to obtain uniform suspension. Do not shake vial.
- Store drug in refrigerator. Protect from light. Enter drug vial only once. Discard remaining drug after use.
- Insert 5 French catheter into the endotracheal tube; do not instill into the main stream bronchus.

- Instill dose slowly; inject one-fourth of dose over 2–3 sec; remove catheter and reattach infant to ventilator for at least 30 sec or until stable; repeat procedure administering one-fourth of dose at a time.
- Do not suction infant for 1 hr after completion of full dose; do not flush catheter.
- Continually monitor patient color, lung sounds, ECG, oximeter and blood gas readings during administration and for at least 30 min following administration.
- Maintain appropriate interventions for critically ill infant.
- Offer support and encouragement to parents.

Teaching points

- Parents of the critically ill infant will need a comprehensive teaching and support program. Details of drug effects and administration are best incorporated into the comprehensive program.

▷ porfimer sodium

See Appendix U, *Less commonly used drugs*.

▷ posaconazole (pabs ab kon' ab zall)

Noxafil

PREGNANCY CATEGORY C

Drug class

Antifungal (triazole)

Therapeutic actions

Inhibits the synthesis of ergosterol, a key component of the fungal cell membrane; this inhibition leads to inability of the fungus to form the fungal cell wall and results in cell death.

Indications

- Prophylaxis of invasive *Aspergillus* and *Candida* infections in patients 13 yr and older who are at risk of developing these infections because they are immunosuppressed because of prolonged neutropenia from antineoplastic chemotherapy, graft-versus-host

disease secondary to bone marrow transplants, or hematologic malignancies

- Treatment of oropharyngeal candidiasis including cases refractory to itraconazole or fluconazole

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug and with concurrent use of ergot alkaloids or drugs that are CYP3A4 substrates (terfenadine, pimozone, halofantrine, or quinidine).
- Use cautiously with liver impairment, concurrent use of cyclosporine, prolonged QT interval, pregnancy, lactation.

Available forms

Oral suspension—40 mg/mL

Dosages

Adults and children 13 yr and older

Prevention: 200 mg (5 mL) PO tid. Give with a full meal or liquid nutritional supplement.

Treatment: Loading dose of 100 mg (2.5 mL) PO bid on day 1; then 100 mg/day PO for 13 days. For refractory infection, 400 mg (10 mL) PO bid, with duration based on patient response.

Patients with hepatic impairment

Use cautiously and monitor closely.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 20–66 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Headache, dizziness, insomnia, anxiety*
- **CV:** *Hypotension, hypertension, tachycardia*
- **GI:** *Diarrhea, nausea, vomiting, abdominal pain, constipation, mucositis, dyspepsia, anorexia, liver enzyme changes*

- **Hematologic:** *Anemia, neutropenia, hypokalemia, hypomagnesemia, hyperglycemia, hypocalcemia, thrombocytopenia*
- **Respiratory:** *Cough, dyspnea, epistaxis*
- **Other:** *Rash, fever, fatigue, weakness, infections*

Interactions

- **Drug-drug** • Decreased serum levels and loss of effectiveness if combined with rifabutin, phenytoin, cimetidine; avoid these combinations • Potential for increased serum levels and increased risk of toxicity of cyclosporine, sirolimus, tacrolimus, rifabutin, midazolam, phenytoin if combined with posaconazole; monitor patient closely and reduce dosages as appropriate • Increased serum levels of ergots and risk of ergotism; this combination is contraindicated • Increased serum levels of astemizole, terfenadine, pimozone, quinidine, leading to risk of prolonged QT interval and potentially fatal arrhythmias; avoid this combination • Increased serum levels of vincristine, vinblastine, and potential neurotoxicity; reduce dosage of these drugs and monitor patient closely • Potential for increased levels of statins, leading to possible rhabdomyolysis; reduce dosage of statins if used concurrently • Potential for increased levels of calcium channel blockers, sirolimus; reduce dosage and monitor patient closely

Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug; concurrent use of ergot alkaloids or drugs that are CYP3A4 substrates (terfenadine, pimozone, halofantrine, or quinidine); liver impairment; concurrent use of cyclosporine; prolonged QT interval; pregnancy, lactation
- **Physical:** T; orientation; reflexes; skin; BP; R, adventitious sounds; abdominal examinations; LFTs, culture of infected area, CBC, serum electrolytes, ECG

Interventions

- Culture infected area prior to starting drug; drug can be started before results are known, but appropriate adjustments in treatment

should be made when culture results are evaluated.

- Give with a full meal or nutritional supplement. If patient is not able to eat a full meal or tolerate oral nutritional supplement, consider a different antifungal agent, or monitor carefully for breakthrough fungal infections.
- Shake bottle well before use. Use the measuring spoon provided for accuracy.
- Periodically monitor LFTs to make sure hepatotoxicity does not occur.
- Obtain a baseline ECG and monitor any patient at risk for proarrhythmias or prolonged QT interval.
- Suggest the use of contraceptive measures while using this drug; the potential effects on a fetus are not known.
- Advise nursing mothers to use another method of feeding the baby while on this drug.
- Provide supportive measures for GI effects as needed.

Teaching points

- This drug must be taken three times a day (prevention) or twice a day (treatment) with a full meal or nutritional supplement (*Ensure* for example). If you are unable to eat, contact your health care provider.
- Store the bottle at room temperature, and shake it well before each use. To measure your dose accurately, use the spoon that comes with the bottle.
- Tell your health care provider about any other drugs you take; this drug can interact with many other drugs, and appropriate precautions will need to be taken.
- It is very important to maintain your fluid and food intake, which will help healing. Notify your health care provider if nausea or vomiting prevents this.
- You may need blood tests to evaluate the effects of the drug on your body.
- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult your health care provider; use of contraceptive measures is advised.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, you should select another method of feeding.

- You may experience these side effects: Headache, nausea, diarrhea (consult your health care provider; medications may be available to help).
- Report severe diarrhea or vomiting, fever that persists, changes in color of stool or urine, palpitations.

⚠ DANGEROUS DRUG

▶ potassium salts (*po tass' ee um*)

potassium acetate

potassium chloride

Oral: Apo-K (CAN), Cena-K, Effer-K, Gen-K, Kaon-Cl, Kaylixir, K-Dur 10, K-Dur 20, K-Lor, K-Tab, Klor-Con ^{ORC}, Klor-Con 10 ^{ORC}, Klor-Con M 10 ^{ORC}, Klor-Con M 15 ^{ORC}, Klor-Con M 20 ^{ORC}, Klorvess, Klotrix ^{ORC}, K+ 10, Micro-K Extencaps ^{ORC}, Potasalan, Ten K
Injection: Potassium Chloride

potassium gluconate

Kaon, K-G Elixir, Tri-K

PREGNANCY CATEGORY C

Drug class

Electrolyte

Therapeutic actions

Principal intracellular cation of most body tissues, participates in a number of physiologic processes—maintaining intracellular tonicity; transmission of nerve impulses; contraction of cardiac, skeletal, and smooth muscle; maintenance of normal renal function; also plays a role in carbohydrate metabolism and various enzymatic reactions.

Indications

- Prevention and correction of potassium deficiency; when associated with alkalosis, use potassium chloride; when associated with acidosis, use potassium acetate, bicarbonate, citrate, or gluconate
- IV: Treatment of cardiac arrhythmias due to cardiac glycosides

Contraindications and cautions

- Contraindicated with allergy to tartrazine, aspirin (tartrazine is found in some preparations marketed as *Kaon-Cl*, *Klor-Con*); therapy with potassium-sparing diuretics or aldosterone-inhibiting agents; severe renal impairment with oliguria, anuria, azotemia; untreated Addison's disease; hyperkalemia; adynamia episodica hereditaria; acute dehydration; heat cramps; GI disorders that delay passage in the GI tract.
- Use cautiously with cardiac disorders, especially if treated with cardiac glycosides, pregnancy, lactation.

Available forms

Liquids—20, 40 mEq/15 mL; powders—15, 20, 25 mEq/packet; effervescent tablets—20, 25, 50 mEq; CR tablets **ONC**—8, 10, 15, 20 mEq; CR capsules **ONC**—8, 10 mEq; tablets—99, 500, 595 mg; injection—2, 10, 20, 30, 40, 60, 90 mEq

Dosages

Individualize dosage based on patient response using serial ECG and electrolyte determinations in severe cases.

Adults

Oral

- Prevention of hypokalemia:* 16–24 mEq/day PO.
- Treatment of potassium depletion:* 40–100 mEq/day PO.

IV

⊗ **Warning** Do not administer undiluted. Dilute in dextrose solution to 40–80 mEq/L. Use the following as a guide to administration:

Serum Potassium	Maxi-mum Infusion Rate	Maxi-mum Concen-tration	Maxi-mum 24-hr Dose
More than 2.5 mEq/L	10 mEq/hr	40 mEq/L	200 mEq
Less than 2 mEq/L	40 mEq/hr	80 mEq/L	400 mEq

Pediatric patients

- Replacement:* 3 mEq/kg/day or 40 mEq/m²/day PO or IV.

Geriatric patients or patients with renal impairment

Carefully monitor serum potassium concentration and reduce dosage appropriately.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–2 hr
IV	Rapid	End of infusion

Metabolism: Cellular; T_{1/2}: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Do not administer undiluted potassium IV; dilute in dextrose solution to 40–80 mEq/L; in critical states, potassium chloride can be administered in saline.

Infusion: Adjust dosage based on patient response at a maximum of 10 mEq/L; do not exceed 20 mEq/hr.

Incompatibility: Do not mix with amphotericin B.

Y-site incompatibilities: Do not give with amphotericin B, azithromycin, diazepam, ergotamine, phenytoin.

Adverse effects

- Dermatologic:** Rash
- GI:** *Nausea, vomiting, diarrhea, abdominal discomfort*, GI obstruction, GI bleeding, GI ulceration or perforation
- Hematologic:** Hyperkalemia—increased serum potassium, ECG changes (peaking of T waves, loss of P waves, depression of ST segment, prolongation of QTc interval)
- Local:** Tissue sloughing, local necrosis, local phlebitis, and venospasm with injection

Interactions

- * Drug-drug** • Increased risk of hyperkalemia with potassium-sparing diuretics, salt substitutes using potassium

■ Nursing considerations

Assessment

- **History:** Allergy to tartrazine, aspirin; severe renal impairment; untreated Addison's disease; hyperkalemia; adynamia episodica hereditaria; acute dehydration; heat cramps; GI disorders that cause delay in passage in the GI tract; cardiac disorders; lactation
- **Physical:** Skin color, lesions, turgor; injection sites; P, baseline ECG; bowel sounds, abdominal examination; urinary output; serum electrolytes, serum bicarbonate

Interventions

- Arrange for serial serum potassium levels before and during therapy.
- Administer liquid form to any patient with delayed GI emptying.
- Administer oral drug after meals or with food and a full glass of water to decrease GI upset.
- Caution patient not to chew or crush tablets; have patient swallow tablet whole.
- Mix or dissolve oral liquids, soluble powders, and effervescent tablets completely in 3–8 oz of cold water, juice, or other suitable beverage, and have patient drink it slowly.
- Arrange for further dilution or dose reduction if GI effects are severe.
- Agitate prepared IV solution to prevent “layering” of potassium; do not add potassium to an IV bag in the hanging position.
- Monitor IV injection sites regularly for necrosis, tissue sloughing, and phlebitis.
- Monitor cardiac rhythm carefully during IV administration.
- Caution patient that expended wax matrix capsules will be found in the stool.
- Caution patient not to use salt substitutes.

Teaching points

- Take drug after meals or with food and a full glass of water to decrease GI upset. Do not chew or crush tablets, swallow tablets whole. Mix or dissolve oral liquids, soluble powders, and effervescent tablets completely in 3–8 ounces of cold water, juice, or other suitable beverage, and drink it slowly. Take the drug as prescribed; do not take more than prescribed.
- Do not use salt substitutes.

- You may find wax matrix capsules in the stool. The wax matrix is not absorbed in the GI tract.
- Have periodic blood tests and medical evaluation.
- You may experience these side effects: Nausea, vomiting, diarrhea (taking the drugs with meals, diluting them further may help).
- Report tingling of the hands or feet, unusual tiredness or weakness, feeling of heaviness in the legs, severe nausea, vomiting, abdominal pain, black or tarry stools, pain at IV injection site.

▾ pralatrexate

See Appendix U, *Less commonly used drugs*.

▾ pralidoxime chloride (2-PAM)

(*pra li dox' eem*)

Protopam Chloride

PREGNANCY CATEGORY C

Drug class

Antidote

Therapeutic actions

Reactivates cholinesterase (mainly outside the CNS) inactivated by phosphorylation due to organophosphate pesticide or related compound. Relieves respiratory muscle paralysis related to organophosphate toxicity.

Indications

- Antidote in poisoning due to organophosphate pesticides and chemicals with anticholinesterase activity
- IM use as an adjunct to atropine in poisoning by nerve agents having anticholinesterase activity (autoinjector)
- Control of overdose by anticholinesterase drugs used to treat myasthenia gravis

Contraindications and cautions

- Contraindicated with concomitant use of theophylline, morphine, aminophylline, and succinylcholine and allergy to any component of drug.

- Use cautiously with impaired renal function, myasthenia gravis, pregnancy, lactation.

Available forms

Injection—1 g

Dosages

Adults

- **Organophosphate poisoning:** In absence of cyanosis, give atropine 2–4 mg IV. If cyanosis is present, give 2–4 mg atropine IM while improving ventilation; repeat every 5–10 min until signs of atropine toxicity appear. Maintain atropinization for at least 48 hr. **Give pralidoxime concomitantly:** Inject an initial dose of 1–2 g pralidoxime IV, preferably as a 15- to 30-min infusion in 100 mL of saline. After 1 hr, give a second dose of 1–2 g IV if muscle weakness is not relieved. Give additional doses cautiously. If IV administration is not feasible or if pulmonary edema is present, give IM or subcutaneously.
- **Anticholinesterase (eg, neostigmine, pyridostigmine, ambenonium) overdose:** 1–2 g IV followed by increments of 250 mg every 5 min.
- **Exposure to nerve agents:** Administer atropine and pralidoxime as soon as possible after exposure. Use the autoinjectors, giving the atropine first; repeat both atropine and pralidoxime after 15 min. If symptoms exist after an additional 15 min, repeat injections. If symptoms persist after third set of injections, seek medical help.

Pediatric patients 16 yr and younger

- **Nerve gas exposure, or ganphosphate poisoning IV:** Loading dose of 20–50 mg/kg (do not exceed 2,000 mg/dose) IV over 15–30 min, followed by continuous IV infusion of 10–20 mg/kg/hr.
- **Intermittent IV:** 20–50 mg/kg (do not exceed 2,000 mg/dose) over 15–30 min. Give second dose of 20–50 mg/kg if muscle weakness is not relieved in 1 hr. Repeat dosing may be done every 10–12 hr as needed.
- **IM:** 40 kg and over, use adult dosage. Less than 40 kg, 15 mg/kg IM every 15 min, if needed, to a total of three doses (45 mg/kg).

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	5–15 min
IM	Rapid	10–20 min

Metabolism: Hepatic; $T_{1/2}$: 0.8–2.7 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute 1–2 g pralidoxime in 100 mL saline.

Infusion: Administer over 15–30 min.

Adverse effects

- **CNS:** *Dizziness, blurred vision, diplopia, headache*, drowsiness, nausea, impaired accommodation
- **CV:** Tachycardia
- **Hematologic:** *Transient AST, ALT, CPK elevations*
- **Local:** *Mild to moderate pain at the injection site* 40–60 min after IM injection
- **Respiratory:** Hyperventilation
- **Other:** Muscular weakness

Nursing considerations

Assessment

- **History:** Allergy to any component of drug, impaired renal function, myasthenia gravis, lactation, pregnancy
- **Physical:** Reflexes, orientation, vision examination, muscle strength; P, auscultation, baseline ECG; liver evaluation; LFTs, renal function tests

Interventions

- Remove secretions, maintain patent airway, and provide artificial ventilation as needed for acute organophosphate poisoning; then begin drug therapy.
- Institute treatment as soon as possible after exposure to the poison.
- **⊗ Warning** Remove clothing; thoroughly wash hair and skin with sodium bicarbonate or alcohol as soon as possible after dermal exposure to organophosphate poisoning.

- Use IV sodium thiopental or diazepam if seizures interfere with respiration after organophosphate poisoning.

⊗ **Warning** Administer by slow IV infusion; tachycardia, laryngospasm, muscle rigidity have occurred with rapid injection. Do not exceed injection rate of 200 mg/min.

Teaching points

- Discomfort may be experienced at IM injection site. If you receive the autoinjector, you need to understand the indications and proper use of the mechanism, review the signs and symptoms of poisoning.
- Report blurred or double vision, dizziness, nausea.

pramipexole dihydrochloride

(*pram ab pex' ole*)

Mirapex, Mirapex ER ORC

PREGNANCY CATEGORY C

Drug classes

Antiparkinsonian

Dopamine receptor agonist

Therapeutic actions

Stimulates dopamine receptors in the striatum, leading to decrease in parkinsonian symptoms thought to be related to low dopamine levels.

Indications

- Treatment of the signs and symptoms of idiopathic Parkinson's disease
- Treatment of moderate to severe primary restless leg syndrome
- Unlabeled use: Treatment of fibromyalgia

Contraindications and cautions

- Contraindicated with hypersensitivity to pramipexole.
- Use cautiously with symptomatic hypotension, impaired renal function, pregnancy, lactation.

Available forms

Tablets—0.125, 0.25, 0.5, 0.75, 1, 1.5 mg; ER tablets ORC—0.375, 0.75, 1.5, 3, 4.5 mg

Dosages

Adults

- **Parkinson's disease:** Increase dosage gradually from a starting dose of 0.125 mg PO tid for 1 wk; wk 2—0.25 mg PO tid; wk 3—0.5 mg PO tid; wk 4—0.75 mg PO tid; wk 5—1 mg PO tid; wk 6—1.25 mg PO tid; wk 7—1.5 mg PO tid. Once levels are established, ER tablets may be used for once-a-day dosing. If used in combination with levodopa, consider levodopa dose reduction.
- **Restless leg syndrome:** Initially, 0.125 mg/day PO taken 2–3 hr before bedtime; dose may be increased every 4–7 days, if needed, to 0.25 mg/day and maximum of 0.5 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

CrCl (mL/min)	Starting Dose	Maximum Dose
More than 60	0.125 mg PO tid	1.5 mg PO tid
35–59	0.125 mg PO bid	1.5 mg PO bid
15–34	0.125 mg PO daily	1.5 mg PO daily
Less than 15	Safety and efficacy not established; data not available	

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, insomnia, somnolence*, hallucinations, confusion, amnesia, extrapyramidal syndrome
- **CV:** Orthostatic hypotension, hypertension, arrhythmia, palpitations, hypotension, tachycardia
- **GI:** *Nausea, constipation*, anorexia, dysphagia
- **Other:** Peripheral edema, decreased weight, *asthenia*, fever

Interactions

★ **Drug-drug** • Increase in levodopa levels and effects if combined • Increase in levels with cimetidine, ranitidine, diltiazem, triamterene, verapamil, quinidine, quinine, and drugs eliminated via renal secretion • Decreased effectiveness with dopamine antagonists

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to pramipexole, symptomatic hypotension, impaired renal function, pregnancy, lactation
- **Physical:** Reflexes, affect; T, BP, P, peripheral perfusion; abdominal examination, normal output; auscultation, R; urinary output, renal function tests

Interventions

⊗ **Warning** Administer with extreme caution to patients with a history of hypotension, hallucinations, confusion, or dyskinesias.

- Administer with food if GI upset becomes a problem.
- Ensure that ER tablets are swallowed whole; ER tablets should not be cut, crushed, or chewed.

⊗ **Warning** Do not discontinue abruptly; taper gradually over at least 1 wk.

- Monitor patient while adjusting drug to establish therapeutic dosage. Dosage of levodopa and carbidopa may need to be reduced accordingly to balance therapeutic effects.
- Provide safety precautions as needed if hallucinations occur (more common with elderly).

Teaching points

- For Parkinson's disease, take this drug exactly as prescribed, three times per day, with breakfast, lunch, and dinner. Continue to take your levodopa and carbidopa if prescribed. The dosage of levodopa may need to be decreased after a few days of therapy. The dosage of pramipexole will be slowly increased over a 7-week period. Write your dose down and follow this pattern. You may be switched to an extended-release tablet to allow once-a-day dosing. Swallow this tablet whole; do not cut, crush, or chew it.

- For restless leg syndrome, take the dose daily 2–3 hours before bedtime. Dosage may be increased as needed.
- Do not stop taking this drug without consulting your health care provider; serious side effects could occur. The drug should be tapered over at least 1 week.
- Avoid becoming pregnant while using this drug; using barrier contraceptives is advised. If you think you are pregnant, notify your health care provider.
- You may experience these side effects: Dizziness, light-headedness, insomnia (avoid driving or operating dangerous machinery); nausea (take drug with meals); edema; weight loss; low blood pressure (change positions slowly; use caution in extremes of heat or exertion); hallucinations (safety precautions may be needed); falling asleep while engaged in activities of daily living (use caution to avoid injury).
- Report severe nausea, severe swelling, sweating, hallucinations, dizziness, fainting.

DANGEROUS DRUG

▷ **pramlintide acetate**
(*pram' lin tyde*)

Symlin

PREGNANCY CATEGORY C

Drug classes

Amylinomimetic
Antidiabetic

Therapeutic actions

A synthetic analogue of human amylin, a hormone produced by the beta cells in the pancreas that helps to control glucose levels in the postprandial period; modulates gastric emptying, causes a feeling of fullness or satiety, prevents the postprandial rise in serum glucagon levels all leading to lower serum glucose levels.

Indications

- Adjunct treatment in patients with type 1 diabetes who use mealtime insulin and who have failed to achieve desired glucose control despite optimal insulin therapy

- Adjunct treatment in type 2 diabetes patients who use mealtime insulin and who have failed to achieve desired glucose control despite optimal insulin therapy with or without a concurrent sulfonylurea or metformin

Contraindications and cautions

- Contraindicated with known hypersensitivity to pramlintide or any of its components, gastroparesis, hypoglycemia unawareness.
- Use cautiously with pregnancy, lactation.

Available forms

Solution for injection—0.6 mg/mL

Dosages

Adults

- *Type 2 diabetes*: Initially, 60 mcg by subcutaneous injection immediately prior to major meals. Dose may be increased to 120 mcg if needed and tolerated. Dosage of oral drugs and insulins will need to be reduced, usually by 50% based on patient response.
- *Type 1 diabetes*: Initially, 15 mcg by subcutaneous injection immediately before major meals, titrate at 15 mcg increments to a maintenance dose of 30 or 60 mcg as tolerated. Dosage of insulins will need to be reduced by 50% and the patient must be monitored closely to achieve optimal glucose control.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Rapid	21 min

Metabolism: Renal; $T_{1/2}$: 48 min

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, headache, fatigue
- **GI:** Nausea, anorexia, vomiting, abdominal pain
- **Respiratory:** Cough, pharyngitis
- **Other: Hypoglycemia**, injection site reaction

Interactions

★ **Drug-drug** • Risk of delayed absorption of oral medications because of effects on

gastric emptying; if rapid effect is needed, take oral medication 1 hr prior to or 2 hr after pramlintide • Risk of combined effects on gastric emptying if combined with anticholinergic drugs or drugs that slow intestinal absorption of nutrients; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to pramlintide or any of its components, gastroparesis, hypoglycemia unawareness, pregnancy, lactation
- **Physical:** Orientation, reflexes, affect; abdominal examination; injection site; blood glucose levels

Interventions

⊗ **Black box warning** Be aware that severe hypoglycemia has been associated with combined use of insulin, pramlintide; monitor accordingly.

- Inject subcutaneously before each major meal of the day; inject it into a site that is more than 2 inches away from the site of insulin injection.
- Do not combine in syringe with insulin.
- Maintain other antidiabetic drugs, diet and exercise regimen for control of diabetes.
- Administer oral medications at least 1 hr before or 2 hr after administering pramlintide.
- Monitor serum glucose levels and HbA_{1c} levels frequently to evaluate effectiveness of drug on controlling glucose levels.
- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection and hygiene.

Teaching points

- This drug is given subcutaneously. Use sterile technique. Dispose of syringes appropriately.
- Do not use any solution that appears cloudy; do not combine this drug in syringe with insulin.
- Inject it into a site on your thigh or abdomen. Rotate injection sites periodically; inject into a site that is at least 2 inches away from the site of your insulin injection.

- Store unopened vials in the refrigerator. Opened bottles may be kept at room temperature. Throw away any out-of-date bottles.
- Inject this drug before any major meal that you are eating; do not use if you are not going to be eating; if you forget a dose, do not inject after you have eaten.
- Be aware that alcohol consumption can change your blood glucose levels and may alter your response to this drug.
- Do not take this drug if you are not able to eat or if you plan to skip a meal or if your blood sugar is too low.
- Do not change the dosage of this drug without consulting your health care provider.
- It is not known how this drug affects a pregnancy. If you think you are pregnant or would like to become pregnant, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, consult your health care provider.
- You will need to regularly monitor your blood glucose levels. Your health care provider may change the dose of pramlintide or your other antidiabetic drugs, based on your blood glucose response.
- It is important that you follow the diet, exercise, and drug guidelines related to your disease.
- Review the signs and symptoms of hypoglycemia; be prepared to treat hypoglycemia with fast-acting sugar or glucagon.
- Do not drive a car or operate potentially dangerous machinery until you are aware of how pramlintide will affect your blood sugar. Low blood sugar can cause dizziness and changes in thinking.
- This drug affects how fast your stomach empties, which may affect other drugs you may be taking. Consult your health care provider about the need to change the timing of drug administration.
- You may experience these side effects: Injection site reactions (proper injection and rotation of injection sites should help; if problems occur, consult your health care provider); hypoglycemia (use fast-acting sugars or glucagons if this occurs; proper use and eat-

ing of meals should prevent this effect); nausea (this usually passes after a few days).

- Report hypoglycemic reactions; redness, pain or swelling at injection sites; stomach pain; vomiting.

DANGEROUS DRUG

 **prasugrel**
(*pra' soo grel*)

Effient

PREGNANCY CATEGORY B

Drug class

Platelet inhibitor

Therapeutic actions

Inhibits platelet activation and aggregation by irreversibly binding to the P2Y₁₂ class of ADP receptors on platelets.

Indications

- To reduce the risk of thrombotic cardiovascular events (including stent thrombosis) in patients with acute coronary syndrome who are to be managed with percutaneous coronary intervention, including patients with unstable angina or non-ST-elevation MI and patients with ST-elevation MI who will be managed with primary or delayed percutaneous coronary intervention

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, active pathological bleeding, history of TIA or stroke, patients likely to undergo CABG surgery.
- Use cautiously with age 75 yr and older, body weight less than 60 kg, bleeding tendency, use of drugs that increase risk of bleeding, pregnancy, lactation.

Available forms

Tablets—5, 10 mg

Dosages

Adults

Loading dose: 60 mg PO as single dose, then 10 mg/day PO without regard to food; use 5 mg/day in patients weighing less than 60 kg.

Patient should also be receiving aspirin (75–325 mg/day).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30 min

Metabolism: Hepatic; $T_{1/2}$: 2–15 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Headache*, dizziness
- **CV:** *Hypertension*, hypotension, peripheral edema, atrial fibrillation, bradycardia
- **GI:** Nausea, diarrhea
- **Hematologic:** *Hypercholesterolemia, hyperlipidemia*, leukopenia
- **Respiratory:** Dyspnea, cough
- **Other: Bleeding, thrombotic thrombocytopenic purpura**, rash, fever, fatigue, pain, **risk of thrombotic episodes if stopped prematurely**

Interactions

★ **Drug-drug** • Increased risk of bleeding if combined with warfarin or prolonged use of NSAIDs; monitor patient closely and adjust dosage as appropriate

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, active pathological bleeding, history of TIA or stroke, planned or anticipated CABG surgery, pregnancy, lactation, age, body weight under 60 kg, bleeding tendency, use of drugs that increase the risk of bleeding
- **Physical:** Weight; T, skin—color, lesions; orientation, affect; P, BP, periphery evaluation for edema; R, adventitious sounds

Interventions

⊗ **Black box warning** There is a risk of serious to fatal bleeding with drug administration; do not use with active bleeding or history of TIA or stroke. Risk increases in patients older than 75 yr, patients weighing less than 60 kg, patients with bleeding tendency, and patients

taking warfarin or NSAIDs. Do not use in patients who are likely candidates for CABG surgery; if patients taking drug require CABG, stop prasugrel at least 7 days before surgery. Suspect bleeding in patient who becomes hypotensive and has undergone invasive procedures. If possible, control bleeding without discontinuing prasugrel; premature discontinuation increases risk of thrombotic episodes.

- Administer loading dose and then give once a day without regard to food.
- Patient should also be taking aspirin once a day. Check with health care provider.
- Advise patient to use contraceptive measures because it is not known if drug affects a fetus.
- Advise patient to select another method of feeding the baby if nursing; it is not known if drug enters breast milk.
- Limit invasive procedures; be aware that patient may experience prolonged bleeding if undergoing invasive procedures.
- Protect patient from injury; risk of bruising and bleeding is increased.
- Do not discontinue drug prematurely because of increased risk of thrombotic events.
- Alert surgeons that patient is taking drug; if possible, drug should be discontinued at least 7 days before surgery.

Teaching points

- Take this drug exactly as prescribed, once a day without regard to food.
- If you forget a dose, take the next dose at the regular time. Do not attempt to make up or double doses unless you have been instructed to do so by your health care provider.
- Do not run out of this drug or stop taking this drug for any reason. If you stop taking the drug, immediately contact your health care provider because serious events could occur.
- Keep a list of all drugs you are taking, including over-the-counter drugs and herbal therapies, so your health care provider can adjust dosages as needed.
- Inform all your health care providers, including your dentist and surgeons, that you are taking this drug. Because this drug makes you bleed longer, appropriate measures will be needed if invasive procedures are planned.
- You should carry or wear a Medical Alert card to alert people who may care for you during an emergency that you are taking this drug.

- It is not known if this drug affects a fetus; the use of contraceptive measures is advised.
- It is not known if this drug enters breast milk. If you are nursing a baby, you should use another method of feeding the baby.
- You may experience these side effects: Increased bleeding and bruising (take extra precautions to avoid injury; be aware that if you are injured, it will take longer to stop bleeding), nausea, diarrhea (small, frequent meals may help; consult your health care provider if this becomes too uncomfortable); rash, fatigue.
- Rarely, a serious disorder called thrombotic thrombocytopenic purpura can occur. Notify your health care provider immediately if you experience fever, weakness, purple skin patches, yellowing of the skin or eyes, extreme paleness, mental changes.
- Report excessive bruising or bruising from no known cause, uncontrollable bleeding, pink or brown urine, red or tarlike stools, coughing up blood or clots, vomiting blood, or vomit that looks like coffee grounds.

pravastatin sodium (*prab va sta' tin*)

Apo-Pravastatin (CAN),
CO Pravastatin (CAN), Gen-
Pravastatin (CAN), Novo-Pravastatin
(CAN), Nu-Pravastatin (CAN),
PMS-Pravastatin (CAN), Pravachol,
ratio-Pravastatin (CAN)

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic
HMG-CoA reductase inhibitor

Therapeutic actions

Inhibits the enzyme HMG-CoA that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs (associated with increased risk of CAD), and either an increase or no change in serum HDLs (associated with decreased risk of CAD).

Indications

- Prevention of first MI and reduction of death from CV disease in patients with hypercholesterolemia at risk of first MI
- Adjunct to diet in the treatment of elevated total cholesterol and LDL cholesterol with primary hypercholesterolemia (types IIa and IIb) in patients unresponsive to dietary restriction of saturated fat and cholesterol and other nonpharmacologic measures
- Slow the progression of coronary atherosclerosis in patients with clinically evident CAD to reduce the risk of acute coronary events in hypercholesterolemia patients
- Reduce the risk of stroke or TIA in patients with history of MI and normal cholesterol levels
- Reduce the risk of recurrent MI and death from heart disease in patients with history of MI and normal cholesterol levels
- Treatment of children 8 yr and older with heterozygous familial hypercholesterolemia as an adjunct to diet and exercise

Contraindications and cautions

- Contraindicated with allergy to pravastatin, fungal byproducts, active liver disease, pregnancy, lactation.
- Use cautiously with impaired hepatic function, cataracts, alcoholism.

Available forms

Tablets—10, 20, 40, 80 mg

Dosages

Adults

Initially, 40 mg/day PO given once daily. Adjust dosage every 4 wk based on response. Maximum daily dose is 80 mg. Maintenance doses range from 40–80 mg/day in a single bedtime dose.

- *Concomitant immunosuppressive therapy*: 10 mg PO daily at bedtime to a maximum of 20 mg/day.

Pediatric patients 14–18 yr

40 mg/day PO.

Pediatric patients 8–13 yr

20 mg/day PO.

Geriatric patients and patients with renal or hepatic impairment

10 mg PO once daily at bedtime; may increase up to 20 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	60–90 min

Metabolism: Hepatic; $T_{1/2}$: 1.8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, blurred vision*, dizziness, insomnia, fatigue, muscle cramps, cataracts
- **GI:** *Flatulence, abdominal pain, cramps, constipation, nausea, vomiting*, heartburn
- **Hematologic:** Elevations of CPK, alkaline phosphatase, and transaminases

Interactions

★ **Drug-drug** • Possible severe myopathy or rhabdomyolysis with cyclosporine, erythromycin, gemfibrozil, niacin • Possible increased digoxin, warfarin levels if combined; monitor patient and decrease dosage as needed • Increased pravastatin levels with itraconazole; avoid this combination • Decreased pravastatin levels if combined with bile acid sequestrants; space at least 4 hr apart

■ Nursing considerations

Assessment

- **History:** Allergy to pravastatin, fungal byproducts; impaired hepatic function; cataracts; pregnancy; lactation
- **Physical:** Orientation, affect, ophthalmologic examination; liver evaluation; lipid studies, LFTs

Interventions

- Ensure that patient is on a cholesterol-lowering diet before and during therapy.
- Caution patient that this drug cannot be used during pregnancy; advise patient to use barrier contraceptives.
- Suggest another method of feeding the infant if patient is nursing.
- Administer drug at bedtime; highest rates of cholesterol synthesis occur between midnight and 5 AM.
- Arrange for periodic ophthalmologic examination to check for cataract development; monitor liver function.

Teaching points

- Take drug at bedtime.
- Continue your cholesterol-lowering diet and exercise program.
- This drug cannot be taken during pregnancy; using barrier contraceptives is advised.
- This drug cannot be taken while nursing; another method of feeding the baby will be needed.
- Have periodic ophthalmic examinations while you are using this drug.
- You may experience these side effects: Nausea (eat frequent small meals); headache, muscle and joint aches and pains (may lessen); sensitivity to sunlight (use sunblock and wear protective clothing).
- Report severe GI upset, changes in vision, unusual bleeding or bruising, dark urine or light-colored stools, muscle pain or weakness.

▷ praziquantel

See Appendix U, *Less commonly used drugs*.

▷ prazosin hydrochloride

(*pra' zoe sin*)

Apo-Prazo (CAN), Minipress, Novo-Prazin (CAN)

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic blocker
Antihypertensive

Therapeutic actions

Selectively blocks postsynaptic α_1 -adrenergic receptors, decreasing sympathetic tone on the vasculature, dilating arterioles and veins, and lowering supine and standing BP; unlike conventional alpha-adrenergic blocking agents (eg, phentolamine), it does not block α_2 presynaptic receptors, so it does not cause reflex tachycardia.

Indications

- Treatment of hypertension, alone or in combination with other agents

- Unlabeled uses: Management of Raynaud's vasospasm, pediatric hypertension

Contraindications and cautions

- Contraindicated with hypersensitivity to prazosin, lactation.
- Use cautiously with HF, angina pectoris, renal failure, pregnancy.

Available forms

Capsules—1, 2, 5 mg

Dosages

⊗ **Warning** First dose may cause syncope with sudden loss of consciousness. First dose should be limited to 1 mg PO and given at bedtime.

Adults

Initial dosage is 1 mg PO bid–tid. Increase dosage to a total of 20 mg/day given in divided doses. When increasing dosage, give the first dose of each increment at bedtime. Maintenance dosages most commonly range from 6–15 mg/day given in divided doses.

- **Concomitant therapy:** When adding a diuretic or other antihypertensive drug, reduce dosage to 1–2 mg PO tid and then readjust.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, feces, and urine

Adverse effects

- **CNS:** *Dizziness, headache, drowsiness, lack of energy, weakness*, nervousness, vertigo, depression, paresthesia
- **CV:** *Palpitations*, sodium and water retention, increased plasma volume, edema, dyspnea, syncope, tachycardia, orthostatic hypotension
- **Dermatologic:** Rash, pruritus, alopecia, lichen planus
- **EENT:** Blurred vision, reddened sclera, epistaxis, tinnitus, dry mouth, nasal congestion

- **GI:** *Nausea*, vomiting, diarrhea, constipation, abdominal discomfort or pain
- **GU:** Urinary frequency, incontinence, impotence, priapism
- **Other:** Diaphoresis, lupus erythematosus

Interactions

- *** Drug-drug *** Severity and duration of hypotension following first dose of prazosin may be greater in patients receiving beta-adrenergic blocking drugs (eg, propranolol), verapamil; first dose of prazosin should be only 0.5 mg or less
- Increased risk of hypotension with phosphodiesterase-5 inhibitors (sildenafil, tadalafil, vardenafil)

Nursing considerations

Assessment

- **History:** Hypersensitivity to prazosin, HF, angina pectoris, renal failure, lactation, pregnancy
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds; status of nasal mucous membranes; bowel sounds, normal output; voiding pattern, normal output; renal function tests, urinalysis

Interventions

- Administer, or have patient take, first dose just before bedtime to lessen likelihood of first dose effect (syncope), believed due to excessive orthostatic hypotension.
- Have patient lie down and treat patient supportively if syncope occurs; condition is self-limiting.
- Monitor for orthostatic hypotension, which is most marked in the morning and is accentuated by hot weather, alcohol, and exercise.
- Monitor edema and weight in patients with incipient cardiac decompensation, and add a thiazide diuretic to the drug regimen if sodium and fluid retention or signs of impending heart failure occur.

Teaching points

- Take this drug exactly as prescribed. Take the first dose just before bedtime. Do not drive

or operate machinery for 4 hours after the first dose.

- You may experience these side effects: Dizziness, weakness (more likely when changing position, in the early morning, after exercise, in hot weather, and with alcohol; some tolerance may occur; avoid driving or engaging in tasks that require alertness; change position slowly, and use caution when climbing stairs; lie down for a while if dizziness persists); GI upset (eat frequent small meals); impotence; dry mouth (sucking on sugarless lozenges, ice chips may help); stuffy nose. Most effects are transient.
- Report frequent dizziness or faintness.

prednisolONE (pred *niss'* ob lone)

prednisolone

Oral: Prelone

prednisolone acetate

Ophthalmic solution:

Econopred, Pred Forte, Pred Mild, ratio-Prednisolone (CAN)

prednisolone sodium phosphate

Ophthalmic solution:

Prednisol

Oral:

Hydrocortone, Orapred, Orapred ODT, PEDIAPRED

PREGNANCY CATEGORY C

Drug classes

Anti-inflammatory

Corticosteroid (intermediate acting)

Glucocorticoid

Hormone

Therapeutic actions

Enters target cells and binds to intracellular corticosteroid receptors, thereby initiating many complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

Systemic

- Hypercalcemia associated with cancer
- Short-term management of various inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (eg, SLE), dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders: Thrombocytopenia purpura, erythroblastopenia
- Ulcerative colitis, acute exacerbations of MS and palliation in some leukemias and lymphomas
- Trichinosis with neurologic or myocardial involvement
- Prednisolone has weaker mineralocorticoid activity than hydrocortisone and is not used as physiologic replacement therapy

Ophthalmic

- Inflammation of the lid, conjunctiva, cornea, and globe

Contraindications and cautions

- Contraindicated with infections (especially TB, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections), lactation, idiopathic thrombocytopenic purpura.
- Use cautiously with renal or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus, pregnancy.

Ophthalmic preparations

- Contraindicated with acute superficial herpes simplex keratitis; fungal infections of ocular structures; vaccinia, varicella, and other viral diseases of the cornea and conjunctiva; ocular TB.

Available forms

Tablets—5 mg; rapidly dissolving tablets—10, 15, 30 mg; oral syrup—15 mg/5 mL, 5 mg/5 mL; ophthalmic suspension—0.12%, 1%; oral suspension—5, 15 mg/5 mL

Dosages

Adults

Individualize dosage, depending on severity of condition and patient's response.

Administer daily dose before 9 AM to minimize adrenal suppression. If long-term therapy is needed, consider alternate-day therapy. After long-term therapy, withdraw drug slowly to avoid adrenal insufficiency. For maintenance therapy, reduce initial dose in small increments at intervals until the lowest dose that maintains satisfactory clinical response is reached.

Oral

Prednisolone: 5–60 mg/day.

- **Acute exacerbations of MS:** 200 mg/day for 1 wk, followed by 80 mg every other day for 1 mo (prednisolone sodium phosphate).

Adults and pediatric patients

Ophthalmic

Prednisolone acetate: 2 drops qid. For *Pred Mild* or *Pred Forte*, 1–2 drops bid–qid during first 48 hr; then dosing frequency may be increased if necessary.

Prednisolone sodium phosphate: 1–2 drops up to every hr during the day and every 2 hr during the night. After a favorable response, reduce to 1 drop every 4 hr. Later, further reduction to 1 drop 3–4 times daily may suffice.

Pediatric patients

Individualize dosage depending on severity of condition and patient's response rather than by strict adherence to formulae that correct adult doses for age or weight. Carefully observe growth and development in infants and children on prolonged therapy.

Oral suspension

0.14–2 mg/kg/day PO in three to four divided doses.

- **Nephrotic syndrome (prednisolone sodium phosphate):** 60 mg/m²/day PO in three divided doses for 4 wk. Then single doses for 4 wk. Alternatively, 40 mg/m²/day PO.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	1–1.5 days

Metabolism: Hepatic; T_{1/2}: 3.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

Effects depend on dose, route, and duration of therapy. The following are primarily associated with systemic absorption.

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis, cataracts, increased IOP, glaucoma (long-term therapy), *euphoria, depression*
- **CV:** Hypotension, **shock**, hypertension and HF secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias
- **Electrolyte imbalance:** *Na⁺ and fluid retention*, hypokalemia, hypocalcemia
- **Endocrine:** Amenorrhea, irregular menses, growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state (long-term effect), increased blood sugar, increased serum cholesterol, decreased T₃ and T₄ levels, HPA suppression with systemic therapy longer than 5 days
- **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention, nausea, vomiting, *increased appetite, weight gain* (long-term therapy)
- **Hypersensitivity:** Hypersensitivity or anaphylactoid reactions
- **Musculoskeletal:** Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
- **Other:** *Immunosuppression, aggravation, or masking of infections; impaired wound healing*; thin, fragile skin; petechiae, ecchymoses, purpura, striae; subcutaneous fat atrophy

Ophthalmic solutions

- **Local:** Infections, especially fungal; glaucoma, cataracts with long-term therapy
- **Other:** Systemic absorption and adverse effects (see above) with prolonged use

Interactions

- **Drug-drug** • Increased therapeutic and toxic effects of prednisolone with ketoconazole • Increased therapeutic and toxic effects of estrogens, including hormonal contraceptives • Risk of severe deterioration of muscle strength in myasthenia gravis patients who also are receiving ambenonium, edrophonium, neostigmine, pyridostigmine • Decreased

steroid blood levels with barbiturates, phenytoin, rifampin • Decreased effectiveness of salicylates

★ **Drug-lab test** • False-negative nitroblue tetrazolium test for bacterial infection • Suppression of skin test reactions

■ Nursing considerations

Assessment

- **History:** Infections; renal or liver disease; hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease; HF; hypertension; thromboembolic disorders; osteoporosis; seizure disorders; diabetes mellitus; pregnancy; lactation. Ophthalmic: Acute superficial herpes simplex keratitis; fungal infections of ocular structures; vaccinia, varicella, and other viral diseases of the cornea and conjunctiva; ocular TB
- **Physical:** Weight, T, reflexes and grip strength, affect and orientation, P, BP, peripheral perfusion, prominence of superficial veins, R, adventitious sounds, serum electrolytes, blood glucose

Interventions

- Administer once-a-day doses before 9 AM to mimic normal peak corticosteroid blood levels.
- Increase dosage when patient is subject to stress.
- Have patient place orally disintegrating tablet in mouth, let dissolve, and then swallow.
- ⊗ **Warning** Taper doses when discontinuing high-dose or long-term therapy to avoid adrenal insufficiency.
- ⊗ **Warning** Do not give live virus vaccines with immunosuppressive doses of corticosteroids.

Teaching points

Systemic

- Take once-daily doses before 9 AM; if using orally dissolving tablet, place in mouth, let dissolve, and then swallow.
- Do not stop taking the drug without consulting your health care provider.
- Avoid exposure to infections.
- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry

stools, fever, prolonged sore throat, colds or other infections, worsening of the disorder for which the drug is being taken.

Ophthalmic preparations

- Learn the proper administration technique: Shake suspension well before each use. Lie down or tilt head backward, and look at ceiling. Pull lower eyelid down to form a pocket. Drop suspension inside lower eyelid while looking up. After instilling eye drops, release lower lid, but do not blink for at least 30 seconds; apply gentle pressure to the inside corner of the eye for 1 minute. Do not close eyes tightly, and try not to blink more often than usual. Do not touch dropper to eye, fingers, or any surface. Wait at least 5 minutes before using any other eye preparations.
- Eyes may be sensitive to bright light; sunglasses may help.
- Report worsening of the condition, pain, itching, swelling of the eye, failure of the condition to improve after 1 week.

▷ predniSONE (pred' ni sone)

Apo-Prednisone (CAN), Novo-Prednisone (CAN), Prednisone IntenSol Concentrate, Winpred (CAN)

PREGNANCY CATEGORY C

Drug classes

Corticosteroid (intermediate acting)
Glucocorticoid
Hormone

Therapeutic actions

Enters target cells and binds to intracellular corticosteroid receptors, initiating many complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

- Replacement therapy in adrenal cortical insufficiency
- Hypercalcemia associated with cancer
- Short-term management of various inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (eg, SLE),

- dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders: Thrombocytopenia purpura, erythroblastopenia
 - Ulcerative colitis, acute exacerbations of MS and palliation in some leukemias and lymphomas
 - Trichinosis with neurologic or myocardial involvement

Contraindications and cautions

- Contraindicated with infections, especially tuberculosis, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections; lactation.
- Use cautiously with renal or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus, hepatic disease, pregnancy (monitor infants for adrenal insufficiency).

Available forms

Tablets—1, 2.5, 5, 10, 20, 50 mg; oral solution—5 mg/5 mL, 5 mg/mL

Dosages

Adults

Individualize dosage depending on severity of condition and patient's response. Administer daily dose before 9 AM to minimize adrenal suppression. If long-term therapy is needed, consider alternate-day therapy. After long-term therapy, withdraw drug slowly to avoid adrenal insufficiency. Initial dose, 5–60 mg/day PO. For maintenance therapy, reduce initial dose in small increments at intervals until lowest dose that maintains satisfactory clinical response is reached. For acute exacerbations of MS, 200 mg/day PO for 1 wk, then 80 mg PO every other day for 1 month.

Pediatric patients

- *Physiologic replacement*: 0.05–2 mg/kg/day PO or 4–5 mg/m²/day PO in equal divided doses every 12 hr.
- *Other indications*: Individualize dosage depending on severity of condition and the patient's response rather than by strict adher-

ence to formulae that correct adult doses for age or body weight. Carefully observe growth and development in infants and children on prolonged therapy.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	1–1.5 days

Metabolism: Hepatic; T_{1/2}: 3.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS**: *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis, cataracts, increased IOP, glaucoma (long-term therapy), *euphoria, depression*
- **CV**: Hypotension, **shock**, hypertension and HF secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias
- **Electrolyte imbalance**: *Sodium and fluid retention*, hypokalemia, hypocalcemia
- **Endocrine**: Amenorrhea, irregular menses, growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state (long-term effect), increased blood sugar, increased serum cholesterol, decreased T₃ and T₄ levels, HPA suppression with systemic therapy longer than 5 days
- **GI**: Peptic or esophageal ulcer, pancreatitis, abdominal distention, nausea, vomiting, *increased appetite, weight gain* (long-term therapy)
- **Hypersensitivity**: Hypersensitivity or anaphylactoid reactions
- **Musculoskeletal**: Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
- **Other**: *Immunosuppression, aggravation or masking of infections; impaired wound healing*; thin, fragile skin; petechiae, ecchymoses, purpura, striae; subcutaneous fat atrophy

Interactions

- **Drug-drug** • Increased therapeutic and toxic effects with troleandomycin, keto-

conazole • Increased therapeutic and toxic effects of estrogens, including hormonal contraceptives • Risk of severe deterioration of muscle strength in myasthenia gravis patients who also are receiving ambenonium, edrophonium, neostigmine, pyridostigmine • Decreased steroid blood levels with barbiturates, phenytoin, rifampin • Decreased effectiveness of salicylates

★ **Drug-lab test** • False-negative nitroblue tetrazolium test for bacterial infection • Suppression of skin test reactions

■ Nursing considerations

Assessment

- **History:** Infections, renal or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, HF, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus, hepatic disease, lactation
- **Physical:** Weight, T, reflexes and grip strength, affect and orientation, P, BP, peripheral perfusion, prominence of superficial veins, R, adventitious sounds, serum electrolytes, blood glucose

Interventions

- Administer once-a-day doses before 9 AM to mimic normal peak corticosteroid blood levels.
- Increase dosage when patient is subject to stress.

⊗ **Warning** Taper doses when discontinuing high-dose or long-term therapy to avoid adrenal insufficiency.

⊗ **Warning** Do not give live virus vaccines with immunosuppressive doses of corticosteroids.

Teaching points

- Do not stop taking the drug without consulting your health care provider; take once-daily doses at about 9 AM.
- Avoid exposure to infections.
- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry stools, fever, prolonged sore throat, colds or other infections, worsening of the disorder for which the drug is being taken.

▽ pregabalin (*pray gab' ab lin*)

Lyrica

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE V

Drug classes

Analgesic
Antiepileptic
Calcium channel modulator

Therapeutic actions

Binds to α_2 -delta sites on the nerves in the CNS, which reduces the calcium influx into the cell and decreases the release of neurotransmitters into the synaptic cleft, resulting in less stimulation of the nerve; in lab studies, it also increases the transport and density of GABA, which is known to suppress nerve activity.

Indications

- Management of acute pain associated with diabetic peripheral neuropathy
- Management of postherpetic neuralgia
- Adjunct therapy of adult patients with partial onset seizures
- Management of fibromyalgia
- Unlabeled uses: Treatment of generalized anxiety disorders

Contraindications and cautions

- Contraindicated with known hypersensitivity to pregabalin or any component of the drug, lactation.
- Use cautiously with diabetes, HF, pregnancy.

Available forms

Capsules—25, 50, 75, 100, 150, 200, 225, 300 mg; oral solution—20 mg/mL

Dosages

Adults

- *Neuropathic pain:* 100 mg PO tid.
- *Postherpetic neuralgia:* 75–150 mg PO bid or 50–100 mg PO tid as needed to control pain; may be adjusted up to a maximum dose of 600 mg/day.

- **Epilepsy:** 150–600 mg/day PO, divided into two to three doses.
- **Fibromyalgia:** 75 mg PO bid. May be increased within 1 wk to 150 mg PO bid. Maximum dose, 450 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

If creatinine clearance is 60 mL/min or greater, 150–600 mg/day in two to three divided doses; if creatinine clearance is 30–60 mL/min, 75–300 mg/day in two to three divided doses; if creatinine clearance is 15–30 mL/min, 25–150 mg/day in one dose or divided into two doses; if creatinine clearance is less than 15 mL/min, 25–75 mg/day as one dose.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.5 hr

Metabolism: None; $T_{1/2}$: 6.3 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, somnolence, neuropathy*, ataxia, vertigo, confusion, euphoria, incoordination, vision abnormalities, tremors, thinking abnormalities, suicidal ideation
- **GI:** *Dry mouth, constipation*, flatulence
- **Other:** *Peripheral edema, weight gain*, hypoglycemia, back pain, chest pain, *infection, creatine kinase elevations*, loss of fertility (male), **angioedema**

Interactions

★ **Drug-drug** • Increased risk of sedation and dizziness if combined with CNS depressants, alcohol • Increased incidence of weight gain if combined with pioglitazone, rosiglitazone; monitor patient weight and blood glucose if this combination is used

■ Nursing considerations

Assessment

- **History:** Lactation, pregnancy, diabetes, heart failure, allergy to pregabalin

- **Physical:** Weight; orientation, reflexes, affect, vision; renal function tests, blood glucose level

Interventions

⊗ **Black box warning** Risk of suicidal ideation is increased; monitor patient accordingly.

- Do not administer this drug after a fatty or large meal, absorption can be affected.
- Do not stop taking this drug suddenly; dosage should be adjusted to avoid adverse effects.
- Provide safety measures if dizziness, somnolence, changes in thinking occur.
- Monitor weight gain and fluid retention; adjust treatment for diabetes, HF accordingly.
- Encourage women of childbearing age to use barrier contraceptives while on this drug because the effects of the drug on a fetus are not known.
- Advise women who are nursing to find another method of feeding the baby, it is not known if this drug can affect a nursing baby.
- Advise men who plan to father a child that in animal studies, this drug affected fertility and was related to birth defects in the offspring of male animals taking the drug. The decision to take the drug may be affected by this information.

Teaching points

- Take this drug exactly as prescribed. Do not increase the dose without consulting your health care provider.
- Do not stop taking this drug suddenly; serious adverse effects could occur.
- Do not share this drug with anyone else. Carefully dispose of any unused or outdated drug.
- Do not take this drug with or immediately after a high fat or heavy meal. This could interfere with the absorption and effectiveness of the drug.
- It is not known how this drug would affect a pregnancy. If you think you are pregnant or would like to become pregnant, consult your health care provider. You should use contraceptive measures while taking this drug.
- This drug should not be taken while nursing a baby. If you are nursing a baby, another

method of feeding the baby should be used while using this drug.

- Do not drink alcohol while you are using this drug.
- If you are a man who wants to father a child, discuss this with your health care provider; this drug caused animals to be less fertile and caused some birth defects in the offspring of males taking this drug.
- You may experience these side effects: Dizziness, sleepiness, changes in thinking and alertness (do not drive a car, operate potentially dangerous equipment, or make important legal decisions if this occurs); dry mouth (sucking on sugarless lozenges, frequent mouth care may help).
- Report rash; changes in vision; weight gain; swelling in feet, legs, face, or tongue; increased bleeding; fever; sudden pain; weakness; or thoughts of suicide.

primidone
(pri' mi done)

Apo-Primidone (CAN), Mysoline

PREGNANCY CATEGORY D

Drug classes

Anticonvulsant
Antiepileptic

Therapeutic actions

Mechanism of action not understood; primidone and its two metabolites, phenobarbital and phenylethylmalonamide, all have anti-epileptic activity.

Indications

- Control of grand mal, psychomotor, or focal epileptic seizures, either alone or with other antiepileptics; may control grand mal seizures refractory to other antiepileptics
- Unlabeled use: Treatment of benign familial tremor (essential tremor)—750 mg/day

Contraindications and cautions

- Contraindicated with hypersensitivity to phenobarbital and primidone, porphyria, lactation (somnolence and drowsiness may occur in nursing newborns).

- Use cautiously with pregnancy (association between use of antiepileptics and an elevated incidence of birth defects; however, do not discontinue antiepileptic therapy in pregnant women who are receiving such therapy to prevent major seizures; discontinuing medication is likely to precipitate status epilepticus, with attendant hypoxia and risk to both mother and fetus; to prevent neonatal hemorrhage, primidone should be given with prophylactic vitamin K₁ therapy for 1 mo before and during delivery).

Available forms

Tablets—50, 250 mg

Dosages

Adults

- *Regimen for patients who have received no previous therapy:* Days 1–3, 100–125 mg PO at bedtime; days 4–6, 100–125 mg bid; days 7–9, 100–125 mg tid; day 10—maintenance, 250 mg tid. The usual maintenance dosage is 250 mg tid–qid. If required, increase dosage to 250 mg five to six times daily, but do not exceed dosage of 500 mg qid (2 g/day).
- *Regimen for patients already receiving other antiepileptics:* Start primidone at 100–125 mg PO at bedtime. Gradually increase to maintenance level as the other drug is gradually decreased. Continue this regimen until satisfactory dosage level is achieved for the combination, or the other medication is completely withdrawn. When use of primidone alone is desired, the transition should not be completed in less than 2 wk.

Pediatric patients

- *Regimen for patients who have received no previous therapy:*
Younger than 8 yr: Days 1–3, 50 mg PO at bedtime; days 4–6, 50 mg bid; days 7–9, 100 mg bid; day 10—maintenance, 125–250 mg tid. The usual maintenance dosage is 125–250 mg tid or 10–25 mg/kg/day in divided doses.
Older than 8 yr: Use adult dosage.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–7 hr

Metabolism: Hepatic; T_{1/2}: 3–24 hr

P

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Ataxia, vertigo, fatigue, hyperirritability*, emotional disturbances, nystagmus, diplopia, drowsiness, personality deterioration with mood changes and paranoia, suicidal ideation, tolerance
- **GI:** *Nausea, anorexia*, vomiting
- **GU:** Sexual impotence
- **Hematologic:** Megaloblastic anemia that responds to folic acid therapy, thrombocytopenia
- **Other:** Morbilliform skin eruptions

Interactions

- *** Drug-drug** • Toxicity with phenytoins
- Increased CNS effects, impaired hand-eye coordination, and death may occur with acute alcohol ingestion
- Decreased serum concentrations of primidone and increased serum concentrations of carbamazepine if taken concurrently
- Decreased serum concentrations with acetazolamide
- Increased levels with isoniazid, nicotinamide, succinimides

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to phenobarbital, porphyria, pregnancy, lactation, suicidal ideation
- **Physical:** Skin color, lesions; orientation, affect, reflexes, vision examination; bowel sounds, normal output; CBC and SMA-12, EEG

Interventions

⊗ **Black box warning** Risk of suicidal ideation is increased. Monitor patient accordingly.

⊗ **Warning** Reduce dosage, discontinue primidone, or substitute other antiepileptic gradually; abrupt discontinuation may precipitate status epilepticus.

- Arrange for patient to have CBC and SMA-12 test every 6 mo during therapy.
- Arrange for folic acid therapy if megaloblastic anemia occurs; primidone does not need to be discontinued.

- Obtain counseling for women of childbearing age who wish to become pregnant.

⊗ **Warning** Evaluate for therapeutic serum levels—5–12 mcg/mL for primidone.

Teaching points

- Take this drug exactly as prescribed; do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Arrange for frequent checkups, including blood tests, to monitor your response to this drug. Keep all appointments for checkups.
- Use contraception at all times. If you wish to become pregnant while you are taking this drug, you should consult your health care provider.
- Wear a medical alert tag at all times so that emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Drowsiness, dizziness, muscular incoordination (transient; avoid driving or performing other tasks requiring alertness); vision changes (avoid performing tasks that require visual acuity); GI upset (take drug with food or milk, eat frequent small meals).
- Report rash, joint pain, unexplained fever, pregnancy, thoughts of suicide.

▽ probenecid

(*proe ben' e sid*)

Benuryl (CAN)

PREGNANCY CATEGORY B

Drug classes

Antigout drug
Uricosuric drug

Therapeutic actions

Inhibits the renal tubular reabsorption of urate, increasing the urinary excretion of uric acid, decreasing serum uric acid levels, retarding urate deposition, and promoting resorption of urate deposits; also inhibits the renal tubular reabsorption of most penicillins and cephalosporins.

Indications

- Treatment of hyperuricemia associated with gout and gouty arthritis (adults)
- Adjuvant to therapy with penicillins or cephalosporins, for elevation and prolongation of plasma levels of the antibiotic

Contraindications and cautions

- Contraindicated with allergy to probenecid, blood dyscrasias, uric acid kidney stones, acute gouty attack.
- Use cautiously with peptic ulcer, acute intermittent porphyria, G6PD deficiency, chronic renal insufficiency, in patients with sulfa allergy, lactation, pregnancy.

Available forms

Tablets—0.5 g

Dosages

Adults

- *Gout*: 0.25 g PO bid for 1 wk; then 0.5 g PO bid. For maintenance, continue dosage that maintains the normal serum uric acid levels. When no attacks occur for 6 mo or longer, decrease the daily dosage by 0.5 g every 6 mo.
- *Penicillin or cephalosporin therapy*: 2 g/day PO in divided doses.
- *Gonorrhea treatment*: Single 1-g dose PO 30 min before penicillin administration.

Pediatric patients

- *Penicillin or cephalosporin therapy*:
Younger than 2 yr: Do not use.
2–14 yr: 25 mg/kg PO initial dose, then 40 mg/kg/day divided in four doses.
Children 50 kg or greater: Use adult dosage.
- *Gonorrhea treatment in children less than 45 kg*: 23 mg/kg PO in one single dose 30 min before penicillin administration.

Geriatric patients or patients with renal impairment

1 g/day PO may be adequate. Daily dosage may be increased by 0.5 g every 4 wk. Probenecid may not be effective in chronic renal insufficiency when GFR less than 30 mL/min.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 5–78 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **GI:** *Nausea, vomiting, anorexia*, sore gums
- **GU:** *Urinary frequency*, exacerbation of gout and uric acid stones
- **Hematologic:** Anemia, hemolytic anemia
- **Hypersensitivity:** Reactions including **anaphylaxis**, dermatitis, pruritus, fever
- **Other:** Blushing, dizziness

Interactions

• **Drug-drug** • Decreased effectiveness with salicylates • Decreased renal excretion and increased serum levels of methotrexate, dipyridine • Increased pharmacologic effects of thiopental, acyclovir, allopurinol, benzodiazepines, clofibrate, dapsone, NSAIDs, sulfonamides, zidovudine, rifampin

• **Drug-lab test** • False-positive test for urine glucose if using Benedict's test, *Climitest* (use *Climistix*) • Falsely high determination of theophylline levels • Inhibited excretion of urinary 17-ketosteroids, phenolsulfonphthalein, sulfobromophthalein

Nursing considerations

Assessment

- **History:** Allergy to probenecid, blood dyscrasias, uric acid kidney stones, acute gouty attack, peptic ulcer, acute intermittent porphyria, G6PD deficiency, chronic renal insufficiency, pregnancy, lactation
- **Physical:** Skin lesions, color; reflexes, gait; liver evaluation, normal output, gums; urinary output; CBC, LFTs, renal function tests, urinalysis

Interventions

- Administer drug with meals or antacids if GI upset occurs.
- Encourage patient to drink 2.5 to 3 L/day of fluids to decrease the risk of renal stone development.
- Check urine alkalinity; urates crystallize in acid urine; sodium bicarbonate or potassium citrate may be ordered to alkalinize urine.

- Arrange for regular medical follow-up and blood tests.
- Double-check any analgesics ordered for pain; salicylates should be avoided.

Teaching points

- Take the drug with meals or antacids if GI upset occurs.
- You may experience these side effects: Headache (monitor lighting, temperature, noise; consult your health care provider if severe); dizziness (change position slowly; avoid driving or operating dangerous machinery); exacerbation of gouty attack or renal stones (drink plenty of fluids—2.5–3 liters per day); nausea, vomiting, loss of appetite (take drug with meals or request antacids).
- Report flank pain, dark urine or blood in urine, acute gout attack, unusual fatigue or lethargy, unusual bleeding or bruising.

procarbazine hydrochloride

See Appendix U, *Less commonly used drugs*.

prochlorperazine (*proe klor per' a zeen*)

prochlorperazine

prochlorperazine edisylate

prochlorperazine maleate

Procomp

PREGNANCY CATEGORY C

Drug classes

Antiemetic
Antipsychotic
Anxiolytic
Dopaminergic blocker
Phenothiazine (piperazine)

Therapeutic actions

Mechanism of action not fully understood: Antipsychotics block postsynaptic dopamine receptors in the brain, but this may not be necessary and sufficient for antipsychotic activity; depresses the RAS, including the parts of the brain involved with wakefulness and emesis; anticholinergic, antihistaminic (H₁), and alpha-adrenergic blocking activity also may contribute to some of its therapeutic (and adverse) actions.

Indications

- Management of manifestations of psychotic disorders
- Control of severe nausea and vomiting
- Short-term treatment of nonpsychotic anxiety (not drug of choice)

Contraindications and cautions

- Contraindicated with hypersensitivity to phenothiazines, coma or severe CNS depression, bone marrow depression, blood dyscrasia, circulatory collapse, subcortical brain damage, Parkinson's disease, liver damage, cerebral arteriosclerosis, coronary disease, congenital long-QT syndrome, severe hypotension or hypertension, history of cardiac arrhythmias.
- Use cautiously with elderly patients, respiratory disorders, glaucoma, prostatic hypertrophy, epilepsy, breast cancer (elevations in prolactin may stimulate a prolactin-dependent tumor), thyrotoxicosis, peptic ulcer, decreased renal function, myelography within previous 24 hr or scheduled within 48 hr, exposure to heat or phosphorous insecticides, pregnancy, lactation, children younger than 12 yr, especially those with chickenpox, CNS infections (children are especially susceptible to dystonias that may confound the diagnosis of Reye's syndrome).

Available forms

Tablets—5, 10, 25 mg; suppositories—25 mg

Dosages

Adults

- *Psychotic disturbances*: Initially, 5–10 mg PO tid or qid. Gradually increase dosage every

2–3 days as needed up to 50–75 mg/day for mild or moderate disturbances, 100–150 mg/day for more severe disturbances. For immediate control of severely disturbed adults, 10–20 mg IM repeated every 2–4 hr (every hour for resistant cases); switch to oral therapy as soon as possible.

- **Antiemetic:** For control of severe nausea and vomiting, 5–10 mg PO tid–qid; 15 mg (SR) on arising; 25 mg rectally bid; or 5–10 mg IM initially, repeated every 3–4 hr up to 40 mg/day.
- **Nausea, vomiting related to surgery:** 5–10 mg IM 1–2 hr before anesthesia or during and after surgery (may repeat once in 30 min); 5–10 mg IV 15 min before anesthesia or during and after surgery (may repeat once); or as IV infusion, 20 mg/L of isotonic solution added to infusion 15–30 min before anesthesia.
- **Nonpsychotic anxiety:** 5 mg PO tid or qid. Do not give more than 20 mg/day or for longer than 12 wk.

Pediatric patients

Do not use in pediatric surgery.

Less than 9 kg or younger than 2 yr: Generally not recommended.

Psychotic disturbances: 2–12 yr: 2.5 mg PO or rectally bid–tid. Do not give more than 10 mg on first day. Increase dosage according to patient response; total daily dose usually does not exceed 20 mg (2–5 yr) or 25 mg (6–12 yr).

Younger than 12 yr: 0.132 mg/kg by deep IM injection. Switch to oral dosage as soon as possible (usually after one dose).

- **Antiemetic for control of severe nausea and vomiting:**

Oral or rectal

More than 20 lb or older than 2 yr:

9.1–13.2 kg: 2.5 mg daily–bid, not to exceed 7.5 mg/day.

13.6–17.7 kg: 2.5 mg bid–tid, not to exceed 10 mg/day.

18.2–38.6 kg: 2.5 mg tid or 5 mg bid, not to exceed 15 mg/day.

IM

2 yr and older weighing at least 9.1 kg: 0.132 mg/kg IM (usually only one dose).

Pharmacokinetics

Route	Onset	Duration
Oral	30–40 min	3–4 hr
SR	30–40 min	10–12 hr
Rectal	60–90 min	3–4 hr
IM	10–20 min	3–4 hr
IV	Immediate	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute 20 mg in not less than 1 L of isotonic solution.

Infusion: Inject 5–10 mg directly IV 15–30 min before induction (may be repeated once), or infuse dilute solution 15–30 min before induction; do not exceed 5 mg/mL/min.

Adverse effects

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, flushed facies, sweating, constipation, paralytic ileus, urinary retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition, male impotence
- **CNS:** *Drowsiness, dizziness,* insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, extrapyramidal syndromes—*pseudoparkinsonism; dystonias; akathisia,* tardive dyskinesia, potentially irreversible; **NMS**
- **CV:** Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, cardiac arrest, HF, cardiomegaly, **refractory arrhythmias,** pulmonary edema
- **EENT:** Glaucoma, *photophobia, blurred vision,* miosis, mydriasis, deposits in the cornea and lens (opacities), pigmentary retinopathy
- **Endocrine:** Lactation, breast engorgement, galactorrhea; SIADH; amenorrhea, menstrual irregularities; gynecomastia; changes in libido; hyperglycemia or hypoglycemia; glycosuria; hyponatremia; pituitary tumor

with hyperprolactinemia; inhibition of ovulation, infertility, pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, progestins

- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia; **aplastic anemia;** **hemolytic anemia;** thrombocytopenic or nonthrombocytopenic purpura; pancytopenia
- **Hypersensitivity:** Jaundice, urticaria, angioedematous edema, laryngeal edema, photosensitivity, eczema, asthma, anaphylactoid reactions, exfoliative dermatitis
- **Respiratory: Bronchospasm, laryngospasm,** dyspnea; suppression of cough reflex and potential for aspiration
- **Other:** *Urine discolored pink to red-brown*

Interactions

- * **Drug-drug** • Additive CNS depression with alcohol • Additive anticholinergic effects and possibly decreased antipsychotic efficacy with anticholinergic drugs • Increased chance of severe neuromuscular excitation and hypotension with barbiturate anesthetics (methohexital, phenobarbital, thiopental)
- * **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used) • Increase in PBI, not attributable to an increase in thyroxine • False-positive PKU test results

■ Nursing considerations

Assessment

- **History:** Coma or severe CNS depression; bone marrow depression; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; respiratory disorders; allergy to phenothiazines; glaucoma, prostatic hypertrophy; epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat or phosphorous insecticides; pregnancy; lactation; age younger than 12 yr
- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious

sounds; bowel sounds and normal output; liver evaluation; urinary output, prostate size; CBC; urinalysis; LFTs, renal and thyroid function tests

Interventions

- Do not administer subcutaneously because of local irritation.
- Give IM injections deeply into the upper outer quadrant of the buttock.
- Avoid skin contact with oral solution; contact dermatitis may occur.
- ⊗ **Warning** Discontinue drug if serum creatinine or BUN become abnormal or if WBC count is depressed.
- Elderly patients may be more sensitive to antipaminergic and anticholinergic effects; monitor accordingly.
- Monitor elderly patients for dehydration, and institute remedial measures promptly; sedation and decreased sensation of thirst related to CNS effects of drug can lead to severe dehydration.
- Consult physician regarding appropriate warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about dosage reduction, use of anticholinergic antiparkinsonians (controversial) if extrapyramidal effects occur.

Teaching points

- Take drug exactly as prescribed.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Avoid exposure to ultraviolet or sunlight to prevent photosensitivity. Use sunscreen and protective clothing.
- Avoid driving or engaging in other dangerous activities if dizziness, drowsiness, or vision changes occur.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine (expect pink or reddish-brown urine), pale stools, yellowing of the skin or eyes.

▼ progesterone

(*proe jess' ter own*)

Progesterone in oil (parenteral):

Progesterone aqueous

Progesterone

Crinone, Prochieve (vaginal gel),

Prometrium

Vaginal insert: Endometrin

PREGNANCY CATEGORY B

PREGNANCY CATEGORY D
(INJECTION)

Drug classes

Hormone

Progestin

Therapeutic actions

Endogenous female progestational substance; transforms proliferative endometrium into secretory endometrium; inhibits the secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; inhibits spontaneous uterine contractions; may have some estrogenic, anabolic, or androgenic activity.

Indications

- Treatment of primary and secondary amenorrhea
- Treatment of abnormal uterine bleeding
- Prevention of endometrial hyperplasia
- Treatment of endometrial hyperplasia in non-hysterectomized women who are receiving conjugated estrogens
- Vaginal: To support embryo implantation and early pregnancy by supplementation of corpus luteal function as part of an assisted reproductive technology treatment program for infertile women younger than 35 yr
- Gel: Infertility, as part of assisted reproductive technology for infertile women
- Unlabeled uses: Treatment of PMS, prevention of premature labor and habitual abortion in the first trimester, treatment of menorrhagia (intrauterine system)

Contraindications and cautions

- Contraindicated with allergy to progestins, thrombophlebitis, thromboembolic disorders, cerebral hemorrhage or history of these conditions, hepatic disease, carcinoma of the breast or genital organs, undiagnosed vaginal bleeding, missed abortion, diagnostic test for pregnancy, pregnancy (fetal abnormalities, including masculinization of the female fetus have occurred), lactation, PID, venereal disease, postpartum endometritis, pelvic surgery, uterine or cervical carcinoma (intrauterine system).
- Use cautiously with epilepsy, migraine, asthma, cardiac dysfunction, renal impairment, lactation.

Available forms

Injection—50 mg/mL; vaginal gel—45 mg (4%), 90 mg (8%); capsules—100, 200 mg; vaginal insert—100 mg

Dosages

Administer parenteral preparation by IM route only.

Adults

- *Amenorrhea*: 5–10 mg/day IM for 6–8 consecutive days. Expect withdrawal bleeding 48–72 hr after the last injection. Or use 400 mg PO in the evening for 10 days. Spontaneous normal cycles may follow.
- *Secondary amenorrhea*: Using 4% gel, 45 mg every other day to maximum of 6 doses. For women who do not respond, trial of 8% gel to maximum of 6 doses.
- *Uterine bleeding*: 5–10 mg/day IM for six doses. Bleeding should cease within 6 days. If estrogen is being given, begin progesterone after 2 wk of estrogen therapy. Discontinue injections when menstrual flow begins.
- *Endometrial hyperplasia*: 200 mg/day PO for 12 days per 28-day cycle in combination with a daily conjugated estrogen.
- *Infertility*: 90 mg vaginally daily in women requiring progesterone supplementation; 90 mg vaginally bid for replacement—continue for 10–12 wk into pregnancy if it occurs.
- *Support for implantation*: 100 mg inserted vaginally two to three times daily starting at oocyte retrieval and continuing for up to 10 wk.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	Unknown
IM	Varies	Unknown	Unknown
Vaginal gel	Slow	Unknown	25–50 hr

Metabolism: Hepatic; $T_{1/2}$: 8–9 hr on steady-state

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, bile

Adverse effects**Parenteral and oral**

- **CNS:** Sudden, partial, or complete loss of vision, proptosis, diplopia, migraine, precipitation of acute intermittent porphyria, mental depression, pyrexia, insomnia, somnolence, *dizziness*
- **CV:** Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, **pulmonary embolism**
- **Dermatologic:** Rash with or without pruritus, acne, melasma or chloasma, alopecia, hirsutism, *photosensitivity*
- **GI:** Cholestatic jaundice, nausea, *abdominal cramping, constipation*
- **GU:** *Breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, changes in cervical erosion and cervical secretions, breast tenderness* and secretion, transient increase in sodium and chloride excretion
- **Other:** Fluid retention, edema, *change in weight*, effects similar to those seen with hormonal contraceptives, breast pain

Oral contraceptives

- **CV:** Increased BP, **thromboembolic and thrombotic disease**
- **Endocrine:** Decreased glucose tolerance
- **GI:** Hepatic adenoma

Vaginal gel

- **CNS:** *Somnolence, headache*, nervousness, depression
- **GI:** *Constipation*, nausea, diarrhea
- **Other:** *Breast enlargement*, nocturia, perineal pain

Interactions

★ **Drug-lab test** • Inaccurate tests of hepatic and endocrine function

★ **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

Nursing considerations**Assessment**

- **History:** Allergy to progestins, thrombophlebitis, thromboembolic disorders, cerebral hemorrhage, hepatic disease, carcinoma of the breast or genital organs, undiagnosed vaginal bleeding, missed abortion, epilepsy, migraine, asthma, cardiac dysfunction, renal impairment, PID, venereal disease, postpartum endometritis, pelvic surgery, uterine or cervical carcinoma, pregnancy, lactation
- **Physical:** Skin color; lesions, turgor; hair; breasts; pelvic examination; orientation, affect; ophthalmologic examination; P, auscultation, peripheral perfusion, edema; R, adventitious sounds; liver evaluation; LFTs, renal function tests, glucose tolerance; Papanicolaou (Pap) test

Interventions

- Arrange for pretreatment and periodic (at least annual) history and physical examination, including BP, breasts, abdomen, pelvic organs, and a Pap test.
- Arrange for insertion of intrauterine system during or immediately after menstrual period to ensure that the patient is not pregnant; arrange to have patient reexamined after first month menses to ensure that system has not been expelled.

⊗ **Black box warning** Do not use progestins for the prevention of CV disease. Drug is not effective for this use; risk of CV disease may actually be increased.

⊗ **Black box warning** Caution patient before therapy of the need to prevent pregnancy during treatment and to obtain frequent medical follow-up.

- Administer parenteral preparations by IM injection only.

⊗ **Warning** Discontinue medication and consult physician if sudden partial or complete loss of vision occurs; discontinue if papilledema or retinal vascular lesions are present on examination.

⊗ **Warning** Discontinue drug and consult physician at the first sign of thromboembolic disease—leg pain, swelling, peripheral perfusion changes, shortness of breath.

Teaching points

- This drug can be given IM; it will be given daily for the specified number of days, or inserted vaginally and can remain for 1 year (as appropriate), or inserted vaginally using the applicator system one to two times per day; or given orally for 10 days.
- If used for fertility program, continue vaginal gel or insert 10–12 weeks into pregnancy until placental autonomy is achieved.
- Do not drink grapefruit juice while using this drug.
- This drug should not be taken during pregnancy (except vaginal gel); serious fetal abnormalities have been reported. If you may be pregnant, consult your health care provider immediately.
- Perform a monthly breast self-examination while using this drug.
- You may experience these side effects: Sensitivity to light (avoid exposure to the sun; use sunscreen and protective clothing); dizziness, sleeplessness, depression (use caution if driving or performing tasks that require alertness); rash, skin color changes, loss of hair; fever; nausea.
- Report pain or swelling and warmth in the calves, acute chest pain or shortness of breath, sudden severe headache or vomiting, dizziness or fainting, visual disturbances, numbness or tingling in the arm or leg.

Vaginal gel or insert

- Report severe headache, abnormal vaginal bleeding or discharge, acute calf or chest pain, fever.

DANGEROUS DRUG

promethazine hydrochloride

(*proe meth' a zeen*)

Phenadoz, Phenergan, Promethegan

PREGNANCY CATEGORY C

Drug classes

Antiemetic
Antihistamine
Anti-motion-sickness drug
Dopaminergic blocker
Phenothiazine
Sedative-hypnotic

Therapeutic actions

Selectively blocks histamine-1 receptors, diminishing the effects of histamine on cells of the upper respiratory tract and eyes and decreasing the sneezing, mucus production, itching, and tearing that accompany allergic reactions in sensitized people exposed to antigens; blocks cholinergic receptors in the vomiting center that are believed to mediate the nausea and vomiting caused by gastric irritation, by input from the vestibular apparatus (motion sickness, nausea associated with vestibular neuritis), and by input from the chemoreceptor trigger zone (drug- and radiation-induced emesis); depresses the RAS, including the parts of the brain involved with wakefulness.

Indications

- Symptomatic relief of perennial and seasonal allergic rhinitis, vasomotor rhinitis, allergic conjunctivitis; mild, uncomplicated urticaria and angioedema; amelioration of allergic reactions to blood or plasma; dermatographism, adjunctive therapy (with epinephrine and other measures) in anaphylactic reactions
 - Treatment and prevention of motion sickness; prevention and control of nausea and vomiting associated with anesthesia and surgery
 - Preoperative, postoperative, or obstetric sedation
 - Adjunct to analgesics to control postoperative pain
 - Adjunctive IV therapy with reduced amounts of meperidine or other opioid analgesics in special surgical situations, such as repeated bronchoscopy, ophthalmic surgery, or in poor-risk patients
- **NEW INDICATION:** Unlabeled uses: Treatment of nausea and vomiting in pregnancy

Contraindications and cautions

- Contraindicated with hypersensitivity to antihistamines or phenothiazines, coma or

severe CNS depression, bone marrow depression, vomiting of unknown cause, concomitant therapy with MAOIs, lactation (lactation may be inhibited).

- Use cautiously with lower respiratory tract disorders (may cause thickening of secretions and impair expectoration), glaucoma, prostatic hypertrophy, CV disease or hypertension, breast cancer, thyrotoxicosis, pregnancy (jaundice and extrapyramidal effects in infants; drug may inhibit platelet aggregation in neonate if taken by mother within 2 wk of delivery), children (antihistamine overdose may cause hallucinations, seizures, and death), a child with a history of sleep apnea, a family history of SIDS, or Reye's syndrome (may mask the symptoms of Reye's syndrome and contribute to its development), the elderly (more likely to cause dizziness, sedation, syncope, toxic confusional states, hypotension, and extrapyramidal effects).

Available forms

Tablets—12.5, 25, 50 mg; syrup—6.25, 25 mg/5 mL; suppositories—12.5, 25, 50 mg; injection—25, 50 mg/mL

Dosages

Adults

- **Allergy:** Average dose is 25 mg PO or by rectal suppository, preferably at bedtime. If needed, 12.5 mg PO before meals and at bedtime; 25 mg IM or IV for serious reactions. May repeat within 2 hr if needed.
- **Motion sickness:** 25 mg PO bid. Initial dose should be scheduled 30–60 min before travel; repeat in 8–12 hr if needed. Thereafter, give 25 mg on arising and before evening meal.
- **Nausea and vomiting:** 25 mg PO; repeat doses of 12.5–25 mg as needed, every 4–6 hr. Give rectally or parenterally if oral dosage is not tolerated. 12.5–25 mg IM or IV, not to be repeated more frequently than every 4–6 hr.
- **Sedation:** 25–50 mg PO, IM, or IV.
- **Preoperative use:** 50 mg PO the night before, or 50 mg with an appropriately reduced dose of meperidine and the required amount of belladonna alkaloid.
- **Postoperative sedation and adjunctive use with analgesics:** 25–50 mg PO, IM, or IV.

- **Labor:** 50 mg IM or IV in early stages. When labor is established, 25–75 mg with a reduced dose of opioid. May repeat once or twice at 4-hr intervals. Maximum dose within 24 hr is 100 mg.

Pediatric patients older than 2 yr

- **Allergy:** 25 mg PO at bedtime or 6.25–12.5 mg tid.
- **Motion sickness:** 12.5–25 mg PO or rectally bid.
- **Nausea and vomiting:** 0.5 mg/lb of body weight IM every 4–6 hr as needed.
- **Sedation:** 12.5–25 mg PO or 12.5–25 mg PO or rectally at bedtime.
- **Preoperative use:** 0.5 mg/lb of body weight PO in combination with an appropriately reduced dose of meperidine and the required amount of an atropine-like drug.
- **Postoperative sedation and adjunctive use with analgesics:** 12.5–25 mg PO, IM, IV or rectally.

Pharmacokinetics

Route	Onset	Duration
Oral	20 min	12 hr
IM	20 min	12 hr
IV	3–5 min	12 hr

Metabolism: Hepatic; $T_{1/2}$: 9–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute to a concentration no greater than 25 mg/mL.

Infusion: Infuse no faster than 25 mg/min.

Incompatibilities: Do not combine with aminophylline, chloramphenicol, heparin, hydrocortisone, pentobarbital, thiopental.

Y-site incompatibilities: Do not give with foscarnet, heparin, hydrocortisone, potassium chloride.

Adverse effects

- **CNS:** *Dizziness, drowsiness, poor coordination, confusion, restlessness, excitation, seizures, tremors, headache, blurred vision, diplopia, vertigo, tinnitus*

- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **Dermatologic:** Urticaria, rash, photosensitivity, chills
- **GI:** *Epigastric distress*, nausea, vomiting, diarrhea, constipation
- **GU:** *Urinary frequency, dysuria*, urinary retention, decreased libido, impotence
- **Hematologic:** Hemolytic anemia, hypoplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia
- **Respiratory:** *Thickening of bronchial secretions*; chest tightness; dry mouth, nose, and throat; respiratory depression; suppression of cough reflex, potential for aspiration
- **Other:** Tingling, heaviness and wetness of the hands

Interactions

★ **Drug-drug** • Additive anticholinergic effects with anticholinergic drugs • Increased frequency and severity of neuromuscular excitation and hypotension with methohexital, phenobarbital anesthetic, thiopental • Enhanced CNS depression with alcohol

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to antihistamines or phenothiazines, severe CNS depression, bone marrow depression, vomiting of unknown cause, concomitant therapy with MAOIs, lactation, lower respiratory tract disorders, glaucoma, prostatic hypertrophy, CV disease or hypertension, breast cancer, thyrotoxicosis, pregnancy, history of sleep apnea or a family history of SIDS, child with Reye's syndrome
- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output, liver evaluation; urinary output, prostate size; CBC; urinalysis; LFTs, renal and thyroid function tests

Interventions

⊗ **Black box warning** Do not give to children younger than 2 yr because of risk of fatal respiratory depression; use lowest effective dose and caution in children 2 yr and older.

- Give IM injections deep into muscle.
- Do not administer subcutaneously; tissue necrosis may occur.

⊗ **Black box warning** Do not administer intra-arterially; arteriospasm and gangrene of the limb may result. Do not administer subcutaneously into an artery or under the skin; drug may leach into tissue and cause serious injury. If IV route is used, limit drug concentration and rate of administration and ensure open IV line.

⊗ **Warning** Reduce dosage of barbiturates given concurrently with promethazine by at least one-half; arrange for dosage reduction of opioid analgesics given concomitantly by one-fourth to one-half.

Teaching points

- Take drug exactly as prescribed.
- Avoid using alcohol.
- Avoid driving or engaging in other dangerous activities if dizziness, drowsiness, or vision changes occur.
- Avoid prolonged exposure to sun, or use a sunscreen or covering garments.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine, pale stools, yellowing of the skin or eyes.

DANGEROUS DRUG

▶ propafenone hydrochloride

(*proe paf' a non*)

Apo-Propafenone (CAN),
Gen-Propafenone (CAN), Rythmol,
Rythmol SR DMC

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic

Therapeutic actions

Class IC antiarrhythmic: Local anesthetic effects with a direct membrane stabilizing action on the myocardial membranes; refractory period is prolonged with a reduction of

spontaneous automaticity and depressed trigger activity.

Indications

- Treatment of documented life-threatening ventricular arrhythmias; reserve use for those patients in whom the benefits outweigh the risks
- To prolong the time to recurrence of symptomatic atrial fibrillation in patients with structural heart disease (ER)
- Unlabeled uses: Treatment of supraventricular tachycardias, including atrial fibrillation associated with Wolff-Parkinson-White syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to propafenone, uncontrolled HF, cardiogenic shock, cardiac conduction disturbances in the absence of an artificial pacemaker, bradycardia, marked hypotension, bronchospastic disorders, manifest electrolyte imbalance, pregnancy (teratogenic in preclinical studies), lactation.
- Use cautiously with hepatic, renal impairment; elevated ANA.

Available forms

Tablets—150, 225, 300 mg; ER capsules **onc**—225, 325, 425 mg

Dosages

Adults

Adjust on the basis of response and tolerance. Initiate with 150 mg PO every 8 hr (450 mg/day). Dosage may be increased at a minimum of 3- to 4-day intervals to 225 mg PO every 8 hr (675 mg/day) and if necessary, to 300 mg PO every 8 hr (900 mg/day). Do not exceed 900 mg/day. Decrease dosage with significant widening of the QRS complex or with AV block; ER capsules—initially, 225 mg PO every 12 hr titrate at 5-day intervals to maximum 425 mg every 12 hr.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Use with caution; increase dose more gradually during the initial phase of treatment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3.5 hr
ER	Unknown	3–8 hr

Metabolism: Hepatic; $T_{1/2}$: 2–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, headache, weakness, fatigue, blurred vision*, abnormal dreams, speech or vision disturbances, coma, confusion, depression, memory loss, numbness, paresthesias, psychosis/mania, seizures, tinnitus, vertigo
- **CV:** *First-degree AV block, intraventricular conduction disturbances*, HF, atrial flutter, AV dissociation, **cardiac arrest**, sick sinus syndrome, sinus pause, sinus arrest, supraventricular tachycardia, *bradycardia, angina*
- **Dermatologic:** Alopecia, pruritus
- **GI:** *Unusual taste, nausea, vomiting, constipation*, dyspepsia, cholestasis, gastroenteritis, hepatitis
- **Hematologic:** *Agranulocytosis*, anemia, granulocytopenia, leukopenia, purpura, thrombocytopenia, positive ANA
- **Musculoskeletal:** Muscle weakness, leg cramps, muscle pain

Interactions

★ **Drug-drug** • Increased serum levels of propafenone and risk of increased toxicity with quinidine, cimetidine, ritonavir, SSRIs • Increased serum levels of digoxin, warfarin, cyclosporine, beta blockers, theophylline

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to propafenone, uncontrolled HF, cardiogenic shock, cardiac conduction disturbances in the absence of an artificial pacemaker, bradycardia, marked hypotension, bronchospastic disorders, manifest electrolyte imbalance, hepatic or renal impairment, pregnancy, lactation
- **Physical:** Reflexes, affect; BP, P, ECG, peripheral perfusion, auscultation; abdomen,

normal function; LFTs, renal function tests; CBC, Hct, electrolytes; ANA

Interventions

⊗ **Warning** Monitor patient response carefully, especially when beginning therapy. Increase dosage at minimum of 3- to 4-day intervals only.

- Ensure that ER capsules are not cut, crushed, or chewed.
- Reduce dosage with renal or hepatic impairment and with marked previous myocardial damage.
- Increase dosage slowly in patients with myocardial dysfunction; renal or hepatic impairment.

⊗ **Black box warning** Arrange for periodic ECG monitoring to monitor effects on cardiac conduction; risk of serious proarrhythmias.

Teaching points

- Take the drug every 8 hours around-the-clock; determine a schedule that will interrupt sleep the least. Do not cut, crush, or chew capsules; swallow them whole.
- Frequent monitoring of ECG will be needed to adjust dosage or determine effects of drug on cardiac conduction.
- Do not stop taking this drug for any reason without consulting your health care provider.
- Avoid pregnancy while using this drug; use of barrier contraceptives is advised.
- You may experience these side effects: Dizziness, headache (avoid driving or performing hazardous tasks); headache, weakness (request medications; rest periods may help); nausea, vomiting, unusual taste (maintain proper nutrition; take drug with meals); constipation.
- Report swelling of the extremities, difficulty breathing, fainting, palpitations, vision changes, chest pain.

▷ propantheline bromide

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ propranolol hydrochloride

(*proe pran' ob lol*)

Apo-Propranolol (CAN), Inderal, Inderal LA, InnoPran XL, Propranolol Intensol

PREGNANCY CATEGORY C

Drug classes

Antianginal
Antiarrhythmic
Antihypertensive
Beta-adrenergic blocker (nonselective)

Therapeutic actions

Competitively blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, decreasing the influence of the sympathetic nervous system on these tissues, the excitability of the heart, cardiac workload and oxygen consumption, and the release of renin and lowering BP; has membrane-stabilizing (local anesthetic) effects that contribute to its antiarrhythmic action; acts in the CNS to reduce sympathetic outflow and vasoconstrictor tone. The mechanism by which it prevents migraine headaches is unknown.

Indications

- Hypertension alone or with other drugs, especially diuretics
- Angina pectoris caused by coronary atherosclerosis
- Idiopathic hypertrophic subaortic stenosis to manage associated stress-induced angina, palpitations, and syncope
- Atrial fibrillation; to control rapid ventricular rate
- To reduce CV mortality in clinically stable patients 5–21 days after MI
- Pheochromocytoma, an adjunctive therapy after treatment with an alpha-adrenergic blocker to manage tachycardia before or during surgery or if the pheochromocytoma is inoperable
- Prophylaxis for migraine headache
- Treatment of essential tremor, familial or hereditary

- Unlabeled uses: Migraine prevention in children and adolescents; smoking cessation; traumatic brain injury

Contraindications and cautions

- Contraindicated with allergy to beta-blocking agents, sinus bradycardia, second- or third-degree heart block, cardiogenic shock, HF, bronchial asthma, bronchospasm, COPD, pregnancy (neonatal bradycardia, hypoglycemia, and apnea, and low birth weight with long-term use during pregnancy), lactation.
- Use cautiously with hypoglycemia and diabetes, thyrotoxicosis, hepatic impairment, Raynaud's disease.

Available forms

ER capsules—60, 80, 120, 160 mg; tablets—10, 20, 40, 60, 80 mg; injection—1 mg/mL; oral solution—4, 8 mg/mL

Dosages

Adults

Oral

- *Hypertension*: 40 mg regular propranolol bid or 80 mg SR or ER daily initially; usual maintenance dose, 120–240 mg/day given bid or tid or 120–160 mg SR or ER daily (maximum dose, 640 mg/day).
- *Angina*: 80–320 mg/day divided bid, tid, or qid or 80 mg SR or ER daily initially; gradually increase dosage at 3- to 7-day intervals; usual maintenance dose, 160 mg/day (maximum dose, 320 mg/day).
- *IHSS*: 20–40 mg tid or qid or 80–160 mg SR or ER daily.
- *Arrhythmias*: 10–30 mg tid or qid.
- *Post-MI*: 180–240 mg/day given tid or qid (maximum dose, 240 mg/day).
- *Pheochromocytoma*: Preoperatively, 60 mg/day for 3 days in divided doses; inoperable tumor, 30 mg/day in divided doses.
- *Migraine*: 80 mg/day daily (SR or ER) or in divided doses; usual maintenance dose, 160–240 mg/day.
- *Essential tremor*: 40 mg bid; usual maintenance dose, 120 mg/day (maximum dose, 320 mg/day).

Parenteral

⊗ **Warning** IV dose is markedly less than oral because of first-pass effect with oral propranolol.

- *Life-threatening arrhythmias*: 1–3 mg IV with careful monitoring, not to exceed 1 mg/min; may give second dose in 2 min, but then do not repeat for 4 hr.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	20–30 min	60–90 min	6–12 hr
IV	Immediate	1 min	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 3–5 hr; 8–11 hr (SR form)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is needed.

Infusion: Inject directly IV or into tubing of running IV; do not exceed 1 mg/min.

Adverse effects

- **Allergic reactions**: Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS**: Dizziness, vertigo, tinnitus, *fatigue*, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV**: *Bradycardia*, HF, *cardiac arrhythmias*, *sinoatrial or AV nodal block*, peripheral vascular insufficiency, claudication, **CVA**, **pulmonary edema**, hypotension
- **Dermatologic**: Rash, pruritus, sweating, dry skin
- **EENT**: Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI**: *Gastric pain*, *flatulence*, *constipation*, *diarrhea*, *nausea*, *vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis

- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequency
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis
- **Other:** *Decreased exercise tolerance, development of ANAs*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH

Interactions

- **Drug-drug** • Increased effects with verapamil • Decreased effects with indomethacin, ibuprofen, piroxicam, sulindac, barbiturates
- Prolonged hypoglycemic effects of insulin
- Initial hypertensive episode followed by bradycardia with epinephrine • Increased first-dose response to prazosin • Increased serum levels and toxic effects with lidocaine, cimetidine
- Increased serum levels of propranolol and phenothiazines, hydralazine if the two drugs are taken concurrently • Paradoxical hypertension when clonidine is given with beta blockers; increased rebound hypertension when clonidine is discontinued in patients on beta blockers • Decreased serum levels and therapeutic effects with methimazole, propylthiouracil • Decreased bronchodilator effects of theophyllines • Decreased antihypertensive effects with NSAIDs (ie, ibuprofen, indomethacin, piroxicam, sulindac), rifampin
- **Drug-lab test** • Interference with glucose or insulin tolerance tests, glaucoma screening tests

■ Nursing considerations

Assessment

- **History:** Allergy to beta-blocking agents, sinus bradycardia, second- or third-degree heart block, cardiogenic shock, HF, bronchial asthma, bronchospasm, COPD, hypoglycemia and diabetes, thyrotoxicosis, hepatic impairment, pregnancy, lactation, peripheral vascular disease
- **Physical:** Weight, skin color, lesions, edema, T; reflexes, affect, vision, hearing, orientation; BP, P, ECG, peripheral perfusion; R, auscultation; bowel sounds, normal output, liver evaluation; bladder palpation; LFTs, thyroid function tests; blood and urine glucose

Interventions

⊗ **Black box warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.

⊗ **Warning** Ensure that alpha-adrenergic blocker has been given before giving propranolol when treating patients with pheochromocytoma; endogenous catecholamines secreted by the tumor can cause severe hypertension if vascular beta receptors are blocked without concomitant alpha blockade.

- Consult with surgeon about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).
- Provide continuous cardiac and regular BP monitoring with IV form. Change to oral form as soon as possible.
- Give oral drug with food to facilitate absorption.

Teaching points

- Take this drug with meals. Do not discontinue the medication abruptly; abrupt discontinuation can cause worsening of your disorder.
- If you have diabetes, the normal signs of hypoglycemia (tachycardia) may be blocked by this drug; monitor your blood or urine glucose carefully; eat regular meals, and take your diabetic medication regularly.
- You may experience these side effects: Dizziness, drowsiness, light-headedness, blurred vision (avoid driving or performing hazardous tasks); nausea, loss of appetite (eat frequent small meals); nightmares, depression (request change of your medication); sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▽ propylthiouracil (PTU)

(*proe pill thye ob yoor' a sill*)

Propyl-Thyracil (CAN)

PREGNANCY CATEGORY D

Drug class

Antithyroid drug

Therapeutic actions

Inhibits the synthesis of thyroid hormones; partially inhibits the peripheral conversion of T_4 to T_3 , the more potent form of thyroid hormone.

Indications

- Hyperthyroidism
- Unlabeled use: Reduces mortality associated with alcoholic liver disease

Contraindications and cautions

- Contraindicated with allergy to antithyroid drugs, pregnancy (can induce hypothyroidism or cretinism in the fetus; use only if absolutely necessary and when mother has been informed about potential harm to the fetus; if antithyroid drug is needed, this is the drug of choice).
- Use cautiously with lactation (if antithyroid drug is needed, this is the drug of choice).

Available forms

Tablets—50 mg

Dosages

Administered usually in three equal doses every 8 hr.

Adults

- Initially, 300 mg/day PO, up to 400–900 mg/day in severe cases. For maintenance, 100–150 mg/day.

Pediatric patients

Reserve use for children allergic to or intolerant of other therapies.

6 yr and older: 50 mg/day PO with careful titration if needed. Monitor TSH and T_4 levels carefully.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Paresthesias, neuritis, vertigo, drowsiness*, neuropathies, depression, headache
- **CV:** Vasculitis, periarteritis
- **Dermatologic:** *Skin rash, urticaria*, pruritus, skin pigmentation, exfoliative dermatitis, lupus-like syndrome, loss of hair
- **GI:** *Nausea, vomiting, epigastric distress*, loss of taste, jaundice, hepatitis, **severe liver injury**
- **GU:** Nephritis
- **Hematologic:** Agranulocytosis, granulocytopenia, thrombocytopenia, hypoprotrombinemia, bleeding, aplastic anemia
- **Other:** Arthralgia, myalgia, edema, lymphadenopathy, drug fever

Interactions

★ **Drug-drug** • Increased risk of bleeding with oral anticoagulants • Alterations in theophylline, metoprolol, propranolol, cardiac glycoside clearance, serum levels and effects as patient moves from hyperthyroid state to euthyroid state

Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between propylthiouracil and *Purinethol* (mercaptapurine). Serious adverse effects can occur; use extreme caution.

Assessment

- **History:** Allergy to antithyroid drugs, pregnancy, lactation
- **Physical:** Skin color, lesions, pigmentation; orientation, reflexes, affect; liver evaluation; CBC, differential, PT; LFTs, renal function tests, thyroid function tests

Interventions

⊗ **Black box warning** Drug has been associated with severe liver injury, which may be fatal. Monitor patient carefully for signs and symptoms of liver adverse effects, especially during first 6 months of therapy. Do not use in children unless they are allergic to or intolerant of other therapies; risk of liver toxicity is higher in children.

- Administer drug in three equally divided doses at 8-hr intervals; schedule to maintain the patient's sleep pattern.
- Arrange for regular, periodic blood tests to monitor bone marrow depression and bleeding tendencies.

⊗ **Warning** Advise medical personnel doing surgical procedures that this patient is using this drug and is at greater risk for bleeding problems.

Teaching points

- Take this drug around-the-clock at 8-hour intervals.
- This drug must be taken for a prolonged period to achieve the desired effects.
- You may experience these side effects: Dizziness, weakness, vertigo, drowsiness (use caution if operating a car or dangerous machinery); nausea, vomiting, loss of appetite (eat frequent small meals); rash, itching.
- Report fever, sore throat, unusual bleeding or bruising, headache, general malaise, changes in color of urine or stool.

▶ protamine sulfate (*proe' ta meen*)

PREGNANCY CATEGORY C

Drug class

Heparin antagonist

Therapeutic actions

Strongly basic proteins found in salmon sperm; protamines form stable salts with heparin, which results in the immediate loss of anticoagulant activity; administered when heparin has not been given; protamine has weak anticoagulant activity.

Indications

- Treatment of heparin overdose

Contraindications and cautions

- Contraindicated with allergy to protamine sulfate or fish products.
- Use cautiously with pregnancy, lactation.

Available forms

Injection—10 mg/mL

Dosages

Dosage is determined by the amount of heparin in the body and the time that has elapsed since the heparin was given; the longer the interval, the smaller the dose required.

Adults and pediatric patients

1 mg IV neutralizes less than 100 heparin units.

Pharmacokinetics

Route	Onset	Duration
IV	5 min	2 hr

Metabolism: Degraded in body; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

▼ IV FACTS

Preparation: Administer injection undiluted; if dilution is needed, use 5% dextrose in water or saline; refrigerate any diluted solution. Do not store diluted solution; no preservatives are added. Reconstitute powder for injection with 5 mL bacteriostatic water for injection with benzyl alcohol added to the 50-mg vial (25 mL to the 250-mg vial); stable at room temperature for 72 hr.

Infusion: Administer very slowly IV over at least 10 min; do not exceed 50 mg in any 10-min period; do not give more than 100 mg over a 2-hr period. Guide dosing with coagulation studies.

Incompatibilities: Do not mix in lines with incompatible antibiotics, including many penicillins and cephalosporins.

Adverse effects

- **CV:** Hypotension, bradycardia
- **GI:** Nausea, vomiting
- **Hypersensitivity:** Anaphylactoid reactions—dyspnea, flushing, hypotension, bradycardia, **anaphylaxis**

■ Nursing considerations

Assessment

- **History:** Allergy to protamine sulfate or fish products, pregnancy, lactation
- **Physical:** Skin color; T; orientation, reflexes; P, BP, auscultation, peripheral perfusion;

R, adventitious sounds; plasma thrombin time

Interventions

⊗ **Warning** Keep emergency equipment for resuscitation and treatment of shock readily available in case of anaphylactoid reaction.

⊗ **Warning** Monitor coagulation studies to adjust dosage, and screen for heparin rebound and response to drug.

Teaching points

- Report shortness of breath, difficulty breathing, flushing, feeling of warmth, dizziness, lack of orientation, numbness, tingling.

▶ protein C concentrate

See Appendix U, *Less commonly used drugs*.

▶ protriptyline hydrochloride

(*proe trip' ti leen*)

Vivactil

PREGNANCY CATEGORY C

Drug class

TCA (secondary amine)

Therapeutic actions

Mechanism of action unknown; the TCAs are structurally related to the phenothiazine antipsychotic drugs (eg, chlorpromazine), but in contrast to the phenothiazines, TCAs inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; the relation of these effects to clinical efficacy is unknown.

Indications

- Relief of symptoms of depression (endogenous depression most responsive; unlike other TCAs, protriptyline is “activating” and may be useful in withdrawn and anergic patients)
- Unlabeled uses: Treatment of obstructive sleep apnea, prevention of migraine

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr, pregnancy (limb reduction abnormalities), lactation.
- Use cautiously with EST; preexisting CV disorders (eg, severe coronary heart disease, progressive HF, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders (TCAs lower the seizure threshold); hyperthyroidism (predisposes to CVS toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis); patients with bipolar disorder (may shift to hypomanic or manic phase); elective surgery (TCAs should be discontinued as long as possible before surgery).

Available forms

Tablets—5, 10 mg

Dosages

Adults

15–40 mg/day PO in three to four divided doses initially. May gradually increase to 60 mg/day if necessary. Do not exceed 60 mg/day. Make increases in dosage in the morning dose.

Pediatric patients

Not recommended; may increase risk of suicidal ideation.

Geriatric patients and adolescents

Initially, 5 mg tid PO. Increase gradually if needed. Monitor CV system closely if dose exceeds 20 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	8–12 hr

Metabolism: Hepatic; $T_{1/2}$: 67–89 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects*—dry mouth, blurred vision, disturbance of accommodation for near vision, mydriasis, increased IOP, *confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, uncoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, *seizures*, speech blockage, dysarthria, tinnitus, altered EEG
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of HF, **CVA**
- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue
- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; increased or decreased libido; impotence
- **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia; purpura; thrombocytopenia; leukopenia
- **Hypersensitivity:** Skin rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized or of face and tongue), drug fever
- **Withdrawal:** Symptoms with abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight change, sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug-drug** • Increased TCA levels and pharmacologic effects with cimetidine, fluox-

etine, ranitidine • Altered response, including arrhythmias and hypertension with sympathomimetics • Risk of severe hypertension with clonidine • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths with MAOIs • Increased CNS effects with alcohol; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; pregnancy; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric disorder; bipolar disorders; elective surgery
- **Physical:** Weight; T; skin color; lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

⊗ **Black box warning** Limit drug access for depressed and potentially suicidal patients; increased risk of suicidality in children, adolescents, and young adults; monitor accordingly.

⊗ **Warning** Reduce dosage if minor side effects develop; discontinue if serious side effects occur.

- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.

Teaching points

- Take drug exactly as prescribed; do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid alcohol and other sleep-inducing or over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; take safety measures if

severe; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (frequent small meals, frequent mouth care, and sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function; fetal abnormalities (avoid pregnancy, use contraceptive measures).

- Report dry mouth, difficulty in urination, excessive sedation, thoughts of suicide.

pseudoephedrine (soo dow e fed' rin)

pseudoephedrine hydrochloride (d-isoephedrine hydrochloride)

Congestaid, Efidac/24 **OND**, Eltor (CAN), Genaphed, Sudafed, Unifed

pseudoephedrine sulfate

ElixSure Children's Congestion

PREGNANCY CATEGORY C

Drug classes

Nasal decongestant
Sympathomimetic amine

Therapeutic actions

Effects are mediated by alpha-adrenergic receptors; causes vasoconstriction in mucous membranes of nasal passages, resulting in their shrinkage, which promotes drainage and improves ventilation.

Indications

- Temporary relief of nasal congestion caused by the common cold, hay fever, other respiratory allergies
- Nasal congestion associated with sinusitis
- Promotes nasal or sinus drainage
- Relief of eustachian tube congestion

Contraindications and cautions

- Contraindicated with MAOI therapy, allergy or idiosyncrasy to sympathomimetic amines, severe hypertension, and CAD.

- Use cautiously with hyperthyroidism, diabetes mellitus, arteriosclerosis, ischemic heart disease, increased IOP, prostatic hypertrophy, lactation, pregnancy.

Available forms

Tablets—30, 60 mg; CR tablets **OND**—240 mg; ER tablets **OND**—120 mg; chewable tablets—15 mg; capsules—30, 60 mg; liquid—15, 30 mg/5 mL; drops—7.5 mg/0.8 mL; syrup—15 mg/5 mL; suspension—50 mg/5 mL

Dosages

Adults and children older than 12 yr

60 mg every 4–6 hr PO (ER, 120 mg PO every 12 hr; 240 mg/day CR); do not exceed 240 mg in 24 hr.

Pediatric patients 6–12 yr

30 mg every 4–6 hr PO; do not exceed 120 mg in 24 hr.

Pediatric patients 2–5 yr

15 mg as syrup every 4–6 hr PO; do not exceed 60 mg in 24 hr.

Pediatric patients 2 yr and younger

Consult physician.

Geriatric patients

These patients are more likely to experience adverse reactions; use with caution.

Pharmacokinetics

Route	Onset	Duration
Oral	30 min	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremors*, insomnia, hallucinations, psychological disturbances, prolonged psychosis, **seizures**, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, orofacial dystonia

- **CV:** Hypertension, arrhythmias, CV collapse with hypotension, palpitations, tachycardia, precordial pain
- **Dermatologic:** Pallor; sweating
- **GI:** Nausea, vomiting, anorexia
- **GU:** Dysuria, urinary retention in BPH
- **Respiratory:** Respiratory difficulty

Interactions

★ **Drug-drug** • Increased hypertension with MAOIs • Increased duration of action with urinary alkalinizers (potassium citrate, sodium citrate, sodium lactate, tromethamine, sodium acetate, sodium bicarbonate) • Decreased therapeutic effects and increased elimination of pseudoephedrine with urinary acidifiers (ammonium chloride, sodium acid phosphate, potassium phosphate) • Decreased antihypertensive effects of methyldopa

■ Nursing considerations

Assessment

- **History:** Allergy or idiosyncrasy to sympathomimetic amines, severe hypertension and CAD, hyperthyroidism, diabetes mellitus, arteriosclerosis, increased IOP, prostatic hypertrophy, pregnancy, lactation
- **Physical:** Skin color, T; reflexes, affect, orientation, peripheral sensation, vision; BP, P, auscultation; R, adventitious sounds; urinary output, bladder percussion, prostate palpation

Interventions

- ⊗ **Warning** Administer cautiously to patients with CV disease, diabetes mellitus, hyperthyroidism, increased IOP, hypertension, and to patients older than 60 yr who may have increased sensitivity to sympathomimetic amines.
- Avoid prolonged use; underlying medical problems may be causing the congestion.
- Do not cut, crush, or allow patient to chew ER tablets.
- Monitor CV effect carefully; hypertensive patients who take this drug may experience changes in BP because of the additional vasoconstriction. However, if a nasal decongestant is needed, pseudoephedrine is the drug of choice.

Teaching points

- Do not exceed the recommended daily dose; serious overdose can occur. Use caution when using more than one over-the-counter preparation because many of these drugs contain pseudoephedrine, and unintentional overdose may occur.
- Do not cut, crush, or chew ER tablets.
- Avoid prolonged use because underlying medical problems can be disguised.
- You may experience these side effects: Dizziness, restlessness, light-headedness, tremors, weakness (avoid driving or performing hazardous tasks).
- Report palpitations, nervousness, sleeplessness, sweating.

▽ pyrantel pamoate

(pi ran' tel)

Combantrin (CAN), Pin-Rid, Pin-X, Reese's Pinworm

PREGNANCY CATEGORY C

Drug class

Anthelmintic

Therapeutic actions

A depolarizing neuromuscular blocking agent that causes spastic paralysis of *Enterobius vermicularis* and *Ascaris lumbricoides*. Also effective against *Ancylostoma duodenale* (hookworm).

Indications

- Treatment of enterobiasis (pinworm infection)
- Treatment of ascariasis (roundworm infection)
- Unlabeled use: Hairworm

Contraindications and cautions

- Contraindicated with allergy to pyrantel pamoate.
- Use cautiously with pregnancy, lactation, hepatic disease.

Available forms

Capsules—180 mg; tablets—62.5 mg; oral suspension—50 mg/mL; liquid—50 mg/mL

Dosages**Adults and pediatric patients older than 2 yr**

11 mg/kg (5 mg/lb) PO as a single oral dose.
Maximum total dose of 1 g.

Pediatric patients younger than 2 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 47–100 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, drowsiness, insomnia
- **Dermatologic:** Rash
- **GI:** *Anorexia, nausea, vomiting, abdominal cramps, diarrhea*, gastralgia, tenesmus, transient elevation of AST

Interactions

- *** Drug-drug** • Pyrantel and piperazine are antagonistic in *Ascaris*; avoid concomitant use
- Increases theophylline concentrations; monitor patient closely

■ Nursing considerations**Assessment**

- **History:** Allergy to pyrantel pamoate, pregnancy, lactation, hepatic impairment
- **Physical:** Skin color, lesions; orientation, affect; bowel sounds; AST levels

Interventions

- Culture for ova and parasites.
- Administer drug with fruit juice or milk; ensure that entire dose is taken at once.
- Treat all family members (pinworm infestations).
- Disinfect toilet facilities after patient use (pinworms).
- Launder bed linens, towels, nightclothes, and undergarments (pinworms) daily.

Teaching points

- Take the entire dose at once. Drug may be taken with fruit juice or milk.
- Pinworms are easily transmitted; all family members should be treated for complete eradication.
- Strict handwashing and hygiene measures are important. Launder undergarments, bed linens, nightclothes daily; disinfect toilet facilities daily and bathroom floors periodically (pinworm).
- You may experience these side effects: Nausea, abdominal pain, diarrhea (eat frequent small meals); drowsiness, dizziness, insomnia (avoid driving and using dangerous machinery).
- Report rash, joint pain, severe GI upset, severe headache, dizziness.

pyrazinamide
(peer a zin' a myde)

Tebrazid (CAN)

PREGNANCY CATEGORY C

Drug class

Antituberculotic

Therapeutic actions

Bacteriostatic or bacteriocidal against *Mycobacterium tuberculosis*; mechanism of action is unknown.

Indications

- Initial treatment of active TB in adults and children when combined with other antituberculotics
- Treatment of active TB after treatment failure with primary drugs
- Treatment of drug-resistant TB as part of an individualized regimen

Contraindications and cautions

- Contraindicated with allergy to pyrazinamide, acute hepatic disease, lactation, acute gout.
- Use cautiously with diabetes mellitus, acute intermittent porphyria, pregnancy.

Available forms

Tablets—500 mg

Dosages

Adults and pediatric patients

15–30 mg/kg/day PO, given once a day; do not exceed 2 g/day. Always use with up to four other antituberculars; administer for the first 2 mo of a 6-mo treatment program. 50–70 mg/kg PO twice weekly may increase compliance and is being studied as an alternative dosing schedule. Patients with HIV infection may require a longer course of therapy.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2 hr

Metabolism: Hepatic; $T_{1/2}$: 9–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Dermatologic:** Rashes, photosensitivity
- **GI:** *Hepatotoxicity*; nausea, vomiting, diarrhea, anorexia
- **Hematologic:** Sideroblastic anemia, thrombocytopenia, adverse effects on clotting mechanism or vascular integrity
- **Other:** Active gout

Interactions

* **Drug-lab test** • False readings on *Acetest*, *Ketostix* urine tests

■ Nursing considerations

Assessment

- **History:** Allergy to pyrazinamide, acute hepatic disease, gout, diabetes mellitus, acute intermittent porphyria, pregnancy, lactation
- **Physical:** Skin color, lesions; joint status; T; liver evaluation; LFTs, serum and urine uric acid levels, blood and urine glucose, CBC

Interventions

- Administer only in conjunction with other antituberculars.
- Administer once a day.
- Arrange for follow-up of LFTs (AST, ALT) prior to and every 2–4 wk during therapy.
- ⊗ **Warning** Discontinue drug if liver damage or hyperuricemia in conjunction with acute gouty arthritis occurs.

Teaching points

- Take this drug once a day; it will need to be taken with your other tuberculosis drugs.
- Take this drug regularly; avoid missing doses. Do not discontinue this drug without first consulting your health care provider.
- Have regular, periodic medical checkups, including blood tests to evaluate the drug effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting (take drug with food); rash, sensitivity to sunlight (avoid exposure to the sun).
- Report fever, malaise, loss of appetite, nausea, vomiting, darkened urine, yellowing of skin and eyes, severe pain in great toe, instep, ankle, heel, knee, or wrist.

▽ pyridostigmine bromide

(peer id ob stig' meen)

Mestinon, Mestinon Timespan ORIG

PREGNANCY CATEGORY C

Drug classes

Antidote
Antimyasthenic
Cholinesterase inhibitor

Therapeutic actions

Increases the concentration of acetylcholine at the sites of cholinergic transmission and prolongs and exaggerates the effects of acetylcholine by reversibly inhibiting the enzyme acetylcholinesterase, thus facilitating transmission at the skeletal neuromuscular junction.

Indications

- Treatment of myasthenia gravis
- Parenteral: Antidote for nondepolarizing neuromuscular junction blockers (eg, tubocurarine) after surgery
- To increase survival after exposure to sarin “nerve gas” poisoning in conjunction with protective measures
- **NEW INDICATION:** Unlabeled uses: Postpoliomyelitis syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinesterases; adverse reactions to bromides; intestinal or urogenital tract obstruction, peritonitis, lactation.
- Use cautiously with asthma, peptic ulcer, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, pregnancy (given IV near term, drug may stimulate uterus and induce premature labor).

Available forms

Tablets—60 mg ER tablets —180 mg; syrup—60 mg/5 mL; injection—5 mg/mL

Dosages

Adults

Oral

- *Symptomatic control of myasthenia gravis:* Average dose is 600 mg given over 24 hr; range, 60–1,500 mg, spaced to provide maximum relief. ER tablets, average dose is 180–540 mg daily or bid. Individualize dosage, allowing at least 6 hr between doses. Optimum control may require supplementation with the more rapidly acting syrup or regular tablets.
- *Military personnel who face the threat of sarin nerve gas:* 30 mg PO every 8 hr starting several hr before exposure; stop drug if exposure occurs.

Parenteral

- *To supplement oral dosage preoperatively and postoperatively, during labor, during myasthenic crisis, etc:* Give $\frac{1}{30}$ the oral dose IM or very slowly IV. May be given 1 hr before second stage of labor is complete (enables patient to have adequate strength and protects neonate in immediate postnatal period).
- *Antidote for nondepolarizing neuromuscular blockers:* Give atropine sulfate 0.6–1.2 mg IV immediately before slow IV injection of pyridostigmine 0.1–0.25 mg/kg. 10–20 mg pyridostigmine usually suffices. Full recovery usually occurs within 15 min but may take 30 min.

Pediatric patients

Oral

- *Symptomatic control of myasthenia gravis:* 7 mg/kg/day divided into five or six doses.

Parenteral

- *Neonates who have myasthenic mothers and who have difficulty swallowing, sucking, breathing:* 0.05–0.15 mg/kg IM. Change to syrup as soon as possible.

Pharmacokinetics

Route	Onset	Duration
Oral	20–30 min	3–6 hr
IM	15 min	2–4 hr
IV	5 min	2–4 hr

Metabolism: Hepatic and tissue; $T_{1/2}$: 1.9–3.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation is required.

Infusion: Infuse very slowly, each 0.5 mg over 1 min for myasthenia gravis, each 5 mg over 1 min as a muscle relaxant agonist, directly into vein or into tubing of actively running IV of D₂₅W, 0.9% sodium chloride, lactated Ringer's solution, or D₂₅W and lactated Ringer's solution.

Adverse effects

- **CNS:** Seizures, dizziness, dysarthria, dysphonia, drowsiness, headache, loss of consciousness
- **CV:** *Bradycardia, cardiac arrhythmias, AV block and nodal rhythm, cardiac arrest*, decreased cardiac output leading to hypotension, syncope
- **Dermatologic:** Diaphoresis, flushing, skin rash, urticaria
- **EENT:** *Lacrimation, miosis*, spasm of accommodation, diplopia, conjunctival hyperemia
- **GI:** *Salivation, dysphagia, nausea, vomiting, increased peristalsis, abdominal cramps*, flatulence, diarrhea
- **GU:** *Urinary frequency and incontinence, urinary urgency*
- **Local:** Thrombophlebitis after IV use
- **Peripheral:** Skeletal muscle weakness, fasciculations, muscle cramps, arthralgia

- **Respiratory:** *Increased pharyngeal and tracheobronchial secretions, laryngospasm, bronchospasm*, bronchiolar constriction, dyspnea, respiratory muscle paralysis, central respiratory paralysis, **anaphylaxis**

Interactions

- **Drug-drug** • Decreased effectiveness with profound muscular depression with corticosteroids • Increased and prolonged neuromuscular blockade with succinylcholine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to anticholinesterases, adverse reactions to bromides, intestinal or urogenital tract obstruction, peritonitis, lactation, asthma, peptic ulcer, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, pregnancy
- **Physical:** Bowel sounds, normal output; urinary frequency, voiding pattern, normal output; R, adventitious sounds; P, auscultation, BP; reflexes, bilateral grip strength, ECG; thyroid function tests; skin color, texture, lesions

Interventions

- Administer IV slowly.
- Overdose with anticholinesterase drugs can cause muscle weakness (cholinergic crisis) that is difficult to differentiate from myasthenic weakness; administration of atropine may mask the parasympathetic effects of anticholinesterase overdose and further confound the diagnosis.

⊗ **Warning** Keep atropine sulfate readily available as an antidote and antagonist to pyridostigmine in case of cholinergic crisis or unusual sensitivity to pyridostigmine.

⊗ **Warning** Discontinue drug and consult physician if excessive salivation, emesis, frequent urination, or diarrhea occurs.

- Have patient swallow ER tablets whole; do not cut, crush, or allow patient to chew ER tablets.
- Decrease dosage of drug if excessive sweating or nausea occurs.

Teaching points

- Take drug exactly as prescribed. Your health care provider should teach you and your sig-

nificant other about drug effects, signs and symptoms of myasthenia gravis, the fact that muscle weakness may be related both to drug overdose and to exacerbation of the disease, and the importance of reporting muscle weakness promptly to the nurse or physician for proper evaluation.

- Do not cut, crush, or chew ER tablets.
- You may experience these side effects: Blurred vision, difficulty with far vision, difficulty with dark adaptation (use caution while driving, especially at night, or performing hazardous tasks in reduced light); increased urinary frequency, abdominal cramps; sweating (avoid hot or excessively humid environments).
- Report muscle weakness, nausea, vomiting, diarrhea, severe abdominal pain, excessive sweating, excessive salivation, frequent urination, urinary urgency, irregular heartbeat, difficulty breathing.

▽ quazepam (*kwa' ze pam*)

Doral

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-IV

Drug classes

Benzodiazepine
Sedative-hypnotic

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; main sites of action may be the limbic system and mesencephalic reticular formation; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter.

Indications

- Insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings, or early morning awakening
- Recurring insomnia or poor sleeping habits
- Acute or chronic medical situations requiring restful sleep

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, established or suspected sleep apnea, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (congenital malformations, neonatal withdrawal syndrome), labor and delivery (“floppy infant” syndrome), lactation (infants become lethargic and lose weight).
- Use cautiously with elderly patients, impaired liver or renal function, debilitation, depression, suicidal tendencies.

Available forms

Tablets—7.5, 15 mg

Dosages

Adults

Initially, 15 mg PO at bedtime. May reduce to 7.5 mg at bedtime in some patients.

Pediatric patients

Not for use in patients younger than 18 yr.

Geriatric patients or patients with debilitating disease

Attempt to reduce nightly dosage after the first one or two nights of therapy.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 41 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Transient, mild drowsiness initially; sedation; depression; lethargy; apathy; fatigue; light-headedness; disorientation; restlessness; confusion; crying; delirium; headache; slurred speech; dysarthria; stupor; rigidity; tremor; dystonia; vertigo; euphoria; nervousness; difficulty in concentration; vivid dreams; psychomotor retardation; extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment (especially in psychiatric patients, aggressive children, and with high

dosage); visual and auditory disturbances; diplopia; nystagmus; depressed hearing; nasal congestion; complex sleep-related behaviors

- **CV:** *Bradycardia, tachycardia*, CV collapse, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)
- **Dermatologic:** Pruritus, skin rash, dermatitis
- **GI:** *Constipation, diarrhea*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes, hepatic impairment, jaundice
- **GU:** Incontinence, changes in libido, urinary retention, menstrual irregularities
- **Hematologic:** Decreased Hct (primarily with long-term therapy), blood dyscrasias (agranulocytosis, leukopenia, neutropenia)
- **Other:** **Anaphylaxis, angioedema**, hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia

Interactions

• **Drug-drug** • Increased CNS depression with alcohol • Increased pharmacologic effects with cimetidine, disulfiram, hormonal contraceptives • Decreased sedative effects with theophylline, aminophylline • Decreased sedative effects with smoking

Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication, pregnancy, labor and delivery, lactation, impaired liver or renal function, debilitation, depression, suicidal tendencies
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

⊗ **Warning** Ensure that patient is not pregnant before use; recommend the use of barrier contraceptives.

- Monitor liver and renal function and CBC during long-term therapy.

⊗ **Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy, to prevent refractory seizures.

Teaching points

- Take drug exactly as prescribed.
- Do not stop taking this drug (in long-term therapy) without consulting your health care provider.
- This drug should not be used during pregnancy; using barrier contraceptives is advised.
- You may experience these side effects: Drowsiness, dizziness (may lessen; avoid driving or engaging in other dangerous activities); allergic reaction; GI upset (take with water); depression, dreams, complex sleep disorders, emotional upset, crying; nocturnal sleep may be disturbed for several nights after discontinuing the drug.
- Report severe dizziness, weakness, drowsiness that persists, complex sleep-related behaviors, rash or skin lesions, palpitations, swelling of the extremities, visual changes, difficulty voiding, allergic reaction.

quetiapine fumarate (*kwe tie' ah peen*)

Seroquel, Seroquel XR

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dibenzothiazepine

Therapeutic actions

Mechanism of action not fully understood: Blocks dopamine and serotonin receptors in the brain; also acts as a receptor antagonist at histamine and adrenergic receptor sites (which may contribute to the adverse effects of orthostatic hypotension and somnolence).

Indications

- Treatment of schizophrenia in patients older than 13 yr
- **NEW INDICATION:** Adjunctive treatment of major depressive disorder in children (ER forms only)
- Short-term treatment of acute manic episodes associated with bipolar I disorder, as monotherapy or in combination with lithium or divalproex
- **NEW INDICATION:** Acute treatment of depressive episodes associated with bipolar I disorder
- Maintenance treatment of bipolar disorder
- **NEW INDICATION:** Unlabeled uses: Alcohol dependence, OCD, Tourette syndrome

Contraindications and cautions

- Contraindicated with coma or severe CNS depression, allergy to quetiapine, lactation.
- Use cautiously with CV disease, hypotension, hepatic impairment, seizures, exposure to extreme heat, autonomic instability, tardive dyskinesia, dehydration, thyroid disease, pregnancy.

Available forms

Tablets—25, 50, 100, 200, 300, 400 mg; ER tablets—50, 150, 200, 300, 400 mg

Dosages

Adults

- **Schizophrenia:** 25 mg PO bid. Increase in increments of 25–50 mg bid–tid on days 2 and 3; dosage range by day 4: 300–400 mg/day in two to three divided doses. Further increases can be made at no less than 2-day intervals. Maximum dose, 800 mg/day. When patient is stabilized on divided doses, may be switched to ER form at the total equivalent dose taken once per day. For ER tablets, 300 mg PO once daily in the evening; range, 400–800 mg/day.
- **Manic episodes:** 100 mg/day PO divided bid on day 1; increase to 400 mg/day PO in bid divided doses by day 4 using 100-mg/day increments. Range, 400–800 mg/day given in divided doses. ER forms: 300 mg/day on day 1, 600 mg on day 2; may be adjusted to 800 mg on day 3 if needed.
- **Depressive episodes (ER form):** 50 mg PO on day 1, then 100 mg PO on day 2 given daily

at bedtime; increase to desired dose of 300 mg/day by day 4.

- **Major depressive disorder** (ER form): Initially, 50 mg PO at bedtime; on day 3, increase to 150 mg PO in the evening. Range is 150–300 mg/day. Give with other antidepressants.

Pediatric patients 10–17 yr

- **Acute treatment of manic episodes:** 50 mg PO on day 1, 100 mg PO on day 2, 200 mg PO on day 3, 300 mg PO on day 4, 400 mg PO on day 5. Maximum dose is 600 mg/day.

Pediatric patients 13–17 yr

- **Schizophrenia:** Give in divided dose twice a day. Total dose: day 1, 50 mg PO; day 2, 100 mg; day 3, 200 mg; day 4, 300 mg; day 5, 400 mg. Usual range is 400–800 mg/day.

Geriatric or debilitated patients or patients with hepatic impairment

Use lower doses starting with 25 mg/day and increase dosage more gradually than in other patients. For schizophrenia, when stabilized on 200 mg/day, patient may be switched to ER tablets.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	1.5 hr	Unknown

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, flushed facies, sweating, constipation
- **CNS:** *Drowsiness*, insomnia, vertigo, *headache*, weakness, tremor, tardive dyskinesias, **NMS**
- **CV:** Hypotension, *orthostatic hypotension*, syncope
- **Hematologic:** Increased ALT, total cholesterol and triglycerides
- **Other:** Risk of development of diabetes mellitus

Interactions

★ **Drug-drug** • CNS effects potentiated by alcohol, CNS depressants • Effects decreased with phenytoin, thioridazine, carbamazepine, phenobarbital, rifampin, glucocorticoids; monitor patient closely and adjust dosages appropriately when these drugs are added to or discontinued from regimen • Increased effects of antihypertensives, lorazepam • Decreased effects of levodopa, dopamine antagonists • Potential for heatstroke and intolerance with drugs that affect temperature regulation (anticholinergics); use extreme caution and monitor patient closely

Nursing considerations

Assessment

- **History:** Coma or severe CNS depression, allergy to quetiapine, lactation, pregnancy, CV disease, hypotension, hepatic impairment, seizures, exposure to extreme heat, autonomic instability, tardive dyskinesia, dehydration, thyroid disease, suicidal tendencies
- **Physical:** Body weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; CBC, urinalysis, LFTs, renal and thyroid function tests

Interventions

⊗ **Black box warning** Do not use this drug to treat elderly patients with dementia-related psychosis; it causes increased risk of CV mortality, including stroke, MI.

⊗ **Black box warning** Increased risk of suicidality in children, adolescents, and young adults; not approved for use in children. Monitor patients accordingly.

⊗ **Warning** Administer small quantity to any patient with suicidal ideation.

- Make sure patient does not cut, crush, or chew ER tablets; they must be swallowed whole.
- Administer ER tablet once daily in the evening.
- Monitor elderly patients for dehydration and institute remedial measures promptly; sedation and decreased sensation of thirst related to CNS effects of drug can lead to severe dehydration.
- Monitor patient closely in any setting that would promote overheating.

- Regularly monitor patient for signs and symptoms of diabetes mellitus.
- Consult physician about dosage reduction and use of anticholinergic antiparkinsonians (controversial) if extrapyramidal effects occur.

Teaching points

- Take this drug exactly as prescribed.
- Take extended-release tablet once daily in the evening. Do not cut, crush, or chew tablets; they must be swallowed whole.
- This drug should not be used during pregnancy; using barrier contraceptives is advised.
- Maintain fluid intake and use precautions against heatstroke in hot weather.
- You may experience these side effects: Dizziness, drowsiness, fainting (avoid driving or engaging in other dangerous activities); dry mouth, nausea, loss of appetite (frequent mouth care, frequent small meals, and increased fluid intake may help).
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, dark-colored urine, pale stools, yellowing of the skin or eyes, suicidal thoughts.

▽ quinapril hydrochloride

(*kwin' ab pril*)

Accupril

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Quinapril blocks ACE from converting angiotensin I to angiotensin II, a powerful vasoconstrictor, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action.

Indications

- Treatment of hypertension alone or in combination with thiazide-type diuretics
- Adjunctive therapy in the management of HF with cardiac glycosides, diuretics, and beta-adrenergic blockers

■ **NEW INDICATION:** Unlabeled use: Pediatric hypertension

Contraindications and cautions

- Contraindicated with allergy to quinapril or other ACE inhibitors, pregnancy, angioedema.
- Use cautiously with impaired renal function, unilateral or bilateral renal artery stenosis, salt or volume depletion, lactation.

Available forms

Tablets—5, 10, 20, 40 mg

Dosages

Adults

- **Hypertension:** Initial dose, 10 or 20 mg PO daily. Maintenance dose, 20–80 mg/day PO as a single dose or two divided doses. Patients on diuretics should discontinue the diuretic 2–3 days before beginning benazepril therapy. If BP is not controlled, add diuretic slowly. If diuretic cannot be discontinued, begin quinapril therapy with 5 mg and monitor carefully for hypotension.
- **HF:** Initial dose, 5 mg PO bid. Dose may be increased as needed to relieve symptoms; usual range, 10–20 mg PO bid; increase doses at weekly intervals until effective dose is reached.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal impairment

Initial dose: 10 mg if creatinine clearance greater than 60 mL/min, 5 mg if creatinine clearance 30–60 mL/min, 2.5 mg if creatinine clearance 10–30 mL/min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	1 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CV:** Angina pectoris, orthostatic hypotension in salt- or volume-depleted patients, palpitations
- **Dermatologic:** Rash, pruritus, diaphoresis, flushing, photosensitivity
- **GI:** Elevated LFTs, pancreatitis
- **Respiratory:** *Cough*
- **Other:** Angioedema, arthralgia

Interactions

★ **Drug-drug** • Increased lithium levels • Decreased tetracycline absorption. Separate drugs by 1–2 hr • Risk of hyperkalemia if combined with potassium-sparing diuretics

■ Nursing considerations**Assessment**

- **History:** Allergy to quinapril, other ACE inhibitors; impaired renal function; HF; salt or volume depletion; lactation, pregnancy
- **Physical:** Skin color, lesions, turgor; T, P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Warning** Alert surgeon and mark the patient's chart with notice that quinapril is being taken; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

⊗ **Black box warning** Caution patient that this drug should not be used during pregnancy; advise patient to use barrier contraceptives.

- Monitor patient closely in any situation that may lead to a fall in BP secondary to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.

Teaching points

- Do not stop taking the medication without consulting your health care provider.
- Be careful in any situation that may lead to a drop in blood pressure (diarrhea, sweating, vomiting, dehydration); if light-headedness

or dizziness occurs, consult your health care provider.

- This drug should not be used during pregnancy; using barrier contraceptives is advised.
- You may experience these side effects: GI upset, loss of appetite (transient); light-headedness (usually transient; change position slowly and limit activities to those that do not require alertness and precision); dry cough (not harmful).
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heart-beat, chest pains; swelling of the face, eyes, lips, tongue; difficulty breathing; persistent cough.

DANGEROUS DRUG**▽ quinidine***(quin' i deen)***quinidine gluconate ORC****quinidine sulfate ORC****PREGNANCY CATEGORY C****Drug class**

Antiarrhythmic

Therapeutic actions

Type IA antiarrhythmic: Decreases automaticity in ventricles, decreases height and rate of rise of action potential, decreases conduction velocity, increases fibrillation threshold.

Indications

- Treatment of atrial arrhythmias, paroxysmal or chronic ventricular tachycardia without heart block
- Maintenance therapy after electrocardioversion of atrial fibrillation or atrial flutter
- Treatment of life-threatening *Plasmodium falciparum* infections when IV therapy (quinidine gluconate) is indicated

Contraindications and cautions

- Contraindicated with allergy or idiosyncrasy to quinidine, second- or third-degree heart block, myasthenia gravis, pregnancy (neonatal thrombocytopenia), lactation, thrombo-

cytopenic purpura, in patients with diseases that might be adversely affected by an anticholinergic agent.

- Use cautiously with renal disease, especially renal tubular acidosis, HF, hepatic insufficiency.

Available forms

Tablets—200, 300 mg; SR tablets **ORIG**—300, 324 mg; injection—80 mg/mL

Dosages

Quinidine gluconate contains 62% anhydrous quinidine alkaloid. Quinidine sulfate contains 83% anhydrous quinidine alkaloid.

Adults

Administer a test dose of 200 mg PO or 200 mg IM to test for idiosyncratic reaction. Maintenance therapy, 200–300 mg tid or qid PO or 300–600 mg every 8 hr or every 12 hr if SR form is used.

PO

- *Paroxysmal supraventricular arrhythmias*: 400–600 mg (sulfate) PO every 2–3 hr until paroxysm is terminated.
- *Conversion of atrial flutter/fibrillation*: 648 mg (gluconate) PO every 8 hr; may increase after three to four doses if needed. Or 324 mg (gluconate) PO every 8 hr for 2 days, then 648 mg PO every 8 hr for 2 days. Or 5–10 mg/kg (gluconate) IM or IV. For ER tablets, 300 mg (sulfate) PO every 8–12 hr; may increase dosage cautiously if serum levels are in therapeutic range. For immediate-release tablets, 400 mg (sulfate) PO every 6 hr; may increase dosage after four to five doses if conversion has not occurred.
- *Reduction of relapse*: 324 mg (gluconate) PO every 8–12 hr. For ER tablets, 300 mg (sulfate) PO every 8–12 hr. For immediate-release tablets, 200 mg (sulfate) PO every 6 hr.

IM

- *Acute tachycardia*: 600 mg (gluconate) IM gluconate, followed by 400 mg every 2 hr until rhythm is stable.

IV

330 mg (gluconate) injected slowly IV at rate of 1 mL/min of diluted solution (10 mL of quinidine gluconate injection diluted to 50 mL with 5% glucose).

Pediatric patients

30 mg/kg/24 hr PO in five equally divided doses; 2–10 mg/kg/dose IV every 3–6 hr has been used, but this route is not recommended.

Patients with hepatic or renal impairment

Reduce dosage and monitor patient closely.

Pharmacokinetics

Route	Onset	Duration
Oral	1–3 hr	6–8 hr
IM	30–90 min	6–8 hr
IV	Rapid	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 6–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Dilute 800 mg quinidine gluconate in 50 mL 5% dextrose injection.

Infusion: Inject slowly at rate of 1 mL/min.

Y-site incompatibility: Do not inject with furosemide.

Adverse effects

- **CNS:** Vision changes (photophobia, blurring, loss of night vision, diplopia)
- **CV: Cardiac arrhythmias,** cardiac conduction disturbances, including heart block, hypotension
- **GI:** Nausea, vomiting, diarrhea, liver toxicity
- **Hematologic:** Hemolytic anemia, hypoprothrombinemia, thrombocytopenic purpura, agranulocytosis, lupus erythematosus-like syndrome (resolves after withdrawal)
- **Hypersensitivity:** Rash, flushing, urticaria, angioedema, respiratory arrest
- **Other:** *Cinchonism* (tinnitus, headache, nausea, dizziness, fever, tremor, visual disturbances)

Interactions

- **Drug-drug** • Increased effects and increased risk of toxicity with cimetidine, amiodarone, verapamil • Increased cardiac depressant effects with sodium bicarbonate • Decreased levels with phenobarbital, hydantoins, rifampin, sucralate • Increased neuromuscular blocking effects

of depolarizing and nondepolarizing neuromuscular blocking agents, succinylcholine • Increased digoxin levels and toxicity • Increased effect of oral anticoagulants and bleeding • Increased effects of TCAs

★ **Drug-food** • Decreased metabolism and increased risk of toxic effects if combined with grapefruit juice; avoid this combination

★ **Drug-lab test** • Quinidine serum levels are inaccurate if the patient is also taking triamterene

■ Nursing considerations

Assessment

- **History:** Allergy or idiosyncrasy to quinidine, second- or third-degree heart block, myasthenia gravis, renal disease, HF, hepatic insufficiency, pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, cranial nerves, bilateral grip strength, reflexes; P, BP, auscultation, ECG, edema; bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests; CBC

Interventions

- Monitor response carefully, especially when beginning therapy.
 - Reduce dosage in patients with hepatic or renal failure.
 - Reduce dosage with digoxin; monitor digoxin levels closely.
 - Adjust dosage if phenobarbital, hydantoin, or rifampin is added or discontinued.
 - Check to see that patients with atrial flutter or fibrillation have been digitalized before starting quinidine.
 - Differentiate the SR form from the regular form. Make sure SR form is not cut, crushed, or chewed.
 - Monitor cardiac rhythm carefully, and frequently monitor BP if given IV or IM.
 - Arrange for periodic ECG monitoring when on long-term therapy.
 - Monitor blood counts, liver function tests frequently during long-term therapy.
- ⊗ **Warning** Evaluate for safe and effective serum drug levels: 2–6 mcg/mL.

Teaching points

- Take this drug exactly as prescribed. Do not chew the sustained-release tablets. If GI

- upset occurs, take drug with food. Do not drink grapefruit juice while using this drug.
- You will need frequent cardiac rhythm monitoring and blood tests.
- Wear a medical alert tag stating that you are using this drug.
- Return for regular follow-up visits to check your heart rhythm and blood counts.
- You may experience these side effects: Nausea, loss of appetite, vomiting (eat frequent small meals); dizziness, light-headedness, vision changes (do not drive or operate dangerous machinery); rash (use skin care).
- Report sore mouth, throat, or gums, fever, chills, cold or flulike symptoms, ringing in the ears, severe vision disturbances, headache, unusual bleeding or bruising.

▽ quinine sulfate

See Appendix U, *Less commonly used drugs.*

▽ rabeprazole sodium

(*rab beh' pray zol*)

AcipHex ^{ORIG}

PREGNANCY CATEGORY B

Drug classes

Antisecretory drug
Proton pump inhibitor

Therapeutic actions

Gastric acid-pump inhibitor: Suppresses gastric acid secretion by specific inhibition of the hydrogen and potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step of acid production.

Indications

- Healing and maintenance of erosive or ulcerative GERD; 4–8 wk therapy; may use additional 8 wk as needed
- Short-term treatment of GERD in children 12 yr and older
- Treatment of daytime and nighttime heartburn and other symptoms of GERD
- Healing of duodenal ulcers as short-term treatment of less than 4 wk

- Treatment of pathological hypersecretory conditions (eg, Zollinger-Ellison syndrome, multiple adenomas, systemic mastocytosis)
- Unlabeled use: Treatment of gastric ulcers

Contraindications and cautions

- Contraindicated with hypersensitivity to any proton pump inhibitor or any drug components.
- Use cautiously because of possible increased risk of *Clostridium difficile* diarrhea.
- Use cautiously with pregnancy, lactation.

Available forms

DR tablet **ORC**—20 mg

Dosages

Adults

- *Healing of GERD*: 20 mg PO daily for 4–8 wk.
- *Maintenance of GERD*: 20 mg daily PO.
- *Healing of duodenal ulcer*: 20 mg PO daily for up to 4 wk.
- *Pathological hypersecretory conditions*: 60 mg PO daily to bid for as long as clinically indicated.

Pediatric patients 12 yr and older:

20 mg/day PO for up to 8 wk.

Patients with hepatic impairment

Use extreme caution with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, asthenia, vertigo, insomnia, apathy, anxiety, paresthesias, dream abnormalities
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea*, possible increased risk of *C. difficile* diarrhea, *abdominal pain, nausea, vomiting*, constipation, dry mouth, tongue atrophy

- **Respiratory:** *URI symptoms*, cough, epistaxis
- **Other:** Cancer in preclinical studies, back pain, fever, increased risk of long-bone fractures

Interactions

- *** Drug-drug** • Increased toxic effects of warfarin, digoxin; monitor patient closely and arrange for dosage adjustment as needed • Decreased effectiveness of azole antifungals; monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any proton pump inhibitor or any drug components, pregnancy, lactation
- **Physical:** Skin lesions; body T; reflexes, affect; urinary output, abdominal examination; respiratory auscultation

Interventions

- Administer once a day. Caution patient to swallow tablets whole, not to cut, crush, or chew.
- Symptomatic improvement does not rule out gastric cancer.
- If administering antacids, they may be administered concomitantly with rabeprazole.
- Maintain supportive treatment as appropriate for underlying problem.
- Provide additional comfort measures to alleviate discomfort such as from GI effects or headache.

Teaching points

- Take the drug once a day. Swallow the tablets whole—do not chew, cut, or crush. This drug will need to be taken for up to 4 weeks (in short-term therapy) or for a prolonged period depending on the condition being treated.
- Arrange to have regular medical follow-up while you are using this drug.
- Maintain all of the usual activities and restrictions that apply to your condition. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (consult your health care provider if these become bothersome);

medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult a dietitian to maintain nutrition; ensure ready access to bathroom facilities); symptoms of upper respiratory tract infection, cough (it may help to know that this is a drug effect, do not self-medicate, consult your health care provider if this becomes uncomfortable).

- Report severe headache, worsening of symptoms, fever, chills.

raloxifene hydrochloride (*rah lox' i feen*)

Evista

PREGNANCY CATEGORY X

Drug class

Selective estrogen receptor modulator

Therapeutic actions

Increases bone mineral density without stimulating endometrium in women; modulates effects of endogenous estrogen at specific receptor sites.

Indications

- Prevention and treatment of osteoporosis in postmenopausal women
- Reduction of risk of invasive breast cancer in postmenopausal women with osteoporosis and a high risk of invasive breast cancer
- Unlabeled uses: uterine leiomyoma, pubertal gynecomastia, prevention of bone loss in men with prostate cancer

Contraindications and cautions

- Contraindicated with allergy to raloxifene, pregnancy, lactation, active or history of DVT, pulmonary embolism, or retinal vein thrombosis.
- Use cautiously with history of smoking, venous thrombosis.

Available forms

Tablets—60 mg

Dosages

Adults

60 mg PO daily.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	4–7 hr

Metabolism: Hepatic; $T_{1/2}$: 27.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces

Adverse effects

- **CNS:** Depression, insomnia, vertigo, neuralgia, hypoesthesia
- **CV: Venous thromboembolism**
- **Dermatologic:** *Hot flashes, skin rash*
- **GI:** *Nausea, vomiting*, food distaste
- **GU:** Vaginal bleeding, vaginal discharge
- **Other:** Peripheral edema

Interactions

- *** Drug-drug** • Decreased effectiveness of oral anticoagulants; monitor PT or INR closely • Decreased raloxifene absorption if taken with cholestyramine; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to raloxifene, pregnancy, lactation, smoking, history of venous thrombosis
- **Physical:** Skin lesions, color, turgor; pelvic examination; orientation, affect, reflexes; peripheral pulses, edema; LFTs, CBC and differential, bone density

Interventions

- Administer daily without regard to food.
- Arrange for periodic blood counts during therapy.

⊗ **Black box warning** Drug increases risk of deep vein thromboses and pulmonary emboli; monitor patient accordingly.

⊗ **Black box warning** Drug increases risk of stroke and CV events in women with documented CAD; weigh benefits against risks before using drug with these women.

⊗ **Warning** Counsel patient about the need to use contraceptive measures to avoid

pregnancy while taking this drug; inform patient that serious fetal harm could occur.

- Provide comfort measures to help patient deal with drug effects: Hot flashes (control environmental temperature); headache, depression (monitor light and noise); vaginal bleeding (use good hygiene).

Teaching points

- Take this drug as prescribed.
- This drug can cause serious fetal harm and must not be taken during pregnancy. Contraceptive measures should be used while you are taking this drug. If you become pregnant or would like to become pregnant, consult your health care provider immediately.
- You may experience these side effects: Bone pain; hot flashes (staying in cool places may help); nausea, vomiting (eat frequent small meals); weight gain; dizziness, headache, light-headedness (use caution if driving or performing tasks that require alertness).
- Report marked weakness, sleepiness, mental confusion, pain or swelling of the legs, shortness of breath, blurred vision, numbness or tingling.

raltegravir

(rabl *teh'* gra veer)

Isentress

PREGNANCY CATEGORY C

Drug classes

Antiretroviral
Integrase inhibitor

Therapeutic action

Inhibits the virus-specific enzyme integrase, an encoded enzyme needed for viral replication. Blocking this enzyme prevents formation of HIV-1 provirus and leads to decreased viral load and increased active CD4 cells.

Indications

- In combination with other antiretrovirals for the treatment of HIV-1 infection in adults

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of drug, treatment-naïve adults, children, lactation.
- Use cautiously with patients taking strong inducers of uridine diphosphate glucuronosyltransferase 1A1, patients at risk for rhabdomyolysis or myopathy, pregnant patients.

Available forms

Tablets—400 mg

Dosages

Adults

400 mg PO bid taken with other antivirals and without regard to food. If given with rifampin, 800 mg PO bid without regard to food.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3 hr

Metabolism: Hepatic; $T_{1/2}$: 9 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **GI:** *Nausea*, *diarrhea*, abdominal pain, vomiting
- **Other:** *Fever*, rhabdomyolysis, immune reconstitution syndrome

Interactions

★ **Drug-drug** • Decreased serum levels of raltegravir if combined with rifampin; monitor patient and adjust dosage if this combination must be used

★ **Drug-drug** • Potential for loss of effectiveness if combined with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to raltegravir or any of its components; risk for myopathy or rhabdomyolysis, pregnancy, lactation
- **Physical:** T; orientation; abdominal examination, LFTs, HIV testing

Interventions

- Make sure patient is taking other antiviral drugs when taking this drug.
- Administer without regard to food.
- Encourage women of childbearing age to use barrier contraceptives while on this drug because drug effects on fetus are not known.
- Advise women who are nursing to find another method of feeding the baby; potential effects on the baby are not known.
- Explain that drug does not cure disease and that there is still a risk of transmitting HIV to others.
- Maintain all other therapies related to the HIV infection.

Teaching points

- This drug does not cure HIV. It works with other antiviral drugs to decrease the amount of virus in your body.
- To prevent the spread of HIV, take precautions to avoid exposing others to your blood and body fluids, and use condoms during sex.
- If you miss a dose, take it as soon as you remember and resume your regular schedule. If you don't remember until it's almost time to take the next dose, skip the missed dose and continue your usual schedule. Do not take two tablets at the same time to make up for a skipped dose. Do not take more than two doses each day.
- Do not let your prescription run out. If you stop taking this drug temporarily, the virus could become resistant to antiviral drugs, decreasing the effectiveness of antiviral treatment and increasing your viral load.
- You will need regular health care, including blood tests, to monitor the effects of this drug on your body.
- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult with your health care provider.
- It is not known how this drug could affect a nursing baby. If you are breast-feeding a baby, you should select another feeding method.
- You may experience these side effects: Headache (consult your health care provider, medication may be available to help); nausea (small, frequent meals may help); diarrhea

(it may lessen with time, but alert your health care provider if it becomes severe).

- Report signs of infection; unexplained muscle pain, tenderness, or weakness; severe diarrhea; headache that will not go away.

(*rab mell' tee on*)

Rozereem

PREGNANCY CATEGORY C

Drug classes

Melatonin receptor agonist
Sedative-hypnotic

Therapeutic actions

Agonist at melatonin receptor sites believed to contribute to sleep promotion and thought to be involved in the maintenance of circadian rhythm underlying the normal sleep-wake cycle.

Indications

Treatment of insomnia characterized by difficulty with sleep onset

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug, severe hepatic impairment, concurrent use of fluvoxamine, lactation, severe sleep apnea, severe COPD.
- Use cautiously with moderate hepatic impairment, pregnancy.

Available forms

Tablets—8 mg

Dosages

Adults

8 mg PO taken within 30 min of going to bed.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

- *Severe hepatic impairment:* Not recommended.
- *Moderate hepatic impairment:* Use with caution.

- **Concurrent use of CYP1A2 inhibitors (such as ciprofloxacin):** Use with caution.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–1.5 hr

Metabolism: Hepatic; T_{1/2}: 2-5 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, somnolence, depression, insomnia, *headache*, complex sleep disorders
- **GI:** Nausea, diarrhea
- **GU:** Decreased testosterone levels (decreased libido, fertility issues), increased prolactin levels (galactorrhea, amenorrhea, problems with fertility)
- **Respiratory:** URIs
- **Other:** Influenza, arthralgia, myalgia, decreased cortisol levels, **anaphylaxis, angioedema**

Interactions

★ **Drug-drug** • Risk of severe increase in serum levels and toxicity of ramelteon if combined with fluvoxamine; avoid this combination • Increased serum levels and risk of adverse effects if combined with potent CYP inhibitors (ketoconazole, fluconazole, itraconazole, clarithromycin, nefazodone, ritonavir, nelfinavir); monitor patient and adjust dosages as needed

■ **Nursing considerations**

Assessment

- **History:** Hypersensitivity to any component of the drug, hepatic impairment, concurrent use of fluvoxamine, lactation, severe sleep apnea, severe COPD, pregnancy
- **Physical:** Orientation, reflexes, affect; R, adventitious sounds; abdominal examination; chest examination

Interventions

- Administer drug 30 min before patient is going to bed; encourage no other activities after the patient takes the drug.
- Monitor patients using drug for suicidal ideation.

- Do not administer this drug after a fatty or large meal, absorption can be affected.
- Encourage women of childbearing age to use barrier contraceptives while on this drug; effects of the drug on a fetus are not known.
- Advise women who are breast-feeding to find another method of feeding the baby; it is not known if this drug can affect a nursing baby.

Teaching points

- Take this drug exactly as prescribed, 30 minutes before going to bed. Do not use it longer than advised by your health care provider.
- Do not take this drug unless you are about to get into bed and are able to get 8 or more hours of sleep before you need to be alert again; after taking the drug, limit activities to those involved with getting ready for bed.
- Do not take this drug with or immediately after a high-fat or heavy meal. This could interfere with the absorption and effectiveness of the drug.
- Do not combine this drug with other sleep drugs, including over-the-counter products.
- It is not known how this drug would affect a pregnancy. If you think you are pregnant or would like to become pregnant, consult your health care provider.
- This drug should not be taken while breast-feeding a baby. If you are breast-feeding, another method of feeding the baby should be used while you are taking this drug.
- Consult your health care provider if you experience worsening of your insomnia or if you develop any new behavioral signs or symptoms, such as complex sleep-related behaviors.
- You may experience these side effects: Allergic reaction, swelling, changes in thinking, alertness (do not drive a car, operate potentially dangerous equipment, or make important legal decisions the day after you take this drug); headache (consult your health care provider for potential pain medications if this occurs); unpleasant taste, nausea (frequent mouth care, frequent small meals may help); cessation of your period (women), enlargement of breasts, fertility problems.
- Report depression, thoughts of suicide or disturbing thoughts, cessation of menses or breast enlargement or engorgement in women, decreased libido, problems with fertility.

R

ramipril*(ra mi' pril)*

Altace

PREGNANCY CATEGORY C
(FIRST TRIMESTER)**PREGNANCY CATEGORY D**
(SECOND AND THIRD TRIMESTERS)**Drug classes**

ACE inhibitor

Antihypertensive

Therapeutic actions

Ramipril blocks ACE from converting angiotensin I to angiotensin II, a powerful vasoconstrictor, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action.

Indications

- Treatment of hypertension alone or in combination with thiazide-type diuretics
- Treatment of HF in stable patients in the first few days after MI
- To decrease the risk of MI, stroke, death from CV disease in patients 55 yr and older who are at risk for developing CAD

Contraindications and cautions

- Contraindicated with allergy to ramipril, pregnancy (embryocidal in preclinical studies).
- Use cautiously with impaired renal function, HF, salt or volume depletion, lactation.

Available forms

Capsules—1.25, 2.5, 5, 10 mg; tablets—1.25, 2.5, 5, 10 mg

Dosages**Adults**

- **Hypertension:** Initial dose, 2.5 mg PO daily. Adjust dosage according to BP response, usually 2.5–20 mg/day as a single dose or in two equally divided doses. Discontinue diuretic 2–3 days before beginning therapy; if

not possible, administer initial dose of 1.25 mg.

- **HF:** Initial dose, 2.5 mg PO bid; if patient becomes hypotensive, 1.25 mg PO bid may be used while adjusting up to target dose of 5 mg PO bid; increase dose every 3 wk until target dose is reached.
- **Decrease risk of CV events:** Initial dose, 2.5 mg PO once daily for 1 wk, then 5 mg PO once daily for next 3 wk; for maintenance, 10 mg PO daily.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Greater sensitivity to drug effects is possible.

Patients with renal impairment

Excretion is reduced in renal failure. Use smaller initial dose: 25% of normally used dose is suggested; for hypertension, 1.25 mg PO daily in patients with creatinine clearance less than 40 mL/min; dosage may be titrated upward until pressure is controlled or a maximum of 5 mg/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–2 hr	1–4 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 13–17 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CV:** *Tachycardia*, angina pectoris, HF, MI, Raynaud's syndrome, hypotension in salt- or volume-depleted patients, syncope
- **Dermatologic:** *Rash*, pemphigoid-like reaction, *pruritus*, photosensitivity, erythema multiforme, **Stevens-Johnson syndrome**
- **GI:** *Gastric irritation*, *aphthous ulcers*, *chylsteasia*, cholestatic jaundice, hepatocellular injury, anorexia, constipation, pancreatitis
- **GU:** *Proteinuria*, renal insufficiency, renal failure, polyuria, oliguria, urinary frequency
- **Hematologic:** Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, **pancytopenia**, hyperkalemia

- **Other:** *Cough*, malaise, dry mouth, **angioedema**

Interactions

- **Drug-drug** • Exacerbation of cough if taken with capsaicin • Increased serum levels and increased toxicity with lithium; monitor patient closely
- **Drug-food** • Rate of absorption is reduced with food
- **Drug-lab test** • False-positive test for urine acetone

■ Nursing considerations

Assessment

- **History:** Allergy to ramipril, impaired renal function, HF, salt or volume depletion, pregnancy, lactation
- **Physical:** Skin color, lesions, turgor; T; P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Black box warning** Do not use during pregnancy; risk of fetal harm. Advise use of a contraceptive.

- Discontinue diuretic for 2–3 days before beginning therapy, if possible, to avoid severe hypotensive effect.
- Open capsules and sprinkle contents over a small amount of applesauce or mix in applesauce or water if patient has difficulty swallowing capsules. Mixture is stable for 24 hr at room temperature and 48 hr if refrigerated.

⊗ **Warning** Alert surgeon and mark chart that ramipril is being used; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

- Monitor patient closely for falling BP secondary to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.
- Reduce dosage in patients with impaired renal function.

Teaching points

- Do not stop taking without consulting your health care provider.

- Be careful in any situation that may lead to a drop in blood pressure (diarrhea, sweating, vomiting, dehydration); if dizziness or light-headedness occurs, consult your health care provider.
- Avoid becoming pregnant while taking this drug; use of a contraceptive is advised.
- You may experience these side effects: GI upset, loss of appetite, change in taste perception (transient); mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, light-headedness (transient; change position slowly, and limit your activities to those that do not require alertness and precision).
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heartbeat, chest pains; swelling of the face, eyes, lips, tongue; difficulty breathing.

▽ ranibizumab

See Appendix U, *Less commonly used drugs*.

▽ ranitidine hydrochloride

(ra nye' te deen)

Apo-Ranitidine (CAN), CO Ranitidine (CAN), Gen-Ranitidine (CAN), Novo-Ranitidine, (CAN), Nu-Ranit (CAN), PMS-Ranitidine (CAN), ratio-Ranitidine (CAN), Zantac, Zantac EFFERdose, Zantac GELDose, Zantac 75, Zantac 150

PREGNANCY CATEGORY B

Drug class

Gastric acid secretion inhibitor
Histamine-2 (H₂) antagonist

Therapeutic actions

Competitively inhibits the action of histamine at the H₂ receptors of the parietal cells of the stomach, inhibiting basal gastric acid secretion and gastric acid secretion that is stimulated by food, insulin, histamine, cholinergic agonists, gastrin, and pentagastrin.

Indications

- Short-term treatment of active duodenal ulcer
- Maintenance therapy for duodenal ulcer at reduced dosage
- Short-term treatment and maintenance therapy of active, benign gastric ulcer
- Short-term treatment of GERD
- Pathologic hypersecretory conditions (eg, Zollinger-Ellison syndrome) (adults only)
- Treatment of erosive esophagitis
- Treatment of heartburn, acid indigestion, sour stomach

Contraindications and cautions

- Contraindicated with allergy to ranitidine, lactation.
- Use cautiously with impaired renal or hepatic function, pregnancy.

Available forms

Tablets—75, 150, 300 mg; capsules—150, 300 mg; effervescent tablets and granules—25, 150 mg; syrup—15 mg/mL; injection—1, 25 mg/mL

Dosages**Adults**

- *Active duodenal ulcer*: 150 mg bid PO for 4–8 wk. Alternatively, 300 mg PO once daily at bedtime or 50 mg IM or IV every 6–8 hr or by intermittent IV infusion, diluted to 100 mL and infused over 15–20 min. Do not exceed 400 mg/day.
- *Maintenance therapy, duodenal ulcer*: 150 mg PO at bedtime.
- *Maintenance therapy, gastric ulcer*: 150 mg PO at bedtime.
- *Active gastric ulcer*: 150 mg bid PO or 50 mg IM or IV every 6–8 hr.
- *Pathologic hypersecretory syndrome*: 150 mg bid PO. Individualize the dose with patient's response. Do not exceed 6 g/day.
- *GERD, esophagitis, benign gastric ulcer*: 150 mg bid PO.
- *Treatment of heartburn, acid indigestion*: 75 mg PO as needed.

Pediatric patients 1 mo–16 yr

Injection: 2–4 mg/kg/day IV or IM every 6–8 hr to a maximum of 50 mg every 6–8 hr.

Geriatric patients or patients with impaired renal function

For creatinine clearance less than 50 mL/min, accumulation may occur; use lowest dose possible, 150 mg every 24 hr PO or 50 mg IM or IV every 18–24 hr. Dosing may be increased to every 12 hr if patient tolerates it and blood levels are monitored.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–3 hr	8–12 hr
IM	Rapid	15 min	8–12 hr
IV	Immediate	5–10 min	8–12 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: For IV injection, dilute 50 mg in 0.9% sodium chloride injection, 5% or 10% dextrose injection, lactated Ringer's solution, 5% sodium bicarbonate injection to a volume of 20 mL; solution is stable for 48 hr at room temperature. For intermittent IV, use as follows: Dilute 50 mg in 100 mL of 5% dextrose injection or other compatible solution.

Infusion: Inject over 5 min or more; for intermittent infusion, infuse over 15–20 min; continuous infusion, 6.25 mg/hr.

Incompatibility: Do not mix with amphotericin B.

Adverse effects

- **CNS**: *Headache*, malaise, dizziness, somnolence, insomnia, vertigo
- **CV**: Tachycardia, bradycardia, PVCs (rapid IV administration)
- **Dermatologic**: *Rash*, alopecia
- **GI**: *Constipation, diarrhea, nausea, vomiting, abdominal pain*, hepatitis, increased ALT levels
- **GU**: Gynecomastia, impotence or decreased libido
- **Hematologic**: Leukopenia, granulocytopenia, thrombocytopenia, pancytopenia

- **Local:** Pain at IM site, local burning or itching at IV site
- **Other:** Arthralgias

Interactions

• *** Drug-drug** • Increased effects of warfarin, TCAs; monitor patient closely and adjust dosage as needed

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Zantac* (ranitidine), *Zyrtec* (cetirizine), and *Xanax* (alprazolam); use caution.

Assessment

- **History:** Allergy to ranitidine, impaired renal or hepatic function, lactation, pregnancy
- **Physical:** Skin lesions; orientation, affect; pulse, baseline ECG; liver evaluation, abdominal examination, normal output; CBC, LFTs, renal function tests

Interventions

- Administer oral drug with meals and at bedtime.
- Decrease doses in renal and liver failure.
- Provide concurrent antacid therapy to relieve pain.
- Administer IM dose undiluted, deep into large muscle group.
- Arrange for regular follow-up, including blood tests, to evaluate effects.

Teaching points

- Take drug with meals and at bedtime. Therapy may continue for 4–6 weeks or longer.
- If you also are using an antacid, take it exactly as prescribed, being careful of the times of administration.
- Have regular medical follow-up care to evaluate your response.
- You may experience these side effects: Constipation or diarrhea (request aid from your health care provider); nausea, vomiting (take drug with meals); enlargement of breasts, impotence or decreased libido (reversible); headache (adjust lights and temperature and avoid noise).

- Report sore throat, fever, unusual bruising or bleeding, tarry stools, confusion, hallucinations, dizziness, severe headache, muscle or joint pain.

ranolazine

(ran **ob'** lab zeen)

Ranexa ORIG

PREGNANCY CATEGORY C

Drug classes

Antianginal

Piperazineacetamide

Therapeutic actions

Antianginal, anti-ischemic. Mechanism of action is not known. Prolongs the QT interval; does not decrease HR or BP; decreases myocardial workload.

Indications

- Treatment of chronic angina as first-line therapy or in patients who have not responded adequately to other antianginal drugs; used with amlodipine, beta blockers, nitrates

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug; preexisting QT prolongation, concurrent use of QT-interval prolonging drugs; hepatic impairment; concurrent use of potent or moderately potent CYP3A inhibitors, including diltiazem; lactation.
- Use cautiously with severe renal impairment, history of ventricular tachycardia, pregnancy.

Available forms

ER tablets ORIG—500, 1,000 mg

Dosages

Adults

500 mg PO bid; may be increased to maximum of 1,000 mg bid.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Not recommended with mild, moderate, or severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–5 hr

Metabolism: Hepatic; $T_{1/2}$: 7 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Dizziness, headache*, tinnitus, vertigo
- **CV:** Palpitations, peripheral edema, **prolonged QT interval**
- **GI:** *Nausea, constipation*, dry mouth, vomiting, abdominal pain
- **Respiratory:** Dyspnea

Interactions

★ **Drug-drug** • Risk of increased serum level and toxicity of ranolazine if combined with ketoconazole, diltiazem, verapamil, rifampin, macrolide antibiotics, HIV protease inhibitors; avoid these combinations • Risk of increased serum digoxin level if taken concurrently; digoxin dosage may need to be decreased • Monitor patients receiving TCAs; antipsychotics or other drugs known to prolong QT interval concurrently; may need lower doses of these drugs

★ **Drug-food** • Risk of toxic effects if combined with grapefruit juice; avoid drinking grapefruit juice while on ranolazine

■ Nursing considerations**Assessment**

- **History:** Allergy to any component of the tablet, preexisting QT-interval prolongation, concurrent use of QT-interval prolonging drugs, hepatic impairment, concurrent use of potent or moderately potent CYP3A inhibitors, renal failure, pregnancy, lactation.
- **Physical:** Orientation, reflexes; BP; respiratory evaluation; baseline ECG, LFTs, and renal function tests

Interventions

- Obtain baseline ECG, LFTs, and renal function tests before starting therapy.
- Ensure that patient swallows tablets whole; do not cut, crush, or let patient chew the tablets.
- Ensure that patient continues to use other prescribed antianginal medications.

- Advise patient to avoid grapefruit juice and grapefruit products while using this drug.
- Suggest use of contraceptive measures while taking this drug; potential effects on a fetus are not known.
- Advise nursing mothers that another method of feeding the baby will be needed while taking this drug.
- Provide safety measures if dizziness and light-headedness occur.

Teaching points

- Take this drug twice a day. Swallow the tablet whole; do not cut, crush, or chew it.
- If you miss a dose of the daily medication, take it as soon as you remember and then return to your usual routine. Do not take more than two doses in one day.
- Do not take this drug for an acute anginal attack; this drug helps chronic chest pain. Continue to use your other angina drugs as prescribed.
- You may be asked to have periodic ECGs and blood tests to monitor the effects of this drug on your body.
- Do not consume grapefruit juice or grapefruit products while taking this drug.
- It is not known how this drug could affect a nursing baby. If you are breast-feeding a baby, you should select another method of feeding the baby.
- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- You may experience these side effects: Dizziness, light-headedness (if this occurs, avoid driving a car or operating dangerous machinery); headache, constipation (consult your health care provider because medications may be available to help).
- Report palpitations, fainting spells, severe constipation.

 **rasagiline**
(raz ah' gab leen)

Azilect

PREGNANCY CATEGORY C

Drug classes

Antiparkinsonian
MAO type B inhibitor

Therapeutic actions

Inhibits MAO type B (found mostly in the CNS), leading to increased levels of dopamine at the synapse particularly in areas of the brain responsible for controlling movement and coordination; much less effect in the periphery leads to fewer peripheral adverse effects.

Indications

- Treatment of signs and symptoms of idiopathic Parkinson's disease as initial monotherapy and as adjunct therapy with levodopa

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug; concurrent use of meperidine, tramadol, methadone, propoxyphene, detromethorphan, sympathomimetic amines, MAOIs, SSRIs, TCAs; elective surgery; pheochromocytomas; diets rich in tyramine; severe hepatic insufficiency.
- Use cautiously with mild hepatic insufficiency, pregnancy, lactation, use of other CYP1A2 inhibitors.

Available forms

Tablets—0.5, 1 mg

Dosages

Adults

Initial monotherapy: 1 mg/day PO.

Adjunct therapy with levodopa: 0.5 mg/day PO; if response is insufficient, may increase to 1 mg/day PO. In some patients, levodopa dose may need to be decreased. Monitor patient response closely.

Patients with hepatic impairment

In mild hepatic impairment, 0.5 mg/day PO; not recommended in moderate to severe hepatic impairment.

Patients taking CYP1A2 inhibitors (such as ciprofloxacin)

0.5 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, conjunctivitis, depression, paresthesia, vertigo
- **CV:** *Hypotension*
- **GI:** *Dyspepsia, dry mouth*, gastroenteritis
- **Respiratory:** Rhinitis
- **Other:** *Arthralgia*, flulike symptoms, fever, arthritis, malaise, neck pain, weight loss, bruising, **melanoma**

Interactions

★ **Drug-drug** ⊗ **Warning** Risk of severe reaction if combined with meperidine or other analgesics including tramadol, propoxyphene, methadone; avoid these combinations. • Risk of psychosis or bizarre behavior when combined with dextromethorphan, mirtazapine, cyclobenzaprine; avoid these combinations • Risk of hypertensive crisis if combined with sympathomimetic amines, MAOIs; avoid these combinations • Risk of hyperpyrexia when combined with some antidepressants (SSRIs, TCAs); monitor patient closely if these combinations are used • Risk of increased rasagiline levels in patients taking other CYP1A2 inhibitors, such as ciprofloxacin; reduce dose of rasagiline if this combination is used

★ **Drug-alternative therapy** ⊗ **Warning** Risk of serious reaction if combined with St. John's wort; avoid this combination.

★ **Drug-food** ⊗ **Warning** Risk of hypertensive crisis with ingestion of tyramine-rich foods or beverages or dietary supplements containing amines.

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the drug; concurrent use of meperidine, tramadol, methadone, propoxyphene, dextromethorphan, sympathomimetic amines, MAOIs, SSRIs, TCAs, other CYP1A2 inhibitors; elective

surgery; pheochromocytomas; diets rich in tyramine; hepatic insufficiency; pregnancy, lactation

- **Physical:** T; skin evaluation, lesions; orientation, reflexes, grip strength, gait; BP; LFTs

Interventions

- Obtain LFTs and skin evaluation, preferably by a dermatologist, before and periodically during therapy.
- Ensure that patient has a list of tyramine-containing foods and understands the importance of avoiding them; hypertensive crisis could occur. However, studies indicate less of a risk than originally thought.
- Ensure that patient continues to use other medications for Parkinson's disease as prescribed.
- Instruct patient and a significant other in the warning signs of a hypertensive crisis.
- Advise patient to avoid use of any other medications, including OTC products and herbal therapies, without consulting a health care provider.
- Provide safety measures if dizziness and light-headedness occur.

Teaching points

- Take this drug once a day as prescribed.
- If you miss a dose of the daily medication, take it as soon as you remember and then return to your usual routine. Do not take more than one dose in one day.
- Inspect your skin regularly for lesions, moles, and other changes. Melanoma occurs more often in patients with Parkinson's disease. Consult a dermatologist for a baseline report and periodically during therapy.
- If you also take levodopa, you may experience a worsening of your tremor and a drop in blood pressure when you stand. Notify your health care provider if this occurs; a dosage adjustment may be possible.
- You will need to avoid large amounts of food rich in tyramine while taking this drug and for 2 weeks after finishing it. Tyramine-containing foods and beverages include aged or smoked meats or fish, aged cheeses, concentrated yeast extract, and beers and wines that have not been pasteurized.

- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are breast-feeding a baby, consult your health care provider.
- This drug interacts with many other drugs and could cause serious side effects; do not take any other drug, including over-the-counter drugs and herbal therapies, until you have checked with your health care provider.
- You may experience these side effects: Vertigo, light-headedness (avoid driving a car or operating dangerous machinery); headache (consult your health care provider; medications may be available to help); dry mouth, upset stomach (frequent mouth care, sugar-free lozenges may help).
- Report severe headache, dizziness, blurred vision, difficulty thinking, changes in your skin, chest pain, worsening of your condition.

▼ rasburicase

See Appendix U, *Less commonly used drugs.*

DANGEROUS DRUG

▼ repaglinide

(*re pag' lab nyde*)

Prandin

PREGNANCY CATEGORY C

Drug classes

Antidiabetic
Meglitinide

Therapeutic actions

Closes potassium channels in the beta cells of the pancreas, which causes the opening of calcium channels and a resultant increase in insulin release; highly selective for beta cells in the pancreas. Glucose-lowering abilities depend on the existence of functioning beta cells in the pancreas.

Indications

- Adjunct to diet and exercise to lower blood glucose in patients with type 2 diabetes mellitus whose hyperglycemia cannot be managed by diet and exercise alone
- Combination therapy with metformin or thiazolidinediones to lower blood glucose in patients whose hyperglycemia cannot be controlled by diet and exercise plus monotherapy with any of the following agents alone: Metformin, sulfonyleureas, or thiazolidinediones

Contraindications and cautions

- Contraindicated with hypersensitivity to the drug, diabetic ketoacidosis, type 1 diabetes.
- Use cautiously with renal or hepatic impairment, pregnancy, lactation.

Available forms

Tablets—0.5, 1, 2 mg

Dosages

Adults

0.5–4 mg PO taken tid or qid 15–30 min (usually within 15 min) before meals; determine dosage based on patient response; maximum dose is 16 mg/day. Monitor patient regularly and adjust dosage as needed, waiting 1 wk between dose adjustments to assess patient response.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

For severe renal impairment, use starting dose of 0.5 mg PO and titrate carefully. Use cautiously with hepatic impairment; monitor closely.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 1 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, paresthesias
- **Endocrine:** *Hypoglycemia*

- **GI:** Nausea, diarrhea, constipation, vomiting, dyspepsia
- **Respiratory:** *URI*, sinusitis, rhinitis, bronchitis

Interactions

- *** Drug-drug** ⊗ **Warning** Risk of severe hypoglycemia if combined with both gemfibrozil and itraconazole; avoid this combination.
- Risk of hypoglycemia if combined with gemfibrozil; use caution; monitor patient closely
- *** Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to the drug, diabetic ketoacidosis, type 1 diabetes, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; blood glucose, LFTs, renal function tests

Interventions

- Administer drug before meals; if a patient skips or adds a meal, the dosage should be skipped or added appropriately.
- Monitor urine or serum glucose levels frequently to determine effectiveness of drug and dosage being used.
- Arrange for consult with dietitian to establish weight loss program and dietary control as appropriate.
- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.

Teaching points

- Do not discontinue this medication without consulting your health care provider.
- Take this drug before meals (three to four times a day); if you skip a meal, skip the dose; if you add a meal, take a dose before that meal also.
- Monitor urine or blood for glucose and ketones as prescribed.

- Return for regular follow-up and monitoring of your response to the drug and possible need for dosage adjustment.
- Continue diet and exercise program established for control of diabetes.
- Know the signs and symptoms of hypoglycemia and hyperglycemia and appropriate treatment as indicated; report the occurrence of either to your health care provider.
- You may experience these side effects: Headache, increased upper respiratory infections, nausea.
- Report fever, sore throat, unusual bleeding or bruising, severe abdominal pain.

ribavirin

(rye ba vye' rin)

Copegus, Rebetol, RibaPak, Ribasphere, Ribatab, Virazole

PREGNANCY CATEGORY X

Drug class

Antiviral

Therapeutic actions

Antiviral activity against RSV, influenza virus, hepatitis C virus, and HSV; mechanism of action is not known.

Indications

- Aerosol: Treatment of carefully selected hospitalized infants and children with severe RSV infection of lower respiratory tract
- Oral: Treatment of chronic hepatitis C in combination with peginterferon alfa 2a (*Pegasys*) or interferon alfa-2b (*Intron A*) in patients 3 yr or older with compensated liver disease untreated with or refractory to alfa interferon therapy
- With *Pegasys*, treatment of adults with hepatitis C who have compensated liver disease and no previous alfa interferon therapy
- Orphan drug use: Treatment of hemorrhagic fever with renal syndrome
- Unlabeled use for aerosol: Treatment of some influenza A and B infections

- Unlabeled uses of oral preparation: Treatment of some viral diseases, including herpes genitalis, measles, Lassa fever

Contraindications and cautions

- Contraindicated with allergy to drug product, COPD, pregnancy or male whose female partner is pregnant (causes fetal damage), lactation.
- Use cautiously with renal impairment, respiratory dysfunction.

Available forms

Capsules—200 mg; oral solution—40 mg/mL; powder for aerosol reconstitution—6 g/100 mL vial; tablets—200, 400, 600 mg

Dosages

Adults

Weighing 75 kg or less: Two 200-mg capsules PO in the AM, three 200-mg capsules PO in the PM with *Intron A*, 3 million international units subcutaneously three times per wk; or with 180 mcg *Pegasys* subcutaneously per wk for 48 wk.

Weighing more than 75 kg: Three 200-mg capsules PO in AM, three 200-mg capsules PO in PM with 3 million international units *Intron A*, subcutaneously three times per wk; or with 180 mcg *Pegasys* subcutaneously per wk for 48 wk.

Pediatric patients

Aerosol

For use only with small-particle aerosol generator. Check operating instructions carefully. Dilute aerosol powder to 20 mg/mL and deliver for 12–18 hr/day for at least 3 but not more than 7 days.

Oral

15 mg/kg/day PO in divided doses AM and PM. Children 25 kg or more who cannot swallow tablets may use oral solution. Give with interferon alfa-2b (*Intron A*), 3 million international units/m², subcutaneously three times per wk.

Patients with anemia as manifested by decrease in Hgb

No cardiac disease, Hgb less than 10 g/dL: Decrease to 600 mg daily (one 200-mg capsule in AM; two 200-mg capsules in PM); 7.5 mg/kg/day PO for children.

No cardiac disease, Hgb less than 8.5 g/dL: Discontinue ribavirin.

Cardiac disease, Hgb decreased by 2 g/dL or more during any 4-wk period of treatment: Decrease to 600 mg daily (one 200-mg capsule in AM; two 200-mg capsules in PM); 7.5 mg/kg/day PO for children.

Cardiac history, Hgb less than 12 g/dL after 4 wk of decreased dose: Discontinue ribavirin.

Patients with hepatitis C and HIV coinfection: 800 mg/day PO ribavirin with 180 mcg Pegasys by subcutaneous injection once each wk for 48 wk.

Patients with renal impairment: Do not use if creatinine clearance is less than 50 mL/min.

Pharmacokinetics

Route	Onset	Peak
Aerosol	Slow	60–90 min

Metabolism: Cellular; $T_{1/2}$: 9.5 hr (aerosol)

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Depression, suicidal behavior, nervousness
- **CV: Cardiac arrest,** hypotension
- **Dermatologic:** Rash
- **Hematologic:** Anemia
- **Respiratory:** *Deteriorating respiratory function,* pneumothorax, apnea, bacterial pneumonia
- **Other:** Conjunctivitis, testicular lesions

Interactions

• **Drug-drug** • Decreased levels of ribavirin when given with antacids; avoid with nucleoside reverse transcriptase inhibitors

■ Nursing considerations

Assessment

- **History:** Allergy to drug product, COPD, pregnancy, lactation
- **Physical:** Skin rashes, lesions; P, BP, auscultation; R, adventitious sounds; Hct

Interventions

- Ensure proper use of small-particle aerosol generator; check operating instructions carefully.

- Ensure that water used as diluent contains no other substance.
- Replace solution in the unit every 24 hr.
- Store reconstituted solution at room temperature.
- For patients on mechanical ventilators, clean and check tubing to prevent accumulation of drug and malfunction of the machine.

⊗ **Black box warning** Inhaled form of drug is not for use in adults; testicular lesions, birth defects can occur.

⊗ **Black box warning** Ribavirin monotherapy is not effective for the treatment of chronic hepatitis C and should not be used alone for this indication.

⊗ **Black box warning** Use of this drug makes patients at high risk for hemolytic anemia, which could lead to MI; do not use in patients with significant or unstable CV disease.

⊗ **Black box warning** Monitor respiratory status frequently; pulmonary deterioration and death have occurred during and shortly after treatment with inhalation product.

⊗ **Black box warning** Risk of significant fetal defects exists. Caution women to avoid pregnancy while using this drug; use of barrier contraceptives is advised; male partners of pregnant women should not take this drug.

⊗ **Warning** Use extreme caution in adults with history of depression or psychiatric disorders.

- Monitor BP and P frequently.

Teaching points

- Explain the use of small-particle aerosol generator to patient or family.
- Take capsules or tablets in morning and evening; mark calendar with days to inject *Intron A* or *Pegasys* as appropriate.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised; male partners of pregnant women should avoid intercourse.
- Report depression, suicidal ideation, difficulty breathing, muscle pain, dizziness, confusion, shortness of breath (pediatric patients).

▷ rifabutin

See Appendix U, *Less commonly used drugs.*

rifampin

(rif' am pin)

Rifadin, Rimactane, Rofact (CAN)

PREGNANCY CATEGORY C

Drug classes

Antibiotic

Antituberculous (first-line)

Therapeutic actions

Inhibits DNA-dependent RNA polymerase activity in susceptible bacterial cells.

Indications

- Treatment of pulmonary TB in conjunction with at least one other effective antituberculous
- *Neisseria meningitidis* carriers, for asymptomatic carriers to eliminate meningococci from nasopharynx; not for treatment of meningitis
- Unlabeled uses: Infections caused by *Staphylococcus aureus* and *Staphylococcus epidermidis*, usually in combination therapy; gram-negative bacteremia in infancy; Legionella (*Legionella pneumophila*) not responsive to erythromycin; leprosy (in combination with dapsone); prophylaxis of meningitis caused by *Haemophilus influenzae*

Contraindications and cautions

- Contraindicated with allergy to any rifamycin, acute hepatic disease, lactation.
- Use cautiously with pregnancy (teratogenic effects have been reported in preclinical studies; safest antituberculous regimen for use in pregnancy is considered to be rifampin, isoniazid, and ethambutol).

Available forms

Capsules—150, 300 mg; powder for injection—600 mg

Dosages

Adults

- **Pulmonary TB:** 10 mg/kg/day; not to exceed 600 mg in a single daily dose PO or IV (used in conjunction with other antituber-

culotics). Continue therapy until bacterial conversion and maximal improvement occur.

- **Meningococcal carriers:** 600 mg PO or IV once daily for 4 consecutive days or 600 mg every 12 hr for 2 days.

Pediatric patients

- **Pulmonary TB:**
Older than 5 yr: 10–20 mg/kg/day PO or IV not to exceed 600 mg/day.
- **Meningococcal carriers:**
Younger than 1 mo: 5 mg/kg PO or IV every 12 hr for 2 days.
Older than 1 mo: 10 mg/kg PO or IV every 12 hr for 2 days, do not exceed 600 mg/dose.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–4 hr
IV	Rapid	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 3–5.1 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Reconstitute by transferring 10 mL sterile water for injection to vial containing 600 mg rifampin; swirl gently. Resultant fluid contains 60 mg/mL; stable at room temperature. Further mix with 500–1,000 mL of dextrose 5% or sterile saline.

Infusion: Infuse over 30–180 min, depending on volume.

Adverse effects

- **CNS:** *Headache, drowsiness, fatigue, dizziness*, inability to concentrate, mental confusion, generalized numbness, ataxia, muscle weakness, visual disturbances, exudative conjunctivitis
- **Dermatologic:** *Rash, pruritus, urticaria, pemphigoid reaction, flushing, reddish-orange discoloration of body fluids—tears, saliva, urine, sweat, sputum*
- **GI:** *Heartburn, epigastric distress, anorexia, nausea, vomiting, gas, cramps, diarrhea, pseudomembranous colitis, pancreatitis, elevations of liver enzymes*, hepatitis

- **GU:** Hemoglobinuria, hematuria, renal insufficiency, **acute renal failure**, menstrual disturbances
- **Hematologic:** *Eosinophilia, thrombocytopenia, transient leukopenia*, hemolytic anemia, decreased Hgb, hemolysis
- **Other:** Pain in extremities, osteomalacia, myopathy, fever, *flulike symptoms*

Interactions

• **Drug-drug** • Increased incidence of rifampin-related hepatitis with isoniazid • Decreased concentrations of itraconazole • Decreased effectiveness of metoprolol, propranolol, antiarrhythmics, benzodiazepine, buspirone, cyclosporine, digoxin, doxycycline, fluoroquinolones, nifedipine, zolpidem, quinidine, corticosteroids, hormonal contraceptives, methadone, oral anticoagulants, oral sulfonyleureas, theophyllines, phenytoin, cyclosporine, ketoconazole, verapamil

• **Drug-lab test** • Rifampin inhibits standard assays for serum folate and vitamin B₁₂

■ Nursing considerations

Assessment

- **History:** Allergy to any rifamycin, acute hepatic disease, pregnancy, lactation
- **Physical:** Skin color, lesions; T; gait, muscle strength; orientation, reflexes, ophthalmologic examination; liver evaluation; CBC, LFTs, renal function tests, urinalysis

Interventions

- Administer on an empty stomach, 1 hr before or 2 hr after meals.
- Administer in a single daily dose.
- Consult pharmacist for rifampin suspension for patients unable to swallow capsules.
- Prepare patient for the reddish-orange coloring of body fluids (urine, sweat, sputum, tears, feces, saliva); soft contact lenses may be permanently stained; advise patients not to wear them during therapy.

⊗ **Warning** Arrange for follow-up visits for liver and renal function tests, CBC, and ophthalmologic examinations.

Teaching points

- Take drug in a single daily dose. Take on an empty stomach, 1 hour before or 2 hours after meals.

- Take this drug regularly; avoid missing any doses; do not discontinue this drug without consulting your health care provider.
- Have periodic medical checkups, including eye examinations and blood tests, to evaluate the drug effects.
- You may experience these side effects: Reddish orange coloring of body fluids (tears, sweat, saliva, urine, feces, sputum; stain will wash out of clothing, but soft contact lenses may be permanently stained; do not wear them); nausea, vomiting, epigastric distress; skin rashes or lesions; numbness, tingling, drowsiness, fatigue (use caution if driving or operating dangerous machinery; use precautions to avoid injury).
- Report fever, chills, muscle and bone pain, excessive tiredness or weakness, loss of appetite, nausea, vomiting, yellowing of skin or eyes, unusual bleeding or bruising, skin rash or itching.

▽ rifampine

(rif ab pin' ten)

Priftin

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Antitubercular

Therapeutic actions

Inhibits DNA-dependent RNA polymerase activity in susceptible strains of *Mycobacterium tuberculosis*, causing cell death.

Indications

- Treatment of pulmonary TB in conjunction with at least one other effective antitubercular
- Orphan drug use: Prophylaxis and treatment of *Mycobacterium avium* complex in patients with AIDS

Contraindications and cautions

- Contraindicated with allergy to any rifamycin, acute hepatic disease.
- Use cautiously with pregnancy (teratogenic effects have been reported in preclinical studies), lactation, hepatic impairment.

Available forms

Tablets—150 mg

Dosages**Adults**

- **TB, intensive phase:** 600 mg PO twice weekly with an interval of at least 72 hr between doses; continue for 2 mo. Always give rifampine in combination with other anti-tuberculars.
- **Continuation phase:** 600 mg PO once a wk for 4 mo in combination with other agents to which the organism is susceptible.

Pediatric patients

Safety and efficacy not established in patients younger than 12 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	5–6 hr

Metabolism: Hepatic; $T_{1/2}$: 13–19 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*
- **Dermatologic:** Pruritus, acne
- **GI:** Nausea, vomiting, diarrhea, cramps
- **GU:** *Pyuria, proteinuria, hematuria*
- **Hematologic:** *Hyperuricemia*, liver enzyme elevations
- **Other:** Pain, arthralgia, *reddish discoloration of body fluids*

Interactions

★ **Drug-drug** • Decreased effectiveness of protease inhibitors; use extreme caution if this combination is needed; try to avoid this combination • Decreased effectiveness of rifampin if taken with p-aminosalicylic acid, ketoconazole—give the drugs at least 8–12 hr apart • Decreased effectiveness of metoprolol, propranolol, quinidine, corticosteroids, hormonal contraceptives, methadone, oral anti-coagulants, oral sulfonyleureas, theophyllines, phenytoin, cyclosporine, ketoconazole, verapamil if taken concurrently with rifampine; monitor patient carefully and adjust dosage as needed

★ **Drug-lab test** • Rifampine inhibits standard assays for serum folate and vitamin B₁₂

Nursing considerations**Assessment**

- **History:** Allergy to any rifamycin, acute hepatic disease, pregnancy, lactation
- **Physical:** Skin color, lesions; T; gait, muscle strength; orientation, reflexes, CBC, LFTs, renal function tests, urinalysis

Interventions

- Administer on an empty stomach, 1 hr before 2 hr after meals; if GI upset is severe, drug may be taken with food.
- Always use in combination with other anti-tuberculars.
- Prepare patient for the reddish orange coloring of body fluids (urine, sweat, sputum, tears, feces, saliva); soft contact lenses may be permanently stained, patients should be advised not to wear them during drug therapy.
- Recommend the use of barrier contraceptives while using this drug; hormonal contraceptives may be ineffective.
- Provide small, frequent meals if GI upset occurs.
- Provide skin care if dermatologic effects occur.

Teaching points

- Take drug along with any other prescribed anti-tuberculars. Take on an empty stomach—1 hour before or 2 hours after meals. If your stomach is very upset by the drug, it may be taken with food.
- Take this drug regularly; avoid missing any doses; do not discontinue this drug without consulting your health care provider. Make sure doses are at least 72 hours apart.
- Avoid pregnancy while taking this drug, using barrier contraceptives is advised.
- Arrange to have periodic medical checkups, which will include blood tests to evaluate the drug effects.
- You may experience these side effects: Reddish orange coloring of body fluids (tears, sweat, saliva, urine, feces, sputum; this is an expected occurrence and is not dangerous, do not be alarmed—stain will wash out of

clothing but soft contact lenses may be permanently stained, do not wear them when on this drug); nausea, vomiting, epigastric distress (consult your health care provider if any of these become too uncomfortable); skin rashes or lesions (consult your health care provider for appropriate skin care).

- Report fever, chills, muscle and bone pain, excessive tiredness or weakness, loss of appetite, yellowing of skin or eyes, unusual bleeding or bruising, skin rash or itching.

rifaximin (*reb facks' ab men*)

Xifaxan ORIG

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Antidiarrheal

Therapeutic actions

A structural analogue of rifampin; binds to bacterial DNA-dependent RNA polymerase and inhibits bacterial RNA synthesis. Ninety-seven percent passes through the GI tract unchanged; affects *Escherichia coli* in the GI tract; cause of most traveler's diarrhea.

Indications

- Treatment of patients 12 yr or older with traveler's diarrhea caused by noninvasive strains of *E. coli*
- **NEW INDICATION:** Reduction of recurrence of hepatic encephalopathy in patients with advanced liver disease
- Unlabeled uses: IBS, *Clostridium difficile*-associated diarrhea

Contraindications and cautions

- Contraindicated with allergy to rifaximin, rifampin, or any component of the drug; diarrhea complicated by fever or blood in the stool or caused by pathogens other than *E. coli*; lactation.
- Use cautiously with pregnancy.

Available forms

Tablets ORIG—200, 550 mg

Dosages

Adults and patients 12 yr and older

- *Traveler's diarrhea:* 200 mg PO tid for 3 days.

Adults

- *Hepatic encephalopathy:* 550 mg PO bid.

Pediatric patients younger than 12 yr

Safety and efficacy not established.

Pharmacokinetics

Route

Oral	Not absorbed systemically
------	---------------------------

Metabolism: None; $T_{1/2}$: 5.4–6.2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Headache, dizziness
- **GI:** Diarrhea, flatulence, abdominal pain, rectal tenesmus, defecation urgency, constipation, vomiting, **pseudomembranous colitis**
- **Respiratory:** Rhinitis, cough, dyspnea, pharyngitis, bronchitis
- **Skin:** Allergic dermatitis, rash, urticaria, pruritus
- **Other:** *Fever*; angioneurotic edema

■ Nursing considerations

Assessment

- **History:** Allergy to rifaximin, rifampin or any component of the drug, diarrhea complicated by fever or blood in the stool or caused by pathogens other than *E. coli*, lactation, pregnancy
- **Physical:** Skin lesions; orientation, reflexes; abdominal examination

Interventions

- Administer three times a day for traveler's diarrhea and twice a day for hepatic encephalopathy prophylaxis, with or without food; ensure that the tablet is swallowed whole.
- ⊗ **Warning** Do not administer if the patient has diarrhea complicated by fever or blood in the stool.
- Administer only to patients with traveler's diarrhea caused by *E. coli*; this drug is not

effective for systemic bacterial infections because it is not absorbed.

- Encourage the use of barrier contraceptives during treatment with this drug; it is not known if this drug crosses the placenta.
- Find another method of feeding the baby if patient is nursing; it is not known if this enters breast milk.
- Discontinue drug if diarrhea persists for longer than 24–48 hr or worsens.
- Maintain other measures appropriate for traveler's diarrhea—avoidance of local water, pushing fluids to maintain hydration.
- Maintain other measures for treatment of advanced liver disease.

Teaching points

- Take this drug three times a day, with or without food, for the treatment of traveler's diarrhea or two times a day for advanced liver disease.
- Swallow the tablet whole; do not cut, crush, or chew the tablets.
- If you forget a dose, take it as soon as you remember and return to your usual regimen. Do not make up doses and do not take more than three doses in 24 hours.
- Do not use this drug to treat any infection other than traveler's diarrhea or your liver disease; it is not absorbed into the bloodstream and is not effective in treating other infections.
- Stop taking the drug and notify your health care provider if a fever develops or blood in the diarrhea occurs, or if the diarrhea persists or worsens after 24–48 hours.
- Avoid pregnancy while taking this drug; if you suspect that you are pregnant, consult your health care provider.
- You should find another method of feeding the baby if you are breast-feeding; it is not known if this drug enters breast milk.
- You may experience these side effects: Dizziness (if this occurs, do not drive a car or operate heavy machine until you know how you will be affected), flatulence, abdominal pain, nausea (try to maintain your hydration drinking bottled water or beverages).
- Report bloody diarrhea, fever, worsening diarrhea.

▼ rilonacept

See Appendix U, *Less commonly used drugs*.

▼ riluzole

See Appendix U, *Less commonly used drugs*.

▼ rimantadine hydrochloride (ri man' ta deen)

Flumadine

PREGNANCY CATEGORY C

Drug class

Antiviral

Therapeutic actions

Synthetic antiviral agent that inhibits viral replication, possibly by preventing the uncoating of the virus.

Indications

- Prophylaxis and treatment of illness caused by influenza A virus in adults
- Prophylaxis against influenza A virus in children
- **NEW INDICATION:** Unlabeled uses: Treatment and prophylaxis of H1N1 (swine flu) infection

Contraindications and cautions

- Contraindicated with allergy to amantadine, rimantadine; lactation.
- Use cautiously with seizures, liver or renal disease, pregnancy.

Available forms

Tablets—100 mg

Dosages

Adults and patients older than 10 yr

- *Prophylaxis:* 100 mg/day PO bid.
- *Treatment:* Same dose as above; start treatment as soon after exposure as possible, continuing for 7 days from initial onset of symptoms.

Geriatric patients in nursing homes and patients with severe renal or hepatic impairment

Dose of 100 mg PO daily is recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	6 hr

Metabolism: $T_{1/2}$: 25.4–32 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Light-headedness, dizziness, insomnia*, confusion, irritability, ataxia, psychosis, depression, hallucinations, seizures
- **CV:** HF, orthostatic hypotension, dyspnea
- **GI:** *Nausea*, anorexia, constipation, dry mouth

Interactions

• **Drug-drug** • Decreased effectiveness with acetaminophen, aspirin • Increased serum levels and effects with cimetidine • Intranasal influenza virus vaccine may interfere with rimantadine; do not vaccinate for 48 hr after rimantadine therapy is complete; do not administer rimantadine for 2 wk after intranasal influenza vaccine administration.

■ Nursing considerations

Assessment

- **History:** Allergy to amantadine, rimantadine; seizures; liver or renal disease; lactation
- **Physical:** Orientation, vision, speech, reflexes; BP, orthostatic BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; BUN, creatinine clearance

Interventions

- Administer full course of drug to achieve the beneficial antiviral effects. Initiate therapy for treatment within 48 hr of onset of symptoms and continue for 7 days.

Teaching points

- You may experience these side effects: Drowsiness, blurred vision (use caution in driving or using dangerous equipment); dizziness,

light-headedness (avoid sudden position changes); irritability or mood changes (common; if severe, request a drug change).

- Report swelling of the fingers or ankles, shortness of breath, difficulty urinating, tremors, slurred speech, difficulty walking.

▽ risedronate sodium (*rah sed' dro nate*)

Actonel, Atelvia DMC

PREGNANCY CATEGORY C

Drug class

Bisphosphonate

Therapeutic actions

Affects osteoclast activity by reducing the enzymatic and transport processes that lead to resorption of the bone and by inhibiting the osteoclast proton pump, leading to a rate of bone turnover near normal in patients with Paget's disease.

Indications

- Treatment of Paget's disease of bone in patients with alkaline phosphatase at least two times the upper limit of normal, those who are symptomatic, those at risk for future complications
- Treatment and prevention of osteoporosis in postmenopausal women
- Treatment and prevention of glucocorticoid-induced osteoporosis
- To increase bone mass in men with osteoporosis

Contraindications and cautions

- Contraindicated with allergy to bisphosphonates; severe renal disease, hypocalcemia, inability to stand or sit upright for at least 30 min.
- Use cautiously with renal impairment, lactation, pregnancy.

Available forms

Tablets—5, 30, 35, 75, 150 mg; DR tablets DMC—35 mg

Dosages

Adults

- *Treatment and prevention of postmenopausal osteoporosis:* 5 mg PO once daily taken in an upright position with 6–8 oz of water at least 30 min before or after any other beverage or food. For postmenopausal osteoporosis, may switch to 35-mg tablet taken PO once per wk or 75 mg PO taken on 2 consecutive days each mo (total of 2 tablets per mo) or one 150-mg tablet PO per mo.
- *Treatment or prevention of glucocorticoid osteoporosis:* 5 mg/day PO.
- *Paget's disease:* 30 mg PO once daily for 2 mo taken in an upright position with 6–8 oz of plain water at least 30 min before or after any other beverage or food; may retreat after at least a 2-mo posttreatment period if indicated.
- *To increase bone mass in men with osteoporosis:* 35 mg PO once/wk.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Not recommended with creatinine clearance less than 30 mL/min; no dosage adjustment is needed if creatinine clearance greater than 30 mL/min.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Not metabolized; $T_{1/2}$: Initial half-life: 1.5 hr; terminal half-life: 48 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, paresthesia, dizziness*
- **CV:** Chest pain, edema, hypertension
- **EENT:** Glaucoma, conjunctivitis, cataract
- **GI:** *Nausea, diarrhea, dyspepsia, abdominal pain, anorexia*
- **Skeletal:** *Increased or recurrent bone pain, osteonecrosis*
- **Other:** *Arthralgia, bone pain, leg cramps, rash*

Interactions

★ **Drug-drug** • Absorption of risedronate decreased by calcium, aspirin, aluminum, magnesium; avoid these drugs for 2 hr before to 2 hr after taking risedronate

Nursing considerations

Assessment

- **History:** Allergy to bisphosphonates, renal failure, hypocalcemia, pregnancy, lactation
- **Physical:** Muscle tone, bone pain; bowel sounds; eye examination; urinalysis, serum calcium; orientation, affect

Interventions

⊗ **Warning** Administer with a full glass of plain (not mineral) water, at least 30 min before or after any other beverage, food, or medication; have patient remain in an upright position for at least 30 min to decrease the incidence of GI effects. Patients taking weekly dose should mark calendar as a reminder. Ensure that patient swallows DR tablet whole.

- Monitor serum calcium levels before, during, and after therapy.

⊗ **Warning** Ensure at least a 2-mo rest period after 2-mo course of treatment if retreatment is required for Paget's disease.

- Ensure adequate vitamin D and calcium intake.
- Provide comfort measures if bone pain returns.

Teaching points

- Take this drug with a full glass of water (plain water, not mineral water), at least 30 minutes before or after any other beverage, foods, or medication; remain in an upright position for at least 30 minutes to decrease the GI side effects of the drug. If taking a once-weekly dose, mark a calendar as a reminder. If using delayed-release tablet, swallow whole; do not cut, crush, or chew tablet.
- Inform dentist that you are taking this drug before any dental surgery.
- Maintain adequate vitamin D and calcium intake while you are using this drug.
- You may experience these side effects: Nausea, diarrhea; bone pain, headache

(analgesics may be available to help); rash (appropriate skin care will be suggested).

- Report twitching, muscle spasms, dark-colored urine, edema, bone pain, rash, difficulty swallowing.

▷ risperidone

(ris *peer'* i *dohn*)

Risperdal, Risperdal Consta, Risperdal M-TAB

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Benzisoxazole

Therapeutic actions

Mechanism of action not fully understood: Blocks dopamine and serotonin receptors in the brain, depresses the RAS; anticholinergic, antihistaminic, and alpha-adrenergic blocking activity may contribute to some of its therapeutic and adverse actions.

Indications

- Treatment of schizophrenia
- Delaying relapse in long-term treatment of schizophrenia
- Short-term treatment of acute manic or mixed episodes associated with bipolar 1 disorder; alone or in combination with lithium or valproate (oral only)
- **NEW INDICATION:** Long-acting injection used as monotherapy or as adjunct to lithium or valproate for maintenance treatment of bipolar 1 disorder (*Risperdal Consta*)
- Treatment of irritability (aggression, self-injury, temper tantrums, quickly changing moods) associated with autistic disorders in children and adolescents
- Unlabeled uses: Treatment of OCD refractory to SSRIs; treatment of tics in Tourette syndrome; stuttering

Contraindications and cautions

- Contraindicated with hypersensitivity to risperidone, lactation.

- Use cautiously with CV disease, pregnancy, renal or hepatic impairment, hypotension.

Available forms

Tablets—0.25, 0.5, 1, 2, 3, 4 mg; oral solution—1 mg/mL; orally disintegrating tablets—0.5, 1, 2, 3, 4 mg; powder for injection—12.5, 25, 37.5, 50 mg

Dosages

Adults

Schizophrenia

- **Initial treatment:** 1 mg PO bid; then gradually increase with daily dosage increments of 1 mg bid on the second and third days to a target dose of 3 mg PO bid by the third day. Range, 4–8 mg/day or 25 mg IM every 2 wk; do not exceed 50 mg IM every 2 wk.
- **Reinitiation of treatment:** Follow initial dosage guidelines, using extreme care due to increased risk of severe adverse effects with reexposure.
- **Switching from other antipsychotics:** Minimize the overlap period and discontinue other antipsychotic before beginning risperidone therapy.
- **Delaying relapse time in long-term treatment:** 2–8 mg PO bid.

Bipolar 1 disorder

- **Long-term maintenance:** 25–30 mg IM every 2 wk.

Bipolar mania

- 2–3 mg/day PO as a once daily dose; range 1–6 mg/day.

Pediatric patients with irritability associated with autistic disorder

Initially, 0.25 mg/day PO for patients weighing less than 20 kg or 0.5 mg/day for patients 20 kg or more. After at least 4 days, may increase to 0.5 mg/day for patients less than 20 kg or 1 mg/day for patients 20 kg or more. Maintain dosage for at least 14 days; may then increase in increments of 0.25 mg/day (less than 20 kg) or 0.5 mg/day (20 kg or more) at 2-wk intervals. Dose may be divided; give at bedtime if somnolence occurs.

Geriatric patients or patients with renal or hepatic impairment

Initial dose of 0.5 mg PO bid or 25 mg IM every 2 wk; monitor patient for adverse effects and response.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	3–17 hr	Weeks

Metabolism: Hepatic; $T_{1/2}$: 20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Insomnia, anxiety, agitation, headache*, somnolence, aggression, dizziness, tardive dyskinesias
- **CV:** Orthostatic hypotension, **arrhythmias**
- **Dermatologic:** Rash, dry skin, seborrhea, photosensitivity
- **GI:** *Nausea, vomiting, constipation*, abdominal discomfort, dry mouth, increased saliva
- **Respiratory:** Rhinitis, coughing, sinusitis, pharyngitis, dyspnea
- **Other:** Chest pain, arthralgia, back pain, fever, **NMS**, diabetes mellitus, hyperglycemia

Interactions

* **Drug-drug** • Increased therapeutic and toxic effects with clozapine • Decreased therapeutic effect with carbamazepine • Decreased effectiveness of levodopa

■ Nursing considerations**Assessment**

- **History:** Allergy to risperidone, lactation, CV disease, pregnancy, renal or hepatic impairment, hypotension
- **Physical:** T, weight; reflexes, orientation; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; CBC, urinalysis, LFTs, renal function tests

Interventions

⊗ **Black box warning** Do not use drug to treat geriatric patients with dementia; it increases risk of CV mortality; drug is not approved for this use.

⊗ **Warning** Maintain seizure precautions, especially when initiating therapy and increasing dosage.

⊗ **Warning** Administer oral solution directly from calibrated pipette or mix oral solution with 3–4 oz of water, coffee, orange juice, or low-fat milk. Do not mix with cola or tea.

- Open blister units of orally disintegrating tablets individually; do not push tablet through the foil. Use dry hands to remove tablet—immediately place on tongue. Do not allow patient to chew tablet.

⊗ **Warning** Monitor patient regularly for signs and symptoms of diabetes mellitus.

- Monitor T. If fever occurs, rule out underlying infection, and consult physician for appropriate comfort measures.
- Advise patient to use contraception during drug therapy.

⊗ **Warning** Follow guidelines for discontinuation or reinstitution of the drug carefully.

Teaching points

- Dosage will be increased gradually to achieve most effective dose. Do not take more than your prescribed dosage. Do not make up missed doses; contact your health care provider if this occurs. Do not stop taking this drug suddenly; gradual reduction of dosage is needed to prevent side effects.
- Mix oral solution in 3–4 ounces of water, coffee, orange juice, or low-fat milk. Do not mix with cola or tea.
- Remove orally disintegrating tablet with dry hands. Do not push tablet through foil. Immediately place tablet on tongue; do not split or chew tablet. The tablet will disintegrate within seconds and you can then swallow.
- If receiving IM doses, mark your calendar for every-2-week injections.
- This drug cannot be taken during pregnancy. If you think you are pregnant or wish to become pregnant, consult your health care provider.
- Avoid alcohol while taking this drug.
- You may experience these side effects: Drowsiness, dizziness, sedation, seizures (avoid driving, operating machinery, or performing tasks that require concentration); dizziness, faintness on arising (change positions slowly; use caution); increased salivation (reversible); constipation; sensitivity

to the sun (use a sunscreen or protective clothing).

- Report lethargy, weakness, fever, sore throat, malaise, mouth ulcers, palpitations, increased thirst, increased urination, increased hunger.

▷ ritonavir (ri ton' ab veer)

Norvir

PREGNANCY CATEGORY B

Drug class

Antiretroviral

Therapeutic actions

Antiviral activity; inhibits HIV protease activity, leading to decrease in production of HIV particles.

Indications

- Treatment of HIV infection in combination with other antiretrovirals

Contraindications and cautions

- Contraindicated with allergy to ritonavir; use of certain drugs (see Interactions).
- Use cautiously with pregnancy, hepatic impairment, lactation.

Available forms

Capsules—100 mg; tablets—100 mg; oral solution—80 mg/mL

Dosages

Adults

600 mg PO bid with food.

Pediatric patients

Start at 250 mg/m² PO bid and increase by 50 mg/m² twice daily at 2–3 day intervals, to maximum of 400 mg/m² PO bid; do not exceed 600 mg bid. Use in combination with other antiretrovirals.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; T_{1/2}: 3–5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Asthenia, peripheral and circumoral paresthesias*, anxiety, dreams, headache, dizziness, hallucinations, personality changes
- **CV:** Hemorrhage, hypotension, syncope, tachycardia, increased PR interval, increased QT interval
- **Dermatologic:** Acne, dry skin, contact dermatitis, rash
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, taste perversion*, dry mouth, hepatitis, hepatic impairment, dehydration
- **GU:** Dysuria, hematuria, nocturia, pyelonephritis
- **Respiratory:** Apnea, dyspnea, cough, rhinitis
- **Other:** Hypothermia, chills, back pain, chest pain, edema, cachexia

Interactions

* Drug-drug ☒ **Black box warning**

Potentially large increase in serum concentration of alfuzosin, amiodarone, astemizole, bepridil, bupropion, clozapine, ergotamine, flecainide, meperidine, pimozone, piroxicam, propafenone, propoxyphene, quinidine, rifabutin, terfenadine, voriconazole; potential for serious arrhythmias, seizures, and fatal reactions; do not administer ritonavir with any of these drugs.

☒ **Black box warning**

Potentially large increases in serum concentration of these sedatives and hypnotics: Alprazolam, clonazepam, diazepam, estazolam, flurazepam, midazolam, triazolam, zolpidem; extreme sedation and respiratory depression could occur; do not administer ritonavir with any of these drugs. • Risk of prolonged QT interval; do not give with other drugs that prolong QT interval

* **Drug-food** • Absorption increased by presence of food; taking drug with food is strongly recommended • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

* **Drug-alternative therapy** • Decreased effectiveness if taken with St. John's wort

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has been reported between *Retrovir* (zidovudine) and ritonavir; use caution.

Assessment

- **History:** Allergy to ritonavir, hepatic impairment, pregnancy, lactation
- **Physical:** T; orientation, reflexes; BP, P, peripheral perfusion; R, adventitious sounds; bowel sounds; skin color, perfusion; LFTs

Interventions

- Capsules and oral solution should be stored in refrigerator; solution should be left at room temperature if used within 30 days; protect from light and extreme heat.
- Administer with meals or food to increase absorption.
- ⊗ **Black box warning** Carefully screen drug history to avoid potentially dangerous or life-threatening drug interactions.

Teaching points

- Take this drug with meals or food. Store capsules in refrigerator; tablets and solution can be left at room temperature. Taste of solution may be improved if mixed with chocolate milk, *Ensure*, or *Advera* 1 hour before taking. Do not drink grapefruit juice while using this drug.
- Take the full course of therapy as prescribed; do not take double doses if one is missed; do not change dosage without consulting your health care provider. Always take in combination with your other HIV drugs.
- This drug does not cure HIV infection; long-term effects are not yet known; continue to take precautions as the risk of transmission is not reduced by this drug.
- Do not take any other drugs, prescription or over-the-counter, without consulting your health care provider; this drug interacts with many other drugs and serious problems can occur.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, ab-

dominal pain, headache, dizziness, numbness, tingling.

- Report severe diarrhea, severe nausea, personality changes, changes in color of urine or stool, fever, chills.

▼ rituximab

See Appendix U, *Less commonly used drugs*.

▼ rivastigmine tartrate
(*riv ab stig' meen*)

Exelon, Exelon Oral Solution, Exelon Patch

PREGNANCY CATEGORY B

Drug classes

Alzheimer's disease drug
Cholinesterase inhibitor

Therapeutic actions

Centrally acting, selective, long-acting reversible cholinesterase inhibitor; causes elevated acetylcholine levels in the cortex, which slows the neuronal degradation that occurs in Alzheimer's disease.

Indications

- Treatment of mild to moderate dementia of the Alzheimer's type
- Treatment of mild to moderate dementia associated with Parkinson's disease
- Unlabeled use: Treatment of behavioral effects of Lewy-body dementia

Contraindications and cautions

- Contraindicated with hypersensitivity to rivastigmine.
- Use cautiously with sick sinus syndrome, GI bleeding, seizures, asthma, COPD, pregnancy, lactation.

Available forms

Capsules—1.5, 3, 4.5, 6 mg; oral solution with dosing syringe—2 mg/mL; transdermal patch—4.6 mg/24 hr, 9.5 mg/24 hr

Dosages

Adults

- **Alzheimer's disease:** Initial dosage, 1.5 mg PO bid with food. If tolerated, may adjust to higher doses at 1.5-mg intervals every 2 wks. Usual range, 6–12 mg/day; should not exceed 12 mg/day. If dose is not tolerated, stop drug for several doses and then restart at the same or a lower level. For transdermal patch, initially one 4.6-mg/24 hr patch once/day; after 4 or more wk, may be increased to one 9.5-mg/24 hr patch.
- **Parkinson's dementia:** 3–12 mg/day PO in divided doses bid. Initial dose, 1.5 mg PO bid; increase every 4 wk based on patient tolerance. For transdermal patch, initially one 4.6-mg/24 hr patch once/day; after 4 or more wk, may be increased to one 9.5-mg/24 hr patch.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1.4–2.6 hr	12 hr

Metabolism: Hepatic; $T_{1/2}$: 1 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Insomnia, fatigue, dizziness, confusion, ataxia, insomnia, somnolence, tremor, agitation, depression, anxiety, abnormal thinking, syncope*
- **CV:** Bradycardia
- **GI:** *Nausea, vomiting, diarrhea, dyspepsia, anorexia, abdominal pain, flatulence, constipation*

Interactions

• **Drug-drug** • Increased effects and risk of toxicity if theophylline, cholinesterase inhibitors taken concurrently • Decreased effects of anticholinergics taken concurrently • Increased risk of GI bleeding if taken with NSAIDs

■ Nursing considerations

Assessment

- **History:** Allergy to rivastigmine; pregnancy, lactation; sick sinus syndrome; GI bleeding; seizures; asthma; COPD

- **Physical:** Orientation, affect, reflexes; BP, P; abdominal examination; LFTs, renal function tests

Interventions

- Establish baseline functional profile to follow evaluation of drug effectiveness.
- Administer with food in the morning and evening to decrease GI discomfort.
- Mix solution with water, fruit juice, or soda to improve compliance. Dosage of capsules and solution is interchangeable.
- Apply patch to clean, dry skin once daily. Rotate application sites, and remove old patch before applying new one.
- Monitor patient for weight loss, diarrhea, arrhythmias before use and periodically with prolonged use.
- Provide small, frequent meals if GI upset is severe.
- Provide patient safety measures if CNS effects occur.

⊗ **Warning** Notify surgeons that patient is on rivastigmine, exaggerated muscle relaxation may occur if succinylcholine-type drugs are used.

Teaching points

- Take drug exactly as prescribed, take with food to decrease GI upset. Solution may be swallowed directly from the syringe or mixed in a small glass of water, cold fruit juice, or soda. In cold fruit juice or soda, mixture is stable up to 4 hours at room temperature.
- Patch should be applied to clean, dry skin. Rotate sites, and remove old patch before applying a new one.
- This drug does not cure the disease but may slow down the degeneration associated with the disease.
- Dosage changes may be needed to achieve the best drug levels.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals) insomnia, fatigue, confusion (use caution if driving or performing tasks that require alertness).
- Report severe nausea, vomiting, changes in stool or urine color, diarrhea, changes in neurologic functioning, palpitations.

rizatriptan (*rib zab trip' tan*)

Maxalt, Maxalt-MLT

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug

Serotonin selective agonist

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selected patients whose migraines are caused by vasodilation.

Indications

- Treatment of acute migraine attacks with or without aura

Contraindications and cautions

- Contraindicated with allergy to rizatriptan, active CAD, Prinzmetal's angina, uncontrolled hypertension; recent (within 24 hr) treatment with another 5-HT agonist or an ergotamine-containing or ergot type medication; hemiplegic or basilar migraine.
- Use cautiously with hepatic impairment, dialysis, pregnancy, lactation.

Available forms

Tablets—5, 10 mg; orally disintegrating tablets—5, 10 mg

Dosages

Adults

5 or 10 mg at onset of headache; may repeat in 2 hr if needed. Wait 2 hr between doses. Maximum dose, 30 mg/day.

Pediatric patients younger than 18 yr

Safety and efficacy not established.

Patients with hepatic or renal impairment

Use lowest possible dose, monitor patient closely.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, vertigo, weakness, somnolence, paresthesias*
- **CV:** BP increase, palpitations, chest pain
- **GI:** Dry mouth, nausea
- **Other:** *Chest, jaw, or throat pressure*

Interactions

- * **Drug-drug** ⊗ **Warning** Prolonged vasoactive reactions when taken concurrently with ergot-containing drugs; do not use within 24 hr of each other or other serotonin agonist.
 - Risk of severe effects if taken with or within 2 wk of discontinuation of an MAOI
 - Risk of increased serum levels and toxic effects with propranolol; recommend 5-mg dose no more than three doses per 24 hr period
- * **Drug-food** • Food will delay peak onset by 1 hr

Nursing considerations

Assessment

- **History:** Allergy to rizatriptan, active CAD, Prinzmetal's angina, uncontrolled hypertension, hepatic impairment, dialysis, pregnancy, lactation
- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure.
- Have patient place orally disintegrating tablet on tongue and swallow with or without water.
- Establish safety measures if CNS or visual disturbances occur.
- Control environment as appropriate to help relieve migraine (lighting, temperature, noise).
- ⊗ **Warning** Monitor BP of patients with possible CAD; discontinue at any sign of angina, prolonged high BP, or other adverse signs.

Teaching points

- Take drug exactly as prescribed, at the onset of headache or aura; dosage may be repeated in 2 hours if needed. Place orally disintegrating tablet on tongue and allow to dissolve before eating or drinking.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, consult your health care provider and stop using drug.
- Continue to do anything that normally helps you during a migraine, such as controlling lighting or noise.
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or the use of dangerous machinery while using this drug); numbness, tingling, feelings of tightness or pressure.
- Report feelings of heat, flushing, tiredness, feelings of sickness, chest pain.

▷ romidepsin

See Appendix U, *Less commonly used drugs*.

▷ romiplostim

See Appendix U, *Less commonly used drugs*.

▷ ropinirole hydrochloride (row *pin'* ab roll)

Requip, Requip XL OND

PREGNANCY CATEGORY C

Drug classes

Antiparkinsonian
Dopamine receptor agonist

Therapeutic actions

Acts as a non-ergot dopamine agonist acting directly on postsynaptic dopamine receptors of neurons in the brain, mimicking the effects of the neurotransmitter dopamine, which is thought to be deficient in parkinsonism.

Indications

- Treatment of idiopathic Parkinson's disease in the early stages as well as in the late stages (immediate-release or ER)
- Treatment of moderate to severe primary restless leg syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to ropinirole, severe ischemic heart disease or peripheral vascular disease, lactation.
- Use cautiously with dyskinesia, orthostatic hypotension, hepatic or renal impairment, pregnancy, history of sleep disorders or somnolence.

Available forms

Tablets—0.25, 0.5, 1, 2, 3, 4, 5 mg; ER tablets OND—2, 4, 6, 8, 12 mg

Dosages

Adults

- *Parkinson's disease*: Initially, 0.25 mg PO tid for 1st wk; 0.5 mg PO tid for 2nd wk; 0.75 mg PO tid for 3rd wk; 1 mg PO tid for 4th wk. May increase by 1.5 mg/day at 1-wk intervals to 9 mg/day, then by up to 3 mg/day at 1-wk intervals to a maximum dose of 24 mg/day. ER tablets: Initially, 2 mg/day PO; after 1–2 wk, may increase by 2 mg/day; titrate with weekly increases of 2 mg/day to a maximum of 24 mg/day.
- *Restless leg syndrome*: 0.25 mg/day PO, 1–3 hr before bed; after 2 days, increase to 0.5 mg/day PO; after 1 week to 1 mg/day PO. Week 3, increase to 1.5 mg/day; week 4—2 mg/day; week 5—2.5 mg/day; week 6—3 mg/day; week 7—4 mg/day PO if needed to control symptoms.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Elderly are at higher risk for development of hallucinations; monitor closely and adjust dosage more slowly.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	8 hr
ER	Varies	6–10 hr	16 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, somnolence, insomnia, hypokinesia or hyperkinesia*, syncope, asthenia, confusion, hallucinations (more common in the elderly), abnormal vision, tremor, anxiety, paresthesias, aggravated parkinsonism, worsening of impulse control symptoms (eg, gambling)
- **CV:** *Orthostatic hypotension*, edema
- **GI:** *Nausea, constipation*
- **Other:** Fatigue, infections, sweating, pharyngitis, pain, arthralgia

Interactions

- *** Drug-drug** • Increased effects of levodopa; consider decreasing levodopa dose • Increased CNS depression with alcohol, CNS depressants
- Monitor and adjust ropinirole dose if estrogen is added to or discontinued from regimen
- Increased effects with ciprofloxacin

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to ropinirole, severe ischemic heart disease or peripheral vascular disease, pregnancy, lactation, dyskinesia, orthostatic hypotension, hepatic or renal impairment
- **Physical:** Skin T, color, lesions; orientation, affect, reflexes, bilateral grip strength; vision examination including visual fields; P, BP, orthostatic BP, auscultation; liver evaluation; LFTs, renal function tests

Interventions

- Administer drug with food if GI upset becomes a problem. Ensure that patient does not cut, crush, or chew ER tablets.
- Monitor patient for orthostatic hypotension and establish safety precautions if needed (use side rails, accompany patient).
- **⊗ Warning** Withdraw gradually over 1 wk to avoid serious side effects.
- Monitor patient carefully and adjust dosage more slowly if patient has hypotension or dyskinesias.

- Monitor elderly patients for the development of hallucinations; provide appropriate safety measures as needed.

⊗ **Warning** Start adjustment of drug over again if drug has been discontinued and is being restarted.

- Monitor hepatic and renal function periodically during therapy.

Teaching points

- Take this drug exactly as prescribed; take with food if GI upset occurs. Dosage will change gradually over several weeks. Do not cut, crush, or chew ER tablets.
- Do not discontinue this drug without consulting your health care provider; drug must be stopped gradually to prevent serious adverse effects.
- You may experience these side effects: Drowsiness, dizziness, confusion (avoid driving or engaging in activities that require alertness); nausea (take drug with meals; eat frequent small meals); dizziness or faintness when you get up (change position slowly, exercise caution when climbing stairs); headache, nasal stuffiness (consult your health care provider; there may be medication for these).
- Report fainting, light-headedness, dizziness; black, tarry stools; hallucinations; falling asleep during activities of daily living.

DANGEROUS DRUG

▽ **rosiglitazone maleate**
(rob zee *glit'* ab zobn *mal' ee ate*)

Avandia

PREGNANCY CATEGORY C

Drug classes

Antidiabetic
Thiazolidinedione

Therapeutic actions

Resensitizes tissues to insulin; decreases hepatic gluconeogenesis and increases insulin-dependent muscle glucose uptake.

Indications

- Monotherapy as an adjunct to diet and exercise to improve glucose control in patients with type 2 diabetes
- As part of combination with metformin or a sulfonyleurea when diet, exercise, and either agent alone does not result in adequate glycemic control in type 2 diabetes
- Unlabeled uses: Increased ovulation frequency in women with polycystic ovary syndrome; reduction of in-stent restenosis in patients with diabetes

Contraindications and cautions

- Contraindicated with allergy to any thiazolidinedione, type 1 diabetes, ketoacidosis, New York Heart Association Class III or IV HF, lactation.
- Use cautiously with advanced heart disease, liver failure, HF (not recommended in symptomatic HF), pregnancy.

Available forms

Tablets—2, 4, 8 mg

Dosages

Adults

4 mg as a single oral dose or divided into two doses; if adequate response is not seen in 8–12 wk, may be increased to 8 mg daily PO.

- **Combination therapy with metformin:** 4 mg daily PO added to the established dose of metformin; may be increased after 8–12 wk to 8 mg daily PO.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Use caution and monitor patient closely. Do not administer with active liver disease or if ALT exceeds 2.5 times the upper limit of normal.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.3–3.5 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, pain*
- **CV:** **HF**
- **Endocrine:** **Hypoglycemia, hyperglycemia**
- **GI:** **Diarrhea, liver injury**
- **Respiratory:** Sinusitis, URI, rhinitis, dyspnea
- **Other:** *Infections, fatigue, accidental injury, edema*

Interactions

- *** Drug-drug** • Risk of increased serum levels if combined with gemfibrozil; monitor patient and adjust dosage as needed

Nursing considerations

Assessment

- **History:** Allergy to any thiazolidinedione, type 1 diabetes, ketoacidosis, serious hepatic impairment, advanced heart disease, pregnancy, lactation
- **Physical:** T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation; LFTs, blood glucose, CBC

Interventions

⊗ **Black box warning** Drug may cause or worsen HF, angina, or MI in some patients; observe patient closely, and stop drug if necessary; do not use in patients with symptomatic HF.

- Monitor serum glucose levels frequently to determine effectiveness of drug and dosage being used.
- Monitor baseline LFTs before beginning therapy and periodically during therapy.
- Administer without regard to meals.
- Arrange for consult with dietitian to establish weight loss program and dietary control as appropriate.
- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.

Teaching points

- Do not discontinue drug without consulting your health care provider; continue diet and exercise program for diabetes control.

- Take this drug with meals if desired. If dose is missed, it may be taken at the next meal. If dose is missed for an entire day, do not double dose the next day.
- Monitor urine or blood for glucose and ketones as prescribed; watch very closely while adjusting to drug.
- Report fever, sore throat, bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions, swelling, difficulty breathing.

rosuvastatin calcium (row sue' va sta tin)

Crestor

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic drug
HMG-CoA reductase inhibitor (statin)

Therapeutic actions

A fungal metabolite that inhibits the enzyme (HMG-CoA) that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs (associated with increased risk of coronary artery disease) and either an increase or no change in serum HDLs (associated with decreased risk of coronary artery disease).

Indications

- As an adjunct to diet in the treatment of elevated total cholesterol and LDL cholesterol and triglyceride levels in patients with primary hypercholesterolemia (familial and nonfamilial), and in patients with mixed dyslipidemia
- Adjunct to diet to slow atherosclerosis progression in patients with elevated cholesterol
- As an adjunct to diet for the treatment of patients with elevated serum triglyceride levels
- To reduce LDL-C, total cholesterol, and ApoB in patients with homozygous familial hypercholesterolemia as an adjunct to other

lipid-lowering treatments or if such treatments are not available

- Treatment of patients with primary dysbetalipoproteinemia
- Treatment of children 10–17 yr (girls must be postmenarchal) with heterozygous familial hypercholesterolemia when diet therapy fails
- **NEW INDICATION:** Primary prevention of CV disease; to reduce risk of stroke, MI, and arterial revascularization procedures in patients with no clinically evident CAD but at increased risk due to age (50 and older in men, 60 and older in women), elevated C-reactive protein, and at least one other risk factor (hypertension, low HDL, smoking, family history)

Contraindications and cautions

- Contraindicated with allergy to any component of the product, active liver disease or persistent elevated serum transaminases, pregnancy, lactation.
- Use cautiously with impaired hepatic function, alcoholism, renal impairment, advanced age, hypothyroidism.

Available forms

Tablets—5, 10, 20, 40 mg

Dosages

Adults

- *Hypercholesteremia; mixed dyslipidemia; primary prevention of CAD; atherosclerosis:* 5–40 mg daily PO. Usual starting dose is 10 mg daily with titration based on serum lipid levels, monitored every 2–4 wk until desired level is achieved.
- *Homozygous familial hypercholesterolemia:* 20 mg daily PO with a maximum 40 mg per day.
- *In combination with cyclosporine:* 5 mg daily PO.
- *In combination with other lipid-lowering drugs:* 10 mg daily PO.

Asian patients

5 mg PO once daily. Risk of serious side effects if dose increase is needed to control lipid levels.

Pediatric patients 10–17 yr

5–20 mg/day PO.

Patients with renal impairment

5 mg daily PO; do not exceed 10 mg per day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3–5 hr

Metabolism: Hepatic metabolism; $T_{1/2}$: 19 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Headache*, dizziness, insomnia, hypertension, paresthesia, depression, anxiety, vertigo, neuralgia
- **CV:** Hypertension, angina pectoris, vasodilatation, palpitation, peripheral edema
- **GI:** *Nausea*, dyspepsia, *diarrhea*, constipation, gastroenteritis, vomiting, flatulence, periodontal abscess, gastritis, **liver failure**
- **Respiratory:** *Pharyngitis*, *rhinitis*, *sinusitis*, cough, dyspnea, pneumonia
- **Other:** Arthritis, arthralgia, **rhabdomyolysis**, **myopathy**, *flulike symptoms*

Interactions

* **Drug-drug** ⊗ **Warning** Possible increased serum levels and risk of toxicity if taken with cyclosporine, gemfibrozil, lopinavir/ritonavir; adjust dosage accordingly and monitor patient; 10 mg/day is suggested maximum dosage.

- Increased risk of bleeding with coumarin anticoagulants; lower dose and monitor bleeding levels frequently to establish correct dosage
- Decreased absorption if taken with aluminum or magnesium hydroxide antacids; if this combination is used, take the antacid at least 2 hr after the rosuvastatin

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the product, liver disease or persistent elevated serum transaminases, pregnancy, lactation, alcoholism, renal impairment, advanced age, hypothyroidism
- **Physical:** Orientation, affect, P, BP, R, adventitious sounds; liver evaluation; lipid studies, LFTs, renal function tests

Interventions

- Establish baseline serum lipid levels and liver function test results before beginning therapy.

- Arrange for proper consultation about need for diet and exercise changes.
- Administer drug at bedtime (highest rates of cholesterol synthesis occur between midnight and 5 AM).
- Arrange for regular follow-up during long-term therapy.
- Monitor patient closely for signs of muscle injury, especially at higher doses, in Asian patients, and when used in combination with gemfibrozil or cyclosporine.
- Provide comfort measures to deal with headache, muscle cramps, or nausea.
- Advise women of childbearing age that this drug is contraindicated during pregnancy; advise the use of barrier contraceptives.
- Suggest an alternate means of feeding the baby to any nursing mother who is prescribed this drug.
- Offer support and encouragement to deal with disease, diet, drug therapy, and follow-up care.

Teaching points

- Take drug at bedtime.
- Institute appropriate diet and exercise changes that need to be made.
- If you miss a dose, take the next dose as soon as you remember and begin again the next day. Do not take two doses in 1 day.
- Avoid pregnancy while taking this drug; using a barrier contraceptive is advised.
- If you are also taking antacids, take the antacid at least 2 hours after your rosuvastatin.
- Stop the drug and contact your health care provider immediately if you experience unexplained muscle pain, tenderness, or weakness with fever or malaise.
- You may experience these side effects: Nausea (eat frequent small meals); headache, flulike symptoms (analgesics may help).
- Report severe GI upset, unusual bleeding or bruising, dark urine or light-colored stools, unexplained muscle pain, tenderness, or weakness.

▷ rufinamide

See Appendix U, *Less commonly used drugs*.

▷ sacrosidase

See Appendix U, *Less commonly used drugs*.

▷ saliva substitute

(*sa lye' vah*)

Entertainer's Secret, Moi-Stir,
Moi-Stir Swabsticks, MouthKote,
Numoisyn, Salivart

PREGNANCY CATEGORY UNKNOWN

Drug class

Saliva substitute

Therapeutic actions

Contains electrolytes and carboxymethylcellulose as a thickening agent to serve as a substitute for saliva in dry mouth syndromes.

Indications

- Management of dry mouth and throat in xerostomia and hyposalivation caused by stroke, medications (including those that cause dysfunction of the salivary glands), radiation therapy, chemotherapy, Sjögren syndrome, Bell palsy, HIV/AIDS, lupus, aging, emotional factors, hoarse voice, scratchy throat, salivary gland disorders, other illnesses

Contraindications and cautions

- Contraindicated with hypersensitivity to carboxymethylcellulose, parabens, components of the preparation.
- Use cautiously with renal failure, HF, hypertension, pregnancy.

Available forms

Solution; lozenges; swab sticks

Dosages

Adults

Spray for one-half second or apply to oral mucosa.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

No general systemic absorption. Electrolytes may be absorbed and dealt with in normal electrolyte pathways.

Adverse effects

Other: Excessive absorption of electrolytes (elevated magnesium, sodium, potassium)

■ Nursing considerations

Assessment

- **History:** Allergy to carboxymethylcellulose, parabens, HF, hypertension, renal failure
- **Physical:** BP, P, auscultation, edema; renal function tests; mucosa evaluation

Interventions

- Give for dry mouth and throat.
- Have patient try to swish saliva substitute around mouth following application.
- Monitor patient while eating; swallowing may be impaired and additional therapy required.

Teaching points

- Apply the drug as instructed; swish it around in your mouth after application.
- Use as needed for dry mouth and throat.
- Take care when eating because swallowing may be difficult; additional therapy may be needed.
- Report swelling, headache, irregular heart-beat, leg cramps, failure to relieve discomfort of dry mouth and throat.

▷ salmeterol xinafoate

(*sal mee' ter ol ze inn ah joh' ate*)

Serevent Diskus

PREGNANCY CATEGORY C

Drug classes

Antasthmatic

Beta₂-selective adrenergic agonist

Therapeutic actions

Long-acting agonist that binds to beta₂ receptors in the lungs, causing bronchodilation;

also inhibits the release of inflammatory mediators in the lung, blocking swelling and inflammation.

Indications

- Maintenance therapy for asthma and prevention of bronchospasm in patients 4 yr and older with reversible obstructive airway disease including nocturnal asthma
- Long-term maintenance treatment of bronchospasm related to COPD
- Prevention of exercise-induced bronchospasm in patients 4 yr and older

Contraindications and cautions

- Contraindicated with hypersensitivity to salmeterol, acute asthma attack, worsening or deteriorating asthma (life-threatening), acute airway obstruction.
- Use cautiously with pregnancy, lactation.

Available forms

Inhalation powder—50 mcg (*Diskus*)

Dosages

Adults and patients 12 yr and older

- *Asthma or bronchospasm*: 1 inhalation (50 mcg) bid.
- *Exercise-induced asthma*: 1 inhalation 30 min or more before exertion.
- *COPD*: 1 inhalation (50 mcg) bid.

Pediatric patients 4–12 yr

- *Asthma or bronchospasm*: 1 inhalation (50 mcg) bid, 12 hr apart.
- *Prevention of exercise-induced asthma*: 1 inhalation 30 min or more before exercising.

Pharmacokinetics

Route	Onset	Peak	Duration
Inhalation	13–20 min	3–4 hr	7.5–17 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, tremor, dizziness*
- **CV:** *Tachycardia, palpitations, hypertension*

- **Respiratory:** Worsening of asthma, difficulty breathing, **bronchospasm; asthma related deaths (risk higher in black than white patients)**
- **Other:** Pain

Interactions

★ **Drug-drug** • Risk of severe bronchospasm if combined with beta blockers; use a cardio-selective beta blocker and monitor patient closely if this combination is used • Potential for worsened hypokalemia and ECG abnormalities if combined with diuretics; monitor patient very closely • Administer with extreme caution to patients being treated with MAOIs or TCAs, or within 2 wk of discontinuation of such agents because the action of salmeterol may be potentiated by these agents • Risk of severe toxicity if combined with antiviral protease inhibitors; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to salmeterol, pregnancy, acute asthma attack, worsening asthma, lactation
- **Physical:** R, adventitious sounds; P, BP, ECG; orientation, reflexes; LFTs

Interventions

⊗ **Black box warning** Ensure that drug is not used to treat acute asthma or with worsening or deteriorating asthma (risk of death).

- Do not use for asthma unless combined with a long-term asthma-control medication; use only as an additional therapy in patients not controlled by other medications.
- Assess asthma patients regularly to determine when tapering off drug can begin.
- Instruct in the proper use of *Diskus*.
- Have patients who experience exercise-induced asthma use it 30–60 min before activity.
- Arrange for periodic evaluation of respiratory condition.

Teaching points

- Use the pressurized metered-dose inhaler as instructed. Shake well before using. Use only twice a day. If drug is to be used periodically for exercise-induced asthma, use 30–60 minutes before activity.

- To gain full therapeutic benefit in the treatment of reversible airway obstruction, administer twice a day (morning and evening).
- This drug is not for treatment of acute asthma attacks. Never take this drug alone for treating asthma; it must be combined with other long-term asthma-control medications.
- Obtain periodic evaluations of your respiratory problem.
- You may experience these side effects: Headache (request analgesics); tremors (use care in performing dangerous tasks); fast heartbeat, palpitations (monitor activity; rest frequently).
- Report severe headache, irregular heartbeat, worsening of asthma, difficulty breathing.

salsalate
(salicylic acid)
(*sal' sa layt*)

Amigesic, Argesic-SA, Artha-G,
Disalcid, Marthritic, Salflex, Salsitab

PREGNANCY CATEGORY C

Drug classes

Analgesic (nonopioid)
Anti-inflammatory
Antirheumatic
NSAID
Salicylate

Therapeutic actions

Analgesic and antirheumatic effects are attributable to the ability to inhibit the synthesis of prostaglandins, important mediators of inflammation; antipyretic effects are not fully understood, but salicylates probably act in the thermoregulatory center of the hypothalamus to block the effects of endogenous pyrogen by inhibiting the synthesis of the prostaglandin intermediary; after absorption, this drug is hydrolyzed into two molecules of salicylic acid; insoluble in gastric secretions, it is not absorbed in the stomach, but in the small intestine; reported to cause fewer GI adverse effects than aspirin.

Indications

- Relief of mild to moderate pain
- Relief of symptoms of various inflammatory conditions—rheumatic fever, rheumatoid arthritis, osteoarthritis

Contraindications and cautions

- Contraindicated with allergy to salicylates or NSAIDs, bleeding disorders, impaired hepatic or renal function, GI ulceration (less of a problem with salsalate than with other anti-inflammatories), lactation and perioperatively in patients undergoing coronary artery bypass graft surgery.
- Use cautiously in pregnancy; and in children and teenagers with influenza or chickenpox—use of salicylates in these patients may be associated with the development of Reye's syndrome. This acute, life-threatening condition, characterized by vomiting, lethargy, and belligerence, may progress to delirium and coma and has a mortality rate of 20%–30%.

Available forms

Capsules—500, 750 mg; tablets—500, 750 mg

Dosages

Adults

3,000 mg/day PO given in divided doses.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	10–30 min	1–3 hr	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr (15–30 hr with large doses over extended periods)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Acute salicylate toxicity:** Respiratory alkalosis, hyperpnea, tachypnea, hemorrhage, excitement, confusion, asterixis, pulmonary edema, seizures, tetanus, metabolic acidosis, fever, coma, **CV collapse, renal and respiratory failure**

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Salicylism:** Dizziness, tinnitus, difficulty hearing, nausea, vomiting, diarrhea, mental confusion, lassitude (dose-related)
- **Other:** Peripheral edema, **anaphylactoid reactions** to **anaphylactic shock**

Interactions

• **Drug-drug** • Increased risk of GI ulceration with corticosteroids and alcohol • Increased risk of salicylate toxicity with carbonic anhydrase inhibitors • Increased toxicity of carbonic anhydrase inhibitors, valproic acid • Decreased serum salicylate levels with corticosteroids, antacids, urine alkalinizers (sodium acetate, sodium bicarbonate, sodium citrate, sodium lactate, tromethamine) • Increased methotrexate levels and toxicity • Greater glucose-lowering effect of sulfonylureas, insulin with large doses of salicylates • Decreased uricosuric effect of probenecid, sulfinpyrazone • Decreased diuretic effect of spironolactone

• **Drug-lab test** • Salicylate competes with thyroid hormone for binding to plasma proteins, which may be reflected in a depressed plasma T_4 value • False-negative readings for urine glucose by glucose oxidase method and copper reduction method • Interference with urine 5-HIAA determinations by fluorescent methods but not by nitrosonaphthol colorimetric method • Interference with urinary ketone determination by ferric chloride method • Falsely elevated urine VMA levels with most tests; false decrease in VMA using the Pisano method • Serum uric acid levels are elevated by salicylate levels less than 10 mg/dL and decreased by levels greater than 10 mg/dL

■ Nursing considerations

Assessment

- **History:** Allergy to salicylates or NSAIDs, bleeding disorders, impaired hepatic or renal function, GI ulceration, lactation, pregnancy
- **Physical:** Skin color and lesions; eighth cranial nerve function, orientation, reflexes, affect; P, BP, perfusion; R, adventitious sounds; liver evaluation and bowel sounds; CBC, urinalysis, stool guaiac, LFTs, renal function tests

Interventions

⊗ **Black box warning** Patient may be at increased risk for GI bleeding and CV events; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Administer drug with a full glass of water to reduce risk of tablet or capsule lodging in the esophagus.

⊗ **Warning** Institute emergency procedures if overdose occurs: Gastric lavage, induction of emesis, activated charcoal, supportive therapy.

- Provide further comfort measures to reduce pain, fever, and inflammation.

Teaching points

- Take the drug with food or after meals if GI upset occurs.
- Report ringing in the ears, dizziness, confusion, abdominal pain, rapid or difficult breathing, nausea, vomiting.

▷ sapropterin dihydrochloride

S

See Appendix U, *Less commonly used drugs*.

▷ saquinavir mesylate (*sa kwen' a veer*)

Invirase

PREGNANCY CATEGORY B

Drug classes

Antiretroviral
Protease inhibitor

Therapeutic actions

Protease inhibitor, which in combination with nucleoside analogues is effective in HIV infections with changes in surrogate markers.

Indications

- Treatment of HIV infection in combination with other antiretrovirals
- Unlabeled use: Postexposure prophylaxis following occupational exposure to HIV

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component, severe hepatic impairment.
- Use cautiously with hepatic impairment, pregnancy, lactation, hemophilia, diabetes.

Available forms

Capsules—200 mg; tablets—500 mg

Dosages**Adults and patients older than 16 yr**

1,000 mg bid with ritonavir 100 mg bid given together within 2 hr after a meal or with lopinavir 400 mg/ritonavir 100 mg PO bid (tablets); 1,000 mg bid PO with lopinavir 400 mg ritonavir 100 mg PO bid (capsules).

Pediatric patients younger than 16 yr

Safety and efficacy not established.

Patients with hepatic impairment

Reduce dose and monitor hepatic function tests. Drug is contraindicated with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	Unknown

Metabolism: Hepatic; $T_{1/2}$: 3–6 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Headache*, insomnia, myalgia, malaise, dizziness, paresthesia, fatigue
- **CV:** Prolonged QT interval, prolonged PR interval

- **GI:** *Nausea, GI pain, diarrhea*, anorexia, vomiting, dyspepsia
- **Metabolic:** Fat redistribution may occur (central obesity, buffalo hump, cushingoid appearance)
- **Other:** *Asthenia*, elevated CPK, elevated triglycerides, cholesterol

Interactions

- *** Drug-drug** • Decreased effectiveness with rifampin, rifabutin, phenobarbital, phenytoin, dexamethasone, carbamazepine, nevirapine
- Increased saquinavir plasma concentrations with clarithromycin, indinavir, ritonavir, nelfinavir, delavirdine, ketoconazole
- Increased sildenafil concentrations when coadministered with saquinavir
- Potential for serious to life-threatening reactions with ergot derivatives, midazolam, triazolam, antiarrhythmics, rifampin
- Risk of serious hepatic toxicity if combined with HMG-CoA inhibitors (statins); avoid this combination and, if use is required, monitor LFTs regularly
- Risk of severe prolonged QT interval if combined with other drugs that prolong QT interval; avoid this combination.
- *** Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice, garlic capsules; avoid these combinations
- *** Drug-alternative therapy** • Decreased effectiveness if combined with St. John's wort

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between saquinavir and *Sinequan*; use caution.

Assessment

- **History:** Life-threatening allergy to any component; impaired hepatic function, pregnancy, lactation, diabetes, hemophilia
- **Physical:** T; affect, reflexes, peripheral sensation; bowel sounds, liver evaluation; LFTs, CPK levels, abdominal examination, baseline ECG

Interventions

- **⊗ Black box warning** Capsules and tablets are not interchangeable; use tablets

only when combined with ritonavir. If saquinavir is the only protease inhibitor in a treatment regimen, use capsules.

- Administer within 2 hr after a full meal.
- Monitor patient for signs of opportunistic infections that will need to be treated appropriately.
- Administer the drug concurrently with a nucleoside analogue.
- Offer support and encouragement to the patient to deal with the diagnosis as well as the effects of drug therapy and the high expense of treatment.

Teaching points

- Take drug as prescribed; take within 2 hours of a full meal; take concurrently with other prescribed medication. Do not drink grapefruit juice while using this drug.
- Store drug at room temperature; use by expiration date.
- These drugs are not a cure for AIDS or AIDS-related complex; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- The long-term effects of this drug are not yet known.
- This drug combination does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination—use appropriate precautions.
- You may experience these side effects: Nausea, loss of appetite, change in taste (eat frequent small meals); dizziness, loss of feeling (take appropriate precautions).
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty breathing, rash, changes in color of urine or stool.

sargramostim **(granulocyte macrophage colony-stimulating factor, GM-CSF)**

(*sar gram' oh stim*)

Leukine

PREGNANCY CATEGORY C

Drug class

Colony-stimulating factor

Therapeutic actions

Human GM-CSF produced by recombinant DNA technology; increases the proliferation and differentiation of hematopoietic progenitor cells; can activate mature granulocytes and macrophages.

Indications

- Myeloid reconstitution after autologous bone marrow transplantation and allogenic bone marrow transplantation
- Treatment of neutropenia associated with bone marrow transplantation failure or engraftment delay
- Induction chemotherapy in AML to shorten neutrophil recovery time
- Acceleration of myeloid recovery in patients with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, and Hodgkin's lymphoma undergoing autologous bone marrow transplantation
- Mobilization of hematopoietic progenitor cells for collection by leukapheresis and to accelerate myeloid reconstitution following peripheral blood progenitor cell (PBPC) transplantation
- Unlabeled uses: Treatment of myelodysplastic syndrome, decreases nadir of leukopenia related to myelosuppression of chemotherapy, corrects neutropenia in aplastic anemia patients, decreases transplant-associated organ system damage, promotes early grafting; stomatitis, melanoma, drug-induced neutropenia

Contraindications and cautions

- Contraindicated with hypersensitivity to yeast products, excessive leukemic myeloid blasts in bone marrow or peripheral blood; in neonates (benzyl alcohol is a constituent of *Leukine* liquid and bacteriostatic water for injection diluent and should not be administered to neonates because of association with fatal "gasping syndrome").
- Use cautiously with renal or hepatic failure, lactation, concomitant use with chemotherapy and radiation therapy or within 24 hours preceding or following chemotherapy or radiation therapy, pregnancy.

Available forms

Powder for injection—250 mcg

Dosages**Adults**

- *Myeloid reconstitution after autologous or allogeneic bone marrow transplantation:* 250 mcg/m²/day for 21 days as a 2-hr IV infusion beginning 2–4 hr after the autologous bone marrow infusion and not less than 24 hr after the last dose of chemotherapy and radiation therapy. Patient should not receive sargramostim until post-marrow infusion ANC is less than 500 cells/mm³. Continue until ANC is greater than 1,500 cells/mm³ for 3 consecutive days. If severe adverse reactions occur, decrease dose by 50% or stop drug. If patient has blast cells or disease progression, stop drug immediately.
- *Bone marrow transplantation failure or engraftment delay:* 250 mcg/m²/day for 14 days as a 2-hr IV infusion; the dose can be repeated after 7 days off therapy if engraftment has not occurred. If engraftment still does not occur, third dose of 500 mcg/m²/day may be administered for 14 days after another 7 days off therapy.
- *Neutrophil recovery following chemotherapy in AML:* 250 mcg/m²/day IV over 4 hr starting on about day 11 or 4 days after chemotherapy induction.
- *Mobilization of PBPC:* 250 mcg/m²/day IV over 24 hr or subcutaneously once daily; continue throughout harvesting.
- *Post-PBPC transplant:* 250 mcg/m²/day IV over 24 hr or subcutaneously once daily beginning immediately after infusion of progenitor cells; continue until ANC is greater than 1,500 cells/mm³ for 3 consecutive days.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Peak	Duration
IV	2 hr or more	6 hr
Subcut.	1–3 hr	12 hr

Metabolism: Unknown; T_{1/2} (IV): 60 min; subcutaneous: 162 min

Distribution: May cross placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: Reconstitute powder with 1 mL sterile water for injection; gently swirl contents to avoid foaming; do not shake, and avoid excessive agitation. Resulting solution should be clear, colorless, and isotonic. Do not reenter vial; discard any unused portion. Dilute in 0.9% sodium chloride injection; administer within 6 hr; refrigerate until ready to use.

Infusion: ⊗ **Warning** Infuse over 2 hr; do not use an in-line membrane filter; do not mix with any other medication or in any other diluent (except if albumin is needed for final concentration; see package label).

Incompatibilities: Do not mix with any solution other than 0.9% sodium chloride. Do not add to any other medications.

Adverse effects

- **CNS:** Headache, fever, generalized weakness, fatigue, malaise, asthenia
- **CV:** Edema
- **Dermatologic:** Alopecia, rash, mucositis
- **GI:** Nausea, vomiting, stomatitis, anorexia, diarrhea, constipation
- **Other:** Bone pain, generalized pain, sore throat, cough, arthralgia

Interactions

• **Drug-drug** • Drugs that may potentiate the myeloproliferative effects of sargramostim, such as lithium and corticosteroids, should be used with caution

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to yeast products; pregnancy, lactation, excessive leukemic myeloid blasts in bone marrow or peripheral blood, renal or hepatic failure
- **Physical:** Skin color, lesions, hair; T; abdominal examination, status of mucous membranes; blood counts, platelets, body weight and hydration status

Interventions

- Obtain CBC and platelet count prior to and twice weekly during therapy.
- ⊗ **Warning** Administer no less than 24 hr after cytotoxic chemotherapy and within 2–4 hr of bone marrow infusion.

- Administer daily as a 2-hr infusion.
- ⊗ **Warning** Store in refrigerator; do not freeze or shake. Use powder within 6 hr of mixing. If using powder, use each vial for one dose; do not reenter vial. Discard any unused drug.
- Do not shake vial before use.

Teaching points

- This drug must be taken as long as needed.
- Avoid exposure to infection (avoid crowds, visitors with infections).
- This drug should not be taken during pregnancy; using barrier contraceptives is advised.
- Frequent blood tests will be needed to evaluate drug effects.
- You may experience these side effects: Nausea and vomiting (eat frequent small meals); loss of hair (obtain appropriate head covering; cover head in temperature extremes); fever (request medication).
- Report fever, chills, sore throat, weakness, pain or swelling at injection site, difficulty breathing, chills.

DANGEROUS DRUG

 **saxagliptin**
(sacks ab glip' ten)

Onglyza

PREGNANCY CATEGORY B

Drug classes

Antidiabetic drug

DPP—4 (dipeptidyl peptidase—4) enzyme inhibitor

Therapeutic actions

Slows the inactivation of the incretin hormones, increasing these hormone levels and prolonging their activity. The incretin hormones stimulate insulin release in response to a meal and help regulate glucose homeostasis throughout the day. This increases and prolongs insulin release and reduces hepatic glucose production to help achieve glycemic control.

Indications

- As an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes

Contraindications and cautions

- Contraindicated with history of serious hypersensitivity reactions to saxagliptin.
- Use cautiously with moderate or severe renal impairment, concurrent use of strong CYP3A inhibitors, pregnancy, lactation.

Available forms

Tablets—2.5, 5 mg

Dosages

Adults

2.5–5 mg/day PO without regard to meals.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

2.5 mg/day PO for moderate to severe renal impairment (CrCl 50 mL/min or less).

Pharmacokinetics

Route	Onset	Peak
Oral	Moderate	2 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–3 hr

Distribution: May cross placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness
- **GI:** Abdominal pain, gastroenteritis, vomiting
- **GU:** UTI
- **Respiratory:** URI, nasopharyngitis
- **Other:** Hypoglycemia

Interactions

★ **Drug-drug** • Risk of increased plasma levels and toxicity if combined with strong CYP3A4/5 inhibitors (atazanavir, clarithromycin, ketoconazole, indinavir, itraconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin); if this combination is used, limit saxagliptin dosage to 2.5 mg/day

★ **Drug-alternative therapies** • Increased risk of hypoglycemia if taken with celery, coriander, dandelion root, fenugreek, garlic, ginseng, juniper berries

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to component of drug, renal impairment, pregnancy, lactation
- **Physical:** R, adventitious sounds; renal function tests; blood glucose, HbA_{1c} levels

Interventions

- Monitor blood glucose and HbA_{1c} levels before and periodically during therapy.
- Monitor renal function tests before and periodically during therapy.
- Ensure that patient continues diet and exercise program for management of type 2 diabetes.
- If appropriate, ensure that patient continues use of other prescribed drugs to manage type 2 diabetes.
- Arrange for thorough diabetic teaching program, including diet, exercise, signs and symptoms of hypoglycemia and hyperglycemia, and safety measures to avoid infections and injuries.

Teaching points

- Take this drug once a day, with or without food.
- If you forget a dose, take it as soon as you remember; then begin your usual dosage the next day. Do not make up skipped doses and do not take more than one dose each day.
- Maintain your blood glucose level as directed by your health care provider.
- Continue the diet and exercise program designed for the treatment of your type 2 diabetes. Continue other drugs you may be using to treat your diabetes if instructed to do so by your health care provider.
- Arrange for periodic monitoring of your fasting blood glucose and glycosylated hemoglobin levels.
- Know that your health care provider will request periodic blood tests to monitor your kidney function.
- It is not known how this drug affects a fetus. If you are pregnant or thinking about becoming pregnant, discuss this with your health care provider.
- This drug does enter breast milk, but it is not known how this could affect a nursing

baby. If you are nursing a baby, discuss this with your health care provider.

- During times of stress (surgery, infection, injury), the needs of your body change. Consult your health care provider immediately if you experience stress. The dosage of your antidiabetic drugs and the actual drugs that are needed may change.
- Report the use of herbal or over-the-counter therapies or other prescription drugs to your health care provider; many of these may change your glucose level and dosage adjustments will be needed.
- Report signs and symptoms of infection, uncontrolled glucose level, severe headache, increased stress, trauma.

▼ scopolamine hydrobromide (hyoscine HBR)

(*skoe pol' a meen*)

Oral, Parenteral: Scopace, Scopolamine HBR

Transdermal system:
Transderm-Scop

Ophthalmic solution: Isopto Hyoscine Ophthalmic

PREGNANCY CATEGORY C

Drug classes

Anticholinergic
Antiemetic
Anti-motion-sickness drug
Antimuscarinic
Antiparkinsonian
Antispasmodic
Belladonna alkaloid
Parasympatholytic

Therapeutic actions

Mechanism of action as anti-motion-sickness drug not understood; antiemetic action may be mediated by interference with cholinergic impulses to the vomiting center (CTZ); has sedative and amnesia-inducing properties; blocks effects of acetylcholine at muscarinic cholinergic receptors that mediate effects of

parasympathetic postganglionic impulses, thus depressing salivary and bronchial secretions, inhibiting vagal influences on the heart, relaxing the GI and GU tracts, inhibiting gastric acid secretion, relaxing the pupil of the eye (mydriatic effect), and preventing accommodation for near vision (cycloplegic effect).

Indications

- Transdermal system: Prevention and control of nausea and vomiting associated with motion sickness and recovery from surgery
- Adjunctive therapy with antacids and histamine-2 antihistamines in peptic ulcer supportive treatment of functional GI disorders (diarrhea, pylorospasm, hypermotility, IBS, spastic colon, acute enterocolitis, pancreatitis, infant colic)
- Preanesthetic medication to control bronchial, nasal, pharyngeal, and salivary secretions; prevent bronchospasm and laryngospasm; block cardiac vagal inhibitory reflexes during induction of anesthesia and intubation; produce sedation
- Induction of obstetric amnesia with analgesics calming delirium
- Treatment of postencephalitic parkinsonism and paralysis agitans; relief of symptoms in spastic states; maniacal states; delirium tremens
- Ophthalmic solution: Diagnostically to produce mydriasis and cycloplegia
- Ophthalmic solution: Preoperative and postoperative states in the treatment of iridocyclitis

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinergic drugs; glaucoma; adhesions between iris and lens; stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction; bronchial asthma, COPD, cardiac arrhythmias, tachycardia, myocardial ischemia; impaired metabolic, liver, or renal function (increased likelihood of adverse CNS effects); myasthenia gravis; pregnancy (causes respiratory depression in neonates, contributes to neonatal hemorrhage); lactation.

- Use cautiously with Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism; glaucoma or tendency to glaucoma (ophthalmic solution).

Available forms

Tablets—0.4 mg; injection—0.3, 0.4, 0.86, 1 mg/mL; transdermal system—1.5 mg; ophthalmic solution—0.25%

Dosages

Adults

Oral

0.4–0.8 mg PO daily; may be increased with caution.

Transdermal system

- *Motion sickness*: Apply one transdermal system to the postauricular skin at least 4 hr before antiemetic effect is required. Scopolamine 1 mg will be delivered over 3 days. If continued effect is needed, replace system every 3 days.

Parenteral

- *Obstetric amnesia, preoperative sedation*: 0.32–0.65 mg subcutaneously or IM. May give IV after dilution in sterile water for injection. May repeat if needed up to qid.
- *Sedation, tranquilization*: 0.6 mg subcutaneously or IM three or four times a day.
- *Antiemetic*: 0.6–1 mg subcutaneously.

Ophthalmic solution

- *Refraction*: Instill 1–2 drops into the eye or eyes 1 hr before refracting.
- *Uveitis*: Instill 1–2 drops into the eye or eyes up to four times a day.

Pediatric patients

Oral

Do not use oral scopolamine in children unless directed by physician.

Transdermal system

Do not use transdermal system in children.

Parenteral

0.006 mg/kg subcutaneously, IM or IV; maximum dose is 0.3 mg. 6 mo–3 yr: 0.1–0.15 mg IM or IV. 3 yr–6 yr: 0.2–0.3 mg IM or IV.

Antiemetic

0.006 mg/kg subcutaneously.

Geriatric patients

More likely to cause serious adverse reactions, especially CNS reactions; use lowest possible dose and monitor patient closely.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Unknown	1 hr	8–10 hr
IM, Subcut.	30 min	1 hr	4–6 hr
IV	10 min	1 hr	2–4 hr
Transdermal	4–5 hr	24 hr	72 hr
Ophthalmic	10–20 min	30–45 min	Days

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute in sterile water for injection.

Infusion: Inject directly into vein or into tubing of actively running IV; inject slowly over 5–10 min.

Adverse effects

- **CNS:** *Pupil dilation, photophobia, blurred vision, headache, drowsiness, dizziness, mental confusion, excitement, restlessness, hallucinations, delirium in the presence of pain*
- **CV:** Palpitations, tachycardia
- **GI:** *Dry mouth, constipation, paralytic ileus, altered taste perception, nausea, vomiting, dysphagia, heartburn*
- **GU:** *Urinary hesitancy and retention, impotence*
- **Hypersensitivity: Anaphylaxis,** urticaria, other dermatologic effects
- **Other:** Suppression of lactation, flushing, fever, *nasal congestion, decreased sweating*

Interactions

★ **Drug-drug** • Decreased antipsychotic effectiveness of haloperidol • Decreased effectiveness of phenothiazines, but increased incidence of paralytic ileus • Increased CNS depression with alcohol

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to anticholinergic drugs; glaucoma; adhesions between iris and lens; stenosing peptic ulcer, pyloroduod-

denal obstruction, intestinal atony, severe ulcerative colitis, symptomatic prostatic hypertrophy, bladder neck obstruction; bronchial asthma, COPD; cardiac arrhythmias, myocardial ischemia; impaired metabolic, liver, or renal function; myasthenia gravis; Down syndrome; brain damage, spasticity; hypertension; hyperthyroidism; pregnancy; lactation

- **Physical:** Skin color, lesions, texture; T; orientation, reflexes, bilateral grip strength; affect; ophthalmic examination; P, BP, R, adventitious sounds; bowel sounds, normal output; urinary output, prostate palpation; LFTs, renal function tests, ECG

Interventions

- Ensure adequate hydration; provide environmental control (temperature) to prevent hyperpyrexia.

Teaching points

- Take as prescribed, 30–60 minutes before meals. Avoid excessive dosage.
- Avoid hot environments. You will be heat intolerant, and dangerous reactions may occur.
- Avoid alcohol; serious sedation could occur.
- When using transdermal system, take care to wash hands thoroughly after handling patch and dispose of patch properly to avoid contact with children and pets. Remove the old patch before applying a new one.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); constipation (ensure adequate fluid intake, proper diet); dry mouth (sugarless lozenges, frequent mouth care may help; may lessen); blurred vision, sensitivity to light (reversible, avoid tasks that require acute vision; wear sunglasses); impotence (reversible); difficulty urinating (empty bladder before taking drug).
- Report rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, abdominal distention, hallucinations, severe or persistent dry mouth, difficulty urinating, constipation, sensitivity to light.

DANGEROUS DRUG**secobarbital sodium**(see *koe bar' bi tal*)

Seconal Sodium

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-II

Drug classes

Antiepileptic

Barbiturate (short-acting)

Sedative-hypnotic

Therapeutic actions

General CNS depressant; barbiturates inhibit impulse conduction in the ascending RAS, depress the cerebral cortex, alter cerebellar function, depress motor output, and can produce excitation (especially with subanesthetic doses with pain), sedation, hypnosis, anesthesia, and deep coma; at anesthetic doses, has antiepileptic activity.

Indications

- Intermittent use as a sedative, hypnotic, or preanesthetic medication

Contraindications and cautions

- Contraindicated with hypersensitivity to barbiturates; manifest or latent porphyria; marked liver impairment; nephritis; severe respiratory distress, respiratory disease with dyspnea, obstruction, or cor pulmonale; previous addiction to sedative-hypnotic drugs (drug may be ineffective, and use may contribute to further addiction); pregnancy (readily crosses placenta and has caused fetal damage, neonatal withdrawal syndrome).
- Use cautiously with acute or chronic pain (drug may cause paradoxical excitement or mask important symptoms); seizure disorders (abrupt discontinuation of daily doses can result in status epilepticus); lactation (has caused drowsiness in nursing infants); fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, status asthmaticus, shock, uremia; impaired liver or renal function, debilitation.

Available forms

Capsules—100 mg

Dosages**Adults**

Adjust dosage on basis of age, weight, condition.

- *Preoperative sedation*: 200–300 mg PO 1–2 hr before surgery.
- *Bedtime hypnotic*: 100 mg PO at bedtime; do not use longer than 2 wk.

Pediatric patients

⊗ **Warning** Barbiturates may produce irritability, excitability, inappropriate tearfulness, and aggression.

- *Preoperative sedation*: 2–6 mg/kg PO 1–2 hr before surgery; maximum dose, 100 mg.

Geriatric patients or patients with debilitating disease

Reduce dosage and monitor closely. May produce excitement, depression, or confusion.

Patients with hepatic or renal impairment

Reduce dosage.

Pharmacokinetics

Route	Onset	Duration
Oral	10–15 min	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: 15–40 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, agitation, confusion, hyperkinesia, ataxia, vertigo, CNS depression, nightmares, lethargy, residual sedation (hangover), paradoxical excitement, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, thinking abnormality, complex sleep disorders*
- **CV:** *Bradycardia, hypotension, syncope*
- **GI:** *Nausea, vomiting, constipation, diarrhea, epigastric pain*
- **Hypersensitivity:** Rashes, angioneurotic edema, serum sickness, morbilliform rash, urticaria; rarely, exfoliative dermatitis, **Stevens-Johnson syndrome**
- **Respiratory:** *Hypoventilation, apnea, respiratory depression, laryngospasm, bronchospasm, circulatory collapse*

- **Other:** Tolerance, psychological and physical dependence; **anaphylaxis, angioedema, withdrawal syndrome**

Interactions

★ **Drug-drug** • Increased CNS depression with alcohol • Increased renal toxicity with methoxyflurane • Decreased effects of oral anticoagulants, corticosteroids, hormonal contraceptives and estrogens, metronidazole, metoprolol, propranolol, doxycycline, oxyphenbutazone, phenylbutazone, quinidine with barbiturates • Decreased theophylline serum levels and effectiveness secondary to increased clearance • Decreased bioavailability of verapamil

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to barbiturates; manifest or latent porphyria; nephritis; severe respiratory distress; previous addiction to sedative-hypnotic drugs; pregnancy; acute or chronic pain; seizure disorders; lactation; fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, shock, uremia; impaired liver or renal function, debilitation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, blood and urine glucose, BUN

Interventions

- ⊗ **Warning** Monitor patient for anaphylaxis, angioedema, blood levels with the above interacting drugs; suggest alternatives to hormonal contraceptives.
- Do not use as a bedtime hypnotic for longer than 2 wk.
- Stay with children who have received preoperative sedation.
- ⊗ **Warning** Taper dosage gradually after repeated use, especially in patients who have epilepsy, to avoid refractory seizures.

Teaching points

- Do not use this drug with alcohol.
- Do not use this drug during pregnancy; use of barrier contraceptives is recommended.

- If you are breast-feeding a baby, you should use another method of feeding the baby.
- Do not stand or sit up after you have received this drug (request assistance if you must sit up or move about).
- This drug will make you drowsy (or induce sleep) and make you less anxious. This drug may cause allergic reaction, swelling, complex sleep-related behaviors.

▷ secretin

See Appendix U, *Less commonly used drugs.*

▷ selegiline hydrochloride

(*se leb' ge leen*)

Apo-Selegiline (CAN), Eldepryl, Emsam, Gen-Selegiline (CAN), Zelapar

PREGNANCY CATEGORY C

Drug classes

Antidepressant
Antiparkinsonian
MAO type B inhibitor

Therapeutic actions

Mechanism of action not completely understood; inhibits MAO type B activity; may have other mechanisms of increasing dopaminergic activity.

Indications

- Adjunct in management of patients with Parkinson's disease whose response to levodopa and carbidopa has decreased
- Treatment of major depressive disorder (*Emsam*)

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, pregnancy, lactation, concurrent use of carbamazepine or oxcarbazepine.
- Use cautiously with geriatric patients.

Available forms

Capsules—5 mg; tablets—5 mg; orally disintegrating tablets—1.25 mg; transdermal system—6 mg/24 hr, 9 mg/24 hr, 12 mg/24 hr

Dosages**Adults**

- **Parkinson's disease:** 10 mg/day PO in divided doses of 5 mg each taken at breakfast and lunch. After 2–3 days, attempt to decrease dose of levodopa and carbidopa; reductions of 10%–30% are typical. If using orally disintegrating tablet, 1.25 mg/day PO in the morning before breakfast. Place tablet on top of tongue; avoid food or beverage for 5 min. May be increased after 6 wk to 2.5 mg/day. Patient should be under close supervision because of risk of altered mental state.
- **Depression:** Apply one patch (*Emsam*) daily to dry, intact skin on upper torso, upper thigh, or outer surface of upper arm. Start with 6-mg/24-hr system and increase to maximum of 12 mg/24 hr if needed and tolerated.

Pediatric patients

Not recommended for children younger than 12 yr.

Geriatric patients

Maximum dose of transdermal system, 6 mg/24 hr. Use with caution and carefully monitor for orthostatic BP changes.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30–120 min

Metabolism: Hepatic; $T_{1/2}$: 20.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, light-headedness, confusion, hallucinations, dyskinesias, vivid dreams*, increased tremor, loss of balance, restlessness, depression, drowsiness, disorientation, apathy, blurred vision, diplopia
- **CV:** Orthostatic hypotension, hypertension, arrhythmia, palpitations, hypotension, tachycardia

- **Dermatologic:** Increased sweating, diaphoresis, facial hair development, hair loss, hematoma, rash, photosensitivity
- **GI:** *Nausea, vomiting, abdominal pain, dry mouth*, constipation, rectal bleeding, heartburn, diarrhea, anorexia
- **GU:** Slow urination, transient nocturia, prostatic hypertrophy, urinary hesitancy, urine retention
- **Other:** **Asthma**

Interactions

- *** Drug-drug** • Severe adverse effects to fatalities if combined with meperidine, fluoxetine: Avoid these combinations • Use extreme caution with opioid analgesics • Concurrent use of carbamazepine, oxcarbazepine is contraindicated
- *** Drug-food** • Avoid tyramine-rich foods and beverages starting on first day of therapy with 9- or 12-mg patch; continue to avoid for 2 wk after reduction to 6-mg patch or discontinuation of 9- or 12-mg patch

Nursing considerations
Assessment

- **History:** Hypersensitivity to any component of drug; pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, affect, reflexes; BP, standing BP, P; abdominal examination; prostate examination (males)

Interventions

- **⊗ Black box warning** Risk of suicidality in children, adolescents, and young adults is increased; monitor accordingly.
- Administer oral drug only as adjunct to levodopa and carbidopa in patients whose symptoms are deteriorating; administer twice daily with breakfast and lunch.
- Limit oral drug to 10 mg/day; larger doses may lead to loss of MAO type B specificity and increase risk of severe hypertensive reactions.
- Dispense least amount of drug possible, especially with depressed patients.
- Administer orally disintegrating tablet by placing on patient's tongue; do not allow food or beverages for 5 min.
- Apply dermal patch to dry, intact skin on upper torso, upper thigh, or outer upper arm.

Replace every 24 hr; remove the old patch before applying a new one.

- Monitor the patient for improvement in Parkinson's disease symptoms; if symptoms improve after 2–3 days, begin reducing dosage of levodopa and carbidopa.
- Provide safety measures if dizziness and lightheadedness occur.
- Provide small, frequent meals if GI upset is a problem.
- Provide ice, sugarless lozenges to suck and frequent mouth care if dry mouth is an issue.
- Maintain usual program for treatment of patients with Parkinson's disease.

Teaching points

- Take the oral drug twice a day, with breakfast and lunch. Continue to take your levodopa and carbidopa; the dosage may be decreased in a few days. Do not exceed 10 milligrams per day, serious effects could occur; maintain all of your usual activities and restrictions related to your Parkinson's disease.
- If using orally disintegrating tablets, place on your tongue and allow to dissolve; do not eat or drink anything for 5 minutes; do this in the morning before breakfast.
- If using the patch, apply to your upper torso, upper thigh, or outer upper arm on dry, intact skin; replace the patch every 24 hours; always remove the old patch before applying a new one.
- It is not known how this drug could affect a fetus, if you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, consult your health care provider.
- This drug interacts with some other drugs, and this interaction could cause serious side effects; tell any health care provider who is taking care of you that you are on this drug.
- You may experience these side effects: Dizziness, drowsiness, anxiety, disorientation (do not drive a car or operate any dangerous machinery while on this drug; avoid making any important decisions); dry mouth (frequent mouth care, sugarless lozenges may help); nausea, vomiting (it is impor-

tant to try to maintain your fluid intake and nutrition, let your health care provider know if this becomes difficult).

- Report severe headache, mood changes, confusion, sleep disturbances, dizziness on rising, fainting.

sertraline hydrochloride

(*sir' trab leen*)

Apo-Sertraline (CAN), Novo-Sertraline (CAN), ratio-Sertraline (CAN), Zoloft

PREGNANCY CATEGORY C

Drug classes

Antidepressant
SSRI

Therapeutic actions

Acts as an antidepressant by inhibiting CNS neuronal uptake of serotonin; blocks uptake of serotonin with little effect on norepinephrine, muscarinic, histaminergic, and α_1 -adrenergic or dopaminergic receptors.

Indications

- Treatment of major depressive disorder
- Treatment of OCD
- Treatment of panic disorder with or without agoraphobia
- Treatment of PTSD; long-term use to prevent relapse and sustain symptom improvement
- Treatment of PMDD
- Treatment of social anxiety disorder (social phobia)
- Unlabeled uses: Nocturnal enuresis, hot flashes, cholestatic pruritus, migraine prevention, smoking cessation, traumatic brain injury

Contraindications and cautions

- Contraindicated with hypersensitivity to sertraline.
- Use cautiously with impaired hepatic or renal function, lactation, pregnancy.

Available forms

Tablets—25, 50, 100, 150, 200 mg; oral concentrate—20 mg/mL

Dosages**Adults**

- **Major depressive disorder and OCD:** Administer once a day, morning or evening. 50 mg PO daily; may be increased to up to 200 mg/day; dosage increases should not occur at intervals less than 1 wk.
- **Panic disorder and PTSD:** 25 mg PO daily. After 1 wk increase to 50 mg once daily.
- **PMDD:** 50 mg/day PO daily or just during luteal phase of menstrual cycle.
- **Social anxiety disorder:** 25 mg/day PO; increase to 50 mg/day after 1 wk. Range, 50–200 mg/day.

Pediatric patients

- **OCD:**
6–12 yr: 25 mg PO once daily. May be increased slowly as needed.
13–17 yr: 50 mg PO once daily. May be increased slowly at intervals of at least 1 wk as needed, to maximum of 200 mg/day.

Patients with hepatic impairment

Give a lower or less frequent dose. Use response as dosage guide.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	4.5–8.4 hr

Metabolism: Hepatic; $T_{1/2}$: 26 hr (104-active metabolite)

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, nervousness, drowsiness, anxiety, tremor, dizziness, insomnia, light-headedness, agitation, sedation, abnormal gait, psychosis, seizures, vision changes, fatigue*
- **CV:** Hot flashes, palpitations, chest pain
- **Dermatologic:** *Sweating*, rash, pruritus, acne, contact dermatitis
- **GI:** *Nausea, vomiting, diarrhea, dry mouth*, anorexia, dyspepsia, constipation, taste changes, flatulence, gastroenteritis, dysphagia, gingivitis

- **GU:** *Painful menstruation*, sexual dysfunction, frequency, cystitis, impotence, urgency, vaginitis
- **Respiratory:** URIs, pharyngitis, cough, dyspnea, bronchitis, *rhinitis*
- **Other:** Fever, back pain, thirst

Interactions

★ **Drug-drug** ⊗ **Warning** Serious, sometimes fatal, reactions with MAOI; allow at least 14 days to elapse between MAOI and sertraline use.

⊗ **Warning** Possible risk of increased QTc interval if combined with pimozide; do not use together.

• Increased serum levels of sertraline with cimetidine

★ **Drug-food** • Increased rate of absorption with food

★ **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to sertraline, impaired hepatic or renal function, lactation, pregnancy
- **Physical:** Weight; T; skin rash, lesions; reflexes, affect; bowel sounds, liver evaluation; P, peripheral perfusion; urinary output, LFTs, renal function tests

Interventions

⊗ **Black box warning** Risk of suicidality is increased in children, adolescents and young adults; monitor accordingly.

- Use lower dose in elderly patients and with hepatic or renal impairment.
- Dilute oral concentrate in 4 oz water, ginger ale, lemon-lime soda, lemonade, or orange juice only; administer immediately after diluting.

⊗ **Warning** Establish suicide precautions for severely depressed patients. Limit number of tablets given at any time.

- Give drug once a day, morning or evening.
- Increase dosage at intervals of not less than 1 wk.
- Counsel patient to use nonhormonal contraceptives; pregnancy should be avoided due to risk to fetus.

Teaching points

- Take this drug once a day, at the same time, morning or evening; do not exceed the prescribed dose. It may take 4–6 weeks to see any improvement.
- Dilute concentrate immediately before use in 4 ounces of water, ginger ale, lemon-lime soda, lemonade, or orange juice only.
- Consult your health care provider if you think that you are pregnant or wish to become pregnant.
- You may experience these side effects: Dizziness, drowsiness, nervousness, insomnia (avoid driving or performing hazardous tasks); nausea, vomiting (eat frequent small meals); dry mouth (suck sugarless lozenges; perform frequent mouth care); excessive sweating (monitor temperature; avoid overheating).
- Report rash, mania, seizures, edema, difficulty breathing, increased depression, thoughts of suicide.

sevelamer hydrochloride

See Appendix U, *Less commonly used drugs*.

sildenafil citrate

(*sill den' ah fill*)

Revatio, Viagra

PREGNANCY CATEGORY B

Drug classes

Impotence drug

Phosphodiesterase inhibitor

Therapeutic actions

Selectively inhibits cGMP-specific phosphodiesterase type 5. The mechanism of penile erection involves the release of nitric oxide into the corpus cavernosum of the penis during sexual stimulation. Nitrous oxide activates cGMP, which causes smooth muscle relaxation, allowing the flow of blood into the corpus cavernosum. Sildenafil prevents the breakdown of cGMP by phosphodiesterase, leading to in-

creased cGMP levels and prolonged smooth muscle relaxation, promoting the flow of blood into the corpus cavernosum and decreasing pressure in the pulmonary bed.

Indications

- Treatment of ED in the presence of sexual stimulation (*Viagra*)
- Treatment of pulmonary arterial hypertension to improve exercise ability (*Revatio*)

Contraindications and cautions

- Contraindicated with allergy to any component of the tablet, concomitant use of nitrates; contraindicated for women or children if used for sexual dysfunction.
- Use cautiously with hepatic or renal impairment; with anatomic deformation of the penis; with known cardiac disease (effects of sexual activity need to be evaluated); concomitant use of protease inhibitors when used for pulmonary hypertension

Available forms

Tablets—20 mg (*Revatio*); 25, 50, 100 mg (*Viagra*); single use vial for injection—10 mg/12.5 mL (*Revatio*)

Dosages

Adults

ED: 50 mg PO taken 1 hr before anticipated sexual activity; range, 25–100 mg PO. May be taken 30 min–4 hr before sexual activity. Limit use to once per day (*Viagra*).

Pulmonary arterial hypertension: 20 mg PO tid, at least 4–6 hr apart and without regard to food (*Revatio*); or 10 mg by IV bolus tid (*Revatio*).

Pediatric patients

Not intended for use in children.

Geriatric patients

For patients older than 65 yr, start with 25 mg PO when used for erectile dysfunction.

Patients with renal or hepatic impairment

Patients with hepatic impairment or creatinine clearance less than 30 mL/min may have increased serum levels; start dose at 25 mg PO (*Viagra*); no dosage adjustment needed for *Revatio*.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30–120 min

Metabolism: Hepatic; $T_{1/2}$: 4 hr

Distribution: Not intended for use in women, no clear studies on crossing the placenta or entering breast milk (*Viagra*)

Excretion: Feces, urine

IV FACTS

Preparation: Use as provided; solution should be clear and colorless. Store at room temperature. Single use only.

Infusion: Administer as IV bolus into actively running line or by direct IV injection.

Adverse effects

- **CNS:** *Headache*, abnormal vision, dizziness, nasal congestion, ischemic optic neuropathy, sudden loss of hearing, temporary amnesia
- **CV:** *Flushing*
- **GI:** *Dyspepsia*, diarrhea
- **Other:** UTI, rash

Interactions

★ **Drug-drug** ⊗ **Warning** Possible severe hypotension and serious cardiac events if combined with nitrates or alpha adrenergic blockers; this combination must be avoided.

• Possible increased sildenafil levels and effects if taken with cimetidine, amlodipine, erythromycin, protease inhibitors; monitor patient and reduce dosage as needed • Risk of toxic effects if combined with protease inhibitors when used to treat pulmonary hypertension; avoid this combination

★ **Drug-food** • Decreased rate of absorption and onset of action if taken with a high-fat meal • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination • Use with alcohol may result in decrease in BP; orthostatic hypotension

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the tablet; hepatic or renal impairment; with anatomical deformation of the penis, known cardiac disease; concomitant use of nitrates

- **Physical:** Orientation, affect; skin color, lesions; P, BP, ECG, LFTs, renal function tests

Interventions

- Ensure diagnosis of pulmonary arterial hypertension (*Revatio*). Reserve IV use for patients unable to take oral form.
- Ensure diagnosis of ED and determine underlying causes and other appropriate treatment (*Viagra*).
- Advise patient that drug does not work in the absence of sexual stimulation. Limit use to once per day (*Viagra*).
- Remind patient that drug does not protect against STDs and appropriate measures should be taken.

⊗ **Warning** Advise patient to never take this drug with nitrates; serious and even fatal complications can occur.

⊗ **Warning** Advise patients receiving HIV medications that there is an increased risk of sildenafil-associated adverse drug reactions, including hypotension, visual changes, and priapism. Do not exceed 25 mg of sildenafil in 48 hr; use extreme caution if using *Revatio*.

⊗ **Warning** Advise patients not to take this drug within 4 hr of an alpha blocker.

Teaching points

- For erectile dysfunction, take this drug 30 minutes to 4 hours before anticipated sexual activity. The usual timing is 1 hour. The drug will have no effect in the absence of sexual stimulation.
- If taking this drug for pulmonary arterial hypertension take three times a day; make sure the doses are 4–6 hours apart.
- Onset of drug effects will be slowed if taken with a high-fat meal; plan accordingly. Avoid drinking grapefruit juice if using this drug.
- This drug will not protect you from sexually transmitted diseases; use appropriate precautions.
- Stop the drug and call your health care provider immediately if you experience sudden loss of vision.
- Do not take this drug if you are taking any nitrates; serious side effects and even death can occur.
- You may experience these side effects: Headache, dizziness, rash, flushing.

- Report difficult or painful urination, rash, dizziness, palpitations, loss of vision or hearing.

silodosin

(*sill ob do' zin*)

Rapaflo

PREGNANCY CATEGORY B

Drug classes

Alpha₁-adrenergic blocker
BPH drug

Therapeutic actions

Blocks the smooth muscle alpha₁-adrenergic receptors in the prostate, prostatic capsule, prostatic urethra, and bladder neck, leading to bladder and prostate relaxation and improved urine flow in cases of BPH.

Indications

- Treatment of signs and symptoms of BPH

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug, lactation, pregnancy, severe renal impairment, severe hepatic impairment, concurrent use of strong cytochrome P450 inhibitors.
- Use cautiously in patients with hypotension, prostate cancer, cataract surgery, moderate renal impairment.

Available forms

Capsules: 4, 8 mg

Dosages

Adults

8 mg/day PO once daily with a meal.

Pediatric

Safety and efficacy not established.

Patients with renal impairment

With severe renal impairment (creatinine clearance of 30 mL/min or less), drug is contraindicated; with moderate renal impairment (creatinine clearance of 30–50 mL/min), 4 mg/day PO once daily with a meal.

Patients with hepatic impairment

With severe hepatic impairment (Child-Pugh score of 10 or more), drug is contraindicated. With mild to moderate hepatic impairment, no dosage adjustment is needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–3.5 hr

Metabolism: Hepatic; T_{1/2}: 5–20 hr

Distribution: May cross placenta; may enter breast milk (not indicated for use in women)

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, headache*, insomnia
- **CV:** Orthostatic hypotension
- **GI:** Diarrhea, impaired hepatic function
- **GU:** *Retrograde ejaculation, abnormal ejaculate*
- **Respiratory:** Nasopharyngitis, nasal congestion, sinusitis
- **Other:** Pruritus, purpura, intraoperative floppy iris syndrome with cataract surgery

Interactions

★ **Drug-drug** • Increased risk of elevated silodosin serum levels and toxicity if combined with strong cytochrome 450 inhibitors (ketoconazole, clarithromycin, itraconazole, ritonavir); this combination is contraindicated • Increased risk of hypotension if combined with other alpha blockers; if this combination is used, monitor patient closely and adjust dosages as needed • Risk of increased serum levels if combined with cyclosporine; avoid this combination

■ Nursing considerations

Assessment

- **History:** Known hypersensitivity to any component of the drug, lactation, pregnancy, renal impairment, hepatic impairment, concurrent use of strong cytochrome P450 inhibitors, hypotension, prostate cancer, cataract surgery
- **Physical:** Orientation, affect, reflexes; skin color, lesions; BP, orthostatic BP, status of nasal mucosa; prostate examination, voiding

pattern, normal output; LFTs, renal function tests, PSA level

Interventions

- Ensure that patient does not have prostate cancer before beginning therapy.
- Administer drug once a day with a meal.
- If patient is to undergo cataract surgery, there is a risk of intraoperative floppy iris syndrome. Surgeon should be alerted to the use of the drug, even if the drug has been discontinued; the patient may require additional surgical intervention.
- Provide safety measures if CNS effects occur.
- Monitor patient carefully for orthostatic hypotension; dizziness and syncope may occur. Establish safety precautions as needed. (Use side rails and provide assistance with ambulation.)

Teaching points

- Take this drug exactly as prescribed, once a day with a meal.
- Tell your surgeon that you are taking or have taken this drug if you are considering cataract surgery.
- You may experience these side effects: Headache (medications may be available to help); dizziness, weakness, which may become less over time (this is more likely when you are changing positions, after exercise, in hot weather, and after consuming alcohol; do not drive or operate hazardous machinery if this occurs; change position slowly, use caution when climbing stairs, lie down if the dizziness becomes severe); abnormal ejaculation, ejaculate with little to no semen (this is reversible when the drug is discontinued).
- Report fainting, changes in the color of stool or urine, severe dizziness, worsening of symptoms, rash.

▷ simethicone (*sigh meth' ih kohn*)

Flatulex, Gas-X, Genasyme Drops, Mylanta Gas Relief, Mylicon Drops, Ovol (CAN), Phazyme, Phazyme 95, Phazyme 125, Phazyme Quick Dissolve

PREGNANCY CATEGORY UNKNOWN

Drug class

Antiflatulent

Therapeutic actions

Defoaming action disperses and prevents the formation of mucus-surrounded gas pockets in the GI tract; changes the surface tension of gas bubbles in the stomach and small intestine, enabling the bubbles to coalesce, allowing gas to be more easily freed by belching or flatus.

Indications

- Relief of symptoms of pressure, bloating, and fullness from excess gas in the digestive tract; postoperative gaseous distention and pain, use in endoscopic examination; air swallowing; functional dyspepsia; spastic or irritable colon; diverticulosis
- Unlabeled use: Treatment of colic in infants

Contraindications and cautions

- Contraindicated with allergy to components of the product.

Available forms

Chewable tablets—40, 80, 125, 130, 150 mg; tablets—60, 95 mg; capsules—125, 180 mg; drops—40 mg/0.6 mL

Dosages

Adults

Oral

- *Capsules*: 125 mg PO qid, after each meal and at bedtime.
- *Tablets*: 40–125 mg PO qid, after each meal and at bedtime.
- *Drops*: 40–80 mg PO qid up to 500 mg/day, after each meal and at bedtime.

Pediatric patients 2–12 yr

40 mg PO qid after each meal and at bedtime.

Pediatric patients younger than 2 yr

20 mg PO qid after each meal and at bedtime; up to 240 mg/day.

Pharmacokinetics

Not absorbed systemically; excreted unchanged in feces

Adverse effects

- **GI**: Nausea, vomiting, *diarrhea*, constipation, belching, passing of flatus

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to simethicone
- **Physical:** Bowel sounds, normal output

Interventions

- Give after each meal and at bedtime.
- Shake drops thoroughly before each use.
- Add drops to 30 mL cool water, infant formula, or other liquid to ease administration to infants.
- Ensure chewable tablets are chewed thoroughly before swallowing.

Teaching points

- Take drug after each meal and at bedtime; chew chewable tablets thoroughly before swallowing; shake drops bottle before administration. Parents may want to add drops to 30 milliliters of cool water, infant formula, or other liquid to ease administration.
- You may experience increased belching and passing of flatus as gas disperses.
- Report extreme abdominal pain, worsening of condition being treated, vomiting.

simvastatin*(sim va stab' tin)*

Apo-Simvastatin (CAN),
CO Simvastatin (CAN), Gen-
Simvastatin (CAN), Novo-
Simvastatin (CAN), PMS-Simvastatin
(CAN), ratio-Simvastatin (CAN),
Zocor

PREGNANCY CATEGORY X**Drug classes**

Antihyperlipidemic
HMG-CoA reductase inhibitor

Therapeutic actions

Inhibits HMG-CoA reductase, the enzyme that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs, and either an increase or no change in serum HDLs.

Indications

- Adjunct to diet in the treatment of elevated total cholesterol and LDL cholesterol with primary hypercholesterolemia (types IIa and IIb) in those unresponsive to dietary restriction of saturated fat and cholesterol and other nonpharmacologic measures
- To reduce the risk of coronary disease, mortality, and CV events, including stroke, TIA, MI, and reduction in need for bypass surgery and angioplasty in patients with coronary heart disease and hypercholesterolemia
- Treatment of patients with isolated hypertriglyceridemia
- Treatment of type III hyperlipoproteinemia
- Treatment of adolescents 10–17 yr with heterozygous familial hypercholesterolemia

Contraindications and cautions

- Contraindicated with allergy to simvastatin, fungal byproducts; active liver disease or unexplained, persistent elevations of serum transaminases; pregnancy, lactation.
- Use cautiously with impaired hepatic and renal function, cataracts, Asian-Americans (increased risk of myopathy).

Available forms

Tablets—5, 10, 20, 40, 80 mg; orally disintegrating tablets—10, 20, 40, 80 mg

Dosages**Adults**

- *Hyperlipidemia:* Initially, 20 mg PO; up to 80 mg PO daily in the evening. Usual range, 5–80 mg/day. Maximum dose, 80 mg/day. Adjust at 4-wk intervals.
- *Prevention of coronary events:* 20–40 mg PO once daily in the evening.
- *Familial hypercholesterolemia:* 40 mg/day PO in the evening, or 80 mg/day divided into doses of 20 mg, 20 mg, and 40 mg in the evening.
- *Combination therapy:* Do not combine with other statins; if used with fibrates or niacin, do not exceed 10 mg/day; regular dose if combined with bile acid sequestrants. Give at least 4 hr before simvastatin. Combined with cyclosporine, start with 5 mg/day; do not exceed 10 mg/day. Combination with

amiodarone or verapamil, dose should not exceed 20 mg/day. If used with diltiazem, do not exceed 40 mg/day.

Pediatric patients 10–17 yr

10 mg/day PO in the evening. Range, 10–40 mg/day based on response.

Patients with renal impairment

For severe impairment, starting dose is 5 mg/day PO; increase dose slowly, monitoring response. No dosage adjustment needed for mild to moderate impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1.3–2.4 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, asthenia, sleep disturbances
- **GI:** *Flatulence, diarrhea, abdominal pain, cramps, constipation, nausea, dyspepsia, heartburn, liver failure*
- **Respiratory:** Sinusitis, pharyngitis
- **Other:** **Rhabdomyolysis, acute renal failure**, arthralgia, myalgia

Interactions

• **Drug-drug** ⚠ **Warning** Increased risk of myopathy and rhabdomyolysis with clarithromycin, erythromycin, HIV protease inhibitors, itraconazole, ketoconazole, nefazodone; avoid concomitant use or suspend therapy during treatment with clarithromycin, erythromycin, itraconazole, and ketoconazole.

- Increased risk of myopathy and rhabdomyolysis with amiodarone, verapamil; do not exceed 20 mg simvastatin daily
- Increased risk of myopathy and rhabdomyolysis with cyclosporine, fibrates, niacin; monitor patient closely if use together cannot be avoided. Do not exceed 10 mg simvastatin daily
- Digoxin levels may increase slightly; closely monitor plasma digoxin levels at the start of simvastatin therapy
- Increased risk for hepatotoxicity with hepatotoxic drugs; avoid concurrent use
- Simvastatin may slightly enhance anticoagulant effect of war-

farin; monitor PT and INR at the start of therapy and during dose adjustment

- Increased risk of myopathy with diltiazem; do not exceed 40 mg/day if this combination is used
- **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to simvastatin, fungal byproducts; impaired hepatic function; pregnancy; lactation
- **Physical:** Orientation, affect; liver evaluation, abdominal examination; lipid studies, LFTs

Interventions

- Ensure that patient has tried a cholesterol-lowering diet regimen for 3–6 mo before beginning therapy.
- Give in the evening; highest rates of cholesterol synthesis are between midnight and 5 AM.
- Advise patient that this drug cannot be taken during pregnancy; advise patient to use barrier contraceptives.
- Arrange for regular follow-up during long-term therapy. Consider reducing dose if cholesterol falls below target.

Teaching points

- Take drug in the evening. Do not drink grapefruit juice while using this drug.
- Have periodic blood tests.
- This drug cannot be taken during pregnancy; using barrier contraceptives is recommended.
- You may experience these side effects: Nausea (eat frequent small meals); headache, muscle and joint aches and pains (may lessen); sensitivity to light (use a sunscreen and wear protective clothing).
- Report severe GI upset, changes in vision, unusual bleeding or bruising, dark urine or light-colored stools, fever, muscle pain, or soreness.

sipuleucil-T

See Appendix U, *Less commonly used drugs*.

▷ sirolimus

See Appendix U, *Less commonly used drugs*.

*** DANGEROUS DRUG ***

▷ sitagliptin phosphate

(sit ab glip' ten)

Januvia

PREGNANCY CATEGORY B

Drug classes

Antidiabetic drug

DPP-4 (dipeptidyl peptidase-4) enzyme inhibitor

Therapeutic actions

Slows the inactivation of the incretin hormones, increasing these hormone levels and prolonging their activity. The incretin hormones stimulate insulin release in response to a meal and help to regulate glucose homeostasis throughout the day. This increases and prolongs insulin release and reduces hepatic glucose production to help achieve glycemic control.

Indications

- Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes mellitus, as monotherapy or with other oral antidiabetics

Contraindications and cautions

- Contraindicated with history of serious hypersensitivity reactions to sitagliptin.
- Use cautiously with renal insufficiency, concurrent use of other drugs known to cause hypoglycemia, pregnancy, lactation.

Available forms

Tablets—25, 50, 100 mg

Dosages

Adults

100 mg/day PO as monotherapy or combined with metformin, pioglitazone, rosiglitazone, or other oral drugs.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

With creatinine clearance of 30–50 mL/min, 50 mg/day PO; with creatinine clearance less than 30 mL/min, 25 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–4 hr

Metabolism: Unchanged; $T_{1/2}$: 12.4 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **Respiratory:** *Nasopharyngitis, URIs*
- **Other:** Hypoglycemia

Interactions

- **Drug-drug** • Risk of hypoglycemia when combined with other drugs or herbal remedies known to cause hypoglycemia; monitor patient closely and adjust dosages as needed

■ Nursing considerations

Assessment

- **History:** Renal impairment, pregnancy, lactation
- **Physical:** R, adventitious sounds; blood sugar, HbA_{1C}, renal function tests

Interventions

- Monitor blood glucose levels and HbA_{1C} before and periodically during therapy.
- Ensure that patient continues exercise and diet program for management of type 2 diabetes.
- Monitor baseline renal function tests before and periodically during therapy.
- Ensure that patient continues with appropriate use of other drugs to manage type 2 diabetes if indicated.
- Arrange for thorough diabetic teaching program to include diet, exercise, signs and symptoms of hypoglycemia and hyperglycemia, safety measures to avoid infections, injuries.

Teaching points

- This drug should be taken once a day, with or without food.

- If you forget a dose of the drug, take it as soon as you remember, then begin your usual dosage the next day. Do not make up skipped doses or take more than one dose each day.
- Monitor your blood glucose levels as directed by your health care provider.
- Continue the diet and exercise program designed for the treatment of your type 2 diabetes; continue any other drugs used to treat your diabetes if instructed to do so by your health care provider.
- Arrange for periodic monitoring of your fasting blood sugar and glycosylated hemoglobin levels.
- It is not known if this drug could affect a fetus. If you are pregnant or are thinking about becoming pregnant, consult your health care provider.
- It is not known how this drug could affect a nursing baby; discuss the use of this drug during breast-feeding with your health care provider.
- During times of stress (surgery, infection, injury), your body's needs change. Consult your health care provider immediately if you experience times of stress; your dosage or drug choices may need to change.
- Report any other drug, herbal remedies, or over-the-counter medications you may be using to your health care provider; many of these are known to alter your glucose levels, and dosage adjustments may be needed.
- Report fever or signs of infection, uncontrolled glucose levels, severe headache, stress, or trauma.

sodium bicarbonate (soe' dee um)

Parenteral: Neut

Prescription and OTC preparations: Bell/ans

PREGNANCY CATEGORY C

Drug classes

Antacid

Electrolyte

Systemic alkalinizer

Urinary alkalinizer

Therapeutic actions

Increases plasma bicarbonate; buffers excess hydrogen ion concentration; raises blood pH; reverses the clinical manifestations of acidosis; increases the excretion of free base in the urine, effectively raising the urinary pH; neutralizes or reduces gastric acidity, resulting in an increase in the gastric pH, which inhibits the proteolytic activity of pepsin.

Indications

- Treatment of metabolic acidosis, with measures to control the cause of the acidosis
- Adjunctive treatment in severe diarrhea with accompanying loss of bicarbonate
- Treatment of certain drug intoxications, hemolytic reactions that require alkalinization of the urine; prevention of methotrexate nephrotoxicity by alkalinization of the urine
- Minimization of uric acid crystalluria in gout, with uricosuric agents
- Minimization of sulfonamide crystalluria
- Oral: Symptomatic relief of upset stomach from hyperacidity associated with peptic ulcer, gastritis, peptic esophagitis, gastric hyperacidity, hiatal hernia
- Oral: Prophylaxis of GI bleeding, stress ulcers, aspiration pneumonia
- To reduce the incidence of chemical phlebitis and patient discomfort due to vein irritation at or near the infusion site by raising the pH of IV acid solutions

Contraindications and cautions

- Contraindicated with allergy to components of preparations; low serum chloride (secondary to vomiting, continuous GI suction, diuretics associated with hypochloremic alkalosis); metabolic and respiratory alkalosis; hypocalcemia (alkalosis may precipitate tetany).
- Use cautiously with impaired renal function, HF, edematous or sodium-retaining states, oliguria or anuria, potassium depletion (may predispose to metabolic alkalosis), pregnancy, lactation.

Available forms

Injection—0.5, 0.6, 0.9, 1.0 mEq/mL; neutralizing additive solution—0.48, 0.5 mEq/mL; tablets—325, 520, 650 mg

Dosages**Adults**

- **Urinary alkalization:** Initially, 3,900 mg; then 1,300–2,600 mg every 4 hr.
- **Antacid:** 300 mg–2 g daily to qid PO, usually 1–3 hr after meals and at bedtime.
 - *60 yr and older:* 1 or 2 tablets every 4 hr; maximum, 12 tablets/24 hr.
 - *Younger than 60 yr:* 1–4 tablets every 4 hr; maximum, 24 tablets/24 hr.
- **Adjunct to advanced CV life support during CPR:** Although no longer routinely recommended, inject either 300–500 mL of a 5% solution or 200–300 mEq of a 7.5% or 8.4% solution as rapidly as possible. Base further doses on subsequent blood gas values. Alternatively for adults, 1 mEq/kg dose, then repeat 0.5 mEq/kg every 10 min.
- **Severe metabolic acidosis:** Dose depends on blood carbon dioxide content, pH, and patient's clinical condition. Generally, administer 90–180 mEq/L IV during first hr, then adjust PRN.

Adults and adolescents

- **Less urgent metabolic acidosis:** 2–5 mEq/kg as a 4–8 hr IV infusion. May be added to IV fluids, with rate and dosage determined by arterial blood gases and estimation of base deficit.

Pediatric patients

1 to 2 mEq/kg (1 mL/kg of an 8.4% solution) by slow IV or intraosseous injection.

Younger than 2 yr: Use 4.2% solution. Don't exceed 8 mEq/kg daily.

Metabolic acidosis:

Younger children—Use caution, and base dosage on blood gases and calculation of base deficit.

Older children—Follow adult recommendation.

- **Urinary alkalization:** 84–840 mg/kg PO daily.

Geriatric patients or patients with renal impairment

Reduce dosage and carefully monitor base deficit, serum electrolytes, and clinical response.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	30 min	1–3 hr
IV	Immediate	Rapid	Unknown

Metabolism: $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Direct IV push requires no further preparation; continuous infusion may be diluted in saline, dextrose, and dextrose and saline solutions.

Infusion: Administer by IV direct injection slowly; continuous infusion should be regulated with close monitoring of electrolytes and response, 2–5 mEq/kg over 4–8 hr.

Incompatibilities: Avoid solutions containing calcium; precipitation may occur.

Y-site incompatibilities: Do not give with inamrinone, verapamil, calcium. Norepinephrine and dobutamine are also incompatible.

Adverse effects

- **GI:** Gastric rupture following ingestion
- **Hematologic:** *Systemic alkalosis* (headache, nausea, irritability, weakness, tetany, confusion), hypokalemia secondary to intracellular shifting of potassium, hypernatremia
- **Local:** Chemical cellulitis, tissue necrosis, ulceration and sloughing at the site of infiltration (parenteral)

Interactions

- **Drug-drug** • Increased pharmacologic effects of anorexiant, flecainide, quinidine, sympathomimetics with oral sodium bicarbonate
- Increased half-lives and duration of effects of amphetamines, ephedrine, pseudoephedrine due to alkalization of urine
- Decreased pharmacologic effects of lithium, salicylates, sulfonyleureas, methotrexate, doxycycline, and other tetracyclines

■ Nursing considerations

Assessment

- **History:** Allergy to components of preparations, low serum chloride, metabolic and respiratory alkalosis, hypocalcemia, impaired renal function, HF, edematous or sodium-retaining states, oliguria or anuria, potassium depletion, pregnancy
- **Physical:** Skin color, turgor; injection sites; P, rhythm, peripheral edema; bowel sounds, abdominal examination; urinary output; serum electrolytes, serum bicarbonate, arterial blood gases, urinalysis, renal function tests

Interventions

⊗ **Warning** Monitor arterial blood gases, and calculate base deficit when administering parenteral sodium bicarbonate. Adjust dosage based on response. Administer slowly, and do not attempt complete correction within the first 24 hr; risk of systemic alkalosis is increased.

- Give parenteral preparations by IV route.

⊗ **Warning** Check serum potassium levels before IV administration; risk of metabolic acidosis is increased in states of hypokalemia, requiring reduction of sodium bicarbonate. Monitor IV injection sites carefully; if infiltration occurs, promptly elevate the site, apply warm soaks, and if needed, arrange for the local injection of lidocaine or hyaluronidase to prevent sloughing.

- Have patient chew oral tablets thoroughly before swallowing, and follow them with a full glass of water.
- Do not give oral sodium bicarbonate within 1–2 hr of other oral drugs to reduce risk of drug interactions.
- Monitor cardiac rhythm carefully during IV administration.

Teaching points

- Chew oral tablets thoroughly, and follow with a full glass of water. Do not take within 1–2 hours of any other drugs to decrease risk of drug interactions.
- Have periodic blood tests and medical evaluations.
- Report irritability, headache, tremors, confusion, swelling of extremities, difficulty breathing, black or tarry stools, pain at IV injection site (parenteral form).

▷ sodium ferric gluconate complex

See Appendix U, *Less commonly used drugs*.

▷ sodium fluoride (soe' dee um)

ACT, Fluor-A-Day (CAN), Fluorigard, Fluorinse, Fluoritab, Flura, Flura-Drops, Flura-Loz, Gel Kam, Gel-Tin, Karidium, Karigel, Karigel-N, Luride, MouthKote F/R, Pediaflor, Pharmaflur, Pharmaflur df, Pharmaflur 1.1, Phos-Flur, PreviDent 5000 Plus, Stop, Thera-Flur-N Gel-Drops

PREGNANCY CATEGORY C

Drug classes

Mineral

Trace element

Therapeutic actions

Acts systemically before tooth eruption and topically after tooth eruption to increase tooth resistance to acid dissolution and promote remineralization of teeth and inhibit caries formation by microbes.

Indications

- Prevention of dental caries
- Unlabeled use: Prevention of osteoporosis

Contraindications and cautions

- Contraindicated in areas where fluoride content of drinking water exceeds 0.7 parts per million (ppm), with low-sodium or sodium-free diets, hypersensitivity to fluoride. Do not use in children younger than 3 yr when the fluoride content of drinking water is 0.3 ppm or more. Do not use 1 mg/5 mL (as a supplement) in children younger than 6 yr.
- Use cautiously with pregnancy, lactation.

Available forms

Chewable tablets—0.25, 0.5, 1 mg; tablets—1 mg; drops—0.125, 0.25, 0.5 mg/mL; lozenges—1 mg; solution—0.2 mg/mL;

rinse—0.02%, 0.04%, 0.09%, 0.2%; gel—0.1%, 0.5%, 1.2%, 1.23%

Dosages

Adults

Rinse or topical rinse

10 mL once daily or weekly; swish around teeth and spit out.

Gel or cream

Apply thin ribbon to toothbrush or mouth tray for 1 min; brush, rinse, and spit out.

Pediatric patients

Oral

- Fluoride content of drinking water less than 0.3 ppm:
 - 6 mo–3 yr: 0.25 mg PO daily.
 - 3–6 yr: 0.5 mg PO daily.
 - 6–16 yr: 1 mg PO daily.
- Fluoride content of drinking water 0.3–0.6 ppm:
 - 6 mo–3 yr: None.
 - 3–6 yr: 0.25 mg PO daily.
 - 6–16 yr: 0.5 mg PO daily.
- Fluoride content of drinking water more than 0.6 ppm: None.

Rinse or topical rinse

6–12 yr: 5–10 mL/day.

Older than 12 yr: 10 mL/day; have patient swish around teeth for 1 min and spit out.

Gel

Apply 4–6 drops on applicator. Put applicator over teeth and bite down for 6 min. Have patient spit out excess gel.

Pharmacokinetics

Route	Onset
Oral	Unknown

Metabolism: $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, sweat, urine

Adverse effects

- Dermatologic:** Eczema, atopic dermatitis, urticaria, rash
- Other:** Gastric distress, headache, weakness, staining of teeth (with stannous fluoride rinse)

Interactions

* **Drug-food** • Milk, dairy products may decrease absorption; avoid simultaneous use

Nursing considerations

Assessment

- History:** Fluoride content of drinking water; low-sodium or sodium-free diets; hypersensitivity to fluoride; pregnancy, lactation
- Physical:** Skin color, turgor; state of teeth and gums

Interventions

- Do not give within 1 hr of milk or dairy products.
- Tablets may be chewed, swallowed whole, or added to drinking water or juice.
- Give drops undiluted, or with fluids or food.
- Ensure that patient has brushed and flossed teeth before using rinse and that patient expectorates fluid; it should not be swallowed.
- Ensure that patients using cream or gel rinse thoroughly and spit out fluid.
- Monitor teeth, and arrange for dental consultation if mottling of teeth occurs.

⊗ **Warning** Monitor patient for signs of overdose (salivation, nausea, abdominal pain, vomiting, diarrhea, irritability, seizures, respiratory arrest); forced diuresis, gastric lavage, or supportive measures may be required.

Teaching points

- Take this drug as prescribed; chew tablets, swallow whole, or add to drinking water or fruit juice.
- Dilute drops in fluids or food, or take undiluted.
- Brush and floss before using rinse; swish around mouth and spit out liquid; do not eat, drink, or rinse out mouth for 30 minutes after use. If using cream or gel, apply thin ribbon to toothbrush, brush, rinse thoroughly and spit.
- Avoid using milk or dairy products and this drug within 1 hour of each other.
- Arrange to have regular dental examinations.
- Report increased salivation, nausea, abdominal pain, diarrhea, irritability, mottling of teeth.

sodium oxybate (soe' dee um)

Xyrem

PREGNANCY CATEGORY B

CONTROLLED SUBSTANCE C-III

Drug classes

Anticatataplectic
CNS depressant

Therapeutic actions

CNS depressant, its mechanism of action in affecting cataplexy is not understood.

Indications

- Treatment of excessive daytime sleepiness and cataplexy in patients with narcolepsy
- Unlabeled uses: Fibromyalgia pain, fatigue

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, succinic semialdehyde dehydrogenase deficiency, concomitant treatment with sedative-hypnotics.
- Use cautiously with respiratory dysfunction, depression, pregnancy, lactation.

Available forms

Solution—500 mg/mL

Dosages

Adults

4.5 g/day PO divided into two equal doses of 2.25 g. Administer drug at bedtime and again 2.5–4 hr later. Doses may be increased no more than every 1–2 wk to a maximum of 9 g/day in increments of 1.5 g/day (0.75 g/dose).

Pediatric patients younger than 16 yr

Safety and efficacy not established.

Patients with hepatic impairment

Reduce initial dose by half, and adjust dosage to effect while watching closely for adverse reactions.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	0.5–1.25 hr

Metabolism: Hepatic; $T_{1/2}$: 0.5–1 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Lungs, urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, sleepwalking, nervousness, confusion, depression, abnormal dreams, asthenia, muscle weakness, loss of consciousness, insomnia*
- **GI:** *Diarrhea, nausea, vomiting, abdominal pain, dyspepsia*
- **GU:** Urinary incontinence
- **Respiratory:** *URI symptoms, pharyngitis, sinusitis, rhinitis, respiratory depression*
- **Other:** *Flulike symptoms, accidental injury, back pain, infections*

Interactions

- **Drug-drug** • Risk for serious CNS depression if combined with any sedative-hypnotic drug, including alcohol; avoid this combination

Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug, succinic semialdehyde dehydrogenase deficiency, concomitant treatment with sedative-hypnotic agents, respiratory dysfunction, depression, pregnancy, lactation
- **Physical:** T; reflexes, affect, orientation; R, respiratory auscultation; LFTs

Interventions

 **Black box warning** Counsel patient that this drug is also known as GHB, a drug known for abuse. The patient will be asked to view an educational program, agree to the safety measures to ensure that only the patient has access to the drug, and agree to return for follow-up at least every 3 mo.

- Dilute each dose with 60 mL water in the child-resistant dosing cups. Prepare both the bedtime dose and the repeat dose at the same time.
- Encourage patient to refrain from eating for at least 2 hr before going to bed and taking the drug.

⊗ **Warning** Administer first dose of the day when the patient is in bed. Patient should stay in bed after taking the dose. The second dose should be given 2½–4 hr later, with the patient sitting up in bed. After taking the second dose, the patient should lie in bed.

- Encourage patient to avoid driving or performing tasks that require alertness for at least 6 hr after taking the drug.
- Do not administer any sedative or hypnotic drugs to a patient who is taking sodium oxybate.
- Provide safety precautions for storage and dispensing of the drug.

Teaching points

- Prepare two doses of the drug in the evening before going to bed. Add 60 milliliters (4 measuring tablespoons) water to the dose of the drug. Place the doses in the child-resistant dosing cups provided with the drug. Take the first dose when you first go to bed. Place the second dose in easy reach from your bed, but out of the reach of children or pets. Set your alarm to take the second dose 2½–4 hours later. Sit up in bed and take the dose. Lie back down and go back to sleep.
- Avoid eating for at least 2 hours before going to bed. Food will interfere with the actions of this drug.
- Take special precautions to ensure the safety of this drug. It is a controlled substance and cannot be shared with or given to any other person. The drug should be locked up and secured from other people and from children. Keep the drug in the original bottle. When the bottle is empty, remove the label, wash out the bottle and throw the bottle away.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks for at least 6 hours after taking the drug); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult a dietitian to maintain nutrition); symptoms of upper respiratory tract infection, cough (do not self-medicate; consult your health care provider if this becomes uncomfortable); urinary incontinence or bed-wetting (consult your health care provider if this occurs).

- Report fever, difficulty breathing, bed-wetting, confusion, depression, pregnancy.

▷ sodium phenylacetate/sodium benzoate

See Appendix U, *Less commonly used drugs*.

▷ sodium polystyrene sulfonate (*soe' dee um*)

Kayexalate, Kionex, SPS

PREGNANCY CATEGORY C

Drug class

Potassium-removing resin

Therapeutic actions

An ion exchange resin that releases sodium ions in exchange for potassium ions as it passes along the intestine after oral administration or is retained in the colon after enema, thus reducing elevated serum potassium levels; action is limited and unpredictable.

Indications

- Treatment of hyperkalemia

Contraindications and cautions

- Contraindicated with allergy to any component of the drug, obstructive bowel, severe hypertension, severe HF, marked edema (risk of sodium overload).
- Use cautiously with severe hyperkalemia; may need other definitive measures.

Available forms

Suspension—15 g/60 mL; powder 4.1 mEq/g

Dosages

Adults

Oral

15–60 g/day, best given as 15 g daily to qid. May be given as suspension with water or syrup (20–100 mL). Often given with sorbitol to combat constipation. May be introduced into stomach via nasogastric tube.

Enema

30–50 g every 6 hr given in appropriate vehicle and retained for 30–60 min or as long as possible.

Pediatric patients

Give lower doses, using the exchange ratio of 1 mEq potassium/g resin as the basis for calculation; a dose of approximately 1 g/kg every 6 hr has been recommended.

Pharmacokinetics

Route	Onset
Oral	2–12 hr
Rectal	Very long

Excretion: Feces

Adverse effects

- **GI:** *Constipation*, fecal impaction, *gastric irritation*, *anorexia*, *nausea*, *vomiting*
- **Hematologic:** *Hypokalemia*, electrolyte abnormalities (particularly decrease in calcium and magnesium)

Interactions

• **Drug-drug** • Risk of metabolic alkalosis with nonabsorbable cation-donating antacids (eg, magnesium hydroxide, aluminum carbonate)

■ Nursing considerations**Assessment**

- **History:** Severe hypertension, severe HF; marked edema
- **Physical:** Orientation, reflexes; P, auscultation, BP, baseline ECG, peripheral edema; bowel sounds, abdominal examination; serum electrolytes

Interventions

- Administer resin through plastic stomach tube, or mixed with a diet appropriate for renal failure.
- Give powder form of resin in an oral suspension with a syrup base to increase palatability.
- Administer as an enema after first giving a cleansing enema; insert a soft, large (French 28) rubber tube into the rectum for a distance of about 20 cm; with the tip well into the sigmoid colon, tape into place. Suspend the resin in 100 mL sorbitol or 20% dex-

trose in water at body temperature, introduce by gravity, keeping the particles in suspension by stirring. Flush with 50–100 mL fluid and clamp the tube, leaving it in place. If back leakage occurs, elevate hips or have patient assume the knee-chest position. Retain suspension for at least 30 min (several hours is preferable), then irrigate the colon with a non-sodium-containing solution at body temperature; 2 quarts of solution may be necessary to remove the resin. Drain the return constantly through a Y-tube connection.

⊗ **Warning** Prepare fresh suspensions for each dose. Do not store beyond 24 hr. Do not heat suspensions; this may alter the exchange properties.

- Monitor patient and consider use of other measures (IV calcium, sodium bicarbonate, or glucose and insulin) in cases of severe hyperkalemia, with rapid tissue breakdown: burns, renal failure.
- Monitor serum electrolytes (potassium, sodium, calcium, magnesium) regularly, and arrange to counteract disturbances.
- Arrange for treatment of constipation with 10–20 mL of 70% sorbitol every 2 hr or as needed to produce two watery stools per day. Establish a bowel training program.

Teaching points

- This drug is often used in emergencies. Drug instruction should be incorporated within general emergency instructions.
- Frequent blood tests will be needed to monitor drug effect.
- You may experience these side effects: GI upset, constipation.
- Report confusion, irregular heartbeats, constipation, severe GI upset.

 **solifenacin succinate**
(sole ab fen' ab sin suck' sin ate)

VESIcare DMC

PREGNANCY CATEGORY C

Drug classes

Muscarinic receptor antagonist
Urinary antispasmodic

Therapeutic actions

Counteracts smooth muscle spasm of the urinary tract by relaxing the detrusor and other smooth muscles through action at the muscarinic parasympathetic receptors.

Indications

- Treatment of overactive bladder with symptoms of urge urinary incontinence, urgency, and urinary frequency

Contraindications and cautions

- Contraindicated with allergy to drug or any component of the drug, severe hepatic impairment, urine retention, gastric retention, uncontrolled narrow-angle glaucoma, lactation.
- Use cautiously with presence of bladder outflow obstruction, GI obstructive disorders, decreased GI motility, controlled narrow-angle glaucoma, reduced renal or hepatic function, congenital or acquired QT prolongation, pregnancy.

Available forms

Tablets **OTC**—5, 10 mg

Dosages

Adults

5 mg/day PO, swallowed whole with water. May be increased to 10 mg/day if desired effect is not seen.

Pediatric patients

Safety and efficacy not established.

Patients with severe renal or moderate hepatic impairment

Do not exceed 5 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3–8 hr

Metabolism: Hepatic: $T_{1/2}$: 45–68 hr

Distribution: May cross placenta, may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, blurred vision, dry eyes
- **GI:** *Dry mouth, constipation*, nausea, dyspepsia, upper abdominal pain, vomiting

- **GU:** Urinary retention
- **Respiratory:** Cough
- **Other:** Fatigue, lower limb edema

Interactions

* **Drug-drug** ⊗ **Warning** There is a risk of prolonged QT interval and potential serious cardiac arrhythmias if combined with other drugs that prolong QT interval; monitor patient closely.

- Risk of increased serum levels and toxic effects if combined with ketoconazole; if this combination is used, monitor patient and consider lowering dose of solifenacin; maximum dose of 5 mg daily with ketoconazole or other potent CYP3A4 inhibitors

Nursing considerations

Assessment

- **History:** Allergy to drug or any component of the drug, urinary retention, gastric retention, uncontrolled narrow-angle glaucoma, lactation, bladder outflow obstruction, GI obstructive disorders, decreased GI motility, reduced renal or hepatic function, congenital or acquired QT prolongation, pregnancy
- **Physical:** Orientation, affect, reflexes, ophthalmic examination, ocular pressure measurement; P; bowel sounds, oral mucous membranes; baseline ECG, LFTs, renal function tests, bladder residual volume

Interventions

- Arrange for definitive treatment of underlying medical conditions that may be causing overactive bladder.
- Ensure that patient does not cut, crush, or chew tablets.
- Provide sugarless lozenges for patient to suck and frequent mouth care if dry mouth is a serious problem.
- Provide frequent small meals if GI upset occurs.
- Establish bowel program if constipation is a problem.
- Arrange for ophthalmic examination before beginning therapy and periodically during therapy.
- Establish safety precautions if CNS effects occur.

- Measure post-void residual urine volume if patient has difficulty voiding.

Teaching points

- Take drug once a day with water. Swallow whole, do not cut, crush or chew tablet. Take with or without food.
- Be aware that this drug is meant to relieve the symptoms you are experiencing; other medications may be used to treat the cause of the symptoms.
- You may not be able to sweat normally while on this drug; use caution in any situation that could lead to overheating.
- Consult your health care provider if you become pregnant or want to become pregnant; it is not known if this drug affects the fetus.
- If you are breast-feeding a baby, another method of feeding the baby should be used while you are on this drug.
- You may experience these side effects: Dry mouth, GI upset (sucking on sugarless lozenges and frequent mouth care may help); drowsiness, blurred vision (avoid driving or performing tasks that require alertness while on this drug); constipation (medication may be available to help).
- Report inability to void, fever, blurring of vision, severe constipation.

somatotropin (*soe ma troe' pin*)

Accretropin, Genotropin, Genotropin Miniquick, Humatrope, HumatroPen, Norditropin, Norditropin FlexPro, Norditropin Nordiflex Pen, Nutropin, Nutropin AQ, Nutropin AQ NuSpin 20, Omnitrope, Saizen, Serostim, Serostim LQ, Tev-Tropin, Zorbtive

PREGNANCY CATEGORY C

PREGNANCY CATEGORY B
(GENOTROPIN, SAIZEN, SEROSTIM)

Drug class

Hormone

Therapeutic actions

Hormone of recombinant DNA origin; contains the identical amino acid sequence of pituitary-derived human growth hormone; therapeutically equivalent to endogenous growth hormone; stimulates skeletal (linear) growth, growth of internal organs, protein synthesis, many other metabolic processes required for normal growth.

Indications

- All but *Serostim*: Long-term treatment of children with growth failure due to lack of adequate endogenous growth hormone secretion
- *Nutropin* and *Nutropin AQ*: Treatment of children with growth failure related to chronic renal failure, chronic renal insufficiency, up to the time of renal transplantation
- *Accretropin*, *Genotropin*, *Norditropin*, *Nutropin*, *Nutropin AQ*, and *Humatrope*, *HumatroPen*: Treatment of girls suffering from Turner's syndrome
- *Serostim*, *Serostim LQ*: Treatment of AIDS wasting and cachexia to increase lean body mass and improve physical endurance
- *Genotropin*: Long-term treatment of children with growth failure due to Prader-Willi syndrome (PWS)
- *Genotropin*: Long-term treatment of growth failure in children of small gestational age (SGA) who do not catch up by 2 yr
- *Genotropin*, *Norditropin*, *Nutropin*, *Nutropin AQ*, *Humatrope*, *Omnitrope*, *Saizen*: Growth hormone deficiency (GHD) in adults
- *Humatrope*, *HumatroPen*: Treatment of short stature or growth failure in children with short staturehomeobox (SHOX)-containing gene deficiency whose epiphyses have not closed.
- *Humatrope*, *Norditropin*: Treatment of short stature in children of SGA who do not manifest catch-up growth by 2–4 yr
- *Humatrope*, *Nutropin*, *Nutropin AQ*: Long-term treatment of idiopathic short stature in pediatric patients whose epiphyses are not closed and for whom diagnostic evaluation excludes other causes treatable by other means
- *Norditropin*: Treatment of short stature in children with Noonan syndrome or Turner's syndrome

- *Norditropin*: Treatment of adults with severe GHD
- *Saizen*: Replacement of endogenous growth hormone in adults with GHD who have GHD alone or in combination with multiple hormone deficiencies as a result of pituitary disease, hypothalamic disease, surgery, radiation therapy, or trauma or who had GHD as a child and who have had continued GHD established as an adult
- *Zorbtive*: Treatment of short bowel syndrome in patients receiving specialized nutritional support

Contraindications and cautions

- Contraindicated with known sensitivity to somatropin, benzyl alcohol, glycerin (*Humatrope*), closed epiphyses, underlying cranial lesions, neoplasms, diabetic retinopathy, acute illness secondary to complications of open-heart surgery, abdominal surgeries, accidental trauma.
- Use cautiously with pregnancy, lactation.

Available forms

Powder for injection—varies for each brand; prefilled injection pen—5, 10, 15 mg/mL, 30 mg/3mL

Dosages

Individualize dosage based on response.

Adults

Serostim

Weighing less than 35 kg: 0.1 mg/kg subcutaneously daily at bedtime.

Weighing 35–45 kg: 4 mg subcutaneously daily.

Weighing 45–55 kg: 5 mg subcutaneously daily.

Weighing more than 55 kg: 6 mg subcutaneously daily.

Serostim LQ

0.1 mg/kg/day subcutaneously to a maximum 6 mg; patients at increased risk for adverse effects can try 0.1 mg/kg every other day.

Humatrope

Up to 0.006 mg/kg/day subcutaneously; may increase to 0.0125 mg/kg/day.

Nutropin, Nutropin AQ

Up to 0.006 mg/kg/day subcutaneously up to 0.025 mg/kg/day in patients younger than

35 yr and 0.0125 mg/kg/day in patients older than 35 yr. Increase dose in increments of 0.1–0.2 mg/day.

Norditropin

Up to 0.004 mg/kg/day subcutaneously; may be increased to 0.016 mg/kg/day over 6 wk if needed.

Saizen

0.005 mg/kg/day by subcutaneous injection; may be increased up to 0.01 mg/kg/day after 4 wk depending on response and tolerance. Titration should be based on age and gender adjusted serum growth factor levels.

Omnitrope, Genotropin

0.04 mg/kg/wk subcutaneously divided into seven injections; increase at 4- to 8-wk intervals to a maximum of 0.08 mg/kg/wk.

Zorbtive

0.1 mg/kg/day subcutaneously for a maximum of 8 mg/day. Administer daily for 4 wk.

Pediatric patients

Accretropin

- *GHD*: 0.18–0.3 mg/kg/wk subcutaneously divided into daily doses.

- *Turner's syndrome*: 0.36 mg/kg/wk subcutaneously divided into daily doses.

Humatrope

0.18–0.3 mg/kg/wk subcutaneously or IM divided into doses given three times/wk or six times/wk for GHD.

- *Turner's syndrome*: Up to 0.375 mg/kg/wk subcutaneously divided into equal doses given either daily or on 3 alternate days.

- *Short stature with SHOX*: 0.35 mg/kg by subcutaneous injection each week, divided into equal daily doses.

Nutropin or Nutropin AQ

- *GHD*: 0.3 mg/kg/wk subcutaneously up to 0.7 mg/kg/wk in divided daily injections.

- *Chronic renal insufficiency*: 0.35 mg/kg/wk subcutaneously divided into daily doses.

- *Turner's syndrome*: up to 0.375 mg/kg/wk subcutaneously divided into equal doses given either daily or on 3 alternate days.

Omnitrope

0.16–0.24 mg/kg/wk subcutaneously divided into daily doses.

Saizen

0.06 mg/kg subcutaneously or IM three times/wk.

Norditropin

0.024–0.034 mg/kg subcutaneously, six to seven times/wk.

- **Noonan syndrome:** Up to 0.066 mg/kg/day subcutaneously.
- **Turner's syndrome:** Up to 0.067 mg/kg/day subcutaneously.

Tev-Tropin

Up to 0.1 mg/kg subcutaneously three times per wk.

Genotropin

0.24 mg/kg/wk subcutaneously for PWS divided into six to seven doses; 0.16–0.24 mg/kg/wk subcutaneously for GHD divided into six to seven doses; 0.48 mg/kg/wk for SGA.

Pharmacokinetics

Route	Onset	Peak
IM, Subcut.	Varies	3–7.5 hr

Metabolism: Hepatic; $T_{1/2}$: 1.7–4.2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **Endocrine:** Hypothyroidism, insulin resistance
- **Hematologic:** *Development of antibodies to growth hormone*
- **Other:** Swelling, joint pain, muscle pain, carpal tunnel syndrome, increased growth of preexisting nevi, headache, injection site pain

Interactions

* **Drug-drug** • Use caution in combination with drugs metabolized by CYP450 liver enzymes

■ Nursing considerations**Assessment**

- **History:** Known sensitivity to somatropin, closed epiphyses, underlying cranial lesions
- **Physical:** Height; weight; thyroid function tests, glucose tolerance tests, growth hormone levels

Interventions

- Administer drug IM or subcutaneously as appropriate.

- Divide total dose into smaller increments given six to seven times/wk for smaller patients unable to tolerate injections.
- Reconstitute drug following manufacturer's instructions; do not shake; do not inject if solution is cloudy or contains particles.
- Refrigerate vials; reconstituted vials should be used within 7 days; do not freeze drug.
- Arrange for tests of glucose tolerance, thyroid function, and growth hormone antibodies. Arrange for treatment as indicated.

Teaching points

- This drug must be given IM or subcutaneously (depending on drug). It can be given in six to seven smaller doses if needed. Dispose of syringes properly.
- You may experience these side effects: Sudden growth, increased appetite; decreased thyroid function (fatigue, malaise, hair loss, dry skin—request hormone).
- Report lack of growth, increased hunger, thirst, increased and frequent voiding, fatigue, dry skin, intolerance to cold.

▷ somatropin, rDNA origin

See Appendix U, *Less commonly used drugs*.

▷ sorafenib tosylate

See Appendix U, *Less commonly used drugs*.

▷ sotalol hydrochloride (sob' tal lole)

Apo-Sotalol (CAN), Betapace, Betapace AF, Gen-Sotalol (CAN), PMS-Sotalol (CAN), ratio-Sotalol (CAN), Sorine

PREGNANCY CATEGORY B

Drug classes

Antiarrhythmic, classes II and III
Beta-adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney), thus decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption.

Indications

- Treatment of life-threatening ventricular arrhythmias; because of proarrhythmic effects, use for less than life-threatening arrhythmias, even symptomatic ones, is not recommended
- *Betapace AF*: Maintenance of normal sinus rhythm—to delay the time to recurrence of atrial fibrillation or flutter in patients with symptomatic atrial fibrillation or flutter who are currently in sinus rhythm

Contraindications and cautions

- Contraindicated with bronchial asthma (*Betapace*), sinus bradycardia (HR less than 45 beats/min), second, or third-degree heart block (PR interval greater than 0.24 sec), cardiogenic shock, uncontrolled HF, lactation, congenital or acquired long QT syndromes, hypokalemia and hypomagnesemia.
- Use cautiously with diabetes or thyrotoxicosis, hepatic or renal impairment, sick sinus syndrome, recent MI, pregnancy.

Available forms

Tablets—80, 120, 160, 240 mg; injection—15 mg/mL

Dosages

Adults

Initial dose, 80 mg PO bid. Adjust gradually, every 3 days, until appropriate response occurs; may require 240–320 mg/day (*Betapace*); up to 120 mg bid (*Betapace AF*). Use IV dose as a substitute for oral therapy when patient is unable to take drug orally. Initially, 75 mg IV over 5 hours twice a day; may be increased in increments of 75 mg/day every 3 days. Range: 225–300 mg once or twice a day for ventricular arrhythmias; 112.5 mg once or twice a day for AF. Monitor QT interval. Switch to oral form as soon as possible. Converting between oral and IV doses: 80 mg oral—75 mg IV; 120 mg oral—112.5 mg IV; 160 mg oral—150 mg IV

Pediatric patients older than 2 yr with normal renal function

30 mg/m² tid. Can titrate to a maximum of 60 mg/m². Allow 36 hr between increments.

Pediatric patients younger than 2 yr

See manufacturer's instructions.

Geriatric patients or patients with renal impairment

Betapace

For creatinine clearance less than 10 mL/min, individualize dose based on response. See table below for dosing intervals.

CrCl (mL/min)	Dosing Intervals
More than 60	12 hr
30–59	24 hr
10–29	36–48 hr

Betapace AF

Betapace AF is contraindicated for creatinine clearance less than 40 mL/min. See table below for dosing intervals.

CrCl (mL/min)	Dosing Intervals
More than 60	12 hr
40–59	24 hr

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–4 hr

Metabolism: T_{1/2}: 12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute before infusing in normal saline, D₅W, or lactated Ringer's. Prepare a volume of 100–250 mL.

Infusion: Infuse using a volumetric infusion pump to deliver a constant rate over 5 hr.

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm, respiratory distress**
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech

- **CV:** HF, cardiac arrhythmias, SA or AV nodal block, peripheral vascular insufficiency, claudication, **stroke, pulmonary edema**, hypertension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting, anorexia
- **GU:** Impotence, decreased libido, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis
- **Other:** Decreased exercise tolerance, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated serum transaminase

Interactions

- *** Drug-drug** • Possible increased effects with verapamil • Increased risk of orthostatic hypotension with prazosin • Possible increased BP lowering effects with aspirin, bismuth subsalicylate, magnesium salicylate, sulfapyrazone, hormonal contraceptives • Decreased antihypertensive effects with NSAIDs, clonidine • Possible increased hypoglycemic effect of insulin • Risk of potentially fatal arrhythmias if combined with drugs that increase QTc interval (class I and III antiarrhythmics, phenothiazines, TCAs, bepridil, certain oral macrolides, certain quinolone antibiotics) • Possible reduction of efficacy when given with antacids containing aluminum oxide and magnesium hydroxide
- *** Drug-lab test** • Possible false results with glucose or insulin tolerance tests (oral)

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia; second- or third-degree heart block; cardiogenic shock, HF; asthma, COPD; pregnancy, lactation; diabetes or thyrotoxicosis; prolonged QTc interval, bronchial asthma
- **Physical:** Weight; skin condition; neurologic status; P, BP, ECG; respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- Administer this drug on an empty stomach.
- **⊗ Black box warning** Do not give drug for ventricular arrhythmias unless the patient is unresponsive to other antiarrhythmics and has a life-threatening ventricular arrhythmia. Monitor patient response carefully; proarrhythmic effect can be pronounced.
- Maintain patient on continuous cardiac monitoring for at least 3 days when initiating therapy.
- **⊗ Warning** Do not discontinue drug abruptly after long-term therapy. Taper drug gradually over 2 wk with monitoring (abrupt withdrawal may cause serious beta-adrenergic rebound effects).
- Discontinue other antiarrhythmics gradually, allowing for two to three plasma half-lives of the drug before starting sotalol. After discontinuing amiodarone, do not start sotalol until QTc interval is normalized.
- Reserve IV use for patients unable to take drug orally. Monitor QT interval carefully. Switch to oral form as soon as feasible. Convert from IV to oral form; dosages are not the same.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Take drug on an empty stomach. You will be monitored closely as the drug is started.
- Do not stop taking unless told to do so by your health care provider.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Dizziness, light-headedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▽ spironolactone (speer on oh lak' tone)

Alactone, Novospiroton (CAN)

PREGNANCY CATEGORY C

Drug classes

Aldosterone antagonist

Potassium-sparing diuretic

Therapeutic actions

Competitively blocks the effects of aldosterone in the renal tubule, causing loss of sodium and water and retention of potassium.

Indications

- Diagnosis and maintenance of primary hyperaldosteronism
- Adjunctive therapy in edema associated with HF, nephrotic syndrome, hepatic cirrhosis when other therapies are inadequate or inappropriate
- Treatment of hypokalemia or prevention of hypokalemia in patients who would be at high risk if hypokalemia occurred (eg, patients receiving cardiac glycosides), patients with cardiac arrhythmias
- Essential hypertension, usually in combination with other drugs
- **NEW INDICATION:** Adjunctive therapy for treatment of severe heart failure (NYHA class III to IV) to increase survival and decrease need for hospitalization
- Unlabeled uses: Treatment of hirsutism because of its antiandrogenic properties, palliation of symptoms of PMS, treatment of familial male precocious puberty, short-term treatment of acne vulgaris

Contraindications and cautions

- Contraindicated with allergy to spironolactone, hyperkalemia, renal disease, anuria, amiloride or triamterene use.
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—25, 50, 100 mg

Dosages**Adults**

- **Edema:** Initially, 100 mg/day (range 25–200 mg/day) when given as the sole agent; continue at least 5 days; then adjust dosage or add another diuretic or both.
- **Diagnosis of hyperaldosteronism:** 400 mg/day PO for 3–4 wk (long test). Correction of hypokalemia and hypertension are pre-

sumptive evidence of primary hyperaldosteronism. 400 mg/day PO for 4 days (short test). If serum potassium increases but decreases when drug is stopped, presumptive diagnosis can be made.

- **Maintenance therapy for hyperaldosteronism:** 100–400 mg/day PO.
- **Essential hypertension:** 50–100 mg/day PO. May be combined with other diuretics.
- **Hypokalemia:** 25–100 mg/day PO.
- **Severe heart failure:** 25 mg/day PO if potassium level is 5 mEq/L or less and creatinine level is 2.5 mg/dL. Dose may be increased to 50 mg/day if well tolerated or reduced to 25 mg every other day if not well tolerated.

Pediatric patients

- Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	24–48 hr	48–72 hr	48–72 hr

Metabolism: Hepatic; $T_{1/2}$: 20 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** *Dizziness, headache, drowsiness, fatigue, ataxia, confusion*
- **Dermatologic:** *Rash, urticaria*
- **GI:** *Cramping, diarrhea, dry mouth, thirst, vomiting*
- **GU:** Impotence, irregular menses, amenorrhea, postmenopausal bleeding
- **Hematologic:** Hyperkalemia, hyponatremia, agranulocytosis
- **Other:** Carcinogenic in animals, *deepening of the voice, hirsutism, gynecomastia*

Interactions

★ **Drug-drug** • Increased hyperkalemia with potassium supplements, ACE inhibitors, diets rich in potassium • Decreased diuretic effect with salicylates • Decreased hypoprothrombinemic effect of anticoagulants • Increased hypotensive effect with diuretics and other hypotensive drugs, especially ganglionic blockers

★ **Drug-food** • Increased absorption when taken with food

• **Drug-lab test** • Interference with radioimmunoassay for digoxin; false increase in serum digoxin levels • Interference with fluorometric determinations of plasma and urinary cortisol

• **Drug-alternative therapy** • Decreased effectiveness if combined with licorice therapy

■ Nursing considerations

Assessment

- **History:** Allergy to spironolactone, hyperkalemia, renal disease, pregnancy, lactation
- **Physical:** Skin color, lesions, edema; orientation, reflexes, muscle strength; P, baseline ECG, BP; R, pattern, adventitious sounds; liver evaluation, bowel sounds; urinary output patterns, menstrual cycle; CBC, serum electrolytes, renal function tests, urinalysis

Interventions

⊗ **Black box warning** Drug has been shown to be a tumorigen with chronic toxicity in rats; avoid unnecessary use of this drug.

- Mark calendars of edema outpatients as reminders of alternate-day or 3- to 5-day/wk therapy.
- Give daily doses early so that increased urination does not interfere with sleep.
- Measure and record regular weight to monitor mobilization of edema fluid.
- Avoid giving food rich in potassium.
- Arrange for regular evaluation of serum electrolytes and BUN.

Teaching points

- Record alternate-day therapy on a calendar, or prepare dated envelopes. Take the drug early because of increased urination.
- Weigh yourself on a regular basis, at the same time and in the same clothing, and record the weight on your calendar.
- Avoid foods that are rich in potassium (fruits, *Sanka*); avoid licorice.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, confusion, feeling faint on arising, drowsiness (avoid rapid position changes, hazardous activities such as driving, using alcohol); increased thirst (suck on sugarless lozenges; use frequent mouth care); changes in menstrual cycle, deepening of

the voice, impotence, enlargement of the breasts can occur (reversible).

- Report weight change of more than 3 pounds in 1 day, swelling in your ankles or fingers, dizziness, trembling, numbness, fatigue, enlargement of breasts, deepening of voice, impotence, muscle weakness, or cramps.

▷ stavudine (d4T)

(stay *vyoo'* deen)

Zerit

PREGNANCY CATEGORY C

Drug classes

Antiviral

Nucleoside reverse transcriptase inhibitor

Therapeutic actions

Inhibits replication of some retroviruses, including HIV, HTLV III, LAV, and ARV.

Indications

- Treatment of HIV-1 infection in combination with other antiretroviral therapy

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component, lactation.
- Use cautiously with compromised bone marrow, impaired renal or hepatic function, or risk factors for liver disease, pregnancy.

Available forms

Capsules—15, 20, 30, 40 mg; oral solution—1 mg/mL

Dosages

Adults

Weighing 60 kg or more: 40 mg PO bid every 12 hr.

Weighing less than 60 kg: 30 mg PO bid every 12 hr.

Pediatric patients older than 13 days

Weighing 60 kg or more: 40 mg PO every 12 hr.

Weighing 30 kg to less than 60 kg: 30 mg PO every 12 hr.

Weighing less than 30 kg: 1 mg/kg/dose PO every 12 hr.

Pediatric patients, birth to 13 days

0.5 mg/kg/dose PO every 12 hr.

Patients with renal impairment

CrCl (mL/min)	Weighting 60 kg or more	Weighting less than 60 kg
More than 50	40 mg every 12 hr	30 mg every 12 hr
26–50	20 mg every 12 hr	15 mg every 12 hr
10–25	20 mg/day	15 mg/day

Patients with persistent peripheral neuropathy

Dose may be resumed at 50% of normal after temporary withdrawal.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	60–90 min

Metabolism: Unknown; $T_{1/2}$: 30–60 min**Distribution:** Crosses placenta; may enter breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** *Headache*, insomnia, myalgia, *asthenia*, malaise, dizziness, paresthesia, somnolence, motor weakness, peripheral neuropathy
- **GI:** *Nausea*, *GI pain*, *diarrhea*, anorexia, vomiting, dyspepsia, **hepatomegaly with steatosis, pancreatitis**
- **Hematologic:** *Agranulocytopenia*, severe anemia requiring transfusions
- **Other:** *Fever*, diaphoresis, dyspnea, *rash*, taste perversion, **lactic acidosis**, body fat redistribution

Interactions

★ **Drug-drug** • Increased risk of fatal or nonfatal pancreatitis if combined with didanosine; monitor closely • Increased risk of lactic acidosis, severe hepatomegaly when taken with other nucleoside analogues, such as zidovudine, doxorubicin, ribavirin

■ Nursing considerations**Assessment**

- **History:** Life-threatening allergy to any component; compromised bone marrow; impaired renal or hepatic function; pregnancy, lactation
- **Physical:** Skin rashes, lesions, texture; T; affect, reflexes, peripheral sensation; bowel sounds, liver evaluation; LFTs, renal function tests, CBC and differential

Interventions

⊗ **Black box warning** Monitor patient closely for pancreatitis throughout therapy; fatal and nonfatal pancreatitis have occurred.

- Monitor hematologic indices every 2 wk during therapy.

⊗ **Warning** Monitor neurologic function. If neuropathy occurs, discontinue. Restart at 50% dose when neuropathy resolves.

- Give every 12 hr, around-the-clock; schedule dose so it will not interrupt sleep.

⊗ **Black box warning** Monitor LFTs; lactic acidosis and severe hepatomegaly may occur.

Teaching points

- Take drug once each day. Do not share this drug; take exactly as prescribed.
- Stavudine is not a cure for AIDS; opportunistic infections may occur; regular medical care should be sought to deal with the disease.
- Always take this drug in combination with other HIV drugs.
- Frequent blood tests are needed; results may indicate a need to decrease or discontinue drug temporarily.
- Stavudine does not reduce the risk of HIV transmission by sexual contact or blood contamination; use appropriate precautions.
- This drug should be used during pregnancy only if the potential benefit justifies the potential risk; using barrier contraceptives is advised.
- You may experience these side effects: Nausea, loss of appetite, change in taste (eat frequent small meals); dizziness, loss of feeling (take precautions); headache, fever, muscle aches.
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty

breathing, rash, numbness or tingling in feet or hands.

▷ streptomycin sulfate

See Appendix U, *Less commonly used drugs*.

▷ streptozocin

See Appendix U, *Less commonly used drugs*.

▷ succimer (DMSA)

(*sux' i mer*)

Chemet

PREGNANCY CATEGORY C

Drug classes

Antidote

Chelate

Therapeutic actions

Forms water-soluble chelates with lead, leading to increased urinary excretion of lead.

Indications

- Treatment of lead poisoning in children with blood levels greater than 45 mcg/dL (not for prophylactic use)
- Orphan drug use: Prevention of cystine kidney stones in patients with homozygous cystinuria
- Unlabeled use: Treatment of other heavy metal poisonings (mercury, arsenic)

Contraindications and cautions

- Contraindicated with allergy to succimer, pregnancy (teratogenic and embryotoxic), lactation.
- Use cautiously with impaired renal or hepatic function.

Available forms

Capsules—100 mg

Dosages

Pediatric patients

Starting dose of 10 mg/kg or 350 mg/m² every 8 hr PO for 5 days; reduce dosage to 10 mg/kg

or 350 mg/m² every 12 hr PO for 2 wk (therapy runs for 19 days).

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr

Metabolism: Hepatic; T_{1/2}: 2 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Drowsiness, dizziness, sleepiness, otitis media, watery eyes
- **Dermatologic:** Papular rash, herpetic rash, mucocutaneous eruptions, pruritus
- **GI:** *Nausea, vomiting*, diarrhea, severe transaminases, metallic taste in mouth, loss of appetite
- **GU:** Decreased urination, voiding difficulty
- **Hematologic:** Neutropenia, increased platelets, intermittent eosinophilia
- **Other:** *Back, stomach, flank, head, rib pain*; chills; fever; flulike symptoms

Interactions

- **★ Drug-drug** • High risk of toxicity with other chelating agents (EDTA)
- **★ Drug-lab test** • False-positive tests of urine ketones using *Ketostix* • False decrease in serum uric acid, CPK

■ Nursing considerations

Assessment

- **History:** Allergy to succimer; lactation, pregnancy; renal or hepatic impairment
- **Physical:** Weight; orientation, affect; liver evaluation; urinalysis; LFTs, renal function tests; serum lead levels

Interventions

- Test serum blood levels before therapy and monitor weekly.
- Monitor serum transaminase level prior to and weekly during treatment.
- Identify the source of lead and facilitate its removal; succimer is not prophylactic to prevent lead poisoning.
- Ensure that patient continues therapy for full 19 days.

- For children unable to swallow capsules: Separate capsules and give medicated beads on a small amount of soft food or by spoon followed by fruit drink.
- All patients undergoing treatment should be adequately hydrated.

Teaching points

- For children unable to swallow capsules: Separate capsules and give medicated beads on a small amount of soft food or by spoon followed by fruit drink.
- Ensure child maintains good fluid intake.
- You may experience these side effects: Nausea, vomiting, loss of appetite (eat frequent small meals); abdominal, back, rib, flank pain (request medication).
- Report rash, difficulty breathing, difficulty walking, tremors.

sucralfate

(soo kral' fayt)

Apo-Sucralfate (CAN), Carafate,
Sulcrate (CAN)

PREGNANCY CATEGORY B

Drug class

Antiulcer drug

Therapeutic actions

Forms an ulcer-adherent complex at duodenal ulcer sites, protecting the ulcer against acid, pepsin, and bile salts, thereby promoting ulcer healing; also inhibits pepsin activity in gastric juices.

Indications

- Short-term treatment of duodenal ulcers, up to 8 wk
- Maintenance therapy for duodenal ulcer at reduced dosage after healing
- Orphan drug use: Treatment of oral and esophageal ulcers due to radiation, chemotherapy, and sclerotherapy
- Unlabeled uses: Accelerates healing of gastric ulcers, long-term treatment of gastric ulcers, treatment of reflux and peptic esophagitis, treatment of NSAID or aspirin-induced

GI symptoms and GI damage, prevention of stress ulcers in critically ill patients

Contraindications and cautions

- Contraindicated with allergy to sucralfate, chronic renal failure or dialysis (buildup of aluminum may occur with aluminum-containing products).
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—1 g; suspension—1 g/10 mL

Dosages

Adults

- *Active duodenal ulcer*: 1 g PO qid on an empty stomach (1 hr before meals and at bedtime). Continue treatment for 4–8 wk.
- *Maintenance*: 1 g PO bid.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Oral	30 min	5 hr

Minimal systemic absorption

Adverse effects

- **CNS**: Dizziness, sleeplessness, vertigo
- **Dermatologic**: Rash, pruritus
- **GI**: *Constipation*, diarrhea, nausea, indigestion, gastric discomfort, dry mouth
- **Other**: Back pain

Interactions

★ **Drug-drug** • Decreased serum levels and effectiveness of phenytoin, ciprofloxacin, norfloxacin, digoxin, ketoconazole, tetracycline, theophylline, penicillamine, warfarin, levothyroxine, quinidine; separate administration by 2 hr • Risk of aluminum toxicity with aluminum-containing antacids

■ Nursing considerations

Assessment

- **History**: Allergy to sucralfate; chronic renal failure or dialysis; pregnancy, lactation
- **Physical**: Skin color, lesions; reflexes, orientation; mucous membranes, normal output

Interventions

- Give drug on an empty stomach, 1 hr before or 2 hr after meals and at bedtime.
- Monitor pain; use antacids to relieve pain.
- Administer antacids between doses of sucralfate, not within 30 min before or after sucralfate doses.

Teaching points

- Take the drug on an empty stomach, 1 hour before or 2 hours after meals and at bedtime.
- If you are also taking antacids for pain relief, do not take antacids 30 minutes before or after taking sucralfate.
- You may experience these side effects: Dizziness, vertigo (avoid driving or operating dangerous machinery); indigestion, nausea (eat frequent small meals); dry mouth (use frequent mouth care, suck on sugarless lozenges); constipation (request aid).
- Report severe gastric pain.

⚠ DANGEROUS DRUG

▶ sufentanil citrate

(soo fen' ta nil)

Sufenta

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts at specific opioid receptors, causing analgesia, respiratory depression, physical depression, euphoria.

Indications

- Analgesic adjunct to maintain balanced general anesthesia
- Primary anesthetic with 100% oxygen to induce and maintain anesthesia in major surgical procedures
- Epidural analgesia with bupivacaine during labor and delivery

Contraindications and cautions

- Contraindicated with known sensitivity to sufentanil, pregnancy.

- Use cautiously with obesity, hepatic disease, head injury, diabetes, arrhythmias, lactation, severe debilitation, renal or pulmonary disease.

Available forms

Injection—50 mcg/mL

Dosages

Individualize dosage; monitor vital signs routinely.

Adults

- *Adjunct to general anesthesia:* 1–2 mcg/kg IV initially; 10–25 mcg for maintenance; not to exceed 1 mcg/kg/hr of expected surgical time.
- *With oxygen and skeletal muscle relaxant for anesthesia:* 8–30 mcg/kg IV initially; supplement with doses of 0.5–10 mcg/kg IV; not to exceed 30 mcg/kg for the procedure.
- *Epidural analgesia:* 10–15 mcg via epidural administration with 10 mL bupivacaine 0.125%; may repeat twice at 1-hr or longer intervals (total of three doses).

Pediatric patients 2–12 yr

- *With oxygen and skeletal muscle relaxant for anesthesia:* 10–25 mcg/kg IV initially; supplement with doses of 25–50 mcg IV.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	5 min
Epidural	10 min	1.7 hr

Metabolism: Hepatic; $T_{1/2}$: 2.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

▼ IV FACTS

Preparation: Protect vials from light.

Infusion: Give slowly over 1–2 min by direct injection or into running IV tubing.

Adverse effects

- **CNS:** Sedation, clamminess, sweating, headache, vertigo, floating feeling, dizziness, lethargy, confusion, light-headedness, nervousness, unusual dreams, agitation, euphoria, hallucinations, delirium, insomnia, anxiety, fear, disorientation,

impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures

- **CV:** Palpitations, change in BP, circulatory depression, **cardiac arrest, shock**, tachycardia, bradycardia, arrhythmia
- **Dermatologic:** Rash, hives, pruritus, flushing, warmth, sensitivity to cold
- **EENT:** Diplopia, blurred vision
- **GI:** *Nausea, vomiting*, dry mouth, anorexia, constipation, biliary tract spasm
- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Phlebitis following IV injection, pain at injection site
- **Respiratory:** Slow, shallow respiration, apnea, suppression of cough reflex, **laryngospasm, bronchospasm**
- **Other:** Physical tolerance and dependence; psychological dependence; skeletal muscle rigidity, possibly requiring neuromuscular blocker

Interactions

* **Drug-drug** • Potentiation of effects with general anesthetics, opiate agonists, tranquilizers, sedatives, hypnotics (barbiturates) • Increased risk of hypotension and bradycardia if given with beta blockers, calcium channel blockers

* **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

* **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between **sufentanil** and **fentanyl**; use extreme caution.

Assessment

- **History:** Hypersensitivity to sufentanil or opioids; physical dependence on an opioid analgesic; pregnancy, lactation; COPD; increased

intracranial pressure; acute MI, biliary tract surgery; renal or hepatic impairment

- **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; pulse, auscultation, BP; R, adventitious sounds; bowel sounds, normal output; LFTs, renal function tests

Interventions

- Give to lactating women 4–6 hr before the next feeding to minimize the amount in milk.
- Ensure that patient avoids grapefruit juice while using this drug.

⊗ **Warning** Provide opioid antagonist, keep equipment for assisted or controlled respiration readily available during parenteral administration.

Teaching points

- Incorporate teaching about drug into preoperative or postoperative teaching program.
- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (ask for assistance to move); nausea, loss of appetite (lie quietly, eat frequent small meals); constipation (use a laxative).
- Report severe nausea, vomiting, palpitations, shortness of breath or difficulty breathing.

▷ sulfADIAZINE

(sul fa dye' a zeen)

PREGNANCY CATEGORY C

PREGNANCY CATEGORY D
(LABOR AND DELIVERY)

Drug classes

Antibiotic

Sulfonamide

Therapeutic actions

Bacteriostatic. Competitively antagonizes PABA, an essential component of folic acid synthesis in gram-negative and gram-positive bacteria; prevents cell replication.

Indications

- Treatment of acute infections caused by susceptible organisms: UTIs, chancroid,

inclusion conjunctivitis, trachoma, nocardiosis, toxoplasmosis (with pyrimethamine), malaria (as adjunctive therapy for chloroquine-resistant strains of *Plasmodium falciparum*), acute otitis media (due to *Haemophilus influenzae* when used with penicillin or erythromycin), *H. influenzae* meningitis (as adjunctive therapy with parenteral streptomycin), meningococcal meningitis, rheumatic fever

- Orphan drug use: With pyrimethamine for treatment of *Toxoplasma gondii* encephalitis in patients with AIDS

Contraindications and cautions

- Contraindicated with allergy to sulfonamides, sulfonyleureas, thiazides; pregnancy (teratogenic; may cause kernicterus); lactation (risk of kernicterus, diarrhea, rash).
- Use cautiously with impaired renal or hepatic function, G6PD deficiency, porphyria.

Available forms

Tablets—500 mg

Dosages

Adults

Loading dose, 2–4 g PO. Maintenance, 2–4 g/day PO in three to six divided doses.

- Prevention of recurrent attacks of rheumatic fever (not for initial therapy of streptococcal infections):
Weight less than 30 kg: 0.5 g/day PO.
Weight more than 30 kg: 1 g/day PO.
- *Toxoplasmosis:* 1–1.5 g qid in combination with pyrimethamine for 3–4 wk.
- *For suppressive or maintenance therapy in HIV patients:* 0.5–1 g every 6 hr PO with oral pyrimethamine and leucovorin.

Pediatric patients

Younger than 2 mo: Not recommended except to treat congenital toxoplasmosis.

Older than 2 mo: Initial dose, 75 mg/kg PO. Maintenance, 150 mg/kg/day PO in four to six divided doses with a maximum dose of 6 g/day.

- *Toxoplasmosis:* 100–200 mg/kg daily in combination with pyrimethamine for 3–4 wk.
- For suppressive or maintenance therapy in HIV patients:
Infants and children: 85–120 mg/kg daily in two to four divided doses with oral pyrimethamine and leucovorin.

Adolescents: 0.5–1 g every 6 hr PO with oral pyrimethamine and leucovorin.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, peripheral neuropathy, mental depression, seizures, ataxia, hallucinations, tinnitus, vertigo, insomnia, hearing loss, drowsiness, transient lesions of posterior spinal column, transverse myelitis
- **Dermatologic:** *Photosensitivity*, cyanosis, petechiae, alopecia
- **GI:** *Nausea, emesis, abdominal pains, diarrhea, bloody diarrhea, anorexia, pancreatitis, stomatitis, impaired folic acid absorption, hepatitis, hepatocellular necrosis*
- **GU:** *Crystalluria, hematuria*, proteinuria, nephrotic syndrome, toxic nephrosis with oliguria and anuria, oligospermia, infertility
- **Hematologic:** *Agranulocytosis*, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, hypoprothrombinemia, methemoglobinemia, megaloblastic anemia
- **Hypersensitivity: Stevens-Johnson syndrome**, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral redness, photosensitization, arthralgia, allergic myocarditis, transient pulmonary changes with eosinophilia, decreased pulmonary function
- **Other:** Drug fever, chills, periarteritis nodosum

Interactions

- **Drug-drug** • Increased risk of hypoglycemia when tolbutamide, tolazamide, glyburide, glipizide, acetohexamide, chlorpropamide are taken concurrently • Increased risk of phenytoin toxicity with sulfonamides • Risk of hemorrhage when combined with oral

anticoagulants • Increased risk of nephrotoxicity with cyclosporine and decreased cyclosporine effect

★ **Drug-lab test** • False-positive urinary glucose tests using Benedict's method

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between sulfadiazine and *Silvazine* (silver sulfadiazine); use caution.

Assessment

- **History:** Allergy to sulfonamides, sulfonyleureas, thiazides; pregnancy, lactation; impaired renal or hepatic function; G6PD deficiency
- **Physical:** T; skin color, lesions; culture of infected site; orientation, reflexes, affect, peripheral sensation; R, adventitious sounds; mucous membranes, bowel sounds, liver evaluation; LFTs, renal function tests, CBC and differential, urinalysis

Interventions

- Arrange for culture and sensitivity tests of infection before therapy; repeat cultures if response is not as expected.
- Administer drug on an empty stomach, 1 hr before or 2 hr after meals, with a full glass of water.
- ⊗ **Warning** Ensure adequate fluid intake; sulfadiazine is very insoluble and may cause crystalluria if high concentrations occur in the urine; alkalization of the urine may be necessary.
- ⊗ **Warning** Discontinue drug immediately if hypersensitivity reaction occurs.

Teaching points

- Complete full course of therapy.
- Take the drug on an empty stomach, 1 hour before or 2 hours after meals, with a full glass of water.
- Drink 8 glasses of water per day.
- This drug is specific to this disease; do not self-treat any other infection.
- You may experience these side effects: Sensitivity to sunlight (use sunscreens; wear protective clothing); dizziness, drowsiness, difficulty walking, loss of sensation (avoid

driving or performing tasks that require alertness); nausea, vomiting, diarrhea; loss of fertility.

- Report blood in the urine, rash, ringing in the ears, difficulty breathing, fever, sore throat, chills.

▼ sulfasalazine

(*sul fa sal' a zeen*)

Azulfidine, Azulfidine EN-Tabs **ORC**, PMS-Sulfasalazine (CAN), PMS-Sulfasalazine EC (CAN), Salazopyrin EN-Tabs (CAN)

PREGNANCY CATEGORY B

Drug classes

Anti-inflammatory
Antirheumatic
Sulfonamide

Therapeutic actions

Bacteriostatic: Competitively antagonizes PABA, an essential component of folic acid synthesis in susceptible gram-negative and gram-positive bacteria; one-third of the oral dose is absorbed from the small intestine; remaining two-thirds passes into the colon where it is split into 5-aminosalicylic acid and sulfapyridine; most of the sulfapyridine is absorbed; the 5-aminosalicylic acid acts locally as an anti-inflammatory agent.

Indications

- Treatment of ulcerative colitis
- Delayed-release: Treatment of rheumatoid arthritis (RA) in patients intolerant or unresponsive to other anti-inflammatories
- *Azulfidine EN-Tabs*: Treatment of children 6–16 yr with juvenile rheumatoid arthritis, (JRA) involving five joints, who have not responded adequately to salicylates or other NSAIDs
- Unlabeled uses: Crohn's disease, ankylosing spondylitis, psoriatic arthritis

Contraindications and cautions

- Contraindicated with allergy to sulfonamides, sulfonyleureas, thiazides, salicylates;

pregnancy (teratogenic may cause kernicterus); lactation (risk of kernicterus, diarrhea, rash); intestinal or urinary obstruction; porphyria; and in pediatric patients younger than 2 yr.

- Use cautiously with impaired renal or hepatic function, G6PD deficiency, blood dyscrasias.

Available forms

Tablets—500 mg; DR tablets **OND**—500 mg

Dosages

Administer around-the-clock; dosage intervals should not exceed 8 hr. Give after meals.

Adults

- **Ulcerative colitis:** Initial therapy, 3–4 g/day PO in evenly divided doses. Initial doses of 1–2 g/day PO may lessen adverse GI effects. Doses of more than 4 g/day increase risk of toxicity. Maintenance, 2 g/day PO in evenly spaced doses (500 mg qid).
- **Adult RA:** 2 g daily in two evenly divided doses.

Pediatric patients

- **Ulcerative colitis:** For children 6 yr or older, initial therapy, 40–60 mg/kg/24 hr PO in three to six divided doses. Maintenance therapy, 30 mg/kg/24 hr PO in four equally divided doses. Maximum dosage, 2 g/day.
- **JRA—polyarticular course:** For children 6 yr or older, 30–50 mg/kg daily in two evenly divided doses. Maximum, 2 g/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.5–6 hr, 6–24 hr metabolite

Metabolism: Hepatic; $T_{1/2}$: 5–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** **Headache**, peripheral neuropathy, mental depression, seizures, ataxia, hallucinations, tinnitus, vertigo, insomnia, hearing loss, drowsiness, transient lesions of posterior spinal column, transverse myelitis
- **Dermatologic:** Photosensitivity, cyanosis, petechiae, alopecia

- **GI:** **Nausea, emesis, abdominal pains**, diarrhea, bloody diarrhea, **anorexia**, pancreatitis, stomatitis, impaired folic acid absorption, hepatitis, **hepatocellular necrosis**
- **GU:** **Crystalluria, hematuria**, proteinuria, nephrotic syndrome, toxic nephrosis with oliguria and anuria, **oligospermia**, infertility
- **Hematologic:** **Agranulocytosis**, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, hypoprothrombinemia, methemoglobinemia, megaloblastic anemia
- **Hypersensitivity: Stevens-Johnson syndrome**, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral redness, photosensitization, arthralgia, allergic myocarditis, transient pulmonary changes with eosinophilia, decreased pulmonary function
- **Other:** Drug fever, chills, periarteritis nodosum

Interactions

- **Drug-drug** • Decreased absorption of digoxin with lessened therapeutic effect; monitor patient, space doses at least 2 hr apart • Increased risk of folate deficiency, monitor for signs of folate deficiency

Nursing considerations

Assessment

- **History:** Allergy to sulfonamides, sulfonylureas, thiazides, salicylates; pregnancy; lactation; impaired renal or hepatic function; G6PD deficiency; porphyria
- **Physical:** T; skin color, lesions; culture of infected site; orientation, reflexes, affect, peripheral sensation; R, adventitious sounds; mucous membranes, bowel sounds, liver evaluation; LFTs, renal function tests, CBC and differential, urinalysis

Interventions

- Administer drug after meals or with food to prevent GI upset. Administer it around-the-clock.
- Ensure that patient swallows tablets whole; do not cut, crush, or chew.
- **Warning** Ensure adequate fluid intake; sulfasalazine is very insoluble and may cause

crystalluria if high concentrations occur in the urine; alkalinization of the urine may be needed.

⊗ **Warning** Discontinue drug immediately if hypersensitivity reaction occurs.

Teaching points

- Complete full course of therapy. Swallow tablets whole; do not cut, crush, or chew.
- Take the drug with food or meals to decrease GI upset.
- Drink eight glasses of water per day.
- You may experience these side effects: Sensitivity to sunlight (use sunscreen, wear protective clothing); dizziness, drowsiness, difficulty walking, loss of sensation (avoid driving or performing tasks that require alertness); nausea, vomiting, diarrhea; loss of fertility; yellow-orange urine.
- Report blood in the urine, rash, ringing in the ears, difficulty breathing, fever, sore throat, chills.

sulindac (sul in' dak)

Apo-Sulin (CAN), Clinoril

PREGNANCY CATEGORY B
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Analgesic
Antipyretic
NSAID

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Acute or long-term use to relieve signs and symptoms of osteoarthritis, rheumatoid arthritis, acute gouty arthritis

- Acute or long-term use in relief of signs and symptoms of ankylosing spondylitis, acute painful shoulder

Contraindications and cautions

- Contraindicated for perioperative pain in coronary artery bypass graft (CABG) surgery and in pregnancy, lactation.
- Use cautiously with patients for whom acute asthmatic attacks, urticaria, or rhinitis are precipitated by aspirin or other NSAIDs, renal, hepatic, CV, and GI conditions.

Available forms

Tablets—150, 200 mg

Dosages

Do not exceed 400 mg/day.

Adults

- **Rheumatoid arthritis or osteoarthritis, ankylosing spondylitis:** Initial dose of 150 mg bid PO. Individualize dosage.
- **Acute painful shoulder, acute gouty arthritis:** 200 mg bid PO. After adequate response, reduce dosage. Acute painful shoulder usually requires 7–14 days of therapy; acute gouty arthritis, 7 days.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic or renal impairment

Reduce dosage.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	10–12 hr

Metabolism: Hepatic; $T_{1/2}$: 7.8 hr (parent drug), 16.4 hr (active metabolite)

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **CV:** Heart failure, CV events
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis

- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence, anorexia, GI ulceration
- **GU:** Dysuria, renal impairment, pancreatitis
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions** to **fatal anaphylactic shock**

Interactions

- ★ **Drug-drug** • Increased serum lithium levels and risk of toxicity • Decreased antihypertensive effects of beta blockers • Decreased therapeutic effects of bumetanide, furosemide, ethacrynic acid
- ★ **Drug-food** • Decreased rate and extent of absorption when taken with food

■ Nursing considerations

Assessment

- **History:** Allergies; renal, hepatic, CV, and GI conditions; pregnancy; lactation
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

- ⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly. Drug is contraindicated for treating perioperative pain in CABG surgery.
- Give with food or milk if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take with food or meals if GI upset occurs.
- Take only the prescribed dosage.

- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black, tarry stools.

▽ sumatriptan succinate

(sue mab *trip' tan*)

Alsuma, Apo-Sumatriptan (CAN), Gen-Sumatriptan (CAN), Imitrex, Novo-Sumatriptan (CAN), Novo-Sumatriptan DF (CAN), PMS-Sumatriptan (CAN), ratio-Sumatriptan (CAN), Sumavel DosePro

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug (triptan)
Serotonin-selective agonist

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients.

Indications

- Treatment of acute migraine attacks with or without aura (oral, nasal, subcutaneously)

Contraindications and cautions

- Contraindicated with allergy to sumatriptan, cerebrovascular or peripheral vascular syndromes, severe hepatic impairment, MAOIs, uncontrolled hypertension, hemiplegic migraine, pregnancy, CAD
- Use cautiously with the elderly, lactation, renal function impairment.

Available forms

Tablets—25, 50, 100 mg; injection—4 mg/0.5 mL, 6 mg/0.5 mL; nasal spray—5 mg/0.1 mL, 20 mg/0.1 mL; needle-free injection system—4, 6 mg

Dosages**Adults****Oral**

25, 50, or 100 mg; additional doses may be repeated in 2 hr or more; up to a maximum of 200 mg/day.

Subcutaneous

6 mg, may be repeated in 1 hr. Maximum, 12 mg/24 hr. Autoinjector is available.

Intranasal

5, 10, or 20 mg into one nostril or 10 mg divided into two doses of 5 mg, one in each nostril, may be repeated after 2 hr. Maximum, 40 mg/24 hr.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Maximum single dose, 50 mg.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Varies	5–20 min
Oral	60–90 min	2–4 hr
Injection	Rapid	90 min

Metabolism: Hepatic; $T_{1/2}$: 115 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, feces (tablets)

Adverse effects

- **CNS:** *Dizziness, vertigo, headache, anxiety, malaise or fatigue, weakness, myalgia*
- **CV:** *BP alterations, tightness or pressure in chest, shock*
- **GI:** Abdominal discomfort, dysphagia
- **Local:** *Injection site discomfort, nose and throat discomfort (nasal spray)*
- **Other:** *Tingling, warm/hot sensations, burning sensation, feeling of heaviness, pressure sensation, numbness, feeling of tightness, feeling strange, cold sensation*

Nasal spray

- **GI:** Bad taste in mouth, nausea

Interactions

• **Drug-drug** • Prolonged vasoactive reactions with ergot-containing drugs (should not be used within 24 hr of each other) • Increased serum levels and toxicity of sumatriptan with

MAOIs; avoid this combination and for 2 wk after MAOI discontinuation

• **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort therapy

Nursing considerations**Assessment**

- **History:** Allergy to sumatriptan; active CAD; uncontrolled hypertension; hemiplegic migraine; pregnancy, lactation
- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure.
- Administer as subcutaneous injection just below the skin as soon as possible after symptoms begin.
- Repeat injection only after 1 hr if relief is not obtained; only 2 injections may be given each 24 hr.
- Administer PO with fluids; may repeat in 2 hr if no relief.
- Repeat nasal spray after 2 hr if headache returns or does not respond.
- Monitor BP of patients with possible CAD; discontinue at any sign of angina, prolonged high BP.

Teaching points

- Learn to use the autoinjector; injection may be repeated only after 1 hour if relief is not obtained; do not administer more than two injections in 24 hours.
- Inject just below the skin as soon as possible after onset of migraine; this drug is for an acute attack only, not for use to prevent attacks. Dispose of needles and syringes appropriately.
- Administer nasal spray as a single dose; repeat if needed only after 2 hours.
- Take oral drug with fluids, may be repeated in 2 hours if no relief or return of headache.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, consult your health care provider and stop using drug.

- Contact your health care provider immediately if you experience severe or continuous chest pain or pressure.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or the use of dangerous machinery); numbness, tingling, feelings of tightness or pressure.
- Report feelings of heat, flushing, tiredness, feelings of sickness, swelling of lips or eyelids.

▷ sunitinib

See Appendix U, *Less commonly used drugs*.

▷ tacrine hydrochloride (tetrahydroaminoacridine, THA)

(*tay' krin*)

Cognex

PREGNANCY CATEGORY C

Drug classes

Alzheimer's disease drug
Cholinesterase inhibitor

Therapeutic actions

Centrally acting reversible cholinesterase inhibitor, leading to elevated acetylcholine levels in the cortex, which slows the neuronal degradation that occurs in Alzheimer's disease.

Indications

- Treatment of mild to moderate dementia of the Alzheimer's type

Contraindications and cautions

- Contraindicated with allergy to tacrine or acridine derivatives, previous tacrine-associated jaundice, pregnancy, increased serum bilirubin greater than 3 mg/dL.
- Use cautiously with renal or hepatic disease, bladder obstruction, seizure conditions, sick sinus syndrome, GI bleeding, anesthesia, lactation, asthma.

Available forms

Capsules—10, 20, 30, 40 mg

Dosages

Adults

10 mg PO qid; maintain this dose for 4 wk with regular monitoring of transaminase levels; after 4 wk, increase dose to 20 mg PO qid; if patient is tolerant to drug and transaminase levels are within normal limits, increase at 4-wk intervals at 10-mg increases to a total of 120–160 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

For ALT levels greater than 3 but less than 5 times the upper level of normal, reduce dose by 40 mg/day; adjust up if levels improve. For ALT levels greater than 5 times the upper level of normal, stop treatment. Rechallenge if levels become normal.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, fatigue, dizziness, confusion, ataxia, insomnia, somnolence, tremor, agitation, depression, anxiety, abnormal thinking*
- **CV:** Chest pain
- **Dermatologic:** *Rash, flushing, purpura*
- **GI:** *Nausea, vomiting, diarrhea, dyspepsia, anorexia, abdominal pain, flatulence, constipation, hepatotoxicity*
- **GU:** Urinary frequency, UTIs
- **Respiratory:** *Rhinitis*, URIs, coughing

Interactions

- *** Drug-drug** • Increased effects and risk of toxicity of theophylline, cholinesterase inhibitors • Decreased effects of anticholinergics
- Increased effects with cimetidine
- *** Drug-food** • Decreased absorption and serum levels of tacrine if taken with food

■ Nursing considerations**Assessment**

- **History:** Allergy to tacrine or acridine derivatives; previous tacrine-associated jaundice, pregnancy, renal or hepatic disease, bladder obstruction, seizure conditions, sick sinus syndrome, GI bleed, anesthesia, lactation, asthma
- **Physical:** Orientation, affect, reflexes; BP, P; R, adventitious sounds; urinary output; abdominal examination; LFTs, renal function tests; serum transaminase levels

Interventions

- Arrange for regular transaminase level determination before and during therapy.
- ⊗ **Warning** Use with great care in patients with any history of hepatic impairment.
- Administer around-the-clock at regular intervals for best results.
- Give on an empty stomach, 1 hr before or 2 hr after meals.
- Administer with meals only if severe GI upset occurs.
- Decrease dose and slowly discontinue drug if side effects become severe.
- ⊗ **Warning** Notify surgeons that patient is on tacrine; exaggerated muscle relaxation may occur if succinylcholine-type drugs are used.
- ⊗ **Warning** Do not suddenly discontinue high doses of drug.
- Monitor for any signs of neurologic change or deterioration; drug does not stop the disease but slows the degeneration.

Teaching points

- Take drug exactly as prescribed, around-the-clock. Work with your health care provider to establish a schedule that is least disruptive. Do not take more than the prescribed dose.
- Take drug on an empty stomach, 1 hour before or 2 hours after meals. If severe GI upset occurs, drug may be taken with meals.
- This drug does not cure the disease but is thought to slow down the degeneration associated with the disease.
- Arrange for regular blood tests and follow-up visits while adjusting to this drug.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals);

dizziness, confusion, light-headedness (use caution if driving or performing tasks that require alertness).

- Report nausea, vomiting, changes in stool or urine color, diarrhea, rash, changes in neurologic functioning, yellowing of eyes or skin.

▼ tacrolimus (FK 506)*(tack row' lim us)*

Prograf, Protopic

PREGNANCY CATEGORY C**Drug classes**

Immunomodulator
Immunosuppressant

Therapeutic actions

Immunosuppressant; inhibits T-lymphocyte activation; exact mechanism of action not known but binds to intracellular protein, which may prevent the generation of nuclear factor of activated T cells and suppress the immune activation and response of T cells.

Indications

- Prophylaxis for organ rejection in liver, kidney, and heart transplants in conjunction with adrenal corticosteroids
- Topical: Short-term and intermittent long-term treatment of moderate to severe atopic dermatitis when other therapies are not effective or contraindicated
- Unlabeled uses: Crohn's disease, pyoderma gangrenosum, psoriasis

Contraindications and cautions

- Contraindicated with allergy to tacrolimus, hypersensitivity to HCO-60 polyoxyl 60 hydrogenated castor oil (IV form), pregnancy, lactation.
- Use cautiously with impaired renal function, hyperkalemia, malabsorption, impaired hepatic function.

Available forms

Capsules—0.5, 1, 5 mg; injection—5 mg/mL; ointment—0.03%, 0.1%

Dosages**Adults****Oral**

- **Kidney transplant:** 0.2 mg/kg/day PO divided every 12 hr.
- **Liver transplant:** 0.10–0.15 mg/kg/day PO divided every 12 hr; administer initial dose no sooner than 6 hr after transplant. If transferring from IV, give first dose 8–12 hr after discontinuing IV infusion. Adjust dosage based on clinical assessment of rejection tolerance of drug.
- **Heart transplant:** 0.075 mg/kg/day PO or IV in two divided doses given every 12 hr. Give first dose no sooner than 6 hr after transplant. If therapy starts with IV route, switch to oral route as soon as possible, 8–12 hr after discontinuing IV infusion.

Parenteral

For patients unable to take capsules, 0.03–0.05 mg/kg/day (liver or kidney transplant) or 0.01 mg/kg/day (heart transplant) as continuous IV infusion begun no sooner than 6 hr after transplant. Switch to oral drug as soon as possible.

Topical

Apply thin layer of 0.03% or 0.1% ointment to affected area bid. Rub in gently and completely. Stop drug when signs and symptoms resolve.

Pediatric patients

Children require the larger dose; begin treatment at higher end of recommended adult dose.

Oral

- **Liver transplant:** 0.15–0.20 mg/kg/day.

Parenteral

- **Liver transplant:** 0.03–0.05 mg/kg/day.

Topical

2–15 yr: Apply thin layer of 0.03% ointment bid. Rub in gently and completely. Stop drug when signs and symptoms resolve.

Younger than 2 yr: Not recommended.

Patients with hepatic or renal impairment

Start with lowest possible dose; delay therapy up to 48 hr in patients with postoperative oliguria.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.5–3.5 hr
IV	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 11.7–18.8 hr (IV)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, feces

IV FACTS

Preparation: Dilute IV solution immediately before use; use 0.9% sodium chloride injection or 5% dextrose injection to a concentration between 0.004 and 0.02 mg/mL. Do not store in a PVC container; discard after 24 hr.

Infusion: Give by continuous IV infusion using an infusion pump.

Incompatibilities: Do not mix with solutions with a pH of 9 or greater (acyclovir, ganciclovir).

Adverse effects

- **CNS:** Tremor, headache, insomnia, paresthesias
- **CV:** Hypertension
- **GI:** Hepatotoxicity, constipation, diarrhea, nausea, vomiting, anorexia
- **GU:** Renal impairment, nephrotoxicity, UTI, oliguria
- **Hematologic:** Leukopenia, anemia, hyperkalemia, hypokalemia, hyperglycemia, hypomagnesemia
- **Other:** Abdominal pain, fever, asthenia, back pain, ascites, neoplasias, increased susceptibility to infection, lymphoma development, diabetes mellitus, hypercholesterolemia, angiolysis

Interactions

- **Drug-drug** • Increased risk of nephrotoxicity with other nephrotoxic agents (cyclosporine) • Risk of severe myopathy or rhabdomyolysis with any HMG-CoA inhibitor • Increased risk of toxicity with metoclopramide, nifedipine, cimetidine, clarithromycin, erythromycin, calcium channel blockers • Decreased therapeutic effect with carbamazepine, phenobarbital, phenytoin, rifamycins
- **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination
- **Drug-alternative therapy** • Decreased therapeutic effect with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to tacrolimus or polyoxyethylated castor oil; impaired renal function; malabsorption; lactation, pregnancy
- **Physical:** T; skin color, lesions; BP, peripheral perfusion; liver evaluation, bowel sounds, gum evaluation; LFTs, renal function tests, CBC, potassium, glucose

Interventions

⊗ **Black box warning** Protect patient from infection. Risk of infection, lymphoma is high; monitor closely.

- Use parenteral administration only if patient is unable to take the oral drug; transfer to oral drug as soon as possible.
- Apply thin layer of ointment to affected area; do not use occlusive dressings; do not apply to wet skin; encourage patient to avoid exposure to sunlight.
- ⊗ **Warning** Monitor renal and LFTs before and periodically during therapy; marked decreases in function may require dosage changes or discontinuation.
- Monitor tacrolimus blood concentrations.
- Monitor liver function and hematologic tests to determine dosage.

Teaching points

- Avoid infections; avoid crowds and people with infections. Also avoid having vaccinations while taking this drug. Notify your health care provider at once if you injure yourself.
- Do not drink grapefruit juice while using this drug.
- Do not use St. John's wort while taking this drug.
- This drug should not be taken during pregnancy. If you think that you are pregnant or you want to become pregnant, consult your health care provider.
- Arrange to have periodic blood tests to monitor drug response and effects.
- Do not discontinue without consulting your health care provider. Continue use of topical ointment for 1 week after resolution of the infection.
- If you are using the topical form, avoid sunlight, use sunscreen and protective clothing.

- You may experience these side effects: Nausea, vomiting (take drug with food); diarrhea; headache (request analgesics).
- Report unusual bleeding or bruising, fever, sore throat, mouth sores, tiredness.

▽ **tadalafil**
(*tab dal' ab fill*)

Adcirca, Cialis

PREGNANCY CATEGORY B

Drug classes

Impotence drug
Phosphodiesterase-5 inhibitor

Therapeutic actions

Selectively inhibits cyclic guanosine monophosphate (cGMP) specific phosphodiesterase type 5. The mechanism of penile erection involves the release of nitric oxide into the corpus cavernosum of the penis during sexual stimulation. Nitrous oxide activates cGMP, which causes smooth muscle relaxation allowing the flow of blood into the corpus cavernosum. Tadalafil prevents the breakdown of cGMP by phosphodiesterase, leading to increased cGMP levels and prolonged smooth muscle relaxation, thus promoting the flow of blood into the corpus cavernosum, relaxation of pulmonary muscle cells, and vasodilation of the pulmonary vascular bed.

Indications

- Treatment of erectile dysfunction (ED) in the presence of sexual stimulation (*Cialis*)
- Once daily for treatment of ED in men who anticipate having sex more than twice weekly (*Cialis*)
- Treatment of pulmonary arterial hypertension, to improve exercise tolerance (*Adcirca*)

Contraindications and cautions

- Contraindicated with allergy to any component of the tablet, concurrent use of nitrates or alpha blockers; contraindicated for use in women or children.

- Use cautiously with hepatic or renal impairment; with anatomical deformation of the penis, with known cardiac disease (effects of sexual activity need to be evaluated), congenital prolonged QT interval, unstable angina; hypotension (systolic pressure less than 90 mm Hg); uncontrolled hypertension (BP higher than 170/110 mm Hg); severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders.

Available forms

Tablets—2.5, 5, 10, 20 mg (*Cialis*); 20 mg (*Adcirca*)

Dosages

Adults

ED: 10 mg PO taken before anticipated sexual activity; range 5–20 mg PO. Limit use to once per day.

For once-daily use: 2.5 mg/day PO without regard to timing of sexual activity. May be increased to 5 mg/day PO based on patient response.

Pulmonary arterial hypertension: 40 mg/day PO without regard to food, given as a once-daily dose. Do not divide.

Pediatric patients

Not intended for use in children.

Patients receiving itraconazole, ketoconazole, ritonavir being treated for ED

Do not exceed one 10-mg dose in 72-hr period.

Patients with renal impairment being treated for ED

For creatinine clearance 31–50 mL/min, initial dose not to exceed 5 mg PO daily or 10 mg PO every 48 hr; no further adjustment needed for once-daily use. For creatinine clearance less than 30 mL/min, 5 mg PO every 72 hr; once-daily use not recommended (*Cialis*).

Patients with renal impairment being treated for pulmonary arterial hypertension

For creatinine clearance of 31–80 mL/min, starting dose is 20 mg/day PO; increase to 40 mg/day based on patient response. For creatinine clearance of less than 30 mL/min and patients on hemodialysis, avoid use.

Patients with hepatic impairment being treated for ED

For Child-Pugh class A or B, maximum dosage should not exceed 10 mg PO daily. Use caution with once-daily use; Child-Pugh class C not recommended (*Cialis*).

Patients with hepatic impairment being treated for pulmonary arterial hypertension

For Child-Pugh class A or B, starting dose is 20 mg /day. Avoid use with severe hepatic cirrhosis.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–6 hr

Metabolism: Hepatic, T_{1/2}: 17.5 hr

Distribution: Not intended for use in women

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, abnormal vision, changes in color vision, fatigue, ischemic optic neuropathy, sudden loss of hearing
- **CV:** *Flushing*, angina, chest pain, hypertension, hypotension, **MI**, palpitation, postural hypotension, tachycardia
- **GI:** *Dyspepsia*, diarrhea, abdominal pain, dry mouth, esophagitis, gastritis, GERD, nausea, abnormal liver function test results
- **GU:** Abnormal erection, spontaneous erection, priapism
- **Respiratory:** Rhinitis, sinusitis, dyspnea, epistaxis, pharyngitis, nasal congestion
- **Other:** Flulike symptoms, edema, pain, rash, sweating, **Stevens-Johnson syndrome**, myalgia

Interactions

*** Drug-drug** ⊗ **Warning** Possible severe hypotension and serious cardiac events if combined with nitrates, alpha blockers; this combination is contraindicated.

- Possible increased tadalafil levels and effects if taken with ketoconazole, itraconazole, erythromycin; monitor patient and reduce dosage as needed
- Increased tadalafil serum levels if combined with indinavir, ritonavir; if these drugs are being used, limit tadalafil dose to 10 mg in a 72-hr period
- Reduced tadalafil levels and effectiveness if combined with

T

rifampin • Risk for increased cardiac effects, decreased BP, or flushing if combined with alcohol; warn patient of this possibility if patient uses alcohol

★ **Drug-food** • Possible increased tadalafil levels if taken with grapefruit juice

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the tablet; concurrent use of nitrates or alpha blockers; unstable angina, hypotension, uncontrolled hypertension; severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders; anatomical deformation of the penis; cardiac disease; congenital prolonged QT interval
- **Physical:** Orientation, affect; skin color, lesions; R, adventitious sounds; P, BP, ECG, LFTs, renal function tests

Interventions

- Ensure diagnosis of ED and determine underlying causes and other appropriate treatment.
- Advise patient with ED that drug does not work without sexual stimulation. Limit use to once per day.
- Remind patient with ED that drug does not protect against STDs and appropriate measures should be taken.
- Ensure that patient with pulmonary arterial hypertension takes dose all at once, once a day.
- ⊗ **Warning** Tell patient to never take this drug with nitrates or alpha-adrenergic blockers; serious, even fatal complications can occur.
- Warn patient of the risk of lowered BP or dizziness if drug is taken with alcohol.

Teaching points

- If you are taking this drug for erectile dysfunction, take the drug before anticipated sexual activity. The drug will stay in your body for up to 3 days. The drug will have no effect unless there is sexual stimulation. If you anticipate sexual activity more than twice per week, daily dosing should be considered.
- If you are taking this drug for erectile dysfunction, this drug will not protect you from

sexually transmitted diseases; use appropriate precautions.

- If you are taking this drug for pulmonary arterial hypertension, this drug will help to increase your ability to exercise. Take the drug once a day; do not split the dose.
- Do not take this drug if you are taking any nitrates, alpha blockers, or other drugs for treating erectile dysfunction; serious side effects and even death can occur.
- Many drugs may interact with tadalafil; always consult your health care provider before taking any drug, including over-the-counter drugs and herbal therapies. Dosage adjustments may be needed.
- Stop taking the drug and contact your health care provider if you experience sudden loss of vision.
- Combining this drug with alcohol could cause dizziness, loss of blood pressure, or increased flushing.
- You may experience these side effects: Headache, dizziness, upset stomach, runny nose, muscle pains. These side effects should go away within a couple of hours. If side effects persist, consult your health care provider.
- Report difficult or painful urination, vision changes, fainting, erection that persists for longer than 4 hours (if this occurs, seek medical assistance as soon as possible), sudden loss of vision or hearing.

▷ talc, USP

See Appendix U, *Less commonly used drugs.*

DANGEROUS DRUG

▷ tamoxifen citrate (*ta mox' i fen*)

Apo-Tamox (CAN), Gen-Tamoxifen (CAN), Soltamox, Tamofen (CAN)

PREGNANCY CATEGORY D

Drug classes

Antiestrogen
Antineoplastic

Therapeutic actions

Potent antiestrogenic effects: Competes with estrogen for binding sites in target tissues, such as the breast.

Indications

- Treatment of metastatic breast cancer in women and men; in premenopausal women with metastatic breast cancer, tamoxifen is an alternative to oophorectomy or ovarian irradiation
- Treatment of node-positive breast cancer in postmenopausal women following total mastectomy or segmental mastectomy, axillary dissection, and breast irradiation
- Treatment of axillary node-negative breast cancer in women following total mastectomy or segmental mastectomy, axillary dissection, and breast irradiation
- Reduction in risk of invasive breast cancer in women with ductal carcinoma in situ (DCIS) following breast surgery and radiation
- Reduction in occurrence of contralateral breast cancer in patients receiving adjuvant tamoxifen therapy for breast cancer
- Reduction in incidence of breast cancer in women at high risk for breast cancer
- Unlabeled uses: Treatment of mastalgia; useful for decreasing size and pain of gynecomastia; treatment of McCune-Albright syndrome and precocious puberty in girls 2–10 yr; malignant carcinoid tumor, carcinoid syndrome

Contraindications and cautions

- Contraindicated with allergy to tamoxifen, pregnancy, lactation, women who require concomitant coumarin-type anticoagulation therapy or in women with a history of DVT or PE.
- Use cautiously in women with a history of thromboembolic events.

Available forms

Tablets—10, 20 mg; oral solution—10 mg/5 mL

Dosages

Adults

- **Breast cancer:** 20–40 mg/day PO for 5 yr. Dosages of more than 20 mg/day should be given in divided doses, morning and evening.

- **Reduction in breast cancer incidence:** 20 mg/day PO for 5 yr.
- **DCIS:** 20 mg/day PO for 5 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	4–7 hr

Metabolism: Hepatic; $T_{1/2}$: 7–14 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Depression, light-headedness, dizziness, headache, corneal opacity, decreased visual acuity, retinopathy, **stroke**
- **Dermatologic:** **Stevens-Johnson syndrome, hot flashes, rash**
- **GI:** *Nausea, vomiting*, food distaste, alterations in liver enzymes
- **GU:** *Vaginal bleeding, vaginal discharge, menstrual irregularities*, pruritus vulvae, endometrial cancer, uterine sarcoma
- **Hematologic:** Hypercalcemia, especially with bone metastases, thrombocytopenia, leukopenia, anemia, **DVT**
- **Other:** Peripheral edema; increased bone and tumor pain and local disease (initially seen with a good tumor response, usually subsides); cancer in animal studies, changes in LFTs, **PE**

Interactions

- **Drug-drug** • Increased risk of bleeding with oral anticoagulants • Increased serum levels with bromocriptine • Increased risk of thromboembolic events if given with cytotoxic agents
- **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination
- **Drug-lab test** • Possible increase in calcium levels, T₄ levels without hyperthyroidism

■ Nursing considerations

Assessment

- **History:** Allergy to tamoxifen, pregnancy, lactation, previous DVT or PE
- **Physical:** Skin lesions, color, turgor; pelvic examination; orientation, affect, re-

flexes; ophthalmologic examination; peripheral pulses, edema; LFTs, CBC and differential, estrogen receptor evaluation of tumor cells

Interventions

⊗ **Black box warning** Alert women with DCIS and those at high risk for breast cancer of risks for serious to potentially fatal drug effects, including stroke, embolic events, and uterine malignancies; discuss benefits versus risks.

- Administer bid, in the morning and the evening.
- Arrange for periodic blood counts.
- Arrange for initial ophthalmologic examination and periodic examinations if visual changes occur.
- Counsel patient to use contraception while taking this drug; inform patient that serious fetal harm could occur.
- Decrease dosage if adverse effects become severe.

Teaching points

- For doses greater than 20 milligrams, take the drug twice a day, in the morning and evening. Do not drink grapefruit juice while using this drug.
- This drug can cause serious fetal harm and must not be taken during pregnancy. Contraceptive measures should be used. If you become pregnant or you want to become pregnant, consult your health care provider immediately. Avoid nursing a baby during therapy.
- Have regular gynecologic examinations during therapy.
- You may experience these side effects: Bone pain; hot flashes (staying in cool places may help); nausea, vomiting (eat frequent small meals); weight gain; menstrual irregularities; dizziness, headache, light-headedness (use caution if driving or performing tasks that require alertness).
- Report marked weakness, sleepiness, mental confusion, pain or swelling of the legs, shortness of breath, blurred vision.

tamsulosin hydrochloride
(tam soo low' sin)

Flomax GEN

PREGNANCY CATEGORY B

Drug class

Alpha-adrenergic blocker (peripherally acting)

Therapeutic actions

Blocks the smooth muscle α_1 -adrenergic receptors in the prostate, prostatic capsule, prostatic urethra, and bladder neck, leading to relaxation of the bladder and prostate and improving the flow of urine in cases of BPH.

Indications

- Treatment of the signs and symptoms of BPH
- Unlabeled use: Adjunct in managing ureteral stones

Contraindications and cautions

- Contraindicated with hypersensitivity to tamsulosin, prostate cancer, pregnancy, lactation.
- Use cautiously with hypotension, sulfa hypersensitivity.

Available forms

Capsules GEN—0.4 mg

Dosages

Adults

0.4 mg PO daily 30 min after the same meal each day; if response is not satisfactory in 2–4 wk, dosage may be increased to 0.8 mg PO daily 30 min after the same meal each day. If therapy is interrupted for any reason for several days, resume dosing at 0.4 mg PO daily.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 9–15 hr

Distribution: May cross placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Somnolence, insomnia, headache, dizziness*
- **CV:** *Orthostatic hypotension, syncope*
- **GI:** *Nausea, dyspepsia*
- **GU:** *Abnormal ejaculation, decreased libido, increased urinary frequency*
- **Other:** Cough, sinusitis, rhinitis, *increased risk of intraoperative floppy iris syndrome with cataract surgery*

Interactions

★ **Drug-drug** • Increased hypotensive effects with other alpha-adrenergic antagonists, sildenafil, tadalafil, vardenafil • Risk of increased toxic effects of cimetidine

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Flomax* (tamsulosin) and *Fosamax* (alendronate); use caution.

Assessment

- **History:** Allergy to tamsulosin or sulfa drugs; pregnancy, lactation; prostatic cancer; hypotension
- **Physical:** Body weight; skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP; R, adventitious sounds, status of nasal mucous membranes; voiding pattern, normal output, urinalysis

Interventions

- Ensure that patient does not have prostatic cancer before beginning treatment.
- Administer once a day, 30 min after the same meal each day.
- Resume therapy at 0.4 mg daily if therapy is interrupted for several days for any reason.
- Ensure that patient does not crush, chew, or open capsule. Capsule should be swallowed whole.
- Monitor patient carefully for orthostatic hypotension; chance of orthostatic hypotension, dizziness, and syncope is high with the

first dose. Establish safety precautions as appropriate.

- Alert surgeon that patient is on this drug if patient is going to have cataract surgery; increased risk of intraoperative floppy iris syndrome may require additional surgical intervention

Teaching points

- Take this drug exactly as prescribed, once a day. Do not chew, crush, or open capsules; capsules must be swallowed whole. Use care when beginning therapy; the chance of dizziness or syncope is greatest at that time. Change position slowly to avoid increased dizziness. Take the drug 30 minutes after the same meal each day.
- This drug should not be combined with drugs used to treat erectile dysfunction.
- Tell your surgeon that you are taking this drug if you are considering cataract surgery.
- You may experience these side effects: Dizziness, weakness (more likely when you change position, in the early morning, after exercise, in hot weather, and when you have consumed alcohol; some tolerance may occur after you have taken the drug for a while; avoid driving or engaging in tasks that require alertness; change position slowly, use caution in climbing stairs, lie down if dizziness persists); GI upset (eat frequent small meals); impotence (discuss this with your health care provider); stuffy nose. Most of these effects will disappear gradually with continued therapy.
- Report frequent dizziness or fainting, worsening of symptoms.

▷ tapentadol (*tab pen' tab dohl*)

Nucynta

PREGNANCY CATEGORY C

Drug classes

Opioid receptor analgesic (mu specific)
Norepinephrine reuptake inhibitor

Therapeutic actions

Binds to and activates μ -opioid receptors in the CNS, inhibiting transmission of pain at the spinal cord, and affects activity in parts of the brain that control how pain is perceived; analgesic properties are enhanced by the blocking of norepinephrine reuptake at the nerve synapse, increasing concentration of norepinephrine in the synaptic cleft.

Indications

- Relief of moderate to severe pain in patients 18 yr and older

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug, increased intracranial pressure, impaired consciousness or coma, significant respiratory depression, acute or severe bronchial asthma, hypercapnia, paralytic ileus, within 14 days of MAOI use, pregnancy.
- Use cautiously with elderly or debilitated patients, asthma, COPD, severe obesity, sleep apnea syndrome, myxedema, CNS depression, lactation, pancreatic or biliary tract disease, hepatic or renal impairment, seizure disorders.

Available forms

Tablets—50, 75, 100 mg

Dosages

Adults

50–100 mg PO every 4–6 hr.

Pediatric patients

Safety and efficacy not established.

Geriatric or debilitated patients

Use caution. Start with the smallest dose and evaluate response.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, dizziness*, changes in thinking, *headache*
- **GI:** *Nausea, vomiting*, constipation
- **Respiratory:** Respiratory depression
- **Other:** Drug abuse

Interactions

- **Drug-drug** • Risk of increased CNS depression (which could lead to respiratory depression) if combined with general anesthetics, opioids, phenothiazines, sedatives, hypnotics, alcohol; if these combinations are used, monitor patient closely and adjust dosages as needed
- Risk of potentially life-threatening serotonin syndrome if combined with SSRIs, TCAs, triptans, other norepinephrine reuptake inhibitors or with MAOIs; use within 14 days of MAOIs is contraindicated; if other combinations are used, patient should be strictly monitored and dosage adjustments made as needed
- **Drug-alternative therapy** • Risk of serotonin syndrome if combined with St. John's wort; advise patient to avoid this combination

Nursing considerations Assessment

- **History:** Hypersensitivity to any component of the drug; acute or severe bronchial asthma, COPD, hypercapnia; MAOI use within 14 days; severe obesity, sleep apnea syndrome; myxedema, CNS depression, seizure disorders; increased intracranial pressure; pancreatic or biliary tract disease, paralytic ileus; hepatic or renal impairment; pregnancy, lactation
- **Physical:** Orientation, affect, pain evaluation; R, adventitious sounds; bowel sounds; LFTs, renal function tests

Interventions

- Assess for pain before beginning therapy and periodically during therapy.
- Dispense the least amount of drug feasible; risk of abuse exists.
- Institute safety measures (use side rails, assist with ambulation); drug increases risk of dizziness and drowsiness.
- Provide frequent small meals if GI upset is a problem.

Teaching points

- Take this drug exactly as prescribed; do not increase dosage without consulting with the health care provider.
- You may experience these side effects: Headache (medication may be available to help); nausea and vomiting (frequent small meals may help); dizziness and drowsiness (avoid driving a car or operating hazardous machinery until you know how this drug will affect you).
- This drug may enter breast milk and could affect your baby if you are breast-feeding. Allow 3–4 hours to pass before nursing your baby if you are taking this drug. Consider an alternate method of feeding your baby or an alternate pain medication.
- Be aware that alcohol may increase the sedation effects of this drug; avoid this combination.
- This drug may interact with many other medications. Tell your health care provider about every medication you are taking.
- Do not use St. John's wort while you are taking this drug; serious side effects can occur.
- Report severe nausea and vomiting, shortness of breath, rash.

telavancin (tell ab van'sin)

Vibativ

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Lipoglycopeptide

Therapeutic actions

A lipoglycopeptide, a semisynthetic derivative of vancomycin, that inhibits bacterial cell-wall synthesis by interfering with the polymerization and cross-linking of peptidoglycan; binds to the bacterial membrane and disrupts membrane-barrier function, causing bacterial cell death.

Indications

- Treatment of complicated skin and skin-structure infections caused by susceptible

strains of gram-positive organisms (*Staphylococcus aureus* [including methicillin-susceptible and methicillin-resistant isolates], *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus aginosus*, *Enterococcus faecalis* [vancomycin-susceptible isolates only])

Contraindications and cautions

- Contraindicated in known hypersensitivity to components of the drug, lactation, pregnancy.
- Use cautiously with renal impairment, QTc-interval prolongation or risk of prolongation.

Available forms

Single-use vials—250, 750 mg

Dosages

Adults

10 mg/kg IV infused over 60 min once every 24 hr for 7–14 days.

Pediatric patients younger than 18 yr

Safety and efficacy not established.

Patients with renal impairment

For creatinine clearance of more than 50 mL/min, 10 mg/kg IV every 24 hr; for creatinine clearance of 30–50 mL/min, 7.5 mg/kg IV every 24 hr; for creatinine clearance of 10 to less than 30 mL/min, 10 mg/kg IV every 48 hr. No recommendations are available for creatinine clearance of less than 10 mL/min or for patients on hemodialysis.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: Unknown; $T_{1/2}$: 8–9.5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute with 5% dextrose injection, sterile water for injection, or 0.9% sodium chloride injection to a concentration of 15 mg/mL (15 mL added to 250-mg vial, 45 mL added to 750-mg vial). Mix thorough-

ly and ensure that contents have dissolved completely and that solution contains no particulate matter. Use within 4 hr when kept at room temperature or within 72 hr if refrigerated.

Infusion: Infuse over 60 min.

Incompatibilities: Do not administer in the same line as other medications; if the line is used for other solutions, flush the line before administering telavancin.

Adverse effects

- **CNS:** dizziness
- **CV:** QTc-interval prolongation
- **GI:** *nausea, vomiting*, diarrhea, abdominal pain, *Clostridium difficile* diarrhea, decreased appetite, *taste disturbance*
- **GU:** **nephrotoxicity**, *foamy urine*
- **Other:** rash, pruritus, rigors, infusion-site pain and redness; infusion reactions (red man syndrome) with rapid infusion

Interactions

- * **Drug-drug** • Increased risk of prolonged QTc interval if combined with other drugs known to cause QTc-interval prolongation; obtain baseline ECG and monitor patient accordingly • Increased risk of nephrotoxicity if combined with other nephrotoxic drugs; monitor patient accordingly
- * **Drug-lab test** • Alterations in INR, PT, APPT, activated clotting time, and coagulation-based factor Xa tests with no effect on coagulation; take blood samples as close as possible before administration of next dose

■ Nursing considerations

Assessment

History: Known hypersensitivity to components of the drug, lactation, pregnancy, renal impairment, QTc-interval prolongation

Physical: Reflexes; skin color, lesions; abdominal exam; renal function tests; baseline ECG; culture and sensitivity of infected area

Interventions

⊗ **Black box warning** Drug poses fetal risk; women of childbearing age should have a serum pregnancy test before start of therapy. Avoid use in pregnancy and advise patient to use contraception.

- Obtain culture and sensitivity tests of the infected area before start of therapy. Ensure that the drug is used only to treat susceptible strains, to prevent development of drug-resistant bacteria.
- Ensure that drug infuses over at least 60 min; too rapid infusion can result in red man syndrome.
- Monitor patient for *C. difficile* diarrhea. If this occurs, drug may need to be stopped and antibiotics administered. Provide fluid and electrolyte support.
- Monitor renal function before and periodically during treatment; if renal toxicity occurs, a different antibiotic should be considered.
- Be aware of drug's effects on various coagulation tests; draw blood for these tests as close as possible before administration of next dose.

Teaching points

- This drug can only be given intravenously. It will be given over 1 hour, once a day for 7 to 14 days depending on your response to the drug. It is important not to skip doses.
- This drug should not be taken during pregnancy; it can have serious effects on the fetus. Women of childbearing age will need to have a serum pregnancy test before beginning therapy. Use of contraceptive measures is advised.
- If you are breast-feeding, you should use another method of feeding the baby while you are taking this drug because the drug could cause serious adverse effects in your baby.
- You will need to have blood tests to monitor the effects of this drug on your kidneys.
- You may experience these side effects: Dizziness (use caution when moving about, and change position slowly); nausea and vomiting; changes in taste (small, frequent meals may help; medication may be available to relieve these symptoms); rash; foamy urine (this is an effect of the drug and will go away when the drug is stopped).
- Report severe diarrhea, fever, irregular heartbeat, hives, flushing, worsening of your infection.

▷ telbivudine

See Appendix U, *Less commonly used drugs*.

▷ telithromycin (tell ith roe mye´ sin)

Ketek ORIG

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Ketolide

Therapeutic actions

Bacteriostatic or bactericidal in susceptible bacteria; binds to sites on bacterial ribosomes, causing change in protein function, leading to cell death.

Indications

- Only for treatment of mild to moderately severe community-acquired pneumonia caused by *Streptococcus pneumoniae* (including multi-drug resistant strains), *Haemophilus influenzae*, *Moraxella catarrhalis*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae* in patients 18 yr and older

Contraindications and cautions

- Contraindicated with allergy to telithromycin, to any component of the drug or to any macrolide antibiotic; congenital QT prolongation, proarrhythmic conditions (hypokalemia), significant bradycardia; concurrent use of pimozide, class Ia or III antiarrhythmics, simvastatin, lovastatin, atorvastatin; myasthenia gravis; history of hepatitis or jaundice.
- Use cautiously with renal or hepatic impairment, pregnancy, lactation.

Available forms

Tablets ORIG—300, 400 mg

Dosages

Adults

Give 800 mg once daily PO for 7–10 days.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

In patients with creatinine clearance less than 30 mL/min, including those on dialysis, give 600 mg PO once daily for 7–10 days after dialysis session is complete. In patients with creatinine clearance less than 30 mL/min and hepatic impairment, give 400 mg PO once daily for 7–10 days.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–4 hr

Metabolism: Hepatic metabolism; $T_{1/2}$: 10 hr

Distribution: May cross placenta; passes into breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, vertigo
- **CV: Prolonged QT interval, torsades de pointes**
- **GI:** *Diarrhea*, nausea, vomiting, taste alterations, loose stools, **pseudomembranous colitis**, hepatic impairment
- **Other:** *Superinfections*, hypersensitivity reactions ranging from rash to **anaphylaxis**, visual disturbances

Interactions

★ **Drug-drug** ☒ **Warning** Risk of increased serum levels and potentially serious adverse effects if combined with pimozide, simvastatin, lovastatin, atorvastatin, midazolam; avoid these combinations.

- Risk of increased exposure to metoprolol if given in combination, caution should be used
- Risk of increased levels of digoxin; if this combination is used, monitor serum digoxin levels regularly and adjust dosage accordingly
- Risk of decreased telithromycin levels and loss of therapeutic effect if combined with rifampin, phenytoin, carbamazepine, phenobarbital; suggest use of a different antibiotic if these drugs are used
- Risk of increased GI effects of theophylline if taken together, separate doses by at least 1 hr if these two drugs are used

■ Nursing considerations

Assessment

- **History:** Known allergy to telithromycin, to any component of the drug, or to any macrolide antibiotic; congenital QT prolongation, proarrhythmic conditions, significant bradycardia; concurrent use of pimozide, class Ia or III antiarrhythmics, simvastatin, lovastatin, atorvastatin; myasthenia gravis; renal or hepatic impairment; pregnancy; lactation
- **Physical:** Site of infection, skin color, lesions; orientation, affect; baseline ECG, GI output, bowel sounds, liver evaluation; culture and sensitivity tests of infection, LFTs, renal function tests

Interventions

⊗ **Black box warning** Contraindicated for use in patients with myasthenia gravis; life-threatening respiratory failure may occur.

- Culture site of infection before beginning therapy; make sure drug is used only as indicated.
- Administer at about the same time each day, without regard to food.
- Make sure that the tablet is swallowed whole, do not cut, crush, or allow the patient to chew the tablet.
- Monitor liver function in patients on prolonged therapy.
- Institute appropriate hygiene measures and arrange treatment if superinfections occur.
- If GI upset occurs provide frequent, small meals; encourage patient to maintain fluid intake and nutrition.
- Establish safety measures (eg, accompany patient, side rails) if CNS changes occur.

Teaching points

- Take this drug at about the same time each day, without regard to food. Do not cut, crush or chew the tablets; they must be swallowed whole.
- If you miss a dose, take the next dose as soon as you remember and then again about that time the next day; do not take more than one dose per day.
- Avoid quickly looking between objects in the distance and objects nearby if you are having visual difficulties.

- Take the full, prescribed dose of *Ketek*. Do not use the drug after the expiration date and do not save tablets for future use.
- You may experience these side effects: Nausea, diarrhea, discomfort (eat frequent small meals), headache (analgesics may be available to help, consult with your health care provider), dizziness (do not drive a car or operate hazardous machinery if this occurs).
- Report persistent or bloody diarrhea, visual disturbances that interfere with your daily activities, fainting, yellow color to the eyes or skin.

▽ telmisartan

(tell mah sar' tan)

Micardis

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Angiotensin II receptor antagonist
Antihypertensive

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the vascular smooth muscle and adrenal gland; this action blocks the vasoconstriction effect of the renin-angiotensin system, as well as the release of aldosterone, leading to decreased BP.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- **NEW INDICATION:** CV risk reduction, including risk of MI, stroke, or death, in patients 55 yr and older at high risk for developing major CV events who are unable to take ACE inhibitors

Contraindications and cautions

- Contraindicated with hypersensitivity to telmisartan, pregnancy (use during the second or third trimester can cause injury or death to the fetus), lactation.
- Use cautiously with hepatic or biliary impairment, hypovolemia.

Available forms

Tablets—20, 40, 80 mg

Dosages

Adults

Usual starting dose, 40 mg PO daily. Adjust dosage based on patient response. Maximum dose, 80 mg/day. If response is still not as expected, a diuretic should be added. For CV risk reduction, 80 mg PO once a day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	0.5–1 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 24 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Light-headedness, headache, dizziness, muscle weakness*
- **CV:** Hypotension, palpitations
- **Dermatologic:** Rash, dermatitis, eczema, urticaria, pruritus
- **GI:** Constipation, flatulence, gastritis, vomiting, dry mouth, dental pain
- **GU:** Decreased renal function
- **Respiratory:** Asthma, dyspnea, epistaxis, cough
- **Other:** Back pain, gout

Interactions

★ **Drug-drug** • Increased serum levels and risk of toxicity of digoxin if combined

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to telmisartan; pregnancy, lactation; hepatic or biliary impairment; hypovolemia

- **Physical:** Skin lesions, turgor; T; orientation, reflexes, affect; BP; R, respiratory auscultation; LFTs

Interventions

- Administer without regard to meals.

⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy. Suggest the use of barrier birth control while using telmisartan; fetal injury and deaths have been reported.

- Find an alternate method of feeding the baby if given to a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.

⊗ **Warning** Alert the surgeon and mark the patient's chart with notice that telmisartan is being taken. The blockage of the renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.

- If BP control does not reach desired levels, diuretics or other antihypertensives may be added to telmisartan. Monitor patient's BP carefully.
- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea—excessive hypotension can occur.

Teaching points

- Take drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while taking this drug; if you become pregnant or want to become pregnant, consult your health care provider.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult with your dietitian to maintain nutrition); symptoms of upper respiratory tract infection; cough (do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy.

temazepam

(*te maz' e pam*)

Apo-Temazepam (CAN), CO
Temazepam (CAN), Gen-Temazepam
(CAN), Novo-Temazepam (CAN),
PMS-Temazepam (CAN),
ratio-Temazepam (CAN), Restoril

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-IV

Drug classes

Benzodiazepine
Sedative-hypnotic

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; main sites of action may be the limbic system and mesencephalic reticular formation; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter.

Indications

- Insomnia characterized by difficulty falling asleep, frequent nocturnal awakenings, or early morning awakening
- Recurring insomnia or poor sleeping habits
- Acute or chronic medical situations requiring restful sleep

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery (“floppy infant” syndrome), lactation (infants may become lethargic and lose weight).
- Use cautiously with impaired liver or renal function, debilitation, depression, suicidal tendencies.

Available forms

Capsules—7.5, 15, 22.5, 30 mg

Dosages

Adults

15–30 mg PO before bedtime.

Pediatric patients

Not for use in patients younger than 18 yr.

Geriatric or debilitated patients

Initially, 7.5 mg PO; adjust dosage, increasing if needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.2–1.6 hr

Metabolism: Hepatic; $T_{1/2}$: 10–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty concentrating, vivid dreams, psychomotor retardation, extrapyramidal symptoms, mild paradoxical excitatory reactions during first 2 wk of treatment* (especially in psychiatric patients, aggressive children, and with high dosage), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion, complex sleep-related behaviors
- **CV:** *Bradycardia, tachycardia, CV collapse*, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **GI:** *Constipation, diarrhea*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes; hepatic impairment, jaundice
- **GU:** *Incontinence, urinary retention, changes in libido*, menstrual irregularities
- **Hematologic:** Decreased Hct (primarily with long-term therapy), blood dyscrasias

- **Other:** Hiccups, fever, diaphoresis, paresthasias, muscular disturbances, gynecomastia, **anaphylaxis, angioedema**

Interactions

• *** Drug-drug** • Increased CNS depression with alcohol and other CNS depressants (eg, barbiturates, opioids) • Decreased sedative effects with theophylline, aminophylline, dipylline

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock, coma; acute alcoholic intoxication; pregnancy, lactation; impaired liver or renal function, debilitation; depression, suicidal tendencies
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

⊗ **Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy, to prevent refractory seizures.

- Caution patient to avoid pregnancy while taking this drug; advise patient to use barrier contraceptives.

Teaching points

- Take drug exactly as prescribed.
- During long-term therapy, do not stop taking this drug without consulting your health care provider.
- Do not drink alcohol or use other CNS depressants while on this drug.
- Avoid pregnancy while taking this drug; serious fetal harm could occur. Using contraceptive measures is advised.
- Nocturnal sleep may be disturbed for several nights after discontinuing the drug.
- You may experience these side effects: Drowsiness, dizziness (may lessen); avoid driving or engaging in other dangerous activities); swelling, allergic reaction; GI upset (take drug with water); depression, dreams, emotional upset, crying, complex sleep-related behaviors, allergic reaction, or swelling.

- Report severe dizziness, allergies, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of extremities, visual changes, difficulty voiding, sleep disorders.

▷ temozolomide

See Appendix U, *Less commonly used drugs*.

▷ temsirolimus

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ tenecteplase

(teh nek' ti plaze)

TNKase

PREGNANCY CATEGORY C

Drug class

Thrombolytic enzyme

Therapeutic actions

Enzyme that converts plasminogen to the enzyme plasmin (fibrinolysin), which degrades fibrin clots; lyses thrombi and emboli; is most active at the site of the clot and causes little systemic fibrinolysis.

Indications

- Reduction of mortality associated with acute MI

Contraindications and cautions

- Contraindicated with allergy to tenecteplase; active internal bleeding; history of stroke; intracranial or intraspinal surgery or trauma (within 2 mo); intracranial neoplasm, arteriovenous malformation, or aneurysm; known bleeding diathesis; severe uncontrolled hypertension.
- Use cautiously with recent major surgery, previous puncture of noncompressible vessels, cerebrovascular disease, recent GI or GU bleeding, recent trauma, hypertension, high likelihood of left heart thrombus, acute pericarditis, subacute bacterial endocarditis, hemostatic defects (including those secondary to severe hepatic or renal disease),

severe hepatic impairment, pregnancy, diabetic hemorrhagic retinopathy or other hemorrhagic ophthalmic conditions, septic thrombophlebitis or occluded AV cannula at seriously infected site, advanced age, patients currently receiving oral anticoagulants, recent use of GP IIb/IIIa inhibitors, any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of its location.

Available forms

Powder for injection—50 mg

Dosages

Adults

⊗ **Warning** Do not exceed 50 mg/dose. Initiate treatment as soon as possible after onset of acute MI. Administer as IV bolus over 5 sec.

Dose is based on weight:

Less than 60 kg: 30 mg.

60–69 kg: 35 mg.

70–79 kg: 40 mg.

80–89 kg: 45 mg.

90 kg or more: 50 mg.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Dosage adjustment is not recommended, but elderly patients have an increased risk of adverse effects. Monitor closely for early signs of bleeding.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	5–10 min

Metabolism: Hepatic; $T_{1/2}$: 90–130 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile

IV FACTS

Preparation: Reconstitute using the supplied 10-cc syringe with twinpack dual cannula device and 10 mL sterile water for injection. Do not shake. Slight foaming is normal and should dissipate if left standing for 10 min. Reconstituted solution is 5 mg/mL. Use immediately or may be refrigerated for up to 8 hr.

Infusion: Infuse as a bolus injection over 5 sec. Flush any dextrose-containing lines with saline before injecting and after administration. Discard any leftover solution.

Incompatibilities: Do not add other medications to infusion solution.

Adverse effects

- **CV:** Cardiac arrhythmias with coronary reperfusion, hypotension, AV block, **MI**, cardiogenic shock, cholesterol embolization (eg, livedo reticularis, “purple toe” syndrome, acute renal failure, pancreatitis, hypertension)
- **Hematologic: Bleeding**, particularly at venous or arterial access sites; GI bleeding; intracranial hemorrhage
- **Other:** Urticaria, nausea, vomiting, fever, allergic reactions

Interactions

- **Drug-drug** • Increased risk of hemorrhage if used with heparin or oral anticoagulants, aspirin, dipyridamole, ticlopidine, clopidogrel; monitor patient very closely if these combinations are used • Decreased effectiveness if combined with aminocaproic acid
- **Drug-lab test** • During tenecteplase therapy, results of coagulation tests or measures of fibrinolytic activity may be unreliable unless specific precautions are taken to prevent *in vitro* artifacts

Nursing considerations

Assessment

- **History:** Allergy to tenecteplase; active internal bleeding; recent (within 2 mo) stroke; intracranial or intraspinal surgery or neoplasia; recent major surgery, obstetrical delivery, organ biopsy, or rupture of a non-compressible blood vessel; recent serious GI bleed; recent serious trauma, including CPR; SBE; hemostatic defects; cerebrovascular disease; early-onset, type 1 diabetes; severe uncontrolled hypertension; liver disease; pregnancy, lactation
- **Physical:** Skin color, T, lesions; orientation, reflexes; P, BP, peripheral perfusion, baseline ECG; R, adventitious sounds; liver evaluation, Hct, platelet count, thrombin time (TT), aPTT, PT/INR

Interventions

⊗ **Warning** Arrange to discontinue concurrent heparin and tenecteplase if serious bleeding occurs.

- Arrange for regular monitoring of coagulation studies.

⊗ **Warning** Apply pressure or pressure dressings or both to control superficial bleeding (at invaded or disturbed areas); avoid IM injections, invasive procedures, and excessive handling of the patient.

- Avoid any arterial invasive procedures during therapy.
- Arrange for typing and cross-matching of blood in case serious blood loss occurs and whole blood transfusions are required.
- Monitor patient for signs of bleeding; provide safety procedures to avoid injury.

Teaching points

- This drug can only be given IV and you will need to be closely monitored during drug treatment.
- You may experience these side effects: Tendency to bleed easily (use caution to avoid injury, use electric razor, a soft toothbrush, use caution with sharp objects), strict bed rest will help to decrease the risk of bleeding. If bleeding does occur, apply pressure to the site until bleeding stops.
- Report bruising or bleeding; blood in urine, stool, or with coughing; bleeding gums; changes in vision; difficulty breathing, chest pain.

tenofovir disoproxil fumarate

(*te noe' fo veer*)

Viread

PREGNANCY CATEGORY B

Drug classes

Antiviral

Nucleotide reverse transcriptase inhibitor

Therapeutic actions

Antiviral activity; inhibits HIV reverse transcriptase activity, leading to a blocking of HIV reproduction.

Indications

- Treatment of HIV-1 infection in combination with other antiretrovirals
- Treatment of chronic hepatitis B in adults

Contraindications and cautions

- Contraindicated with allergy to tenofovir or any other components of the product, chronic hepatitis B.
- Use cautiously in pregnancy, hepatic or renal impairment, lactation.

Available forms

Tablets—300 mg

Dosages

Adults

300 mg/day PO without regard to food.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Adjust dosage as follows:

CrCl (mL/min)	Dose
50 or more	300 mg every 24 hr
30–49	300 mg every 48 hr
10–29	300 mg twice a wk
Hemodialysis	300 mg every wk or after a total of about 12 hr of dialysis

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	45–75 min

Metabolism: Unknown; $T_{1/2}$: 17 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, asthenia*
- **GI:** *Nausea, vomiting, diarrhea*, anorexia, abdominal pain, *flatulence*, **severe hepatomegaly with steatosis**
- **Metabolic:** **Lactic acidosis, sometimes severe**

Interactions

* **Drug-drug** • Increased concentration and toxicity of didanosine if used concurrently; decrease didanosine dose to 250 mg in patients

weighing more than 60 kg • Increased tenofovir concentrations with atazanavir and lopinavir; monitor patient closely • Risk of decreased atazanavir levels if combined with tenofovir; administer 300 mg atazanavir with 100 mg ritonavir only; do not administer atazanavir alone • Avoid use with other combination drugs that include tenofovir.

★ **Drug-food** • Increased bioavailability if combined with food; tenofovir can be taken without regard to meals

■ Nursing considerations

Assessment

- **History:** Allergy to tenofovir, renal or hepatic impairment, pregnancy, lactation
- **Physical:** T, orientation, reflexes, abdominal examination, LFTs, renal function tests

Interventions

- Administer with other antiretrovirals; do not use as monotherapy.

⊗ **Black box warning** Monitor hepatic function closely; risk of lactic acidosis and severe hepatic toxicity.

⊗ **Black box warning** Severe exacerbation of hepatitis B has occurred when anti-hepatitis B therapy is discontinued. Monitor patient for several months if drug is discontinued.

- Monitor patients with hepatic or renal problems for possible adverse effects.

⊗ **Warning** Withdraw drug and monitor patient if signs or symptoms of lactic acidosis or hepatotoxicity develop, including hepatomegaly and steatosis. These are more common in women, obesity, and prolonged tenofovir use.

- Encourage women of childbearing age to use barrier contraceptives while taking this drug because the effects of the drug on the fetus are not known.
- Advise women who are breast-feeding to find another method of feeding the baby.

Teaching points

- Take this drug once a day without regard to meals or food.
- Take the full course of therapy as prescribed; always take in combination with other antivirals; if you miss a dose, take it as soon as

you remember and then take the next dose at the usual time. If it is almost time for the next dose when you remember, just take the next dose. Do not take any double doses.

- This drug does not cure HIV infection; long-term effects are not yet known; continue to take precautions because the risk of transmission is not reduced by this drug.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised.
- Do not take any other drug, prescription or over-the-counter, without consulting your health care provider; this drug interacts with other drugs and serious problems can occur.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, abdominal pain, headache (try to maintain nutrition and fluid intake as much as possible; eat frequent small meals); redistribution of fat on the body (arms and legs may become thin, a “buffalo hump” may develop on the back of the neck, and fat may be distributed in the breasts and along the trunk).
- Report severe diarrhea, jaundice, changes in color of stool or urine, rapid respirations.

▽ terazosin hydrochloride

(*ter ay' zoe sin*)

Apo-Terazocin (CAN), Hytrin, Novo-Terazocin (CAN), PMS-Terazocin (CAN), ratio-Terazocin (CAN)

PREGNANCY CATEGORY C

Drug classes

Alpha₁-adrenergic blocker
Antihypertensive
BPH drug

Therapeutic actions

Drug selectively blocks postsynaptic alpha₁-adrenergic receptors, decreasing sympathetic tone on the vasculature, dilating arterioles and veins, and lowering supine and standing BP; unlike conventional alpha-adrenergic blocking agents (eg, phentolamine), it does not also block alpha₂ presynaptic receptors, does not cause reflex tachycardia. Relaxes the smooth

muscle by blocking alpha₁-adrenergic receptors in the bladder neck and prostate thereby improving the symptoms of BPH.

Indications

- Treatment of symptomatic BPH
- Treatment of hypertension alone or in combination with other drugs
- Unlabeled uses: Symptomatic treatment of ureteral stones

Contraindications and cautions

- Contraindicated with hypersensitivity to terazosin and during lactation.
- Use cautiously in patients taking other antihypertensives, HF, renal failure, pregnancy.

Available forms

Tablets, capsules—1, 2, 5, 10 mg

Dosages

Adults

Adjust dose and dosing interval (12 or 24 hr) individually.

- **Hypertension:** Initial dose, 1 mg PO at bedtime. Do not exceed 1 mg; strictly adhere to this regimen to avoid severe hypotensive reactions. Slowly increase dose to achieve desired BP response. Usual range, 1–5 mg PO daily. Up to 20 mg/day has been beneficial. Monitor BP 2–3 hr after dosing to determine maximum effect. If response is diminished after 24 hr, consider increasing dosage or use a twice daily regimen. If drug is not taken for several days, restart with initial 1-mg dose.
- **BPH:** Initial dose, 1 mg PO at bedtime. Increase to 2, 5, or 10 mg PO daily. 10 mg/day for 4–6 wk may be required to assess benefit. If drug is not taken for several days, restart with the initial dose.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1 hr

Metabolism: Unknown; T_{1/2}: 12 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, headache, drowsiness, lack of energy, weakness, somnolence, nervousness, vertigo, depression, paresthesia*
- **CV:** *Palpitations, sodium and water retention, increased plasma volume, edema, syncope, tachycardia, orthostatic hypotension, angina*
- **Dermatologic:** Rash, pruritus, alopecia
- **EENT:** Blurred vision, reddened sclera, floppy iris syndrome during cataract surgery, epistaxis, tinnitus, dry mouth, nasal congestion
- **GI:** *Nausea, vomiting, diarrhea, constipation, abdominal discomfort or pain*
- **GU:** Urinary frequency, incontinence, impotence, priapism
- **Respiratory:** *Dyspnea, nasal congestion, sinusitis*
- **Other:** Diaphoresis, **allergic anaphylaxis**

Interactions

★ **Drug-drug** • Risk of marked hypotension with drugs used to treat ED; use caution

Nursing considerations

Assessment

- **History:** Hypersensitivity to terazosin; HF; renal failure; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds, status of nasal mucous membranes; bowel sounds, normal output; voiding pattern, urinary output; renal function tests, urinalysis

Interventions

⊗ **Warning** Administer or have patient take first dose just before bedtime to lessen likelihood of first dose effect, syncope due to excessive orthostatic hypotension.

⊗ **Warning** Have patient lie down, and treat supportively if syncope occurs; condition is self-limiting.

- Monitor patient for orthostatic hypotension, which is most marked in the morning, and is accentuated by hot weather, alcohol, exercise.
- Monitor edema and weight in patients with incipient cardiac decompensation, and add a thiazide diuretic to the drug regimen if

sodium and fluid retention, signs of impending HF, occur.

Teaching points

- Take this drug exactly as prescribed. Take the first dose just before bedtime. Do not drive or operate machinery for 12 hours after the first dose.
- Use caution if you are using drugs to treat erectile dysfunction; dizziness, low blood pressure can occur.
- You may experience these side effects: Dizziness, weakness (more likely when changing position, in early morning, after exercise, in hot weather, and with alcohol use; some tolerance may occur after taking the drug for a while, but avoid driving or engaging in tasks that require alertness; change position slowly; use caution when climbing stairs; lie down for a while if dizziness persists); GI upset (eat frequent small meals); impotence; dry mouth (suck on sugarless lozenges or ice chips); stuffy nose. Most effects will gradually disappear.
- Report frequent dizziness or faintness.

terbinafine hydrochloride

(*ter bin' ah feen*)

Apo-Terbinafine (CAN), CO
Terbinafine (CAN), Gen Terbinafine (CAN), Lamisil, Lamisil AT, Lamisil Oral Granules, PMS-Terbinafine (CAN)

PREGNANCY CATEGORY B

Drug classes

Allylamine
Antifungal

Therapeutic actions

A synthetic allylamine that is thought to block squalene oxidase, thus preventing the biosynthesis of ergosterol, an essential component of fungal cell walls.

Indications

- Treatment of tinea capitis in patients 4 yr and older (oral granules)

- Treatment of onychomycosis of the toenail or fingernail caused by dermatophytes

Contraindications and cautions

- Contraindicated with allergy to any component of the product, hepatic failure, pregnancy, lactation.
- Use cautiously with hepatic impairment, renal impairment, immunodeficiency.

Available forms

Tablets—250 mg; oral granules—125, 187.5 mg

Dosages

Adults

- *Fingernail onychomycosis*: 250 mg/day PO for 6 wk.
- *Toenail onychomycosis*: 250 mg/day PO for 12 wk.
- *Tinea capitis*: 250 mg/day PO for 6 wk.

Pediatric patients

Tinea capitis

Weight less than 25 kg: 125 mg/day PO for 6 wk.
25–35 kg: 187.5 mg/day PO for 6 wk.
Weight more than 35 kg: 250 mg/day PO for 6 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Moderate	2 hr

Metabolism: Hepatic metabolism, $T_{1/2}$: 36 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, taste disturbance, visual disturbance
- **Dermatological:** Rash, *pruritus*, urticaria
- **GI:** Diarrhea, abdominal pain, dyspepsia, nausea, flatulence, **hepatic failure**, liver enzyme abnormalities, taste disturbances

Interactions

- *** Drug-drug** • Decreased effectiveness of terbinafine if combined with rifampin, cyclosporine • Increased serum levels and risk of toxicity if combined with cimetidine • Increased serum levels of dextromethorphan and risk of

toxicity if combined with terbinafine; monitor patient closely if this combination must be used

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Lamisil* (terbinafine) and *Lamictal* (lamotrigine) and *Lamisil AF* (tolnaftate) and *Lamisil AT* (terbinafine); use extreme caution.

Assessment

- **History:** Allergy to any component of the product, hepatic or renal impairment, immunodeficiency, pregnancy, lactation
- **Physical:** Skin evaluation; liver examination, bowel sounds; T; nail specimen culture, LFTs

Interventions

- Obtain nail culture or biopsy to confirm the diagnosis of onychomycosis before beginning therapy.
- Suggest waiting until after delivery instead of using this drug during pregnancy or lactation; effects on the fetus are not known.
- Suggest an alternative method of feeding the infant if this drug is prescribed for a nursing mother.
- For oral granules, sprinkle entire packet of granules on a spoonful of nonacidic food, such as mashed potatoes. Have patient swallow entire spoonful without chewing.

⊗ **Black box warning** Monitor the patient regularly for any sign of hepatic impairment; liver failure can occur.

- Discontinue drug if a skin rash appears, or with hepatic failure.
- Provide appropriate analgesics for headache.

Teaching points

- Take this drug for the full recommended course of treatment.
- If using oral granules, sprinkle entire packet on a spoonful of nonacidic food, such as mashed potatoes. Then swallow entire spoonful without chewing.
- You may experience these side effects: Headache (medication will be arranged), diarrhea, abdominal pain, nausea (eat frequent small meals).

- Report persistent nausea, lack of appetite, yellowing of the eyes or skin, dark urine or pale stools.
- Report skin rash to your health care provider immediately.

▽ terbutaline sulfate (ter *byoo'* ta leen)

PREGNANCY CATEGORY B

Drug classes

Antasthmatic
Beta₂-selective adrenergic agonist
Bronchodilator
Sympathomimetic
Tocolytic drug

Therapeutic actions

In low doses, acts relatively selectively at beta₂-adrenergic receptors to cause bronchodilation and relax the pregnant uterus; at higher doses, beta₂ selectivity is lost and the drug acts at beta₁ receptors to cause typical sympathomimetic cardiac effects.

Indications

- Prophylaxis and treatment of bronchial asthma and reversible bronchospasm that may occur with bronchitis and emphysema in patients 12 yr and older
- Unlabeled use: Tocolytic to prevent preterm labor

Contraindications and cautions

- Contraindicated with hypersensitivity to terbutaline; tachyarrhythmias, tachycardia caused by digoxin toxicity; general anesthesia with halogenated hydrocarbons or cyclopropane, which sensitize the myocardium to catecholamines; unstable vasomotor system disorders; labor and delivery (may inhibit labor; parenteral use of beta-adrenergic agonists can accelerate fetal heart beat, cause hypoglycemia, hypokalemia, and pulmonary edema in the mother and hypoglycemia in the neonate); lactation.
- Use cautiously with diabetes, coronary insufficiency, CAD, history of CVA, COPD patients who have developed degenerative heart

disease, hyperthyroidism, history of seizure disorders, psychoneurotic individuals, hypertension.

Available forms

Tablets—2.5, 5 mg; injection—1 mg/mL

Dosages

Adults and patients older than 15 yr

Oral

5 mg at 6-hr intervals tid during waking hours. If side effects are pronounced, reduce to 2.5 mg tid. Do not exceed 15 mg/day.

Parenteral

0.25 mg subcutaneously into lateral deltoid area. If no significant improvement in 15–30 min, give another 0.25-mg dose. Do not exceed 0.5 mg/4 hr. If patient fails to respond to second 0.25-mg dose within 15–30 min, other therapeutic measures should be considered.

Pediatric patients

Oral

12–15 yr: 2.5 mg tid. Do not exceed 7.5 mg/24 hr.

Younger than 12 yr: Not recommended.

Geriatric patients

Patients older than 60 yr are more likely to experience side effects. Use with extreme caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	5–15 min	30–60 min	1.5–4 hr
Oral	30 min	2–3 hr	4–8 hr

Metabolism: Tissue; $T_{1/2}$: 2–4 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Restlessness, apprehension, anxiety, fear*; CNS stimulation, hyperkinesia, insomnia, tremor, drowsiness, irritability, weakness, vertigo, headache, seizures
- **CV:** *Cardiac arrhythmias, palpitations*, angular pain (less likely with bronchodilator doses of this drug than with bronchodilator doses of a nonselective beta agonist [isoproterenol]), changes in BP and ECG

- **GI:** *Nausea*, vomiting, heartburn, unusual or bad taste in mouth
- **Respiratory:** *Respiratory difficulties, pulmonary edema, coughing, bronchospasm*
- **Other:** Sweating, pallor, flushing, muscle cramps, elevated LFTs

Interactions

- **Drug-drug** • Increased likelihood of cardiac arrhythmias with halogenated hydrocarbon anesthetics (halothane), cyclopropane
- Risk of hypokalemia if combined with diuretics • Increased risk of hypokalemia and ECG changes with MAOIs and TCAs • Do not administer with other sympathomimetics, theophylline

Nursing considerations

CLINICAL ALERT!

Due to similar packaging, terbutaline injection has been confused with methergine injection (methylergonovine maleate); use extreme caution.

Assessment

- **History:** Hypersensitivity to terbutaline; tachyarrhythmias; general anesthesia with halogenated hydrocarbons or cyclopropane; unstable vasomotor system disorders; hypertension; CAD; history of stroke; COPD patients who have developed degenerative heart disease; hyperthyroidism; history of seizure disorders; psychoneurotic individuals; pregnancy; labor and delivery; lactation
- **Physical:** Weight; skin color, T, turgor; orientation, reflexes; P, BP; R, adventitious sounds; blood and urine glucose; serum electrolytes; LFTs, thyroid function tests; ECG

Interventions

- Use minimal doses for minimal periods of time; drug tolerance can occur with prolonged use.
- **Warning** Keep a beta blocker (a cardioselective beta blocker, such as atenolol, should be used in patients with respiratory distress) readily available in case cardiac arrhythmias occur.
- Do not exceed recommended dosage.

Teaching points

- Do not exceed recommended dosage; adverse effects or loss of effectiveness may result. Read product instructions; consult your health care provider if you have any questions.
- You may experience these side effects: Weakness, dizziness, inability to sleep (use caution when driving or performing activities that require alertness); nausea, vomiting (eat frequent small meals); fast heart rate, anxiety.
- Report chest pain, dizziness, insomnia, weakness, tremor or irregular heartbeat, failure to respond to usual dosage.

▷ teriparatide

See Appendix U, *Less commonly used drugs*.

▷ testosterone

(*tess toss' ter ohn*)

testosterone

Transdermal patch: Androderm

Transdermal gel: AndroGel 1%, Testim

Testosterone pellets: Testopel Pellets

Testosterone buccal: Striant

testosterone cypionate (long-acting)

Depo-Testosterone

testosterone enanthate (long-acting)

Delatestryl

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-III

Drug classes

Androgen

Hormone

Therapeutic actions

Primary natural androgen; responsible for growth and development of male sex organs and the maintenance of secondary sex char-

acteristics; administration of exogenous testosterone increases the retention of nitrogen, sodium, potassium, phosphorus; decreases urinary excretion of calcium; increases protein anabolism and decreases protein catabolism; stimulates the production of RBCs.

Indications

- Replacement therapy in hypo-gonadism—primary hypogonadism, hypogonadotropic hypogonadism, delayed puberty (men)
- Testosterone enanthate only: Inoperable breast cancer, metastatic mammary cancer

Contraindications and cautions

- Contraindicated with known sensitivity to androgens; prostate or breast cancer in men; pregnancy; lactation; serious cardiac, hepatic, or renal disease. *Androderm* and *Striant* contraindicated for use in women.
- Use cautiously with MI.

Available forms

Transdermal system—2.5, 5 mg/24 hr; transdermal gel, 1%; pellets—75 mg; testosterone enanthate injection—200 mg/mL; buccal system—30 mg; testosterone cypionate injection—100, 200 mg/mL

Dosages

Adults

- *Carcinoma of the breast and metastatic mammary cancer:* 200–400 mg IM (testosterone enanthate) every 2–4 wk.
- *Male hypogonadism (replacement therapy):* 50–400 mg testosterone cypionate or testosterone enanthate every 2–4 wk given IM, or 150–450 mg testosterone enanthate pellets implanted subcutaneously every 3–6 mo.
- *Males with delayed puberty:* 50–200 mg IM (testosterone enanthate) every 2–4 wk for a limited duration (4–6 mo) or 150 mg pellets subcutaneously every 3–6 mo (testosterone pellets).
- *Primary hypogonadism, hypogonadotropic hypogonadism in males:* Testosterone patch, initially 5 mg/day system applied to scrotal skin; then 2.5-mg/day system (*Androderm*); testosterone gel—5 mg/day (preferably in the morning) applied to clean, dry, intact skin of the shoulders, upper arms,

or abdomen (*AndroGel* or *Testim*); apply one buccal system (30 mg) to gum region bid (morning and evening); rotate sites; usual position is above incisor on either side of mouth (*Striant*).

Pharmacokinetics

Route	Onset	Duration
IM	Slow	1–3 days
IM cypionate	Slow	2–4 wk
IM enanthate	Slow	2–4 wk
Dermal	Rapid	24 hr
Buccal	Rapid	12 hr

Metabolism: Hepatic; $T_{1/2}$: 10–100 min; up to 8 days (cypionate)

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, headache, sleep disorders, fatigue, tremor, sleeplessness, generalized paresthesia, sleep apnea syndrome, hot flashes, hypertension (topical gel)*
- **Dermatologic:** *Rash, dermatitis, anaphylactoid reactions, acne*
- **Endocrine:** *Androgenic effects (acne, edema, mild hirsutism, decrease in breast size, deepening of the voice, oily skin or hair, weight gain, clitoral hypertrophy or testicular atrophy), hypoestrogenic effects (flushing, sweating, vaginitis, nervousness, emotional lability), gynecomastia in males*
- **GI:** *Nausea, hepatic impairment; **hepatocellular carcinoma***
- **GU:** *Fluid retention, decreased urinary output, changes in libido*
- **Hematologic:** *Polycythemia; leukopenia; hypercalcemia; altered serum cholesterol levels; retention of sodium, chloride, water, potassium, phosphates, and calcium*
- **Respiratory:** *dyspnea*
- **Other:** *Chills, premature closure of the epiphyses, hypercalcemia*

Interactions

• **Drug-drug** • Risk of acute or severe alcohol intolerance if gel combined with methonidazole, disulfiram (gel contains alcohol); caution patient appropriately

• **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

• **Drug-lab test** • Altered glucose tolerance tests • With no evidence of clinical thyroid dysfunction, decrease in thyroid function tests, which may persist for 2–3 wk after therapy • Increased creatinine, creatinine clearance, which may last for 2 wk after therapy

Nursing considerations

Assessment

- **History:** Known sensitivity to androgens, prostate or breast cancer in males, cardiac disease, renal disease, liver disease, pregnancy, lactation
- **Physical:** Skin color, lesions, texture; hair distribution pattern; injection site; affect, orientation, peripheral sensation; abdominal examination, liver evaluation; serum electrolytes, serum cholesterol levels, LFTs, glucose tolerance tests, thyroid function tests, long-bone X-ray (in children)

Interventions

- Apply dermal patch to clean, dry skin as directed. Do not use chemical depilatories. *Androderm* is to be applied to nonscrotal skin on back, abdomen, upper arms. Remove the old patch before applying a new one.

⊗ **Black box warning** There is a risk of toxic effects (enlarged genitalia, greater-than-normal bone age) in children exposed to patients using transdermal form (*AndroGel, Testim*). Patient should wash hands after applying drug and cover treated area with clothing to reduce exposure.

- Apply buccal system to gum region above incisor on either side of mouth; rotate sites (*Striant*). Place rounded side of buccal system against gum and hold firmly in place for 30 sec to ensure adhesion. If system falls off during 12-hr period, remove old system and replace with new system.
- Inject testosterone deeply into gluteal muscle.
- Shake vials well before use; crystals will redissolve.
- Do not administer frequently; these drugs are absorbed slowly; testosterone enanthate and cypionate are long acting and provide therapeutic effects for about 4 wk.

- Monitor effect on children with long-bone X-rays every 3–6 mo during therapy; discontinue drug well before the bone age reaches the norm for the patient's chronologic age.
 - Monitor patient for edema; arrange for diuretic therapy as needed.
 - Monitor liver function and serum electrolytes periodically during therapy, and consult with physician for corrective measures as needed.
 - Periodically measure cholesterol levels in patients who are at high risk for CAD.
 - Monitor patients with diabetes closely because glucose tolerance may change; adjustments may be needed in insulin, oral hypoglycemic dosage, and diet.
 - Periodically monitor urine and serum calcium during treatment of disseminated breast carcinoma and metastatic mammary cancer, and arrange for appropriate treatment or discontinuation of the drug.
 - Monitor elderly men for prostatic hypertrophy and carcinoma.
 - Advise female patients, especially pregnant patients, that they should avoid contact with application site of testosterone gel as well as transdermal patches.
- ⊗ **Warning** Discontinue drug and arrange for consultation if abnormal vaginal bleeding occurs.

Teaching points

- The injection forms of this drug can only be given by IM injection. Mark a calendar indicating days for injection. If using the dermal patch, apply the patch to dry, clean skin as directed. *Androderm* is to be applied to nonscrotal skin on your back, abdomen, or upper arm. Remove the old patch before applying a new one. *AndroGel* is to be applied to skin of the shoulders and upper arms. Do not shower or swim for at least 1 hour after application of gel. Wash hands after applying gel. Cover area with clothing if you are in contact with children because children can experience adverse effects if exposed to the gel.
- Apply buccal system to gum region above incisor on either side of mouth; rotate sites. Check to make sure system remains in place after brushing teeth, using mouthwash, eating, and drinking.
- Avoid grapefruit juice while using this drug.

- This drug cannot be taken during pregnancy; serious fetal effects could occur. Women should use contraceptive measures.
- Patients with diabetes should monitor serum glucose closely because glucose tolerance may change; report any abnormalities to prescriber, so corrective action can be taken.
- You may experience these side effects: Body hair growth, baldness, deepening of the voice, loss of libido, impotence (reversible); excitation, confusion, insomnia (avoid driving or performing tasks that require alertness); swelling of the ankles, fingers (request medication).
- Report ankle swelling; nausea; vomiting; yellowing of skin or eyes; unusual bleeding or bruising; penile swelling or pain; hoarseness, body hair growth, deepening of the voice, acne, menstrual irregularities, pregnancy.

tetrabenazine (*tet ra ben' ab zeen*)

Xenazine

PREGNANCY CATEGORY C

Drug classes

Monoamine depletor
Anti-chorea drug

Therapeutic actions

Inhibits monoamine transport systems, resulting in a decreased uptake of the monoamines dopamine, serotonin, norepinephrine, and histamine into synaptic vesicles and a depletion of monoamine stores; exact mechanism of action of effects on chorea are not understood.

Indications

- Treatment of chorea associated with Huntington's disease

Contraindications and cautions

- Contraindicated with active suicidality, untreated or inadequately treated depression, impaired hepatic function, concurrent use of MAOIs or reserpine.

- Use cautiously with prolonged QT interval, pregnancy, lactation.

Available forms

Tablets—12.5, 25 mg

Dosages

Adults

12.5 mg/day PO in the morning; after 1 week, increase to 12.5 mg PO bid; may be slowly titrated as needed to a maximum dose of 100 mg/day in divided doses.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2 hr

Metabolism: Hepatic; $T_{1/2}$: 4–8 hr, then 2–4 hr (active metabolite)

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Sedation, insomnia, depression, anxiety*; irritability, obsessive reaction, *akathisia*, parkinsonism, dizziness, headache, unsteady gait
- **GI:** *Nausea*, vomiting, decreased appetite
- **Respiratory:** *URI*, shortness of breath, bronchitis
- **Other:** *Fatigue*

Interactions

*** Drug-drug** • Risk of increased serum levels and toxicity if given with any potent CYP2D6 inhibitor (fluoxetine, paroxetine, quinidine); dosage of tetrabenazine should be halved if combined with any of these drugs • Increased risk of prolonged QT interval if combined with any other drugs that prolong QT interval (antipsychotics, antiarrhythmics); avoid this combination • Increased sedation if combined with alcohol or other sedating drugs • Increased adverse reactions if combined with dopamine agonists; monitor patient carefully • Increased risk of serious adverse effects if taken with MAOIs, reserpine; avoid this combination; at least 20 days should elapse and chorea symptoms

should return before switching a patient from these drugs to tetrabenazine

Nursing considerations

Assessment

- **History:** Active suicidality, untreated or inadequately treated depression; impaired hepatic function; concurrent use of MAOIs, reserpine; prolonged QT interval; pregnancy, lactation
- **Physical:** T; orientation, affect; R, adventitious sounds; CBC with platelet counts, peripheral blood smear, ECG, LFTs

Interventions

⊗ **Black box warning** There is an increased risk of depression and suicidality with drug administration; monitor patient accordingly.

- Tell patient and his family that there is a risk of increased suicidal ideation and increased depression while on this drug. Discuss signs to watch for and tell them whom to notify if these effects occur.
- Establish a baseline of patient's chorea symptoms to evaluate drug's effectiveness and to create guidelines for dosing.
- Inform patient that motor function changes, including Parkinson-like symptoms, and sedation and confusion may occur. Advise patient to avoid driving, operating dangerous machinery, or making important decisions until the effects of the drug on the patient are known.
- Advise the use of contraceptive measures while on this drug.
- Encourage nursing mothers to find a different method of feeding the baby while on this drug.

Teaching points

- Take this drug once a day in the morning initially. Your dosage will be adjusted over time to determine the dosage that is most effective for you; when your maintenance dosage is determined, you may need to take the drug two to three times a day.
- Be aware that this drug may increase signs and symptoms of depression and may lead to thoughts of suicide. You and a significant other should be aware of these signs (with-

drawal, irritability, inability to sleep, aggression, anxiety) and should report them to your health care provider immediately if they occur.

- Always tell your health care provider about other drugs or alternative therapies that you might be using or that you might stop using. This drug can be affected by many other drugs, and your dosage may need to be adjusted.
- It is not known whether this drug affects an unborn baby. If you wish to become pregnant, discuss this wish with your health care provider. If you should become pregnant while taking this drug, consult with your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for adverse effects to the infant, another method of feeding the baby should be used while you are on this drug.
- Be aware that alcohol or use of any other CNS depressants, such as sleeping aids, may increase the sedative effects of this drug; avoid these combinations.
- You may experience these side effects: Sedation, drowsiness, changes in level of alertness (do not drive a car or operate dangerous machinery and do not make important decisions until you know how this drug will affect you); changes in motor function with tremors, Parkinson-like symptoms. (This is an effect of the drug; if it becomes too uncomfortable, discuss this problem with your health care provider; your dosage may need to be adjusted.)
- Report tremors, restlessness, thoughts of suicide, increased depression, inability to stay alert, sudden behavioral changes.

tetracycline hydrochloride

(*tet ra sye' kleen*)

Apo-Tetra (CAN), Nu-Tetra (CAN), Sumycin

PREGNANCY CATEGORY D

Drug classes

Antibiotic
Tetracycline

Therapeutic actions

Bacteriostatic: Inhibits protein synthesis of susceptible bacteria, preventing cell replication.

Indications

Systemic administration

- Infections caused by rickettsiae; *Mycoplasma pneumoniae*; agents of psittacosis, ornithosis, lymphogranuloma venereum and granuloma inguinale; *Borrelia recurrentis*, *Haemophilus ducreyi*, *Yersinia pestis*, *Yersinia tularensis*, *Bartonella bacilliformis*, *Bacteroides*, *Vibrio cholerae*, *Campylobacter fetus*, *Brucella*, *Escherichia coli*, *Enterobacter aerogenes*, *Shigella*, *Acinetobacter calcoaceticus*, *Haemophilus influenzae*, *Klebsiella*, trachoma
- When penicillin is contraindicated, infections caused by *Neisseria gonorrhoeae*, *Treponema pallidum*, *Treponema pertenuis*, *Listeria monocytogenes*, *Clostridium*, *Bacillus anthracis*, *Fusobacterium fusiforme*, *Actinomyces*
- Adjunct to amebicides in acute intestinal amebiasis
- Uncomplicated urethral, endocervical, or rectal infections in adults caused by *Chlamydia trachomatis*
- Adjunctive therapy for severe acne

Contraindications and cautions

Systemic administration and dermatologic solution

- Contraindicated with allergy to any of the tetracyclines, pregnancy (toxic to the fetus), lactation (causes damage to the teeth of infant).
- Use cautiously with hepatic or renal impairment.

Available forms

Capsules—250, 500 mg; oral suspension—125 mg/5 mL

Dosages

Adults

Systemic administration

- 1–2 g/day PO in two to four equal doses. Up to 500 mg PO qid.
- *Brucellosis*: 500 mg PO four times daily for 3 wk with 1 g streptomycin bid IM the first wk and daily the second wk.

- *Syphilis*: 30–40 g PO in divided doses over 10–15 days (*Sumycin*); 500 mg PO four times daily for 15–30 days (all others).
- *Uncomplicated gonorrhea*: 500 mg every 6 hr PO for 7 days.
- *Gonococcal urethritis*: 500 mg every 4–6 hr for 4–6 days.
- *Uncomplicated urethral, endocervical, or rectal infections with chlamydia trachomatis*: 500 mg four times daily PO for at least 7 days.
- *Severe acne*: 1 g/day PO in divided doses; then 125–500 mg/day.

Pediatric patients older than 8 yr

Oral

25–50 mg/kg/day PO in four equal doses.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr

Topical: No general systemic absorption.

Metabolism: $T_{1/2}$: 6–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

Systemic administration

- **Dermatologic:** *Phototoxic reactions, rash, exfoliative dermatitis*
- **GI:** *Discoloring and inadequate calcification of primary teeth of fetus if used by pregnant women, discoloring and inadequate calcification of permanent teeth if used during period of dental development, fatty liver, liver failure, anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, esophageal ulcers, esophagitis*
- **Hematologic:** Hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia, leukocytosis, leukopenia
- **Hypersensitivity:** Reactions from urticaria to **anaphylaxis**, including intracranial hypertension
- **Other:** *Superinfections, local irritation at parenteral injection sites*

Interactions

* **Drug-drug** • Decreased absorption with calcium salts, magnesium salts, zinc salts,

aluminum salts, bismuth salts, iron, urinary alkalinizers, food, dairy products, charcoal

- Increased digoxin toxicity
- Decreased effectiveness of hormonal contraceptives, although rare, has been reported with a risk of breakthrough bleeding or pregnancy
- Decreased activity of penicillins

■ Nursing considerations

Assessment

- **History:** Systemic administration and dermatologic solution: Allergy to any of the tetracyclines; hepatic or renal impairment; pregnancy, lactation
- **Physical:** Systemic administration, topical dermatologic solution: Site of infection, skin color, lesions; R, adventitious sounds; bowel sounds, output, liver evaluation; urinalysis, BUN, LFTs, renal function tests. Dermatologic ointment: Site of infection

Interventions

- Administer oral medication on an empty stomach, 1 hr before or 2–3 hr after meals. Do not give with antacids. If antacids must be used, give them 3 hr after the dose of tetracycline.
- Culture infection before beginning drug therapy; many resistant strains have been identified.
- Do not administer during pregnancy; drug is toxic to the fetus.
- **⊗ Warning** Do not use outdated drugs; degraded drug is highly nephrotoxic and should not be used.
- Arrange for regular renal function tests with long-term therapy.

Teaching points

- Take the drug throughout the day for best results. The drug should be taken on an empty stomach, 1 hour before or 2–3 hours after meals, with a full glass of water. Do not take the drug with food, dairy products, iron preparations, or antacids.
- Finish your complete prescription; if any is left, discard it immediately. Never take an outdated tetracycline product.
- There have been reports of pregnancy occurring when taking tetracycline with hormonal contraceptives. To be certain of avoid-

ing pregnancy, use an additional type of contraceptive.

- This drug should not be used during pregnancy; using barrier contraceptives is advised.
- You may experience these side effects: Stomach upset, nausea (reversible); superinfections in the mouth, vagina (frequent washing may help this problem; if severe, request medication); sensitivity of the skin to sunlight (use protective clothing and sunscreen).
- Report severe cramps, watery diarrhea, rash or itching, difficulty breathing, dark urine or light-colored stools, yellowing of the skin or eyes.

tetrahydrozoline hydrochloride

(*tet rah bi draz' ob leen*)

Tyzine, Tyzine Pediatric

OTC ophthalmic preparation:

Geneye, Geneye Extra, Murine Plus, Opticlear, Optigene 3, Visine

PREGNANCY CATEGORY C

Drug classes

Alpha agonist
Nasal decongestant
Ophthalmic decongestant
Ophthalmic vasoconstrictor and mydriatic

Therapeutic actions

Acts directly on alpha receptors to produce vasoconstriction of arterioles in nasal passages, which produces a decongestant response; no effect on beta receptors; dilates pupils; increases flow of aqueous humor, vasoconstricts in eyes.

Indications

- Topical: Symptomatic relief of nasal and nasopharyngeal mucosal congestion due to the common cold, hay fever, or other respiratory allergies
- Ophthalmic: Temporary relief of redness, burning, and irritation due to dryness of the eye or discomfort due to minor irritations or to exposure to wind or sun

Contraindications and cautions

- Contraindicated with allergy to tetrahydrozoline, angle-closure glaucoma, anesthesia with cyclopropane or halothane, thyrotoxicosis, diabetes, hypertension, CV disorders, women in labor whose BP exceeds 130/80 mm Hg, concurrent MAOI use.
- Use cautiously with angina, arrhythmias, prostatic hypertrophy, unstable vasomotor syndrome, lactation.

Available forms

Nasal solution—0.05%, 0.1%; nasal spray—0.1%; ophthalmic solution—0.05%, 0.1%

Dosages

Adults

Nasal

2–4 drops of 0.1% solution in each nostril three to four times/day; *or* 3–4 sprays in each nostril every 4 hr as needed.

Ophthalmic

Instill 1–2 drops into eye or eyes up to four times/day.

Pediatric patients

Nasal

2–6 yr: 2–3 drops of 0.05% solution in each nostril every 4–6 hr as needed, but not more frequently than every 3 hr.

6 yr and older: Use adult dosage.

Ophthalmic

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Nasal	5–10 min	6–10 hr
Ophthalmic:	No general systemic absorption.	

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia

- **CV:** Arrhythmias, hypertension resulting in intracranial hemorrhage, **CV collapse with hypotension**, palpitations, tachycardia, precordial pain in patients with ischemic heart disease
- **GI:** *Nausea*, vomiting, anorexia
- **GU:** Constriction of renal blood vessels, *dysuria, vesical sphincter spasm*, resulting in difficult and painful urination, urinary retention in males with prostatism
- **Local:** *Rebound congestion* with topical nasal application, burning, stinging, sneezing, dryness
- **Other:** *Pallor*, respiratory difficulty, orofacial dystonia, sweating

Interactions

- *** Drug-drug** • Severe hypertension when taken with MAOIs, TCAs • Additive effects increase risk of toxicity with urinary alkalinizers
- Decreased vasopressor response with reserpine, methyl dopa, urinary acidifiers

■ Nursing considerations

Assessment

- **History:** Allergy to tetrahydrozoline; narrow-angle glaucoma; anesthesia with cyclopropane or halothane; thyrotoxicosis, diabetes, hypertension, CV disorders; prostatic hypertrophy, unstable vasomotor syndrome; lactation; pregnancy
- **Physical:** Skin color, T; orientation, reflexes, peripheral sensation, vision; P, BP, auscultation, peripheral perfusion; R, adventitious sounds; urinary output pattern, bladder percussion, prostate palpation; nasal mucous membrane evaluation

Interventions

- Do not administer ophthalmic solution if it is cloudy or changes color.
- **⊗ Warning** Monitor CV effects carefully; patients with hypertension who take this drug may experience changes in BP because of the additional vasoconstriction. If an oral nasal decongestant is needed, pseudoephedrine is the drug of choice.

Teaching points

- Do not exceed recommended dose. Demonstrate proper administration technique for

topical nasal application and administration of eyedrops. Do not use nasal spray more frequently than every 3 hours. Remove contact lenses before using eyedrops. Avoid prolonged use because underlying medical problems can be disguised.

- Rebound congestion may occur when this drug is stopped; drink plenty of fluids, use a humidifier, avoid smoke-filled areas, limit use to 72 hours.
- You may experience these side effects: Dizziness, weakness, restlessness, light-headedness, tremor (avoid driving or operating dangerous equipment); urinary retention (empty bladder before taking drug).
- Report nervousness, palpitations, sleeplessness, sweating, blurred vision.

▼ thalidomide

See Appendix U, *Less commonly used drugs*.

▼ theophylline

(*thee off' i lin*)

Immediate-release capsules, tablets: Elixophyllin

Timed-release capsules:

Theo-24 **DMC**

Timed-release tablets:

Theochron **DMC**, Uniphyll **DMC**

PREGNANCY CATEGORY C

Drug classes

Bronchodilator

Xanthine

Therapeutic actions

Relaxes bronchial smooth muscle, causing bronchodilation and increasing vital capacity that has been impaired by bronchospasm and air trapping; actions may be mediated by inhibition of phosphodiesterase, which increases the concentration of cyclic adenosine monophosphate; in concentrations that may be higher than those reached clinically, it also inhibits the release of slow-reacting substance of anaphylaxis and histamine.

Indications

- Symptomatic relief or prevention of bronchial asthma and reversible bronchospasm associated with chronic bronchitis and emphysema
- Unlabeled use of 2 mg/kg/day to maintain serum concentrations between 3 and 5 mcg/mL: Treatment of apnea and bradycardia of prematurity

Contraindications and cautions

- Contraindicated with hypersensitivity to any xanthines, peptic ulcer, active gastritis, pregnancy (neonatal tachycardia, jitteriness, and withdrawal apnea), underlying seizure disorders (unless receiving appropriate anti-epileptic).
- Use cautiously with cardiac arrhythmias, acute myocardial injury, HF, cor pulmonale, severe hypertension, severe hypoxemia, renal or hepatic disease, hyperthyroidism, alcoholism, labor (may inhibit uterine contractions), lactation, status asthmaticus.

Available forms

CR tablets **ORC**—400, 450, 600 mg; ER capsules **ORC**—100, 125, 200, 300, 400, 450 mg; elixir—80 mg/15 mL; injection—0.8, 1.6, 2, 3.2, 4 mg/mL

Dosages

Maintain serum levels in the therapeutic range of 10–15 mcg/mL; base dosage on lean body mass.

Anhydrous Theophylline Content in Theophylline Derivatives (these products are more water soluble than anhydrous theophylline)

Drug	Anhydrous Theophylline Content
aminophylline anhydrous	85.7%
aminophylline hydrous	78.9%
theophylline monohydrate	90.7%

Adults and children weighing more than 45 kg without risk of impaired excretion

- *Elixophyllin*: Initially, 300 mg/day PO in divided doses every 6–8 hr. After 3 days, may be increased to 400 mg/day PO in divided doses every 6–8 hr. After 3 more days

may be increased to 600 mg/day PO in divided doses every 6–8 hr if tolerated and needed.

- *ER capsule*: Initially, 300 mg/day PO in divided doses every 8–12 hr. After 3 days, may be increased to 400 mg/day PO in divided doses every 8–12 hr. After 3 more days, may be increased to 600 mg/day PO in divided doses every 8–12 hr if tolerated and needed.
- *Theo-24, Uniphyll*: Initially, 300–400 mg/day PO once every 24 hr. After 3 days, may be increased to 400–600 mg/day PO once every 24 hr. After 3 more days, may be increased based on theophylline level to stay within safe range.

Adults and children with risk factors for impaired clearance, geriatric patients, patients for whom monitoring serum theophylline levels is not feasible

- *Elixophyllin*: Children 1–15 yr: Final dose should not exceed 16 mg/kg/day up to a maximum 400 mg/day. Patients 16 yr and older and geriatric patients: Final dose should not exceed 400 mg/day.
- *Theo-24, Uniphyll*: Children 12–15 yr: Final dose should not exceed 16 mg/kg/day up to a maximum 400 mg/day. Patients older than 16 yr and geriatric patients: Final dose should not exceed 400 mg/day.

Adults

Parenteral

Check serum levels after 24 hr when changing IV doses.

- *Nonsmokers ages 16–60 yr*: 0.4 mg/kg/hr.
- *Patients with HF, liver function impairment, sepsis, organ failure*: 0.2 mg/kg/hr IV.
- *Geriatric patients*: 0.3 mg/kg/hr IV.
- *Dosage adjustment based on serum theophylline levels during long-term therapy*: Serum theophylline levels less than 10 mcg/mL are too low, levels of 10–15 mcg/mL are within normal limits, and levels greater than 20 mcg/mL are too high. Serum theophylline level 5–10 mcg/mL: Increase dose by about 25% at 3-day intervals until desired response or serum level occurs. Serum theophylline level 10–14.9 mcg/mL: Maintain dosage; recheck at 6- to 12-mo intervals.

Serum theophylline level 15–19.9 mcg/mL: Consider a decrease in dose by 10% to provide a greater margin of safety.

Serum theophylline level 20–25 mcg/mL: Decrease dose by about 25%; recheck level in 3 days.

Serum theophylline level 25–30 mcg/mL: Skip next dose, and decrease subsequent doses by 25%; recheck level after 3 days.

Serum theophylline level greater than 30 mcg/mL: Skip next two doses and decrease later doses by 50%. Recheck level after 3 days.

- *Measurement of serum theophylline levels during chronic therapy:* Measure serum theophylline in blood sample drawn 1–2 hr after administration of immediate-release preparations, 5–9 hr after administration of most timed-release products.

Pediatric patients

Oral

Premature infants younger than 24 days: 1 mg/kg PO every 12 hr.

Premature infants 24 days and older: 1.5 mg/kg PO every 12 hr.

Full-term infants and infants up to 26 wk: Total dose in mg = $[(0.2 \times \text{age in weeks}) + 5] \times \text{body weight in kilograms}$, divided into three equal doses every 8 hr.

Infants 26 wk and older: Total dose in mg = $[(0.2 \times \text{age in weeks}) + 5] \times \text{body weight in kilograms}$, divided into four equal doses every 6 hr.

Parenteral

Neonates 24 days and younger: 1 mg/kg every 12 hr.

Neonates older than 24 days: 1.5 mg/kg every 12 hr.

Infants: mg/hr = $0.008 \times \text{age in weeks} + 0.21$.

Children 1–9 yr: 0.8 mg/kg/hr.

Children 9–12 yr: 0.7 mg/kg/hr.

Children 12–16 yr who smoke cigarettes or marijuana: 0.7 mg/kg/hr.

Children 12–16 yr who are nonsmokers: 0.5 mg/kg/hr.

Pediatric patients weighing less than 45 kg without risk of impaired clearance

Elixophyllin: Initially, 12–14 mg/kg/day PO up to a maximum 300 mg/day PO in divided

doses every 4–6 hr. After 3 days, may be increased to 16 mg/kg/day PO up to a maximum 400 mg/day PO in divided doses every 4–6 hr. After 3 more days, may be increased to 20 mg/kg/day PO up to a maximum 600 mg/day PO in divided doses every 4–6 hr if tolerated and needed.

ER capsule: Initially, 12–14 mg/kg/day PO up to a maximum 300 mg/day PO in divided doses every 8–12 hr. After 3 days, may be increased to 16 mg/kg/day PO up to a maximum 400 mg/day PO in divided doses every 8–12 hr. After 3 more days, may be increased to 20 mg/kg/day PO up to a maximum 600 mg/day PO in divided doses every 8–12 hr if tolerated and needed.

Theo-24, Uniphyll: Initially, 12–14 mg/kg/day PO up to a maximum 300 mg/day PO once every 24 hr. After 3 days, may be increased to 16 mg/kg/day PO up to a maximum 400 mg/day PO once every 24 hr. After 3 more days, may be increased to 20 mg/kg/day PO up to a maximum 600 mg/day PO once every 24 hr if tolerated and needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr
IV	Immediate	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 3–15 hr (nonsmokers) or 4–5 hr (smokers)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare using sterile technique. Drug provided in 5% dextrose solution. Store at room temperature.

Infusion: Titrate based on patient response. Do not exceed 17 mg/hr. Monitor serum concentration.

Incompatibilities: Do not add any other drugs to solution.

Adverse effects

- **CNS:** Irritability (especially children), restlessness, dizziness, headache, seizures, muscle twitching, severe depression, stammering

speech, abnormal behavior characterized by withdrawal, mutism, and unresponsiveness alternating with hyperactive periods

- **CV:** Palpitations, sinus tachycardia, ventricular tachycardia, **life-threatening ventricular arrhythmias**, circulatory failure
- **GI:** *Loss of appetite*, hematemesis, epigastric pain, gastroesophageal reflux during sleep
- **GU:** Proteinuria, increased excretion of renal tubular cells and RBCs; diuresis (dehydration), urinary retention in men with prostate enlargement
- **Respiratory:** Tachypnea, **respiratory arrest**
- **Serum theophylline levels less than 20 mcg/mL:** 20 mcg/mL: Adverse effects uncommon
- **Serum theophylline levels greater than 20–25 mcg/mL:** *Nausea, vomiting, diarrhea, headache, insomnia, irritability* (75% of patients)
- **Serum theophylline levels greater than 35 mcg/mL:** Hyperglycemia, hypotension, cardiac arrhythmias, tachycardia (greater than 10 mcg/mL in premature newborns); seizures, brain damage, **death**
- **Other:** Fever, flushing, hyperglycemia, SIADH, rash, increased AST

Interactions

• **Drug-drug** • Increased effects and toxicity with cimetidine, erythromycin, ciprofloxacin, norfloxacin, ofloxacin, hormonal contraceptives, ticlopidine, ranitidine • Possibly decreased effects with rifampin • Increased serum levels and risk of toxicity in hypothyroid patients, decreased levels in patients who are hyperthyroid; monitor patients on thioamides, thyroid hormones for changes in serum levels as patients become euthyroid • Increased cardiac toxicity with halothane • Decreased effects in patients who are cigarette smokers (1–2 packs/day); theophylline dosage may need to be increased 50%–100% • Decreased effects with barbiturates, charcoal • Decreased effects of phenytoins, benzodiazepines, and theophylline preparations • Decreased effects of nondepolarizing neuromuscular blockers • Mutually antagonistic effects of beta blockers and theophylline preparations

• **Drug-food** • Theophylline elimination is increased by a low-carbohydrate, high-protein diet and by charcoal-broiled beef • Theophylline elimination is decreased by a high-carbohydrate, low-protein diet • Food may alter bioavailability, absorption of timed-release theophylline preparations; these may rapidly release their contents with food and cause toxicity. Timed-release forms should be taken on an empty stomach

• **Drug-lab test** • Interference with spectrophotometric determinations of serum theophylline levels by furosemide, probenecid, theobromine; coffee, tea, cola beverages, chocolate, acetaminophen cause falsely high values • Alteration in assays of uric acid, urinary catecholamines, plasma free fatty acids

• **Drug-alternative therapy** • Decreased effectiveness if taken with St. John's wort

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any xanthines; peptic ulcer, active gastritis; status asthmaticus; cardiac arrhythmias, acute myocardial injury, HF, cor pulmonale; severe hypertension; severe hypoxemia; renal or hepatic disease; hyperthyroidism; pregnancy, lactation
- **Physical:** Skin color, texture, lesions; reflexes, bilateral grip strength, affect; P, auscultation, BP, perfusion; R, adventitious sounds; bowel sounds, normal output; frequency; voiding pattern, normal urinary output; ECG; EEG; LFTs, renal and thyroid function tests

Interventions

- Caution patient not to chew or crush enteric-coated timed-release preparations.
- Give liquid dosage forms in divided doses. Give with food if GI effects occur.
- Do not give timed-release preparations with food; these should be given on an empty stomach, 1 hr before or 2 hr after meals.
- Advise patients that this drug should not be used during pregnancy; using barrier contraceptives is recommended.

⊗ **Warning** Monitor results of serum theophylline level determinations carefully, and reduce dosage if serum levels exceed therapeutic range of 10–15 mcg/mL.

- Monitor carefully for clinical signs of adverse effects, particularly if serum theophylline levels are not available.

⊗ **Warning** Keep diazepam readily available to treat seizures.

Teaching points

- Take this drug exactly as prescribed. If a timed-release product is prescribed, take it on an empty stomach, 1 hour before or 2 hours after meals. Do not chew or crush timed-release preparations; it may be necessary for you to take this drug around-the-clock for adequate control of asthma attacks.
- Avoid excessive intake of coffee, tea, cocoa, cola beverages, and chocolate. These contain theophylline-related substances that may increase your side effects. Avoid St. John's wort while taking this drug.
- Smoking cigarettes or other tobacco products may markedly influence the effects of theophylline. It is preferable not to smoke while you are taking this drug. Notify your health care provider if you change your smoking habits while you are taking this drug; it may be necessary to change your drug dosage.
- Have frequent blood tests to monitor drug effects and ensure safe and effective dosage.
- Do not use this drug during pregnancy; using barrier contraceptives is advised.
- You may experience these side effects: Nausea, loss of appetite (take drug with food if taking immediate-release or liquid dosage forms); difficulty sleeping, depression, emotional lability.
- Report nausea, vomiting, severe GI pain, restlessness, seizures, irregular heartbeat.

DANGEROUS DRUG

▶ **thioguanine**
(**TG, 6-Thioguanine**)
(*thye ob gwab' neen*)

Janvis (CAN), Tabloid

PREGNANCY CATEGORY D

Drug classes

Antimetabolite
Antineoplastic

Therapeutic actions

Tumor-inhibiting properties, probably due to interference with a number of steps in the synthesis and use of purine nucleotides, which are normally incorporated into DNA and RNA.

Indications

- Remission induction, consolidation, and maintenance therapy of acute nonlymphocytic leukemias—usually used in combination therapy

Contraindications and cautions

- Contraindicated with allergy to thioguanine, prior resistance to thioguanine or mercaptopurine, hematopoietic depression, pregnancy (potential mutagen and teratogen), lactation.
- Use cautiously with impaired hepatic or renal function.

Available forms

Tablets—40 mg

Dosages

Adults and pediatric patients 3 yr and older

Total dose may be given at one time. Initial dosage, 2 mg/kg/day PO daily for 4 wk. If no clinical improvement is seen and there are no toxic effects, increase dose to 3 mg/kg/day. If complete hematologic remission is obtained, institute maintenance therapy. No adjustment of dosage is needed if used as part of combination therapy.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	8 hr

Metabolism: Hepatic; $T_{1/2}$: 11 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **GI:** **Hepatotoxicity**, *nausea*, *vomiting*, *anorexia*, *diarrhea*, *stomatitis*
- **Hematologic:** *Bone marrow suppression*, *immunosuppression*, *hyperuricemia* due to rapid lysis of malignant cells

- **Other:** Fever, weakness, cancer, chromosomal aberrations

■ Nursing considerations

Assessment

- **History:** Allergy to thioguanine, prior resistance to thioguanine; hematopoietic depression; impaired hepatic function; pregnancy, lactation
- **Physical:** Skin color; mucous membranes, liver evaluation, abdominal examination; CBC, differential, Hgb, platelet counts; LFTs; serum uric acid

Interventions

- Evaluate hematopoietic status before and frequently during therapy.
- ⊗ **Warning** Discontinue drug therapy if platelet count is less than 50,000 or polymorphonuclear granulocyte count is less than 1,000; consult physician for dosage adjustment.
- ⊗ **Warning** Arrange for discontinuation of this drug at any sign of hematologic or hepatic toxicity; consult physician.
- Ensure that patient is not pregnant before administration.
- ⊗ **Warning** Ensure that patient is well hydrated before and during therapy to minimize adverse effects of hyperuricemia; allopurinol and drugs to alkalinize the urine are sometimes prescribed.
- Administer as a single daily dose.

Teaching points

- Drink adequate fluids while you are using this drug; drink at least 8–10 glasses of fluid each day.
- This drug may cause miscarriages and birth defects. Both men and women who receive this drug should be using a reliable form of contraception. Discuss with your health care provider how long you should wait to conceive a child after therapy ends.
- Have frequent, regular medical follow-up visits, including frequent blood tests to assess drug effects.
- You may experience these side effects: Mouth sores (use frequent mouth care); nausea, vomiting, loss of appetite (eat frequent small meals); increased susceptibility to infection (avoid crowds and infections).

- Report fever, chills, sore throat, unusual bleeding or bruising, yellow discoloration of the skin or eyes, abdominal pain, flank pain, joint pain, swelling of the feet or legs.

⚠ DANGEROUS DRUG

▶ thiotepa (triethylenethiophosphoramide, TESP, TSPA)

(*thye oh tep' ah*)

Thioplex

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic

Therapeutic actions

Cytotoxic: Disrupts the bonds of DNA, causing cell death; cell cycle nonspecific.

Indications

- Treatment of adenocarcinoma of the breast, ovary
- Superficial papillary carcinoma of the urinary bladder
- Controlling intracavity effusions secondary to diffuse or localized neoplastic disease of various serosal cavities
- Treatment of lymphoma, including Hodgkin's lymphoma (no longer a drug of choice)

Contraindications and cautions

- Contraindicated with allergy to thiotepa, hematopoietic depression, pregnancy, lactation.
- Use cautiously with impaired hepatic or renal function, concomitant therapy with other alkylating agents or irradiation.

Available forms

Powder for injection—15, 30 mg

Dosages

Adults

IV

0.3–0.4 mg/kg at 1- to 4-wk intervals.

Intratumor

Drug is diluted in sterile water to a concentration of 10 mg/mL, then 0.6–0.8 mg/kg is injected directly into the tumor after a local anesthetic is injected through the same needle. Maintenance doses of 0.6–0.8 mg/kg every 1–4 wk depending on patient's condition.

Intracavity

0.6–0.8 mg/kg every 1–4 wk through the same tube that is used to remove fluid from the cavity.

Intravesical

Dehydrate patient with papillary carcinoma of the bladder for 8–12 hr prior to treatment. Then instill 60 mg in 30–60 mL of sodium chloride injection into the bladder by catheter. Retain for 2 hr. If patient is unable to retain 60 mL, give the dose in 30 mL. Repeat once a week for 4 wk.

Pharmacokinetics

Route	Onset
IV	Gradual

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute powder with sterile water for injection. 1.5 mL of diluent gives a drug concentration of 5 mg/0.5 mL of solution. May be further diluted with sodium chloride injection, dextrose injection, dextrose and sodium chloride injection, Ringer's injection, lactated Ringer's injection. Store powder in the refrigerator, reconstituted solution is stable for 8 hr if refrigerated. Sterile water for injection produces an isotonic solution, other diluents may produce a hypertonic solution that may cause mild to moderate discomfort on injection. ⊗ **Warning** Check solution before use; solution should be clear to slightly opaque; grossly opaque solutions or solutions with precipitates should not be used.

Infusion: Administer IV dose directly and rapidly, 60 mg over 1 min. There is no need for slow IV drip or the use of large volumes of fluid.

Adverse effects

- **CNS:** *Dizziness*, headache, blurred vision
- **Dermatologic:** Hives, rash, weeping from subcutaneous lesions, contact dermatitis at injection site, alopecia
- **GI:** *Nausea, vomiting*, anorexia
- **GU:** *Amenorrhea, interference with spermatogenesis*, dysuria, urinary retention
- **Hematologic:** *Hematopoietic toxicity*
- **Other:** Febrile reactions, cancer, fatigue

■ Nursing considerations**Assessment**

- **History:** Allergy to thiotepa; hematopoietic depression; impaired renal or hepatic function; concomitant therapy with other alkylating agents or irradiation; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; T; orientation, reflexes; CBC, differential; urinalysis; LFTs, renal function tests

Interventions

- Ensure that patient is not pregnant before administration; advise the use of barrier contraceptives.
- Arrange for blood tests to evaluate bone marrow function before therapy, weekly during therapy, and for at least 3 wk after therapy.
- Mix solution with 2% procaine hydrochloride, 1:1,000 epinephrine hydrochloride, or both for local use into single or multiple sites.
- Reduce dosage with renal or hepatic impairment and for bone marrow depression.

Teaching points

- This drug can be given only parenterally. Prepare a calendar of treatment days.
- This drug should not be taken during pregnancy; use birth control while you are being treated with this drug. If you become pregnant, consult your health care provider.
- Have regular medical follow-up visits, including blood tests, to assess drug effects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (request an antiemetic; eat frequent small meals); dizziness, headache (use special safety precautions to prevent falls or injury); amenorrhea in women, change in sperm production.

- Report unusual bleeding or bruising, fever, chills, sore throat, stomach or flank pain, severe nausea and vomiting, skin rash or hives.

thiothixene (thiothixene hydrochloride)

(*thye oh thix' een*)

Navane

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dopaminergic blocker
Thioxanthene

Therapeutic actions

Mechanism of action not fully understood: Blocks postsynaptic dopamine receptors in the brain, but this may not be necessary and sufficient for antipsychotic activity.

Indications

- Management of schizophrenia

Contraindications and cautions

- Contraindicated with coma or severe CNS depression, blood dyscrasia, circulatory collapse, subcortical brain damage, Parkinson's disease, liver damage, cerebral arteriosclerosis, coronary disease, severe hypotension or hypertension, pregnancy, lactation.
- Use cautiously with respiratory disorders ("silent pneumonia"); glaucoma, prostatic hypertrophy; epilepsy or history of epilepsy (drug lowers seizure threshold); breast cancer; thyrotoxicosis (severe neurotoxicity); peptic ulcer, decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat or phosphorous insecticides; children younger than 12 yr, especially those with chickenpox, CNS infections (children are especially susceptible to dystonias that may confound the diagnosis of Reye's syndrome).

Available forms

Capsules—1, 2, 5, 10, 20 mg

Dosages

Full clinical effects may require 6 wk–6 mo of therapy.

Adults

Initially, 2 mg PO tid (mild conditions) or 5 mg bid (more severe conditions). Increase dose as needed; the usual optimum dose is 20–30 mg/day. May increase to 60 mg/day, but further increases rarely increase beneficial response.

Pediatric patients

Not recommended for children younger than 12 yr.

Geriatric or debilitated patients

Use lower doses and increase more gradually.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	12 hr

Metabolism: Hepatic; $T_{1/2}$: 34 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces

Adverse effects

- **Autonomic:** *Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, flushed facies, sweating, constipation, paralytic ileus, urinary retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition, male impotence*
- **CNS:** *Drowsiness, insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, extrapyramidal syndromes—pseudoparkinsonism; dystonias; akathisia, tardive dyskinesias, potentially irreversible NMS; extrapyramidal symptoms, hyperthermia, autonomic disturbances (rare, but 20% fatal)*
- **CV:** *Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, cardiac arrest, HF, cardiomegaly, refractory arrhythmias (some fatal), pulmonary edema*
- **EENT:** *Glaucoma, photophobia, blurred vision, miosis, mydriasis, deposits in the cornea and lens (opacities), pigmentary retinopathy*
- **Endocrine:** *Lactation, breast engorgement, galactorrhea; SIADH; amenorrhea, menstrual*

irregularities; gynecomastia; changes in libido; hyperglycemia or hypoglycemia; glycosuria; hyponatremia; pituitary tumor with hyperprolactinemia; inhibition of ovulation, infertility, pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, progesterins

- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia, **aplastic anemia**, hemolytic anemia, thrombocytopenic or nonthrombocytopenic purpura, pancytopenia
- **Hypersensitivity:** Jaundice, urticaria, angioneurotic edema, laryngeal edema, photosensitivity, eczema, asthma, anaphylactoid reactions, exfoliative dermatitis
- **Respiratory: Bronchospasm, laryngospasm,** dyspnea, suppression of cough reflex and potential for aspiration
- **Other:** *Urine discolored pink to red-brown*

Interactions

- * **Drug-drug** • Decreased effects with carbamazepine • Possible increased CNS effects with CNS agents such as alcohol • Risk of decreased blood pressure with antihypertensives
- * **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used) • Increase in PBI not attributable to an increase in thyroxine

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Navane* (thiothixene) and *Norvasc* (amlodipine). Use caution.

Assessment

- **History:** Severe CNS depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease, severe hypotension or hypertension; respiratory disorders; glaucoma; prostatic hypertrophy; epilepsy; breast cancer; thyrotoxicosis; peptic ulcer; decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat, phosphorous insecticides; pregnancy, lactation; chickenpox; CNS infections

- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output, liver evaluation; urinary output, prostate size; CBC, urinalysis, LFTs, renal and thyroid function tests

Interventions

- ⊗ **Black box warning** Risk of death increases if antipsychotics are used to treat elderly patients with dementia-related psychosis; drug is not approved for this use.
- ⊗ **Warning** Discontinue drug if serum creatinine or BUN becomes abnormal or if WBC count is depressed.
- Monitor elderly patients for dehydration, and institute remedial measures promptly; sedation and decreased sensation of thirst related to CNS effects can lead to severe dehydration.
- Consult physician regarding appropriate warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about dosage reduction, use of anticholinergic antiparkinsonians (controversial) if extrapyramidal effects occur.

Teaching points

- Take drug exactly as prescribed.
- Avoid driving or engaging in other dangerous activities if drowsiness, tremor, weakness, or vision changes occur.
- Avoid prolonged exposure to sun or use a sunscreen or covering garments.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine (pink or reddish brown urine is to be expected), pale stools, yellowing of the skin or eyes.

▽ thyroid, desiccated (*thye'* roid)

Armour Thyroid, Bio-Thyroid, Nature-Thyroid, Thyroid USP, Westhroid

PREGNANCY CATEGORY A

Drug class

Thyroid hormone preparation (contains T₃ and T₄ in their natural state and ratio)

Therapeutic actions

Increases the metabolic rate of body tissues, increasing oxygen consumption, respiratory and heart rate; rate of fat, protein, and carbohydrate metabolism; and growth and maturation; exact mechanism of action is not known.

Indications

- Replacement therapy in hypothyroidism
- Treatment of thyroid cancer
- Treatment or prevention of various types of euthyroid goiters
- Treatment of thyrotoxicosis with antithyroid drugs to prevent goitrogenesis and hypothyroidism and thyrotoxicosis during pregnancy
- Diagnostic use in suppression tests

Contraindications and cautions

- Contraindicated with allergy to active or extraneous constituents of drug; thyrotoxicosis and acute MI uncomplicated by hypothyroidism.
- Use cautiously with Addison's disease (treatment of hypoadrenalism with corticosteroids should precede thyroid therapy), pregnancy, lactation, myxedema, allergy to pork products, CV disease.

Available forms

Capsules—7.5, 15, 30, 60, 90, 120, 150, 180, 240 mg; tablets—15, 16.25, 30, 32.4, 32.5, 60, 64.8, 65, 90, 120, 129.6, 130, 180, 194.4, 195, 240, 300 mg

Dosages**Adults**

- *Hypothyroidism*: Initially, 30 mg/day PO, increased by 15 mg/day every 2–3 wk. Usual maintenance dose is 60–120 mg PO daily.

Geriatric patients or patients with heart disease or longstanding hypothyroidism

Initially, 15 mg/day.

Pediatric patients

15 mg PO daily. May increase dosage at 2-wk intervals.

0–6 mo: 7.5–30 mg/day PO.

6–12 mo: 30–45 mg/day PO.

1–5 yr: 45–60 mg/day PO.

6–12 yr: 60–90 mg/day PO.

Older than 12 yr: 90 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	4 hr

Metabolism: Liver, kidney, and tissue; T_{1/2}: 1–2 days (T₁₃), 6–7 days (T₄)

Distribution: Does not readily cross placenta; minimally enters breast milk

Excretion: Feces, urine

Adverse effects

All adverse effects are rare at therapeutic doses.

- **Dermatologic**: Partial loss of hair in first few months of therapy in children
- **Endocrine**: Hyperthyroidism (palpitations, elevated pulse pressure, tachycardia, arrhythmias, angina pectoris, cardiac arrest; tremors, headache, nervousness, insomnia; nausea, diarrhea, changes in appetite; weight loss, menstrual irregularities, sweating, heat intolerance, fever)
- **Hypersensitivity**: Allergic skin reactions

Interactions

★ **Drug-drug** • Decreased absorption with cholestyramine and antacids; give 4 hr apart from thyroid • Increased risk of bleeding with warfarin • Decreased effectiveness of cardiac glycosides with thyroid replacement • Alterations in theophylline clearance occur in hypothyroid patients; if thyroid state changes during therapy, monitor patient carefully • Possible decreased effects with estrogen products

■ Nursing considerations**Assessment**

- **History**: Allergy to active or extraneous constituents of drug or bovine or porcine products; thyrotoxicosis; acute MI uncomplicated by hypothyroidism; Addison's disease; lactation
- **Physical**: Skin lesions, color, T, texture; T; muscle tone, orientation, reflexes; P, auscultation, baseline ECG, BP; R, adventitious sounds; thyroid function tests

Interventions

⊗ **Black box warning** Do not use to treat obesity. Large doses used in euthyroid patients may produce serious to life-threatening manifestations of toxicity.

- Monitor response carefully when beginning therapy, and adjust dosage accordingly.
- Administer as a single daily dose before breakfast with a full glass of water.
- Arrange for regular, periodic blood tests of thyroid function.
- Monitor cardiac response throughout therapy. Reduce dose if angina occurs.

Teaching points

- Take as a single dose before breakfast with a full glass of water. Take drug 4 hours apart from antacids.
- This drug replaces a very important hormone and will need to be taken for life. Do not discontinue this drug without consulting your health care provider; serious problems can occur.
- Wear or carry a medical alert tag to alert emergency medical personnel that you are using this drug.
- Nausea and diarrhea may occur (dividing the dose may help).
- Have periodic blood tests and medical evaluations while you are using this drug. Keep your scheduled appointments.
- Report headache, chest pain, palpitations, fever, weight loss, sleeplessness, nervousness, irritability, unusual sweating, intolerance to heat, diarrhea.

tiagabine hydrochloride

(*tye ag' ab bine*)

Gabitril Filmtabs

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Increases GABA levels in the brain, which may result in antiseizure effects. GABA is the major

inhibitory neurotransmitter in the CNS; tiagabine binds to GABA reuptake sites, preventing its reuptake, and increases levels in the presynaptic neurons and the glia.

Indications

- Adjunctive therapy in patients older than 12 yr with partial seizures

Contraindications and cautions

- Contraindicated with hypersensitivity to tiagabine, hepatic disease or significant hepatic impairment.
- Use cautiously with pregnancy, lactation, and the elderly.

Available forms

Tablets—2, 4, 12, 16 mg

Dosages

Adults

4 mg PO daily for 1 wk; may be increased by 4–8 mg/wk until desired response is seen; maximum dose, 56 mg/day in two to four divided doses. Usual maintenance dose is 32–56 mg daily.

Pediatric patients 12–18 yr

4 mg PO daily for 1 wk; may be increased to 8 mg/day in two divided doses for 1 wk; then increased by 4–8 mg/wk up to a maximum of 32 mg/day in two to four divided doses.

Pediatric patients younger than 12 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30–60 min

Metabolism: Hepatic; $T_{1/2}$: 7–9 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, asthenia, somnolence, nervousness, tremor, concentration difficulties*
- **Dermatologic:** **Serious rash**
- **EENT:** Possible long-term ophthalmic effects
- **GI:** *GI upset, pain, nausea*

- **GU:** Irregular menses, secondary amenorrhea, dysuria, incontinence

Interactions

★ **Drug-drug** • Decreased serum levels with carbamazepine, phenytoin, primidone; phenobarbital, adjustment in tiagabine dosage may be needed • Possible interaction with valproate; monitor patient closely • Increased CNS depression if combined with other CNS depressants (alcohol, hypnotics)

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to tiagabine; hepatic disease or significant hepatic impairment; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; orientation, eye examination, affect, reflexes; LFTs

Interventions

⊗ **Black box warning** Risk of suicidal ideation is increased; monitor patient accordingly.

- Give drug with food.
- Reduce dosage and adjust more slowly if patient is not on concomitant phenytoin, phenobarbital, or carbamazepine.
- Provide frequent skin care if dermatologic effects occur.

⊗ **Warning** Avoid abrupt discontinuation; serious side effects could occur.

- Establish safety precautions (use side rails, accompany patient) if CNS changes occur.
- Arrange for appropriate counseling for women of childbearing age who wish to become pregnant.

Teaching points

- Take this drug exactly as prescribed. If you miss a dose, take it as soon as you remember; do not double doses.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Avoid the use of alcohol and sleep-inducing or over-the-counter drugs while you are using this drug; these preparations could cause dangerous effects. If you feel that you need one of these preparations, consult your health care provider.

- Use contraceptives at all times. If you want to become pregnant while you are taking this drug, consult your health care provider.
- Wear a medical alert bracelet at all times so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Drowsiness (avoid driving or performing other tasks requiring alertness); GI upset (take the drug with food or milk; eat frequent small meals).
- Report bruising, yellowing of the skin or eyes, pale-colored feces, rash, pregnancy, vision changes, thoughts of suicide.

▷ ticlopidine hydrochloride

(*tye kloh' pib deen*)

Apo-ticlopidine (CAN), Gen-Ticlopidine (CAN), Nu-Ticlopidine (CAN), Ticlid

PREGNANCY CATEGORY B

Drug class

Antiplatelet

Therapeutic actions

Interferes with platelet membrane function by inhibiting fibrinogen binding and platelet-platelet interactions; inhibits platelet aggregation and prolongs bleeding time; effect is irreversible for life of the platelet.

Indications

- Reduces risk of thrombotic stroke in patients who have experienced stroke precursors and in patients who have had a completed thrombotic stroke; reserve use for patients who are intolerant to aspirin therapy because side effects may be life-threatening
- Prevention of acute stent thrombosis in coronary arteries; used with antiplatelet doses of aspirin
- Unlabeled uses: Intermittent claudication, chronic arterial occlusion, subarachnoid hemorrhage, uremic patients with AV shunts or fistulas, open-heart surgery, coronary

artery bypass grafts, primary glomerulonephritis, sickle cell disease

Contraindications and cautions

- Contraindicated with allergy to ticlopidine, neutropenia, thrombocytopenia, history of thrombotic thrombocytopenic purpura (TTP), hemostatic disorders, bleeding ulcer, intracranial bleeding, severe liver disease, lactation.
- Use cautiously with renal disorders, pregnancy, elevated cholesterol, recent trauma.

Available forms

Tablets—250 mg

Dosages

Adults

250 mg PO bid with food.

Pediatric patients

Safety and efficacy not established for patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2 hr

Metabolism: Hepatic; $T_{1/2}$: 12.6 hr, then 4–5 days

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness
- **GI:** *Diarrhea, nausea, vomiting, abdominal pain*, flatulence, dyspepsia, anorexia
- **Hematologic:** **Neutropenia, TTP**, bleeding
- **Local:** *Pain, phlebitis*, thrombosis at injection site
- **Other:** Rash, purpura

Interactions

★ **Drug-drug** • Decreased effectiveness of digoxin • Increased serum levels and effects of theophylline, aspirin, NSAIDs • Increased effects with cimetidine • Decreased absorption with antacids

★ **Drug-food** • Increased availability with food

■ Nursing considerations

Assessment

- **History:** Allergy to ticlopidine; neutropenia, thrombocytopenia; hemostatic disorders; bleeding ulcer, intracranial bleeding; severe liver disease; renal disorders; pregnancy, lactation, elevated cholesterol; recent trauma
- **Physical:** Skin color, lesions; orientation; bowel sounds, normal output; CBC, LFTs, renal function tests, serum cholesterol

Interventions

⊗ **Black box warning** Monitor WBC count before use and frequently while initiating therapy; if neutropenia is present or occurs, discontinue drug immediately.

- Administer with food or just after eating to minimize GI irritation and increase absorption.
- Monitor patient for any sign of excessive bleeding (eg, bruises, dark stools), and monitor bleeding times.
- Provide increased precautions against bleeding during invasive procedures; bleeding will be prolonged.

⊗ **Warning** Mark chart of patient receiving drug to alert medical personnel of increased risk of bleeding in cases of surgery or dental surgery.

Teaching points

- Take drug with meals or just after eating.
- You will need regular blood tests to monitor your response to this drug.
- It may take longer than normal to stop bleeding; avoid contact sports, use electrical razors; apply pressure for extended periods to bleeding sites.
- Notify dentist or surgeon that you are using this drug before invasive procedures.
- You may experience these side effects: Upset stomach, nausea, diarrhea, loss of appetite (eat frequent small meals).
- Report fever, chills, sore throat, rash, bruising, bleeding, dark stools or urine.

tigecycline

(*tye gab sigb' klin*)

Tygacil

PREGNANCY CATEGORY D

Drug classes

Antibiotic
Glycylcycline

Therapeutic actions

Inhibits protein translation on ribosomes in specific bacteria, leading to inhibition of bacterial cell growth and cell death; mechanism is not used by many resistant strains.

Indications

- Treatment of complicated skin and skin structure infections caused by susceptible strains of *Escherichia coli*, *Enterococcus faecalis* (vancomycin-susceptible strains only), *Staphylococcus aureus* (methicillin-susceptible and resistant strains), *Streptococcus agalactiae*, *Streptococcus anginosus*, *Streptococcus pyogenes*, *Bacteroides fragilis*, *Klebsiella pneumoniae*, *Enterobacter cloacae*
- Treatment of adults with community-acquired pneumonia
- Treatment of intra-abdominal infections caused by *Citrobacter freundii*, *Enterobacter cloacae*, *E. coli*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Enterococcus faecalis* (vancomycin susceptible strains only), *S. anginosus*, *B. fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Clostridium perfringens*, *Peptostreptococcus micros*

Contraindications and cautions

- Contraindicated with hypersensitivity to tigecycline or any of its components, pregnancy.
- Use cautiously with allergy to tetracycline antibiotics, lactation.

Available forms

Powder for reconstitution for injection—50 mg/5 mL vial

Dosages

Adults

100 mg IV, followed by 50 mg IV every 12 hr. *Tygacil* should be infused over 30–60 min. Therapy should continue for 5–14 days, based on patient response and bacterial progress.

- **Severe hepatic impairment (Child-Pugh C):** 100 mg IV, followed by 25 mg IV every 12 hr. Patient should be monitored closely.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: Minimal metabolism: $T_{1/2}$: 27–42 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute with 5.3 mL 0.9% sodium chloride or 5% dextrose to yield 10 mg/mL. Gently swirl vial until drug dissolves, withdraw 5 mL of solution and immediately add to 100 mL IV bag for infusion. Reconstituted solution should be orange to yellow in color. Solution should be clear with no particulate matter. If particulate matter or discoloration (green to black) is seen, discard solution. Reconstituted solution is stable for up to 6 hr at room temperature, 24 hr if refrigerated, or up to 48 hr if refrigerated in IV bag.

Infusion: Infuse over 30–60 min; flush the tubing of any running IV with 0.9% sodium chloride injection or 5% dextrose injection before and after infusing *Tygacil*.

Y-site incompatibilities: Amphotericin B, chlorpromazine, methylprednisolone, voriconazole, diazepam.

Y-site compatibilities: Dobutamine, dopamine, lactated Ringer's solution, lidocaine, potassium chloride, ranitidine, theophylline, morphine.

Adverse effects

- **CNS:** Dizziness, insomnia, *headache*
- **CV:** Hypotension, hypertension, phlebitis, peripheral edema

- **GI:** *Diarrhea*, **pseudomembranous colitis**, dyspepsia, *nausea*, *vomiting*, constipation, liver enzyme elevations
- **Respiratory:** Cough, dyspnea
- **Other:** Pruritus, rash, sweating, fever, pain, suppressed bone marrow, superinfections, photosensitivity

Interactions

★ **Drug-drug** • Possible decreased effectiveness of oral contraceptives; suggest use of barrier contraceptives during treatment • Possible alteration in effects of warfarin if taken in combination; monitor patient closely and follow coagulation tests closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to tigeicycline or any of its components, pregnancy, allergy to tetracycline antibiotics, lactation
- **Physical:** T; orientation, reflexes; BP, peripheral pulses; abdominal examination; skin color, lesions; R, chest sounds; LFTs; culture and sensitivity of infected site

Interventions

- Perform culture and sensitivity tests to assure that this is the most appropriate antibiotic for the infection being treated.
- ⊗ **Warning** There is an increased risk of mortality with drug use. Monitor patient closely and weigh risks before starting drug.
- Advise the use of barrier contraceptives during therapy.
- Suggest another method of feeding the baby if patient is nursing a baby during therapy.
- Provide comfort measures and possible analgesics for headache and pain.
- Encourage frequent, small meals if GI effects are uncomfortable.

Teaching points

- You will receive *Tygacil* as an IV infusion over 30–60 minutes every 12 hours for 5–14 days.
- Tests will be run to make sure that this is the most appropriate antibiotic for your particular infection.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, an-

other method of feeding the baby should be selected.

- It is not known how this drug could affect a fetus, if you are pregnant or decide to become pregnant while on this drug, consult your health care provider. Use of barrier contraceptives is advised; this drug may block the effects of hormone contraceptives.
- You may experience these side effects: Nausea, vomiting, and diarrhea (these symptoms may lessen over time; if they become bothersome, talk to your health care provider about possible treatments); sensitivity to light (use a sunscreen and wear protective clothing and sunglasses if you have to be exposed to sunlight).
- Report bloody diarrhea, unremitting diarrhea, rash, swelling of the extremities, discomfort at the injection site.

▼ tiludronate disodium

See Appendix U, *Less commonly used drugs*.

▼ timolol maleate

(*tim' ob lol*)

Apo-Timol (CAN), Apo-Timop (CAN), Betimol, Blocadren, Gen-Timolol (CAN), Istalol, PMS-Timolol (CAN), Timoptic, Timoptic-XE

PREGNANCY CATEGORY C

Drug classes

Antiglaucoma drug
Antihypertensive
Beta-adrenergic blocker

Therapeutic actions

Competitively blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, decreasing the influence of the sympathetic nervous system on these tissues and decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption, decreasing the release of renin, and lowering BP; reduces IOP by decreasing the production of aqueous humor and possibly by increasing aqueous humor outflow.

Indications

- Hypertension, used alone or in combination with other antihypertensives, especially thiazide-type diuretics
- Prevention of reinfarction in MI patients who are hemodynamically stable
- Prophylaxis of migraine
- Ophthalmic solution: Reduction of IOP in chronic open-angle glaucoma, some patients with secondary glaucoma, aphakic patients with glaucoma ocular hypertension

Contraindications and cautions

- Contraindicated with sinus bradycardia (HR less than 45 beats/min), second- or third-degree heart block (PR interval greater than 0.24 sec), cardiogenic shock, HF, asthma, COPD, pregnancy, lactation.
- Use cautiously with diabetes or thyrotoxicosis (timolol can mask the usual cardiac signs of hypoglycemia and thyrotoxicosis).

Available forms

Tablets—5, 10, 20 mg; ophthalmic solution, gel—0.25%, 0.5%

Dosages

Adults

Oral

- **Hypertension:** Initially, 10 mg bid. Increase dosage at 1-wk intervals to a maximum of 60 mg/day divided into two doses, as needed. Usual maintenance dose is 20–40 mg/day given in two divided doses.
- **Prevention of reinfarction in MI (long-term prophylaxis in patients who survived the acute phase):** 10 mg bid PO within 1–4 wk of infarction.
- **Migraine:** 10 mg PO bid; during maintenance, the 20 mg/day may be given as a single dose. May be increased to a maximum of 30 mg/day in divided doses or decreased to 10 mg/day. Discontinue if satisfactory response is not obtained after 6–8 wk.

Ophthalmic

Initially, 1 drop of 0.25% solution bid into the affected eye or eyes. Adjust dosage on basis of response to 1 drop of 0.5% solution bid or 1 drop of 0.25% solution daily. When replacing other agents, make change gradually and individualize dosage. One drop in the affected eye each morning (*Istalol*).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
Ophthal	Rapid	1–5 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

Oral

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
 - **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss
 - **CV:** *HF, cardiac arrhythmias, sinoatrial or AV nodal block*, peripheral vascular insufficiency, claudication, **stroke, pulmonary edema**, hypotension, chest pain
 - **Dermatologic:** Rash, pruritus, sweating, dry skin
 - **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
 - **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
 - **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
 - **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
 - **Respiratory:** **Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
 - **Other:** *Decreased exercise tolerance, development of ANA*, hyperglycemia or hypoglycemia, elevated serum transaminase
- ### Ophthalmic
- **Local:** Ocular irritation, decreased corneal sensitivity, visual refractive changes, diplopia, ptosis, tearing

Interactions

- *** Drug-drug** • Increased effects with verapamil • Increased risk of orthostatic hypotension with prazosin • Decreased antihypertensive effects with NSAIDs • Risk of rebound hypertension following clonidine withdrawal • Decreased elimination of theophyllines with resultant decrease in expected actions of both drugs when taken concurrently • Peripheral ischemia and possible gangrene with ergotamine, methysergide, dihydroergotamine • Increased risk of hypoglycemia and masked signs of hypoglycemia with insulin • Hypertension followed by severe bradycardia with epinephrine • All of the above may occur with ophthalmic timolol; in addition, additive effects are possible with oral beta blockers
- *** Drug-lab test** • Possible false results with glucose or insulin tolerance tests (oral)

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, HF, asthma, COPD, pregnancy, lactation, diabetes or thyrotoxicosis
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function, blood and urine glucose

Interventions

- **⊗ Black box warning** Do not discontinue the drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult with surgeon about withdrawal if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Do not stop taking this drug unless instructed to do so by your health care provider.
- Avoid driving or dangerous activities if dizziness or shaking occurs.
- If using ophthalmic form, administer eye drops properly to minimize systemic absorption.

- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▽ tinidazole

(*teb nid' ab zol*)

Tindamax

PREGNANCY CATEGORY C

Drug classes

Antiprotozoal
Nitroimidazole

Therapeutic actions

Antiprotozoal; mechanism of action against *Giardia*, *Entamoeba* species is not known.

Indications

- Treatment of trichomoniasis caused by *Trichomonas vaginitis*
- Treatment of giardiasis caused by *Giardia duodenalis* or *G. lamblia* in patients 3 yr and older
- Treatment of amebiasis and amebic liver abscess caused by *Entamoeba histolytica* patients 3 yr and older
- Treatment of bacterial vaginosis in non-pregnant adult women

Contraindications and cautions

- Contraindicated with allergy to tinidazole, any component of the drug, or other nitroimidazoles; the first trimester of pregnancy; lactation.
- Use cautiously with second or third trimester of pregnancy, history of blood dyscrasias, CNS disorders, hepatic impairment.

Available forms

Tablets—250, 500 mg

Dosages

Adults

- *Trichomoniasis, giardiasis:* Single dose of 2 g PO taken with food.
- *Amebiasis:* 2 g/day PO for 3 days, taken with food.

- *Amebic liver abscess*: 2 g/day PO for 3–5 days, taken with food.
- *Bacterial vaginosis*: 2 g/day PO for 2 days or 1 g/day PO for 5 days.

Pediatric patients older than 3 yr

- *Giardiasis*: Single dose of 50 mg/kg PO (up to 2 g) taken with food.
- *Amebiasis*: 50 mg/kg/day PO (up to 2 g/day) for 3 days, taken with food.
- *Amebic liver abscess*: 50 mg/kg/day PO (up to 2 g/day) for 3–5 days, taken with food.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.6 hr

Metabolism: Hepatic metabolism; $T_{1/2}$: 12–14 hr

Distribution: Crosses placenta; passes into breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Weakness, fatigue, malaise, dizziness, headache, drowsiness, **seizures**, peripheral neuropathy
- **GI:** Metallic taste, nausea, anorexia, dyspepsia, cramps, vomiting, constipation, diarrhea, stomatitis
- **GU:** Darkened urine
- **Other:** *Transient neutropenia, transient leukopenia*, superinfections (*Candida*); **severe hypersensitivity reactions**, including urticaria, pruritus, angioedema, Stevens-Johnson syndrome, erythema multiforme

Interactions

★ **Drug-drug** ⊗ **Warning** Risk of severe adverse effects if combined with alcohol; advise patient to avoid intake of alcohol while on tinidazole and for 3 days after treatment.

- Possibility of increased effects of oral anticoagulants; monitor the patient and adjust dosage of oral anticoagulant appropriately for up to 8 days after stopping tinidazole therapy
- Risk of psychotic reactions if combined with disulfiram; avoid this combination and avoid use within 2 wk of tinidazole therapy
- Potential for increased serum levels of lithium if taken concurrently; monitor patient for any sign

of lithium intoxication

- Potential risk for increased serum levels of cyclosporine, tacrolimus, IV phenytoin, 5-FU if taken with tinidazole; monitor patients for potential toxicity and decrease dosage appropriately
- Potential for decreased effectiveness of tinidazole if combined with cholestyramine or oxytetracycline
- Potential for increased serum levels and risk of toxicity if combined with cimetidine, ketoconazole, other CYP3A4 inhibitors; monitor patient closely

Nursing considerations

Assessment

- **History:** Allergy to tinidazole or any component of the drug or to other nitroimidazoles, pregnancy, lactation, history of blood dyscrasias, CNS disorders, hepatic impairment
- **Physical:** Orientation, affect, reflexes; GI mucosa, output, bowel sounds, liver evaluation; CBC, LFTs, renal function tests

Interventions

⊗ **Black box warning** Avoid use unless clearly needed; tinidazole is carcinogenic in laboratory animals.

- Administer with food to decrease GI side effects.
- Institute appropriate hygiene measures and arrange treatment if superinfections occur.
- If GI upset occurs provide frequent small meals; encourage patient to maintain fluid intake and nutrition.
- Establish safety measures (eg, accompany patient, side rails) if CNS changes occur.
- Suggest another method of feeding the baby if patient is nursing.
- Recommend the use of contraceptive measures while using this drug.

Teaching points

- Take this drug exactly as prescribed, complete the full course of the therapy and do not use this drug to treat any other infections.
- If you miss a dose, take the next dose as soon as you remember; do not take more than the prescribed dose each day.
- Take the drug with food to help decrease GI side effects.
- Be aware that your urine may become dark; this is a drug effect.

- Do not drink alcohol while taking this drug and for three days following completion of the treatment; serious adverse effects could occur.
- This drug should not be used during pregnancy or while breast-feeding; use of contraceptives is recommended while on this drug. If you are breast-feeding, you should select another method of feeding the baby.
- You may experience these side effects: Nausea, diarrhea, metallic taste (frequent small meals, frequent mouth care may help); headache (analgesics may be available to help, consult your health care provider); dizziness (do not drive a car or operate hazardous machinery if this occurs).
- Report vaginal itching, white patches in the mouth, numbness or tingling of the extremities.

⚠ DANGEROUS DRUG

▶ tinzaparin sodium
(ten zah' pear in)

Innohep

PREGNANCY CATEGORY B

Drug classes

Anticoagulant

Low-molecular-weight heparin

Therapeutic actions

Low-molecular-weight heparin that inhibits thrombus and clot formation by blocking factor Xa and factor IIa, preventing the formation of clots.

Indications

- Treatment of acute, symptomatic deep vein thrombosis with or without pulmonary emboli when given with warfarin sodium
- Unlabeled use: Prevention of DVT in patients undergoing surgery at risk for thromboembolic complications

Contraindications and cautions

- Contraindicated with hypersensitivity to any tinzaparin, sulfites, benzyl alcohol, heparin, pork products; history of heparin-induced thrombocytopenia; uncontrolled bleeding.

- Use cautiously with pregnancy or lactation, history of GI bleed, elderly patients with renal insufficiency.

Available forms

Injection—20,000 international units/mL

Dosages**Adults**

175 international units/kg/day subcutaneously given once daily for 6 days or more and until the patient has been successfully anticoagulated with warfarin (INR 2 or higher for 2 consecutive days).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	2–3 hr	4–5 hr	12 hr

Metabolism: Cellular; $T_{1/2}$: 3–4 hr

Distribution: May cross placenta, may enter breast milk

Excretion: Urine

Adverse effects

- **Hematologic: Hemorrhage;** *bruising*; thrombocytopenia; elevated AST, ALT levels; hyperkalemia
- **Hypersensitivity:** Chills, fever, urticaria, asthma
- **Other:** Fever; pain; local irritation; hematoma; erythema at site of injection; **increased risk of death in elderly patients with renal insufficiency**

Interactions

- **Drug-drug** • Increased bleeding tendencies with oral anticoagulants, salicylates, penicillins, cephalosporins, antiplatelets
- **Drug-lab test** • Increased AST, ALT levels
- **Drug-alternative therapy** • Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo, and ginseng therapy

■ Nursing considerations**Assessment**

- **History:** Recent surgery or injury; sensitivity to heparin, low-molecular-weight

heparins, pork products; pregnancy, lactation; recent GI bleed

- **Physical:** Peripheral perfusion, R, stool guaiac test, PTT, INR or other tests of blood coagulation, platelet count, renal function tests

Interventions

- Arrange to begin warfarin therapy within 1–3 days of starting tinzaparin.

⊗ **Warning** Increased risk of death in elderly patients with renal insufficiency. A different anticoagulant should be considered in these situations.

⊗ **Warning** Give deep subcutaneous injections; do not give by IM or IV injection.

⊗ **Black box warning** Use extreme caution with spinal or epidural anesthesia; risk of spinal hematoma and neurologic damage exists.

- Administer by deep subcutaneous injection; patient should be lying down; alternate administration between the left and right anterolateral and left and right posterolateral abdominal wall. Introduce the whole length of the needle into a skin fold held between the thumb and forefinger; hold the skin fold throughout the injection.
- Apply pressure to all injection sites after needle is withdrawn; inspect injection sites for signs of hematoma.
- Do not massage injection sites.
- Do not mix with other injections or infusions.
- Store at room temperature; fluid should be clear, colorless to pale yellow.
- Provide for safety measures (electric razor, soft toothbrush) to prevent injury to patient who is at risk for bleeding.
- Check patient for signs of bleeding and monitor blood tests.

⊗ **Warning** Keep protamine sulfate (tinzaparin antidote) readily available in case of overdose. Each milligram of protamine sulfate (1% solution) neutralizes 100 international units of tinzaparin. Give very slowly IV over 10 min.

Teaching points

- This drug must be given subcutaneously (cannot be taken orally).

- Arrange for periodic blood tests that will be needed to monitor your response to this drug.
- Be careful to avoid injury while you are using this drug: Use an electric razor, avoid activities that might lead to injury.
- Report nose bleed, bleeding of the gums, unusual bruising, black or tarry stools, cloudy or dark urine, abdominal or lower back pain, severe headache.

▷ tiopronin

See Appendix U, *Less commonly used drugs*.

▷ tiotropium bromide

(*tye oh trob' pee um*)

Spiriva

PREGNANCY CATEGORY C

Drug classes

Anticholinergic
Antimuscarinic
Bronchodilator

Therapeutic actions

Competitively antagonistic at muscarinic receptor sites; causes smooth muscle relaxation, leading to bronchodilation.

Indications

- Long-term once-daily maintenance treatment of bronchospasm associated with COPD, including chronic bronchitis and emphysema

Contraindications and cautions

- Contraindicated with allergy to atropine or its derivatives, ipratropium or any component of the product.
- Use cautiously with narrow-angle glaucoma, prostatic hyperplasia, bladder neck obstruction, moderate to severe renal impairment (creatinine clearance of 50 mL/min or less), pregnancy, lactation.

Available forms

Powder for inhalation—18 mcg supplied with *Handihaler* inhalation device

Dosages

Adults

Two inhalations of the contents of one capsule per day using the *Handibaler* inhalation device.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Inhalation	Rapid	5 min

Metabolism: $T_{1/2}$: 5–6 days

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Blurred vision*
- **CV:** Edema
- **GI:** *Dry mouth*, constipation, abdominal pain, dyspepsia, vomiting
- **Respiratory:** Epistaxis, pharyngitis, rhinitis, *sinusitis*, URI, cough
- **Other:** Myalgia, rash, infections, *accidents*, candidiasis, UTI, flulike symptoms, arthritis

Interactions

★ **Drug-drug** • Risk of increased adverse effects if combined with other anticholinergics; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to atropine or its derivatives, ipratropium, or any component of the product; narrow-angle glaucoma; prostatic hyperplasia, bladder neck obstruction, severe renal impairment; pregnancy, lactation
- **Physical:** Orientation, vision, IOP; skin evaluation; cardiac rhythm, bowel sounds; R, adventitious sounds

Interventions

- Do not use this drug for acute respiratory problems.
- Instruct patient in the proper use of the *Handibaler* inhalation device.
- Do not use any other drugs in the *Handibaler* inhalation device.

⊗ **Warning** Evaluate patient for glaucoma; discontinue drug at first sign of developing glaucoma—eye pain, blurred vision, visual halos with red eye and corneal edema.

- Have patient void before using medication if urinary retention is a problem.

Teaching points

- Administer this drug once daily using the provided *Handibaler* inhalation device. Do not use this device for any other drugs. Do not swallow capsules.
- Keep the capsule in the foil blister pack until ready to use; discard any capsules inadvertently opened and left exposed to the air.
- Follow the directions that come with the *Handibaler* for proper administration of the drug and cleaning of the device.
- Avoid getting the inhalation powder in your eyes; if this occurs, gently wash the eye.
- Use this drug for maintenance of your COPD. Do not use it if you have acute trouble breathing.
- Empty your bladder before using this drug if you have a problem with urinary retention.
- You may experience these side effects: Dry mouth (drink plenty of fluids; suck sugarless lozenges); constipation (consult your health care provider); blurred vision (avoid driving a car or operating hazardous machinery).
- Report eye pain, eye discomfort, blurred vision, visual halos or colored images along with red eye (consult your health care provider immediately), urinary retention, difficulty urinating.

▽ tipranavir

(*tip ran' ah veer*)

Aptivus OND

PREGNANCY CATEGORY C

Drug classes

Antiviral drug
Protease inhibitor

Therapeutic actions

Inhibits virus specific processing of polyproteins, leading to the inability to produce mature virions and decreasing virus levels.

Indications

- Along with zidovudine, as combination treatment of patients infected with HIV, with evidence of viral replication who are treatment-experienced or have HIV-1 strains resistant to multiple protease inhibitors

Contraindications and cautions

- Contraindicated with known hypersensitivity tipranavir or any of its components, moderate to severe hepatic insufficiency (Child-Pugh class B or C).
- Use cautiously with diabetes mellitus, hyperglycemia, known allergy to sulfonamides, hemophilia, hepatitis B or C infection, pregnancy, lactation.

Available forms

Capsules —250 mg; solution—100 mg/mL

Dosages

Adults

500 mg/day PO in combination with 200 mg ritonavir, taken with food.

Pediatric patients ages 2–18 yr

14 mg/kg with 6 mg/kg of ritonavir PO bid (375 mg/m² with 150 mg/m² ritonavir PO bid). Maximum dose, 500 mg with 200 mg ritonavir twice daily, taken with food.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2.9 hr

Metabolism: Hepatic: $T_{1/2}$: 4.8–6 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Depression, insomnia, headache
- **GI:** Nausea, vomiting, abdominal pain, diarrhea, potentially fatal liver impairment
- **Respiratory:** Cough, bronchitis
- **Other:** Skin rash, flulike symptoms, fever, malaise, increased cholesterol, triglycerides

Interactions

★ **Drug-drug** • Potential for serious to life-threatening reactions if combined with amiodarone, flecainide, propafenone, quinidine, rifampin, dihydroergotamine, ergonovine, ergotamine, methylergonovine, lovastatin, simvastatin, pimozide, midazolam, triazolam; avoid these combinations • Potential for decreased serum levels of didanosine if combined; space doses of didanosine and tipranavir and ritonavir by at least 2 hr • Potential for decreased serum levels of amprenavir, lopinavir, saquinavir if combined with tipranavir and ritonavir; avoid this combination • Potential for increased serum levels of itraconazole, ketoconazole, voriconazole if used in combination with tipranavir and ritonavir; avoid high doses, monitor patient closely • Potential for adverse effects if combined with calcium channel blockers; use caution and monitor patient closely • Potential for increased levels of desipramine if used in combination; dosage reduction of desipramine and careful patient monitoring is recommended • Potential for disulfiram-like reaction if combined with disulfiram, metronidazole; monitor patient • Risk of increased levels of oral antidiabetic drugs, leading to potential for hypoglycemia; monitor glucose levels closely and adjust dosages as needed • Risk of increased tipranavir levels and atorvastatin levels if these two drugs are combined; start with lowest possible dose of atorvastatin and monitor patient closely • Risk of increased serum levels and toxic effects of cyclosporine, sirolimus, tacrolimus if used in combination; monitor serum levels closely and adjust dosages as needed • Possible decreased levels of meperidine, methadone if combined with tipranavir and ritonavir; monitor patient and adjust dosages as needed • Risk of decreased serum levels of hormonal contraceptives, leading to lack of effectiveness, and ethinyl estradiol; alternate forms of birth control should be used; monitor women on replacement therapy for low levels of estrogen • Risk of increased serum levels and adverse effects of sildenafil, tadalafil, vardenafil; use extreme caution, start at lowest possible doses and limit use to every 48 hr (sildenafil) or 72 hr (tadalafil, vardenafil) • Risk of increased serum levels of SSRIs; monitor patient and adjust dosage as needed • Potential for unpredictable effects of warfarin

when used in combination; monitor bleeding times carefully and adjust dosages as needed

★ **Drug-alternative therapy** • Potential for loss of effectiveness if combined with St. John's wort; avoid this combination

■ Nursing considerations

Assessment:

- **History:** Hypersensitivity to tipranavir or any of its components, moderate to severe hepatic insufficiency, diabetes mellitus, hyperglycemia, known allergy to sulfonamides, hemophilia, hepatitis B or C infection, pregnancy, lactation
- **Physical T:** orientation; skin color, lesions; abdominal examination, LFTs, HIV testing, blood counts

Interventions

⊗ **Black box warning** Assess liver function before and periodically during therapy; increased risk of hepatotoxicity in patients with hepatitis. Administration of tipranavir with ritonavir has caused fatal and nonfatal intracranial hemorrhage; monitor patient carefully.

- Make sure that the patient also takes ritonavir when taking this drug.
- Make sure that the patient swallows capsules whole; do not cut, crush, or allow the patient to chew the capsules.
- Administer ritonavir and tipranavir with food.
- Before beginning therapy, assess the patient's drug regimen for numerous, potential drug interactions.
- Withdraw drug and monitor patient if patient develops signs of lactic acidosis or hepatotoxicity, including hepatomegaly and steatosis.
- Encourage women of childbearing age to use barrier contraceptives while on this drug because the effects of the drug on a fetus are not known.
- Advise women who are nursing to find another method of feeding the baby; potential effects on the baby are not known.
- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others.
- Maintain all other therapies related to the HIV infection.

Teaching points

- This drug is not a cure for HIV. It works with ritonavir to decrease the number of viruses in your body.
- You should still take precautions to prevent the spread of HIV; do not share any personal items that may have blood or body fluids on them; use barrier contraceptives if having intercourse.
- Always take tipranavir with ritonavir; take these drugs with food.
- Do not cut, crush, or chew the capsules; swallow capsules whole.
- Store opened bottles of these capsules in the refrigerator; do not use this drug after the expiration date on the bottle. Do not refrigerate or freeze oral solution.
- If you forget a dose of the drug, take that dose along with your ritonavir as soon as you remember, then take your next dose at the usual time. Do not take more than one dose each day.
- This drug interacts with many other drugs; make sure to tell all health care providers that you are taking this drug.
- You will need to have regular health care, including blood tests, to monitor the effects of this drug on your body.
- It is not known how this drug could affect a nursing baby. If you are breast-feeding a baby, another method of feeding the baby should be selected while you are taking this drug.
- It is not known how this drug could affect a fetus, if you are pregnant or want to become pregnant while on this drug, consult your health care provider.
- You may experience these side effects: Headache (consult your health care provider, medication may be available to help); nausea (eating frequent small meals may help); diarrhea (this may lessen with time; alert your health care provider if this becomes severe); liver injury (this could be serious; stop taking the drug and alert your health care provider if you experience yellowing of your skin or eyes, tea-colored urine, general tiredness, pale stools, pain or sensitivity on your right side).
- Report yellowing of the skin or eyes, general malaise and flulike symptoms, changes in the color of your urine or stool, right-sided pain or tenderness.

tirofiban hydrochloride

(*tye row fye' ban*)

Aggrastat

PREGNANCY CATEGORY B

Drug classes

Antiplatelet
Glycoprotein IIb/IIIa inhibitor

Therapeutic actions

Inhibits platelet aggregation by binding to the platelet receptor glycoprotein, which prevents the binding of fibrinogen and other adhesive ligands to the platelet.

Indications

- Treatment of acute coronary syndrome in combination with heparin
- Prevention of cardiac ischemic complications in patients undergoing elective, emergency, or urgent percutaneous coronary intervention

Contraindications and cautions

- Contraindicated with allergy to any component of this product, bleeding diathesis, hemorrhagic stroke, active or abnormal bleeding or stroke within 30 days, uncontrolled or severe hypertension, major surgery within 4 wk, low platelet count, aortic aneurysm, aortic dissection, acute pericarditis.
- Use cautiously with pregnancy, lactation, renal insufficiency, the elderly, platelet count less than 150,000/mm³, dialysis.

Available forms

Injection concentrate—250 mcg/mL; injection—50 mcg/mL

Dosages

Adults

0.4 mcg/kg/min IV infusion over 30 min, then continue at rate of 0.1 mcg/kg/min.

Pediatric patients

Not recommended.

Patients with renal impairment

Use one-half the recommended adult dosage and monitor patient closely.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	15 min	30 min	4–8 hr

Metabolism: Tissue; T_{1/2}: 2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Withdraw and discard 100 mL from a 500-mL bag of sterile 0.9% sodium chloride or D₅W; replace this volume with 100 mL tirofiban injection (two-50 mL vials) or remove 50 mL from 250-mL bag of sterile 0.9% sodium chloride or D₅W; replace this volume with 50 mL tirofiban injection; doing so will provide a concentration of 50 mcg/mL; mix well prior to administration. Protect from light; discard any remaining solution 24 hr after beginning of infusion. Premixed tirofiban is available in *IntraVia* containers at a concentration of 50 mcg/mL. To open, tear off dust cover; squeeze bag to ensure that no leaks occur—if fluid leaks out, discard solution as sterility has been compromised.

Infusion: Infuse loading dose of 0.4 mcg/kg/min over 30 min; continue infusion at rate of 0.1 mcg/kg/min.

Incompatibilities: Do not mix in solution with diazepam. May be given in same IV line as heparin, dopamine, lidocaine, potassium chloride, and famotidine.

Adverse effects

- **CNS:** *Dizziness*, weakness, syncope, flushing
- **CV:** Bradycardia
- **GI:** Nausea, GI distress, constipation, diarrhea
- **Other:** *Bleeding, hypotension, edema, pain*

Interactions

- **Drug-drug** • Increased risk of bleeding when combined with aspirin, warfarin, NSAIDs, antiplatelets, heparin; monitor patient closely
- **Drug-alternative therapy** • Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo and ginseng, turmeric, horse chestnut seed, green tea leaf, grape seed extract, feverfew, don quai; monitor patient closely

T

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported with *Aggrastat* (tirofiban) and argatroban. Use extreme caution.

Assessment

- **History:** Allergy to any component of this product; bleeding diathesis; hemorrhagic CVA; active, abnormal bleeding or CVA within 30 days; uncontrolled or severe hypertension; major surgery within 6 wk; dialysis; low platelet count; aortic aneurysm; aortic dissection; pregnancy; lactation; renal impairment
- **Physical:** Skin color, T, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; respiratory rate, adventitious sounds, aPTT, PT, active clotting time, CBC

Interventions

- Use tirofiban in conjunction with heparin.
- To minimize patient's blood loss, use as few arterial and venous punctures, IM injections, catheterizations, and intubations as possible.
- ⊗ **Warning** Avoid the use of noncompressible IV access sites to prevent excessive, uncontrollable bleeding.
- Arrange for baseline and periodic CBC, PT, aPTT, and active clotting time. Maintain aPTT between 50–70 sec; and active bleeding time between 300 and 350 sec.
- Properly care for femoral access site to minimize bleeding. Document aPTT of less than 45 sec, and stop heparin for 3–4 hr before pulling sheath.

Teaching points

- This drug is given to minimize blood clotting and cardiac damage. It must be given IV.
- You will be monitored closely and your blood will be tested periodically to monitor the effects of this drug on your body.
- You may experience these side effects: Dizziness, light-headedness, bleeding.
- Report light-headedness, palpitations, pain at IV site, bleeding.

▽ tizanidine

(tis an' i deen)

Apo-Tizanidine (CAN), Zanaflex

PREGNANCY CATEGORY C

Drug classes

Antispasmodic
Sympatholytic (centrally acting)

Therapeutic actions

Centrally acting alpha₂-agonist; antispasmodic effect thought to be a result of indirect depression of polysynaptic reflexes by blocking the excitatory actions of spinal interneurons.

Indications

- Acute and intermittent management of increased muscle tone associated with spasticity

Contraindications and cautions

- Contraindicated with hypersensitivity to tizanidine, concomitant use of fluroxamine, ciprofloxacin.
- Use cautiously with hepatic or renal impairment, hypotension, pregnancy, lactation.

Available forms

Tablets—2, 4 mg; capsules—2, 4, 6 mg

Dosages

Adults

4 mg/day PO, increased in 2- to 4-mg increments as needed over 2–4 wk. Usual maintenance dose is 8 mg PO every 6–8 hr; maximum dose, 36 mg/day in divided doses.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Use lower doses, monitor response.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1–2 hr	3–6 hr

Metabolism: Hepatic; T_{1/2}: 2.7–4.2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, asthenia*, headache, hallucinations, somnolence
- **CV:** *Hypotension, orthostatic hypotension*, bradycardia
- **GI:** *Dry mouth, constipation*, anorexia, malaise, nausea, vomiting, parotid pain, parotitis, mild transient abnormalities in LFTs

Interactions

• **Drug-drug** • Potential risk of increased depression with alcohol, baclofen, other CNS depressants • Possible increased effects with hormonal contraceptives; monitor patient and decrease tizanidine dose • Do not use in combination with other α_2 -adrenergic agonists • Increased risk of QT prolongation with other drugs that can prolong QT interval (antiarrhythmics, fluoroquinolones)

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to tizanidine, clonidine; hepatic or renal impairment; hypotension; pregnancy, lactation
- **Physical:** Mucous membranes—color, lesions; orientation, affect; P, BP, orthostatic BP; perfusion; liver evaluation; LFTs, renal function tests

Interventions

- Administer drug every 6–8 hr around-the-clock for best effects.
- Adjust drug dosage slowly, which helps to decrease side effects.
- Continue all supportive measures used for spinal cord–injured or neurologically damaged patients.
- Provide sugarless lozenges or ice chips, as appropriate, if dry mouth or altered taste occurs.
- Establish safety precautions if CNS or hypotensive changes occur (use side rails, accompany patient when ambulating).
- Attempt to lower dose if side effects become severe or intolerable.

Teaching points

- Take this drug exactly as prescribed. It is important that you not miss doses. Consult your health care provider to determine a schedule that will not interfere with rest.

- Continue all other supportive measures for your condition.
- You may experience these side effects: Drowsiness, dizziness, light-headedness, headache, weakness (use caution while driving or performing tasks that require alertness or physical dexterity); dry mouth (suck on sugarless lozenges or ice chips); GI upset (eat frequent small meals); dizziness, light-headedness when changing position (rise slowly, use caution when transferring).
- Report changes in urine or stool, severe dizziness or passing out, changes in vision, difficulty swallowing.

▷ tobramycin sulfate (*toe bra mye' sin*)

Parenteral: generic

Nebulizer solution: TOBI

Ophthalmic: AK-Tob, Defy, Tobrasol, Tobrex Ophthalmic

PREGNANCY CATEGORY D
(INJECTION, INHALATION)

PREGNANCY CATEGORY B
(OPHTHALMIC)

Drug class

Aminoglycoside antibiotic

Therapeutic actions

Bactericidal: Inhibits protein synthesis in susceptible strains of gram-negative bacteria; mechanism of lethal action is not fully understood, but functional integrity of bacterial cell membrane appears to be disrupted.

Indications

- Parenteral: Serious infections caused by susceptible strains of *Pseudomonas aeruginosa*, *Proteus species*, *Providencia species*, *Escherichia coli*, *Klebsiella-Enterobacter-Serratia* group, *Citrobacter species*, and staphylococci (including *Staphylococcus aureus*)
- Staphylococcal infections when penicillin is contraindicated or when the bacteria are not susceptible

- Serious, life-threatening, gram-negative infections when susceptibility studies have not been completed (sometimes concurrent penicillin or cephalosporin therapy)
- Nebulizer solution: Management of cystic fibrosis patients with *P. aeruginosa*
- Ophthalmic: Treatment of superficial ocular infections due to susceptible strains of organisms

Contraindications and cautions

- Contraindicated with allergy to aminoglycosides, pregnancy, lactation.
- Use cautiously with patients who are elderly or who have diminished hearing, decreased renal function, dehydration, neuromuscular disorders (myasthenia gravis, parkinsonism, infant botulism), herpes, vaccinia, varicella, mycobacterial infections, fungal infections.

Available forms

Injection—10, 40 mg/mL, 80 mg/100 mL normal saline; powder for injection—1.2 g; nebulizer solution—300 mg/5 mL; ophthalmic solution—0.3%; ophthalmic ointment—3 mg/g

Dosages

IM or IV

Doses based on ideal body weight.

Adults

3 mg/kg/day in three equal doses every 8 hr. Up to 5 mg/kg/day in three to four equal doses can be used in life-threatening infections, but reduce to 3 mg/kg/day as soon as possible. Do not exceed 5 mg/kg/day unless serum levels are monitored.

Pediatric patients older than 1 wk

6–7.5 mg/kg/day in three to four equally divided doses.

Premature infants or neonates

1 wk and younger

Up to 4 mg/kg/day in two equal doses every 12 hr.

Geriatric patients or patients with renal failure

Reduce dosage, and carefully monitor serum drug levels and renal function tests throughout treatment. Reduced dosage nomogram is available; check manufacturer's information.

Adults and children 6 yr and older

Nebulizer solution

300 mg bid. Administer in 28-day cycles: 28 days on, 28 days of rest. Inhale over 10–15 min.

Ophthalmic solution

- *Mild to moderate infection*: One or two drops into conjunctival sac of affected eye or eyes every 4 hr.
- *Severe infection*: Two drops into conjunctival sac of affected eye or eyes hourly until improvement occurs.

Ophthalmic ointment

One-half-inch ribbon bid–tid.

- *Severe infection*: One-half inch every 3–4 hr.

Pharmacokinetics

Route	Onset	Peak
IM, IV	Rapid	30–90 min
Ophthalmologic	Rapid	Unknown
Inhalation	Rapid	20 min

Metabolism: Minimal hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute vials of solution for injection. Usual volume of diluent is 50–100 mL of 9% sodium chloride injection or 5% dextrose injection (less for children). Reconstitute powder for injection with sterile water for injection according to manufacturer's instructions.

Infusion: Infuse over 20–60 min.

Incompatibilities: Do not premix with other drugs; administer other drugs separately.

Adverse effects

- **CNS**: Ototoxicity, vestibular paralysis, confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, *numbness, tingling*, tremor, paresthesias, muscle twitching, seizures, muscular weakness, neuromuscular blockade
- **CV**: Palpitations, hypotension, hypertension
- **EENT**: Localized ocular toxicity and hypersensitivity reactions; *lid itching*,

swelling; conjunctival erythema; punctate keratitis

- **GI:** Hepatic toxicity, *nausea, vomiting, anorexia*, weight loss, stomatitis, increased salivation
- **GU:** *Nephrotoxicity*
- **Hematologic:** Agranulocytosis, *leukemoid reaction*, granulocytosis, leukopenia, leukocytosis, thrombocytopenia, eosinophilia, pancytopenia, anemia, hemolytic anemia, increased or decreased reticulocyte count, electrolyte disturbances
- **Hypersensitivity:** *Purpura, rash, urticaria, exfoliative dermatitis, itching*
- **Local:** *Pain, irritation, arachnoiditis at IM injection sites*
- **Other:** Fever, apnea, splenomegaly, joint pain, *superinfections*

Interactions

★ **Drug-drug** • Increased ototoxic, nephrotoxic, neurotoxic effects with other aminoglycosides, potent diuretics • Increased neuromuscular blockade and muscular paralysis with anesthetics, nondepolarizing neuromuscular blocking drugs, succinylcholine • Potential inactivation of both drugs if mixed with beta-lactam-type antibiotics • Increased bactericidal effect with penicillins, cephalosporins, carbenicillin, ticarcillin

■ Nursing considerations

Assessment

- **History:** Allergy to aminoglycosides, diminished hearing, decreased renal function, dehydration, neuromuscular disorders, lactation, pregnancy, infections (ophthalmic solutions)
- **Physical:** Weight; renal function, eighth cranial nerve function; state of hydration; hepatic function, CBC; skin color and lesions; orientation and affect; reflexes; bilateral grip strength; bowel sounds

Interventions

⊗ **Black box warning** Injection may cause serious ototoxicity, nephrotoxicity, and neurotoxicity. Monitor patient closely for changes in renal and CNS function.

- Arrange culture and sensitivity tests of infection before beginning therapy.

⊗ **Warning** Limit duration of treatment to short term to reduce the risk of toxicity; usual duration of treatment is 7–14 days.

- Use ophthalmologic tobramycin only when indicated by sensitivity tests; use of ophthalmologic tobramycin may cause sensitization that will contraindicate the systemic use of tobramycin or other aminoglycosides in serious infections.
- Monitor total serum concentration of tobramycin if ophthalmologic solution or inhaled tobramycin is used concurrently with parenteral aminoglycosides.
- Administer IM dose by deep IM injection.
- Administer nebulizer solution for 28 days; followed by 28 days of rest; have patient in upright position, inhale over 10–15 min.
- Ensure that patient is well hydrated before and during therapy.

Teaching points

Parenteral

- Report hearing changes, dizziness, pain at injection site.

Ophthalmic solution

- Tilt head back; place medication into conjunctival sac, and close eye; apply light finger pressure on lacrimal sac for 1 minute.
- Solution may cause blurring of vision or stinging on administration.
- Report severe stinging, itching, or burning.

Nebulizer solution

- Inhale over 10–15 minutes while in an upright position.
- Mark calendar with 28 days of using drug followed by 28 days without using drug.
- Store drug in refrigerator; do not expose to intense light.

▷ tocilizumab

(*toe sib liz'oo mab*)

Actemra

PREGNANCY CATEGORY C

Drug classes

Antirheumatic

Interleukin-6 receptor inhibitor

Therapeutic actions

Binds with interleukin receptors, inhibiting interleukin-6-mediated signaling to a variety of cells, including T cells, B cells, lymphocytes, monocytes, and fibroblasts. This action decreases the inflammatory processes that occur in rheumatoid arthritis. Also decreases rheumatoid factor, erythrocyte sedimentation rate, serum amyloid A, and neutrophil counts and increases hemoglobin level.

Indications

- Treatment of patients with moderately to severely active rheumatoid arthritis who have had an inadequate response to one or more tumor necrosis factor (TNF) antagonist therapies

Contraindications and cautions

- Contraindicated with history of serious allergy to components of the drug, pregnancy, lactation, active infection.
- Use cautiously with GI perforation or history of ulcers, bone marrow suppression, liver impairment, history of TB or hepatitis B.

Available forms

Single-use vials—20 mg/mL

Dosages

Adults

4 mg/kg by IV infusion over 1 hr, followed by an increase to 8 mg/kg based on clinical response; can repeat infusion once every 4 wk. Maximum dose, 800 mg/infusion.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Moderate	End of infusion

Metabolism: Endogenous; $T_{1/2}$ 11 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Endogenous clearance

IV FACTS

Preparation: Dilute to 100 mL using 0.9% sodium chloride injection. Withdraw a volume

equal to the *Actemra* solution to be used. Slowly add drug to infusion bag, then mix gently, inverting the bag to avoid foaming; inspect for particulate matter or discoloration. Diluted solution may be stored at room temperature, protected from light, for up to 24 hr.

Infusion: Infuse over 60 min through an infusion set; do not administer by IV push or bolus.

Incompatibilities: Do not infuse through the same infusion line as other drugs; do not mix in solution with other drugs.

Adverse effects

- **CNS:** *headache*, dizziness, demyelinating disorders
- **CV:** *hypertension*
- **GI:** mouth ulcerations, upper abdominal pain, gastritis, GI perforation, lipid changes, *increased liver enzymes*
- **Respiratory:** *URI, nasopharyngitis*
- **Other: infections, potentially serious;** infusion reaction, bone marrow suppression, **anaphylaxis**

Interactions

★ **Drug-drug** • Possible serious infections if combined with TNF antagonists, interleukin antagonist anti-CD20 monoclonal antibodies; these combinations are not recommended • Possible increased toxicity of drugs metabolized by CYP450 substrates (such as statins, omeprazole, warfarin, cyclosporine); dosage increases for these drugs may be needed to obtain their therapeutic effect during and for 6 months after tocilizumab is discontinued; monitor patient closely • Live vaccines should be avoided during drug therapy

Nursing considerations Assessment

- **History:** Hypersensitivity to components of the drug; GI perforation; infections, including TB and hepatitis B; liver impairment; bone marrow suppression; pregnancy; lactation
- **Physical:** Orientation; temperature; R, adventitious sounds; GI exam; CBC, LFTs

Interventions

⊗ **Black box warning** Serious to life-threatening infections may occur with drug

use, including TB and bacterial, invasive fungal, viral, and opportunistic infections. Perform TB test before start of therapy. Interrupt treatment if serious infection occurs; monitor patient for signs and symptoms of TB during therapy.

- Obtain CBC and LFTs before start of therapy. Do not initiate in patients with neutrophil count below 2,000, platelet count below 100,000, or ALT or AST level above 1.5 times the upper limit of normal.
- Monitor liver enzyme and lipid levels and neutrophil and platelet counts periodically during therapy. Dosage adjustments may be needed in response to changes in these parameters.
- Protect patient from infection; monitor patient for signs and symptoms of active infection.
- Continue other nonbiological drugs used for treating arthritis, such as methotrexate, corticosteroids, and NSAIDs.
- Ensure that patient continues all other therapies for rheumatoid arthritis.

Teaching points

- This drug will need to be infused into a vein over 1 hour once every 4 weeks. Mark your calendar for the days you will need to have these infusions.
- If you forget a date for a scheduled infusion, talk to your health care provider about a new schedule.
- Continue other drugs prescribed for your rheumatoid arthritis and any other therapies you have been using.
- Keep appointments for periodic blood tests to check your liver enzyme levels and blood counts, which might be affected by this drug. The dosage or timing of your drug may be changed based on the results of these tests.
- It is not known if this drug could affect a fetus but studies have shown that the drug adversely affects animal fetuses. If you are pregnant or thinking about becoming pregnant, discuss this with your health care provider; use of contraceptives is advised.
- This drug may appear in breast milk and may have serious effects on your baby. If you are breast-feeding, you should use another method of feeding the baby while taking this drug.

- Do not get live vaccines while taking this drug; tell your health care provider about other drugs you might be taking.
- You may experience these side effects: Upper respiratory infections, stuffy nose; lower white blood cell count (you will be more susceptible to infections; avoid crowds and people you know to be sick); low platelet count (you will be more prone to bleeding; avoid situations in which you could be easily injured and use a soft-bristled toothbrush); tears in the GI tract (this is very rare and occurs more frequently in people with a history of ulcers, but you should report fever, stomach pain, and change in bowel habits).
- Report signs and symptoms of infection (fever, chills, muscle aches, cough, skin sores, diarrhea, burning on urination), shortness of breath, rash, swelling of the lips or face, chest pain, dizziness, difficulty breathing, black or tarry stools, severe abdominal pain, excessive bruising or bleeding.

▷TOLAZamide

See Appendix U, *Less commonly used drugs*.

▷TOLBUTamide

See Appendix U, *Less commonly used drugs*.

▷tolcapone (*toll kap' own*)

Tasmar

PREGNANCY CATEGORY C

Drug classes

Antiparkinsonian
COMT inhibitor

Therapeutic actions

Selectively and reversibly inhibits COMT, an enzyme that eliminates biologically active catecholamines including dopa, dopamine, norepinephrine, epinephrine; when given with levodopa, tolcapone's inhibition of COMT is believed to increase the plasma concentrations and duration of action of levodopa.

Indications

- Adjunct with levodopa and carbidopa in the treatment of the signs and symptoms of idiopathic Parkinson's disease

Contraindications and cautions

- Contraindicated with hypersensitivity to drug or its components, lactation, liver disease, patients with a history of nontraumatic rhabdomyolysis or hyperpyrexia and confusion.
- Use cautiously with hypertension, hypotension, or renal impairment, pregnancy.

Available forms

Tablets—100, 200 mg

Dosages

Adults

Initial maintenance dosage, 100 mg PO tid. Maximum daily dose, 600 mg. 200 mg tid is more associated with liver enzyme elevation and is only recommended when benefit outweighs risk. However, 200 mg tid can be used if benefit is justified. If patient does not show a clinical benefit within 3 wk of treatment with 200 mg tid, tolcapone should be discontinued.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

Discontinue drug if liver enzyme values are greater than 2x upper limit of normal. Patients with moderate to severe hepatic impairment should not exceed 100 mg PO tid; patients with liver enzyme values greater than the upper limit of normal at initiation should not receive this drug. Use caution in patients with renal impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Disorientation, confusion*, memory loss, *hallucinations*, psychoses, agitation,

nervousness, delusions, delirium, paranoia, euphoria, excitement, *light-headedness, dizziness*, depression, drowsiness, weakness, giddiness, paresthesia, heaviness of the limbs, numbness of fingers

- **CV:** Hypotension, orthostatic hypotension
- **Dermatologic:** Rash, urticaria, other dermatoses
- **GI:** Acute suppurative parotitis, *nausea, vomiting, diarrhea*, epigastric distress, flatulence, **fulminant and possibly fatal liver failure**
- **Respiratory:** URIs, dyspnea, sinus congestion
- **Other:** Muscular weakness, muscular cramping

Interactions

★ **Drug-drug** • Risk of serious reaction if combined with MAOIs; avoid this combination

Nursing considerations

Assessment

- **History:** Hypersensitivity to drug or its components; hypertension, hypotension; hepatic or renal impairment; pregnancy, lactation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, bilateral grip strength, visual examination; P, BP, orthostatic BP, auscultation; bowel sounds, normal output, liver evaluation; urinary output, voiding pattern, LFTs, renal function tests

Interventions

- Administer in conjunction with levodopa and carbidopa. Monitor patient response; customary levodopa dosage may need to be decreased.

⊗ **Black box warning** Risk of potentially fatal acute fulminant liver failure exists. Monitor LFTs before and every 2 wk during therapy; discontinue drug at any sign of liver damage; use drug for patients no longer responding to other therapies.

- Provide sugarless lozenges or ice chips to suck if dry mouth is a problem.
- Give with meals if GI upset occurs; give before meals to patients bothered by dry mouth; give after meals if drooling is a problem or if drug causes nausea.

⊗ **Warning** Avoid abrupt withdrawal of drug, which can lead to more serious complications. Taper drug slowly over 2 wk if possible.

- Advise patient to use barrier contraceptives; serious birth defects can occur while using this drug. Advise nursing mothers to use another means of feeding the baby because drug can enter breast milk and adversely affect the infant.
- Establish safety precautions if CNS, vision changes, hallucinations, or hypotension occurs (eg, use side rails, accompany patient when ambulating).
- Provide additional comfort measures appropriate to patient with parkinsonism.

Teaching points

- Take this drug exactly as prescribed. Take in conjunction with your levodopa and carbidopa. Do not stop this drug suddenly; it must be tapered over 2 weeks.
- Use barrier contraceptives while using this drug; serious birth defects can occur. Do not breast-feed your baby while using this drug; the drug enters breast milk and can adversely affect the baby.
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving a car or engaging in activities that require alertness and visual acuity if these occur; rise slowly when changing positions to help decrease dizziness); nausea (eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips); hallucinations (it may help to know that this is a side effect of the drug; use care and have someone stay with you if this occurs); constipation (if maintaining adequate fluid intake and exercising regularly do not help, consult your health care provider).
- Report constipation, rapid or pounding heart-beat, confusion, eye pain, hallucinations, rash, changes in color of urine or stools, fever, chills, fatigue, yellowing of skin or eyes.

tolmetin sodium (tole' met in)

PREGNANCY CATEGORY C

PREGNANCY CATEGORY D
(3RD TRIMESTER)

Drug class

NSAID

Therapeutic actions

Anti-inflammatory, analgesic, and antipyretic activities largely related to inhibition or prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Treatment of acute flares and long-term management of rheumatoid arthritis and osteoarthritis
- Treatment of juvenile rheumatoid arthritis in patients older than 2 yr

Contraindications and cautions

- Contraindicated in patients with hypersensitivity to the drug or any of its components, in patients who have had reactions to aspirin or other NSAIDs, and with lactation.
- Use cautiously with allergies, renal, hepatic, CV and GI conditions, coagulation defects, patients taking anticoagulants, pregnancy.

Available forms

Tablets—200, 600 mg; capsules—400 mg

Dosages

Adults

Do not exceed 1,800 mg/day. Doses exceeding 1.8 g daily have not been studied. Subsequent dosing adjustment based on response and tolerance after 1–2 wk.

- *Rheumatoid arthritis or osteoarthritis*: Initial dose, 400 mg PO tid (1,200 mg/day) preferably including dose on arising and at bedtime. Maintenance dose, 600–1,800 mg/day in three to four divided doses for rheumatoid arthritis; 600–1,600 mg/day in three to four divided doses for osteoarthritis.

Pediatric patients 2 yr and older

Initially, 20 mg/kg/day PO in three to four divided doses; when control has been achieved, the usual dose is 15–30 mg/kg/day. Do not exceed 30 mg/kg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	30–60 min

Metabolism: Hepatic; $T_{1/2}$: 2–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, *ophthalmologic effects*, weakness
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment, including renal failure, interstitial nephritis, hematuria
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, *leukopenia*, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, *menorrhagia*
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions** to **fatal anaphylactic shock**

Interactions

★ **Drug-lab test** • False-positive tests for proteinuria using acid precipitation tests; no interference has been reported with dye-impregnated reagent strips

■ Nursing considerations

Assessment

- **History:** Allergies; renal, hepatic, CV, and GI conditions; pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

- Administer with milk if GI upset occurs; do not give with food—bioavailability is decreased by up to 16%.
- Use antacids other than sodium bicarbonate if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

⊗ **Black box warning** Be aware that patient may be at increased risk for CV event, GI bleeding; monitor accordingly.

Teaching points

- Take drug on an empty stomach; may be taken with milk or antacids other than sodium bicarbonate if GI upset occurs.
- Take only the prescribed dosage.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools; chest pain.

▽ tolterodine tartrate

(*toll tear' oh deen*)

Detrol, Detrol LA **ORC**

PREGNANCY CATEGORY C

Drug class

Antimuscarinic

Therapeutic actions

Competitively blocks muscarinic receptor sites; bladder contraction is mediated by muscarinic receptors—blocking these receptors decreases bladder contraction.

Indications

- Treatment of overactive bladder in patients with symptoms of urinary frequency, urgency or incontinence

Contraindications and cautions

- Contraindicated with urinary retention, uncontrolled narrow-angle glaucoma, gastric retention, allergy to the drug or any of its components.
- Use cautiously with renal or hepatic impairment, pregnancy, lactation.

Available forms

Tablets—1, 2 mg; ER capsules **ORC**—2, 4 mg

Dosages

Adults

2 mg PO bid, may be lowered to 1 mg PO bid based on individual response; ER capsules—4 mg PO taken once daily; may be lowered to 2 mg once daily based on response.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic and renal impairment

Reduce dosage to 1 mg PO bid (2 mg daily ER capsules) and monitor patient.

Pharmacokinetics

Route	Onset	Duration
Oral	1–2 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 1.9–3.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Blurred vision*, headache, dizziness, somnolence
- **Dermatologic:** Pruritus, rash, erythema, dry skin
- **GI:** *Nausea, vomiting, constipation, dyspepsia*, flatulence, *dry mouth*, abdominal pain
- **GU:** *Dysuria*, urinary retention; impotence, UTIs
- **Other:** Weight gain, pain, fatigue, acute myopia and secondary angle closure glaucoma (pain, visual changes, redness, increased IOP)

Interactions

★ **Drug-drug** • Risk of increased serum levels and toxicity if given with drugs that inhibit CYP2D6 (such as fluoxetine) or with potent CYP3A4 inhibitors (such as azole antifungals); reduce tolterodine dose to 1 mg PO bid (2 mg daily ER capsules)

■ Nursing considerations

Assessment

- **History:** Urinary retention, uncontrolled narrow-angle glaucoma, allergy to the drug or any of its components, renal or hepatic impairment, pregnancy, lactation

- **Physical:** Bowel sounds, normal output; normal urinary output, prostate palpation; IOP; vision; LFTs, renal function tests; skin color, lesions, texture; weight

Interventions

- Ensure that patient does not cut, crush, or chew ER forms.
- Provide frequent small meals if GI upset is severe.
- Provide frequent mouth hygiene or skin care if dry mouth or skin occurs.
- Arrange for safety precautions if blurred vision occurs.
- Monitor bowel function and arrange for bowel program if constipation occurs.

Teaching points

- Take drug exactly as prescribed. Do not cut, crush, or chew ER forms.
- You may experience these side effects: Constipation (ensure adequate fluid intake, proper diet; consult your health care provider if this becomes a problem); dry mouth (suck sugarless lozenges, practice frequent mouth care; this effect sometimes lessens over time); blurred vision (it may help to know that these are drug effects that will go away when you discontinue the drug; avoid tasks that require acute vision); difficulty in urination (it may help to empty the bladder immediately before taking each dose of drug).
- Report rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, palpitations, headache, abdominal distention.

▷ tolvaptan

See Appendix U, *Less commonly used drugs*.

▷ topiramate

(*toe pie' rab mate*)

Gen-Topiramate (CAN), PMS-Topiramate (CAN), ratio-Topiramate (CAN), Topamax ORIG, Topamax Sprinkle, Topiragen

PREGNANCY CATEGORY C

Drug classesAntiepileptic
Antimigraine**Therapeutic actions**

Mechanism of action not understood; antiepileptic effects may be due to the actions of blocking sodium channels in neurons with sustained depolarization; increasing GABA activity at receptors, thus potentiating the effects of this inhibitory neurotransmitter; and blocking excitatory neurotransmitters at neuron receptor sites.

Indications

- Monotherapy for the treatment of patients 10 yr and older with partial onset or primary generalized tonic-clonic seizures
- Adjunctive therapy for partial-onset seizure treatment in adults and children 2–16 yr
- Adjunctive therapy for seizures associated with Lennox-Gastaut syndrome in adults and children older than 2 yr
- Adjunctive therapy for primary generalized tonic-clonic seizures in adults and children 2–16 yr
- Prophylaxis of migraine headaches in adults
- Unlabeled uses: Cluster headaches, infantile spasms, alcohol dependence, bulimia nervosa, weight loss

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug.
- Use cautiously with pregnancy (use only if benefits outweigh potential risks to fetus), lactation, renal or hepatic impairment, renal stones, glaucoma.

Available forms

Tablets **OND**—25, 50, 100, 200 mg; sprinkle capsules—15, 25 mg

Dosages**Adults 17 yr and older**

- **Migraine prophylaxis:** Initially, 25 mg PO in the evening for 1 wk; week 2—25 mg PO bid, morning and evening; week 3—25 mg PO in the morning and 50 mg PO in the evening; week 4—50 mg PO morning and evening.

- **Seizure disorder:** 200–400 mg PO daily in two divided doses. Therapy should be initiated at a dose of 25–50 mg/day titrated up in increments of 25–50 mg/wk.

Patients 10 yr and older

- **Monotherapy:** 25 mg PO bid, titrating to maintenance dose of 200 mg PO bid over 6 wk. Week 1—25 mg bid; week 2—50 mg bid; week 3—75 mg bid; week 4—100 mg bid; week 5—150 mg bid; week 6—200 mg bid.

Pediatric patients 2–16 yr

5–9 mg/kg/day PO in two divided doses. Therapy should be initiated at a nightly dose of 25 mg (or less, based on 1–3 mg/kg/day) for the first week. The dose may be titrated up by increments of 1–3 mg/kg/day (administered in two divided doses) at 1–2 wk intervals.

Patients with hepatic or renal impairment

For creatinine clearance less than 70 mL/min, use one-half the usual dose; allow increased time to reach desired level. For patients with hepatic impairment, adjust slowly; monitor patient carefully.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2 hr

Metabolism: Hepatic; $T_{1/2}$: 21 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Removed by hemodialysis: Supplemental dose may be needed

Adverse effects

- **CNS:** *Ataxia, somnolence, dizziness, nystagmus*, nervousness, anxiety, tremor, speech impairment, paresthesias, confusion, depression
- **GI:** *Nausea, dyspepsia*, anorexia, vomiting
- **GU:** Dysmenorrhea, renal stones
- **Hematologic:** Leukopenia
- **Respiratory:** *URI*, pharyngitis, sinusitis
- **Other:** *Fatigue*, rash, acute myopia and secondary angle-closure glaucoma (pain, visual disturbances, pupil dilation, redness, increased IOP), weight loss

Interactions

★ **Drug-drug** • Increased CNS depression if taken with alcohol or CNS depressants; use extreme caution • Increased risk of renal stone development with carbonic anhydrase inhibitors • Decreased effects of hormonal contraceptives with topiramate; suggest use of barrier contraceptives instead • Decreased serum levels if combined with phenytoin, carbamazepine, valproic acid

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Topamax* and *Toprol-XL* (metoprolol); use caution.

Assessment

- **History:** Hypersensitivity to any component of the drug; pregnancy, lactation; renal or hepatic impairment, renal stones
- **Physical:** Skin color, lesions; orientation, affect, reflexes, vision examination; R, adventitious sounds; LFTs, renal function tests

Interventions

⊗ **Warning** Reduce dosage; discontinue or substitute other antiepileptic gradually; abrupt discontinuation may precipitate status epilepticus.

⊗ **Black box warning** There is an increased risk of suicidality with drug administration; monitor patient accordingly.

⊗ **Warning** Stop the drug immediately and arrange for appropriate consultations at first sign of blurred vision, periorbital edema, or redness.

- Administer with food if GI upset occurs.
- Caution patient not to chew or break tablets because of bitter taste.
- Have patient swallow sprinkle capsules whole or by carefully opening capsule and sprinkling onto a soft food. Swallow this immediately; do not allow it to be chewed.
- Encourage patients with a history of renal stone development to maintain adequate fluid intake while using this drug.
- Suggest using barrier contraceptives to patients taking this drug.

- Arrange for consultation with appropriate epilepsy support groups as needed.

Teaching points

- Take this drug exactly as prescribed. Do not break or chew tablets; they have a very bitter taste. Sprinkle capsule may also be swallowed whole. If using sprinkle capsules, open carefully and sprinkle onto soft food and swallow immediately; do not chew.
- Do not discontinue this drug abruptly or change dosage except on the advice of your health care provider.
- Arrange for frequent check-ups to monitor your response to this drug. It is very important that you keep all appointments for check-ups.
- Wear or carry medical identification at all times so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- Avoid using alcohol while you are taking this drug; serious sedation could occur.
- You may experience these side effects: Drowsiness, dizziness, sleepiness (avoid driving or performing other tasks that require alertness; symptoms may occur initially but usually disappear with continued therapy); vision changes (avoid performing tasks that require visual acuity); GI upset (take drug with food; eat frequent small meals).
- Report fatigue, vision changes, speech problems, personality changes, thoughts of suicide.

▷ toptecan hydrochloride

See Appendix U, *Less commonly used drugs.*

DANGEROUS DRUG

▷ toremifene citrate

(*tore em' ah feen*)

Fareston

PREGNANCY CATEGORY D

Drug classes

Antineoplastic

Estrogen receptor modulator

Therapeutic actions

Binds to estrogen receptors, has anti-estrogen effects, and inhibits growth of estrogen receptor-positive and estrogen receptor-negative breast cancer cell lines.

Indications

- Treatment of advanced breast cancer in postmenopausal women with estrogen receptor-positive disease or estrogen-receptor unknown tumors

Contraindications and cautions

- Contraindicated with allergy to toremifene, history of thromboembolic disorder, pregnancy, lactation.
- Use cautiously with history of hypercalcemia, hepatic impairment, pre-existing endometrial hyperplasia.

Available forms

Tablets—60 mg

Dosages

Adults

60 mg PO daily; continue until disease progression occurs.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–6 hr

Metabolism: Hepatic; $T_{1/2}$: 5–6 days

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Depression, light-headedness, *dizziness*, headache, hallucinations, vertigo
- **Dermatologic:** *Hot flashes*, *skin rash*
- **GI:** *Nausea*, *vomiting*, food distaste
- **GU:** Vaginal bleeding, vaginal discharge
- **Other:** Peripheral edema, hypercalcemia, cataracts, sweating, thrombophlebitis, pulmonary embolism

Interactions

* **Drug-drug** • Increased risk of bleeding if taken with oral anticoagulants; monitor the

patient's INR • Increased risk of hypercalcemia if taken with remifene or drugs that decrease renal calcium excretion; monitor patient accordingly

■ Nursing considerations

Assessment

- **History:** Allergy to toremifene, pregnancy, lactation, hypercalcemia, hepatic impairment, thromboembolism history and pre-existing endometrial hyperplasia
- **Physical:** Skin lesions, color, turgor; pelvic examination; orientation, affect, reflexes; BP, peripheral pulses, edema; LFTs, serum electrolytes

Interventions

- Administer daily without regard to food.
- Counsel patient about the need to use contraceptive measures while taking this drug; inform patient that serious fetal harm could occur.
- Provide comfort measures to help patient deal with drug effects: Hot flashes (control temperature of environment); headache, depression (monitor light and noise); vaginal bleeding (use hygiene measures).

Teaching points

- Take this drug as prescribed.
- This drug can cause serious fetal harm and must not be taken during pregnancy. Barrier contraceptives should be used while you are taking this drug. If you become pregnant or decide that you want to become pregnant, consult your health care provider immediately.
- You may experience these side effects: Hot flashes (stay in cool places); nausea, vomiting (eat frequent small meals); weight gain; dizziness, headache, light-headedness (use caution if driving or performing tasks that require alertness).
- Report marked weakness, sleepiness, mental confusion, changes in color of urine or stool, rash, vision changes.

torsemide (tor' seb myde)

Demadex

PREGNANCY CATEGORY B

Drug classes

Loop (high-ceiling) diuretic
Sulfonamide

Therapeutic actions

Inhibits the reabsorption of sodium and chloride from the proximal and distal renal tubules and the loop of Henle, leading to a natriuretic diuresis.

Indications

- Treatment of hypertension and edema associated with HF, hepatic cirrhosis, renal failure

Contraindications and cautions

- Contraindicated with allergy to torsemide; known hypersensitivity to sulfonylureas; anuria, severe renal failure; hepatic coma.
- Use cautiously with SLE, electrolyte depletion, gout, diabetes mellitus, lactation, pregnancy.

Available forms

Tablets—5, 10, 20, 100 mg; injection—10 mg/mL

Dosages

Adults

- ⊗ **Warning** Do not exceed 200 mg/day.
- **HF:** 10–20 mg PO or IV daily. Dose may be titrated upward by doubling the dose until desired results are seen. Do not exceed 200 mg/day.
- **Chronic renal failure:** 20 mg PO or IV daily. Dose may be titrated upward by doubling the dose until desired results are seen. Do not exceed 200 mg/day.
- **Hepatic failure:** 5–10 mg PO or IV daily. Do not exceed 40 mg/day.
- **Hypertension:** 5 mg PO daily. May be increased to 10 mg if response is not sufficient.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	60 min	60–120 min	6–8 hr
IV	10 min	60 min	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 210 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: May be given direct IV over 2 min or diluted in solution with D₅W, 0.9% sodium chloride, 0.45% sodium chloride. Discard unused solution after 24 hr.

Infusion: Give by direct injection slowly, over 1–2 min. Further diluted in solution, give slowly, each 200 mg over 2 min.

Adverse effects

- **CNS:** *Asterixis*, *dizziness*, vertigo, paresthasias, confusion, fatigue, nystagmus, *weakness*, *headache*, *drowsiness*, fatigue, blurred vision, tinnitus, irreversible hearing loss
- **CV:** *Orthostatic hypotension*, volume depletion, cardiac arrhythmias, thrombophlebitis
- **GI:** *Nausea*, *anorexia*, *vomiting*, *diarrhea*, gastric irritation and pain, dry mouth, acute pancreatitis, jaundice, polydipsia
- **GU:** *Polyuria*, *nocturia*, glycosuria, renal failure
- **Hematologic:** *Hypokalemia*, leukopenia, anemia, thrombocytopenia, hyperuricemia, hypoglycemia
- **Local:** *Pain*, *phlebitis at injection site*
- **Other:** Muscle cramps and muscle spasms, weakness, arthritic pain, fatigue, hives, photosensitivity, rash, pruritus, sweating, nipple tenderness, impotence

Interactions

- * **Drug-drug** • Decreased diuresis and natriuresis with NSAIDs • Increased risk of cardiac glycoside toxicity (secondary to hypokalemia) • Increased risk of ototoxicity with aminoglycoside antibiotics, cisplatin, ethacrynic acid

■ Nursing considerations**Assessment**

- **History:** Allergy to toremide, sulfonyleurea; electrolyte depletion; anuria; severe renal failure; hepatic coma; SLE; gout; diabetes mellitus; lactation, pregnancy
- **Physical:** Skin color, lesions; edema; orientation, reflexes, hearing; pulses, baseline ECG, BP, orthostatic BP, perfusion; R, pattern, adventitious sounds; liver evaluation, bowel sounds; urinary output patterns; CBC, serum electrolytes, blood sugar, LFTs, renal function tests, uric acid, urinalysis

Interventions

- Administer with food or milk to prevent GI upset.
- Mark calendars or other reminders of drug days if intermittent therapy is optimal for treating edema.
- Administer single daily doses early in the day so increased urination will not disturb sleep.
- Avoid IV use if oral use is at all possible.
- Measure and record regular weights to monitor fluid changes.
- Monitor serum electrolytes, hydration, and liver function during long-term therapy.
- Provide diet rich in potassium or give supplemental potassium.

Teaching points

- Record alternate-day or intermittent therapy on a calendar or dated envelopes.
- Take the drug early in the day so increased urination will not disturb sleep.
- Take the drug with food or meals to prevent GI upset.
- Weigh yourself on a regular basis, at the same time and in the same clothing, and record the weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes, driving a car and other hazardous activities, and alcohol consumption); sensitivity to sunlight (use sunglasses and sunscreen; wear protective clothing when outdoors); increased thirst (suck sugarless lozenges; practice frequent mouth care); loss of body potassium

(a potassium-rich diet, or even a potassium supplement, will be needed).

- Report weight change of more than 3 pounds in 1 day; swelling in ankles or fingers; unusual bleeding or bruising; nausea, dizziness, trembling, numbness, fatigue; muscle weakness or cramps.

▼ tositumomab and iodine I-131 tositumomab

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▼ tramadol hydrochloride
(*tram' ab doll*)

Rybix ODT, Ryzolt **OND**, Ultram, Ultram ER **OND**

PREGNANCY CATEGORY C

Drug classes

Analgesic (centrally acting)
Opioid analgesic

Therapeutic actions

Binds to mu-opioid receptors and inhibits the reuptake of norepinephrine and serotonin; causes many effects similar to the opioids—dizziness, somnolence, nausea, constipation—but does not have the respiratory depressant effects.

Indications

- Relief of moderate to moderately severe pain
- Relief of moderate to severe chronic pain in adults who need around-the-clock treatment for extended periods (ER tablets)
- Unlabeled uses: Premature ejaculation; restless leg syndrome

Contraindications and cautions

- Contraindicated with allergy to tramadol or opioids or acute intoxication with alcohol, opioids, or psychoactive drugs.
- Use cautiously with pregnancy, lactation; seizures; concomitant use of CNS depres-

sants, MAOIs, SSRIs, TCAs; renal impairment; hepatic impairment.

Available forms

Tablets—50 mg; ER tablets **ORC**—100, 200, 300 mg; orally disintegrating tablets—50 mg

Dosages

Adults

Patients who require rapid analgesic effect: 50–100 mg PO every 4–6 hr; do not exceed 400 mg/day.

Patients with moderate to moderately severe chronic pain: Initiate at 25 mg/day in the morning, and titrate in 25-mg increments every 3 days to reach 100 mg/day. Then, increase in 50-mg increments every 3 days to reach 200 mg/day. After titration, 50–100 mg every 4–6 hr; do not exceed 400 mg/day. Alternatively, 100-mg ER tablet once daily, titrated by 100-mg increments every 5 days; do not exceed 300 mg/day. For orally disintegrating tablets, do not exceed 200 mg/day.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic or renal impairment

Older than 75 yr: Do not exceed 300 mg/day. *Patients with cirrhosis:* 50 mg every 12 hr. ER tablets should not be used in severe hepatic impairment (Child-Pugh class C).

Patients with creatinine clearance less than 30 mL/min: 50–100 mg PO every 12 hr. Maximum 200 mg/day. ER tablets should not be used in patients with creatinine clearance less than 30 mL/min.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	2 hr

Metabolism: Hepatic; $T_{1/2}$: 6–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Sedation, dizziness or vertigo, headache, confusion, dreaming, sweating, anxiety, **seizures**

- **CV:** Hypotension, tachycardia, bradycardia, vasodilation, syncope, orthostatic hypotension
- **Dermatologic:** Sweating, pruritus, rash, pallor, urticaria
- **GI:** Nausea, vomiting, dry mouth, constipation, flatulence
- **Other:** Potential for abuse, **anaphylactoid reactions**

Interactions

- **Drug-drug** • Decreased effectiveness with carbamazepine • Increased risk of tramadol toxicity with MAOIs or SSRIs • Increased risk of respiratory depression if combined with other CNS depressants, alcohol

Nursing considerations

Assessment

- **History:** Hypersensitivity to tramadol; pregnancy; acute intoxication with alcohol, opioids, psychotropic drugs or other centrally acting analgesics; lactation; seizures; concomitant use of CNS depressants or MAOIs; renal or hepatic impairment; past or present history of opioid addiction
- **Physical:** Skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect; P, auscultation, BP; bowel sounds, normal output; LFTs, renal function tests

Interventions

- Control environment (temperature, lighting) if sweating or CNS effects occur.
- Ensure that patient does not cut, crush, or chew ER tablets.
- ⊗ **Warning** Patient may be at increased risk for suicidality. Risk increases with concurrent use of antidepressants or anxiolytics; monitor patient accordingly.
- ⊗ **Warning** Limit use in patients with past or present history of addiction to or dependence on opioids.

Teaching points

- Do not cut, crush, or chew ER tablets; swallow them whole. Dissolve orally disintegrating tablets in your mouth and swallow with water.
- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (avoid driving or perform-

ing tasks that require alertness); nausea, loss of appetite (lie quietly, eat frequent small meals).

- Report severe nausea, dizziness, severe constipation, thoughts of suicide.

trandolapril

(*tran dōle' ab prīl*)

Mavik

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor

Antihypertensive

Therapeutic actions

Blocks ACE from converting angiotensin I to angiotensin II, a powerful vasoconstrictor, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis may also be involved in the antihypertensive action.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- Treatment of post-MI patients with evidence of left-ventricular dysfunction and symptoms of HF
- Unlabeled use: Diabetic nephropathy

Contraindications and cautions

- Contraindicated with allergy to ACE inhibitors, history of ACE-associated angioedema.
- Use cautiously with impaired renal function, HF, CAD, salt or volume depletion, surgery, pregnancy, lactation, renal artery stenosis.

Available forms

Tablets—1, 2, 4 mg

Dosages

Adults

- **Hypertension:** African-American patients: 2 mg PO daily. All other patients: 1 mg PO daily. For maintenance, 2–4 mg/day. Maximum, 8 mg.
- **Patients on diuretics:** To prevent hypotension, stop diuretic 2–3 days before beginning trandolapril. Resume diuretic only if BP is not controlled. If diuretic cannot be discontinued, start at 0.5 mg PO daily and adjust upward as needed.
- **HF post-MI:** May start therapy 3 to 5 days after the MI. 1 mg/day PO; adjust to a target of 4 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

0.5 mg PO daily, adjust at 1-wk intervals to control BP; usual range is 2–4 mg PO daily.

Pharmacokinetics

Route	Peak	Duration
Oral	3–4 hr	24 hr

Metabolism: T_{1/2}: 14–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, fatigue
- **CV:** *Tachycardia*, angina pectoris, **MI**, HF, Raynaud's syndrome, hypotension in salt- or volume-depleted patients
- **Dermatologic:** *Rash*
- **GI:** *Diarrhea*, GI upset
- **GU:** Renal insufficiency, renal failure, polyuria, oliguria, urinary frequency, UTI
- **Other:** *Cough*, *dizziness*, malaise, dry mouth

Interactions

- *** Drug-drug** • Excessive hypotension may occur with diuretics; monitor closely • Hyperkalemia may occur with potassium supplements, potassium-sparing diuretics, salt substitutes; monitor serum potassium levels
- Potential increase in lithium levels if taken

concurrently; decreased lithium dose may be needed

■ Nursing considerations

Assessment

- **History:** Allergy to ACE inhibitors, impaired renal or hepatic function, CAD, HF, salt or volume depletion, surgery, pregnancy, lactation
- **Physical:** Skin color, lesions, turgor; T; P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Black box warning** Ensure that patient is not pregnant before administering; advise patient to use barrier contraceptives.

- Administer once a day at same time each day.

⊗ **Warning** Alert surgeon and mark the patient's chart with notice that trandolapril is being taken; angiotensin II formation subsequent to compensatory renin release during surgery will need to be blocked; hypotension may be reversed with volume expansion.

- Monitor patient closely in any situation that may lead to fall in BP secondary to reduction in fluid volume—excessive perspiration and dehydration, vomiting, diarrhea—as excessive hypotension may occur.
- Reduce dosage in patients with impaired renal or hepatic function.

⊗ **Warning** Discontinue immediately if laryngeal edema, angioedema, or jaundice occurs.

Teaching points

- Take drug once a day at generally the same time each day. Do not stop taking this medication without consulting your health care provider.
- This drug cannot be used during pregnancy; using barrier contraceptives is recommended.
- Be careful in situations that may lead to drop in blood pressure (diarrhea, sweating, vomiting, dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- While taking this drug, avoid using over-the-counter medications, especially cough,

cold, or allergy medications; they may contain ingredients that will interact with this drug. If you feel that you need one of these preparations, consult your health care provider.

- You may experience these side effects: GI upset, diarrhea (limited effects that will pass); dizziness, light-headedness (usually passes after first few days; change position slowly and limit your activities to those that do not require alertness and precision); cough (can be very irritating and does not respond to cough suppressants; notify health care provider if very uncomfortable).
- Report sore throat, fever, chills; swelling of the hands or feet; irregular heartbeat, chest pains; swelling of the face, eyes, lips, tongue; difficulty breathing; yellowing of skin.

▷ tranexamic acid

See Appendix U, *Less commonly used drugs*.

▷ tranylcypromine sulfate

(*tran ill sip' roe meen*)

Parnate

PREGNANCY CATEGORY C

Drug classes

Antidepressant
MAOI

Therapeutic actions

Irreversibly inhibits MAO, an enzyme that breaks down biogenic amines, such as epinephrine, norepinephrine, and serotonin, allowing these biogenic amines to accumulate in neuronal storage sites; according to the biogenic amine hypothesis, this accumulation of amines is responsible for the clinical efficacy of MAOIs as antidepressants.

Indications

- Treatment of adult outpatients with a major depressive episode without melancholia; efficacy in endogenous depression has not been established

- Unlabeled uses: Migraine headache, panic disorder, social anxiety disorder, bipolar depression, Alzheimer's disease, Parkinson's disease

Contraindications and cautions

- Contraindicated with hypersensitivity to any MAOI; pheochromocytoma, HF; history of liver disease or abnormal LFTs; severe renal impairment; confirmed or suspected cerebrovascular defect; CV disease, hypertension; history of headache (headache is an indicator of hypertensive reaction to drug); myelography within previous 24 hr or scheduled within 48 hr; lactation; patients scheduled for elective surgery (MAOIs should be discontinued 10 days before surgery).
- Use cautiously with seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients (agitated or schizophrenic patients may show excessive stimulation; bipolar patients may shift to hypomanic or manic phase); pregnancy or in women of childbearing age.

Available forms

Tablets—10 mg

Dosages

Adults

Usual effective dose is 30 mg/day PO in divided doses. If no improvement is seen within 2–3 wk, increase dosage in 10 mg/day increments every 1–3 wk. May be increased to a maximum of 60 mg/day.

Pediatric patients

Not recommended for patients younger than 16 yr.

Geriatric patients

Patients older than 60 yr are more prone to develop side effects; use with caution.

Pharmacokinetics

Route	Onset	Duration
Oral	Rapid	3–5 days

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, vertigo, headache, overactivity, hyperreflexia, tremors, muscle twitching, mania, hypomania, jitteriness, confusion, memory impairment, insomnia, weakness, fatigue, drowsiness, restlessness, overstimulation, increased anxiety, agitation, blurred vision, sweating, akathisia, ataxia, coma, euphoria, neuritis, repetitious babbling, chills, glaucoma, nystagmus*
- **CV: Hypertensive crises, sometimes fatal,** sometimes with intracranial bleeding, usually attributable to tyramine ingestion (see Drug–food interactions); symptoms include occipital headache, which may radiate frontally; palpitations; neck stiffness or soreness; nausea; vomiting; sweating (sometimes with fever, cold and clammy skin); dilated pupils; photophobia; tachycardia or bradycardia; chest pain; *orthostatic hypotension, sometimes associated with falling; disturbed cardiac rate and rhythm, palpitations, tachycardia*
- **Dermatologic:** Minor skin reactions, spider telangiectases, photosensitivity
- **GI:** *Constipation, diarrhea, nausea, abdominal pain, edema, dry mouth, anorexia, weight changes*
- **GU:** Dysuria, incontinence, urinary retention, sexual disturbances
- **Other:** Hematologic changes, black tongue, hypernatremia

Interactions

★ **Drug–drug** ⊗ **Warning** Potentially dangerous hypotension with general anesthetics; avoid this combination.

- Increased sympathomimetic effects (hypertensive crisis) with sympathomimetic drugs (norepinephrine, epinephrine, dopamine, dobutamine, levodopa, ephedrine), amphetamines, other anorexiant, local anesthetic solutions containing sympathomimetics
- Hypertensive crisis, coma, severe seizures with TCAs (eg, imipramine, desipramine)
- Additive hypoglycemic effect with insulin, oral sulfonylureas (eg, tolbutamide)
- Increased risk of adverse interactive actions with meperidine
- Reduce dose of barbiturates if given with MAOIs
- Toxic levels of buspirone and bupropion if combined with MAOIs; separate use

by 10 or 14 days, respectively • Increased hypertension effects with carbamazepine, levodopa • Risk of hypotension with thiazide diuretics • Serious, sometimes fatal, reactions with SSRIs; separate use by 5 wk with fluoxetine, 2 wk with sertraline and paroxetine

*** Drug-food** **⊗ Warning** Tyramine (and other pressor amines) contained in foods are normally broken down by MAO enzymes in the GI tract; in the presence of MAOIs, these vasopressors may be absorbed in high concentrations; in addition, tyramine releases accumulated norepinephrine from nerve terminals; thus, hypertensive crisis may occur when the following foods that contain tyramine or other vasopressors are ingested by a patient on an MAOI: Dairy products (blue, camembert, cheddar, mozzarella, parmesan, Romano, Roquefort, Stilton cheeses; sour cream; yogurt); meats, fish (liver, pickled herring, fermented sausages [bologna, pepperoni, salami], caviar, dried fish, other fermented or spoiled meat or fish); undistilled beverages (imported beer, ale; red wine, especially Chianti; sherry; coffee, tea, colas containing caffeine; chocolate drinks); fruits, vegetables (avocado, fava beans, figs, raisins, bananas, yeast extracts, soy sauce, chocolate).

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any MAOI; pheochromocytoma; HF; abnormal LFTs; severe renal impairment; confirmed or suspected cerebrovascular defect; CV disease, hypertension; history of headache; myelography within previous 24 hr or scheduled within 48 hr; lactation; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric disorder; scheduled elective surgery; pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; LFTs, renal function tests, urinalysis, CBC, ECG, EEG

Interventions

⊗ Black box warning Limit amount of drug available to suicidal patients; possible increased risk of suicidality in children, adolescents, and young adults; monitor accordingly.

- Monitor BP and orthostatic BP carefully; arrange for more gradual increase in dosage initially in patients who show tendency for hypotension.

⊗ Warning Arrange for periodic LFTs during therapy; discontinue drug at first sign of hepatic impairment or jaundice.

- Monitor BP carefully (and if appropriate, discontinue drug) if patient reports unusual or severe headache.

⊗ Warning Keep phenolamine or another alpha-adrenergic blocking drug readily available in case of hypertensive crisis.

Teaching points

- Take drug exactly as prescribed.
- Do not stop taking drug abruptly or without consulting your health care provider.
- Avoid ingesting tyramine-containing foods or beverages while using this drug and for 10 days afterward (patient and significant other should receive a list of such foods and beverages; see Appendix D, *Important dietary guidelines for patient teaching*).
- You may experience these side effects: Dizziness, weakness or fainting when arising from a horizontal or sitting position (transient; change position slowly); drowsiness, blurred vision (reversible; safety measures may need to be taken if severe; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite (frequent small meals, frequent mouth care may help); nightmares, confusion, inability to concentrate, emotional changes; changes in sexual function.
- Report headache, rash, darkening of the urine, pale stools, yellowing of the eyes or skin, fever, chills, sore throat, or any other unusual symptoms, thoughts of suicide.

DANGEROUS DRUG

▷ trastuzumab
(trass too zoo' mah)

Herceptin

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Monoclonal antibody

Therapeutic actions

Humanoid anticonal antibody to the human epidermal growth factor receptor 2 (HER2) protein. This protein is often overexpressed in patients with aggressive, metastatic breast cancer.

Indications

- Treatment of metastatic breast cancer with tumors that overexpress HER2 protein (a genetic defect) as a first-line therapy in combination with paclitaxel and as a single agent in second- and third-line therapy
- Adjunct treatment of patients with HER2-overexpressing breast cancer in combination with doxorubicin, cyclophosphamide, and paclitaxel
- Part of combination therapy for treatment of metastatic gastric cancer when it is HER2 positive

Contraindications and cautions

- Contraindicated with allergy to trastuzumab or any component of the drug, breast cancers without HER2 overexpression.
- Use cautiously with known cardiac disease, bone marrow depression, lactation, pregnancy.

Available forms

Powder for injection—440 mg

Dosages

Adults

Metastatic HER2 overexpressing breast cancer: Initially, 4 mg/kg IV once by IV infusion over 90 min. For maintenance, 2 mg/kg IV once weekly over at least 30 min as tolerated. Do not exceed 500 mg/dose.

Adjuvant treatment: After completion of doxorubicin and cyclophosphamide therapy, give trastuzumab weekly for 52 wk. Initial dose, 4 mg/kg over 90 min by IV infusion; maintenance dose, 2 mg/kg over 30 min by IV infusion weekly. Or, initial dose, 8 mg/kg over 90 min by IV infusion; then 6 mg/kg over 30–90 min by IV infusion every 3 wk. During the first 12 wk, give trastuzumab with paclitaxel.

Pharmacokinetics

Route	Onset	Duration
IV	Slow	Days

Metabolism: Tissue; $T_{1/2}$: 2–9 days

Distribution: Crosses placenta, may enter breast milk

IV FACTS

Preparation: Reconstitute powder with diluent provided; dilute in 250 mL 0.9% sodium chloride injection. Solution should be colorless to pale yellow. Solution is stable for 28 days after reconstitution with diluent provided. Must write expiration date on vial (28 days after reconstitution).

Infusion: Infuse initial dose over 90 min; maintenance doses may be infused over 30 min.

Incompatibilities: Do not mix with any other drug solution or add any other drugs to the IV line.

Adverse effects

- **CNS:** Malaise, headache, tremor, insomnia, paresthesia
- **CV: Serious cardiac toxicity**
- **GI:** Vomiting, nausea, *diarrhea, abdominal pain*
- **Other:** *Anemia, pain, edema, increased susceptibility to infection, leukopenia, local reaction at infusion site, infusion reaction (flushing, sweating, chills, fever), fever, chills, hypersensitivity reactions, myalgia, rash, pulmonary toxicity*

Nursing considerations

Assessment

- **History:** Allergy to trastuzumab or any component of the product; known cardiac disease, bone marrow depression; pregnancy, lactation
- **Physical:** T; P, BP; R, adventitious sounds; baseline ECG; orientation, affect, CBC with differential, tumor testing for HER2 status

Interventions

⊗ **Black box warning** Monitor patient at time of infusion and provide comfort meas-

ures and analgesics as appropriate if infusion reaction occurs.

⊗ **Black box warning** Monitor cardiac status, especially if patient is receiving chemotherapy. Keep emergency equipment readily available if cardiac toxicity occurs; cardiomyopathy may occur.

⊗ **Black box warning** Monitor patient for possibly severe pulmonary toxicity, especially within 24 hours of infusion. Discontinue at signs or symptoms of respiratory involvement.

- Protect patient from exposure to infections and maintain sterile technique for invasive procedures.

Teaching points

- This drug is given IV to help fight your breast cancer. It will be given once a week. Mark a calendar with return dates for repeat infusion.
- Avoid infection while you are using this drug; stay away from crowded areas and people with known infections.
- You may experience these side effects: Discomfort, sweating, fever during infusion (comfort measures and analgesics may help); diarrhea, nausea, abdominal pain.
- Report chest pain, difficulty breathing, chills, fever.

▷ trazodone hydrochloride

See Appendix U, *Less commonly used drugs*.

▷ treprostinil sodium (tra pros' tin ill)

Remodulin, Tyvaso

PREGNANCY CATEGORY B

Drug classes

Endothelin receptor antagonist
Prostacyclin analogue (vasodilating drug)

Therapeutic actions

Specifically blocks receptor sites for endothelin (ET_A and ET_B) in the endothelium and vascular smooth muscles; these endothelins are elevated in plasma and lung tissue of patients

with pulmonary arterial hypertension; also inhibits platelet aggregation.

Indications

- Treatment of pulmonary arterial hypertension in patients with class II–class IV symptoms, to improve exercise ability and to decrease the rate of clinical worsening
- To diminish the rate of deterioration in patients undergoing transition from epoprostenol (*Flolan*)

Contraindications and cautions

- Contraindicated with allergy to treprostinil or any component of the drug.
- Use cautiously in elderly patients and with hepatic or renal impairment, lactation, pregnancy.

Available forms

Multi-use vials—1, 2.5, 5, 10 mg/mL; solution for inhalation—0.6 mg/mL

Dosages

Adults

Administered by continuous subcutaneous infusion. Initially the rate is 1.25 nanograms/kg/min. If this initial dose cannot be tolerated, the infusion rate should be reduced to 0.625 nanograms/kg/min. Rate is increased in increments of no more than 1.25 nanograms/kg/min/wk for the first 4 wk, then by 2.5 nanograms/kg/min/wk. Do not exceed 40 nanograms/kg/min. Dosage is based on clinical response and patient tolerance. Abrupt withdrawal or significant decrease in dosage may result in worsening symptoms. See the manufacturer's instructions for infusion weight charts.

- *Transition from Flolan*: Base rate of change on individual patient response. Start *Remodulin* infusion at 10% of starting *Flolan* dose. Decrease *Flolan* to 80% starting dose and increase *Remodulin* dose to 30% starting *Flolan* dose. Decrease *Flolan* dose to 60% starting and increase *Remodulin* dose to 50% starting *Flolan* dose. Decrease *Flolan* dose to 40% starting dose and increase *Remodulin* dose to 70% starting *Flolan* dose. Decrease *Flolan* dose to 20% starting dose and increase *Remodulin* dose to 90% starting *Flolan* dose. Decrease *Flolan* dose to 5%

starting dose and increase *Remodulin* dose to 110% starting *Flolan* dose. Discontinue *Flolan* and continue *Remodulin* dose at 110% of *Flolan* starting dose plus an additional 5–10% as needed.

- **Inhalation:** Initially, 3 breaths (18 mcg), using *Tyvaso* Inhalation System, per treatment session; 4 sessions per day, approximately 4 hr apart during waking hours. Increase by additional 3 breaths per session at 1- to 2-wk intervals if needed and tolerated. Maintenance dose, 9 breaths (54 mcg) per session.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Decrease initial dose to 0.625 nanograms/kg/min and increase slowly.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Gradual	10 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **CV:** Vasodilation, edema, hypotension, dyspnea, chest pain
- **GI:** *Nausea*, *diarrhea*, vomiting
- **Skin:** Pruritus, *rash*
- **Other:** *Pain at injection site*, *local reaction at infusion site*, increased bleeding, *jaw pain*

Interactions

- **★ Drug-drug** • Potential for increased hypotensive effects if combined with other drugs that decrease BP; monitor patient carefully
- Potential for increased bleeding tendencies if combined with drugs that alter blood clotting or inhibit platelets

■ Nursing considerations

Assessment

- **History:** Allergy to treprostinil or any component of the drug, hepatic or renal impairment, pregnancy, lactation, advanced age

- **Physical:** Skin color, lesions; injection site; orientation, BP; LFTs, renal function tests, CBC

Interventions

- Evaluate the patient for the ability to accept, place, and care for a subcutaneous catheter and to use a continuous infusion pump.
- Ensure that patient is reevaluated weekly for possible adjustments in dosage.
- Inspect solution to make sure no particulate matter is present before use. Use vial within 14 days of initial introduction into the vial.
- Monitor injection site for any sign of reaction of infection.
- When giving drug through inhalation route, administer only through the *Tyvaso* Inhalation System. Administer undiluted as supplied.
- **⊗ Warning** Monitor patients who are discontinuing treprostinil; tapering of dose may be needed to avoid sudden worsening of disease.
- Provide analgesics as appropriate for patients who develop headache or injection site pain.
- Monitor patient's functional level to note improvement in exercise tolerance.
- Maintain other measures used to treat pulmonary arterial hypertension.

Teaching points

- This drug must be given by a continuous subcutaneous infusion pump. It may be needed for prolonged periods, possibly years. The pump is lightweight and attached to a catheter that goes into your skin. You will need to care for the insertion site and set and monitor the pump. It is recommended to have a significant other who is also able to care for and maintain the site and the pump as a backup for you.
- If receiving this drug by inhalation, use undiluted only through the *Tyvaso* Inhalation System.
- This drug should not be taken during pregnancy; using a barrier contraceptive is advised.
- Keep a chart of your exercise tolerance to help monitor improvement in your condition.
- This drug should not be discontinued abruptly. It must be tapered. Notify your health care provider if anything happens to prevent you

from getting your continuous infusion of the drug.

- Continue your usual procedures for treating your pulmonary arterial hypertension.
- You will need to be followed closely to determine the correct dose of the drug that is best for your situation.
- You may experience these side effects: Headache (analgesics may help); stomach upset (taking with food); pain at the injection site (analgesics may also help, monitor the site for any sign of redness, heat, or swelling).
- Report swelling of the extremities, dizziness, chest pain, fever, changes in the appearance of the catheter insertion site.

DANGEROUS DRUG

▶ tretinoin (retinoic acid)

(*tret' i noyn*)

Atralin, Avita, Renova, Retin-A, Retin-A Micro, Stieva-A (CAN), Tretin-X

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Retinoid (topical form)

Therapeutic actions

Induces cell differentiation and decreases proliferation of acute promyelocytic leukemia cells, leading to an initial maturation of the primitive promyelocytes, followed by a repopulation of the bone marrow and peripheral blood by normal hematopoietic cells in patients achieving complete remission; exact mechanism of action is not understood. Acne: decreased cohesiveness and increased turnover of follicular epithelial cells, decreasing comedones.

Indications

- Induction of remission in acute promyelocytic leukemia (APL)
- Topical treatment of acne vulgaris
- Adjunctive agent for use in mitigation of fine wrinkles, mottled hyperpigmentation in select patients (topical)

- Unlabeled uses: Hyperpigmentation of photoaged skin, postinflammatory hyperpigmentation, facial actinic keratoses (topical), acute promyelocytic leukemia (oral), emphysema (oral)

Contraindications and cautions

- Contraindicated with allergy to retinoids or parabens, suicidal tendencies, pregnancy, lactation.
- Use cautiously with liver disease, hypercholesterolemia, hypertriglyceridemia.

Available forms

Capsule **onc**—10 mg; cream—0.02%, 0.025%, 0.05%, 0.1%; gel—0.025%, 0.01%, 0.04%, 0.05%, 0.1%

Dosages

Adults and children 1 yr and older
Oral

45 mg/m²/day PO administered in two evenly divided doses until complete remission is documented; discontinue therapy 30 days after complete remission is obtained or after 90 days, whichever comes first.

Adults

Topical

Apply once a day before bedtime. Cover entire affected area lightly, avoiding mucous membranes.

Pediatric patients

Not recommended for use in children younger than 1 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–2 hr

Metabolism: Hepatic; T_{1/2}: 0.5–2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Fever, headache, pseudotumor cerebri* (papilledema, headache, nausea, vomiting, visual disturbances), *earache, visual disturbances, malaise, sweating, suicidal ideation*
- **CV:** Arrhythmias, flushing, hypotension, heart failure, **MI, cardiac arrest**

T

- **Dermatologic:** *Skin fragility, dry skin, pruritus, rash*, thinning hair, peeling of palms and soles, skin infections, photosensitivity, nail brittleness, petechiae
- **GI:** *Hemorrhage, nausea, vomiting, abdominal pain*, anorexia, inflammatory bowel disease
- **GU:** Renal insufficiency, dysuria, frequency, enlarged prostate
- **Hematologic: Rapid and evolving leukocytosis, decreased liver function, elevated lipids, elevated liver enzymes**
- **Musculoskeletal:** Skeletal hyperostosis, arthralgia, *bone and joint pain* and stiffness
- **Respiratory: Retinoic acid-APL syndrome** (fever, dyspnea, weight gain, pulmonary infiltrates, pleural or pericardial effusion, hypotension may progress to death)

Interactions

★ **Drug-drug** • Increased risk of high serum levels and toxicity with ketoconazole • Combination therapy with hydroxyurea may lead to massive cell lysis and bone marrow necrosis • Increased risk of skin irritability if topically used with keratolytic agents (sulfur, resorcinol, benzoyl peroxide, salicylic acid); avoid this combination • Increased risk of pseudotumor cerebri or intracranial hypertension with tetracyclines; monitor patient closely

■ Nursing considerations

Assessment

- **History:** Allergy to retinoids or parabens; pregnancy, lactation; liver disease; hypercholesterolemia, hypertriglyceridemia; suicidal tendencies
- **Physical:** Skin color, lesions, turgor, texture; joints—range of motion; orientation, reflexes, affect, ophthalmologic examination; mucous membranes, bowel sounds; R, adventitious sounds, auscultation; serum triglycerides, HDL, sedimentation rate, CBC and differential, urinalysis, pregnancy test, chest X-ray

Interventions

⊗ **Black box warning** Ensure that patient is not pregnant before administering;

arrange for a pregnancy test within 2 wk of beginning therapy. Advise patient to use two forms of contraception during treatment and for 1 mo after treatment is discontinued.

⊗ **Black box warning** There is a risk of rapid leukocytosis (40% of patients); notify physician immediately if this occurs.

⊗ **Black box warning** This drug should only be used under the supervision of an experienced practitioner or in an institution experienced with its use.

⊗ **Warning** Monitor patient for any suicidal ideation or tendencies. The risk of suicide should be explained, the Medguide brochure should be given, and the patient must sign the release affirming that he or she understands the potential risk.

- Oral tretinoin is for induction of remission only; arrange for consolidation or maintenance chemotherapy for acute promyelocytic leukemia after induction therapy.

- Arrange for baseline recording of serum lipids and triglyceride levels, LFTs, chest X-ray, CBC with differential and coagulation profile; monitor for changes frequently.

⊗ **Black box warning** Discontinue drug and notify physician if LFTs are greater than five times upper range of normal, pulmonary infiltrates appear, or patient has difficulty breathing; serious side effects can occur.

⊗ **Warning** Discontinue drug if signs of pilledema occur; consult a neurologist for further care.

⊗ **Black box warning** Monitor patient for retinoic acid-APL syndrome (fever, dyspnea, acute respiratory distress, weight gain, pulmonary infiltrates, pleural and pericardial effusion, multiorgan failure). Endotracheal intubation and mechanical ventilation may be required.

⊗ **Warning** Discontinue drug if visual disturbances occur, and arrange for an ophthalmologic examination.

⊗ **Warning** Discontinue drug if abdominal pain, rectal bleeding, or severe diarrhea occurs, and consult with physician.

- Monitor triglycerides during therapy; if elevations occur, institute other measures to lower serum triglycerides—reduce weight, dietary fat; exercise; increase intake of

insoluble fiber; decrease alcohol consumption.

⊗ **Warning** Keep high-dose steroids readily available in case of severe leukocytosis or liver damage.

- Administer drug with meals; do not crush capsules.
- Do not administer vitamin supplements that contain vitamin A.
- Maintain supportive care appropriate for patients with APL (eg, monitor for and treat infections, prophylaxis for bleeding).
- Topical form should be applied lightly to entire area before bed. Clean area thoroughly before use.

Teaching points

- Take the oral drug with meals; do not crush or cut capsules.
- Frequent blood tests will be needed to evaluate the drug's effects on your body.
- This drug has been associated with severe birth defects and miscarriages; it should not be used by pregnant women. Use contraceptives during treatment and for 1 month after treatment is discontinued. If you think you are pregnant, consult your health care provider immediately.
- You will not be permitted to donate blood while using this drug because of its possible effects on the fetus of a blood recipient.
- Avoid the use of vitamin supplements containing vitamin A; serious toxic effects may occur. Limit alcohol consumption. You may also need to limit your intake of fats and increase exercise to limit the drug's effects on blood triglyceride levels.
- At bedtime, clean affected area well and apply topical form lightly to entire area.
- You may experience these side effects: Dizziness, lethargy, headache, visual changes (avoid driving or performing tasks that require alertness); sensitivity to the sun (avoid sunlamps, exposure to the sun; use sunscreens and protective clothing); diarrhea, abdominal pain, loss of appetite (take drug with meals); dry mouth (suck sugarless lozenges); eye irritation and redness, inability to wear contact lenses; dry skin, itching, redness.
- Report headache with nausea and vomiting, difficulty breathing, severe diarrhea or rectal

bleeding, visual difficulties, suicidal ideas or feelings.

▷ triamcinolone

(trye am *sin'* ob lone)

triamcinolone acetonide

IM, intra-articular, or soft-tissue injection; respiratory inhalant; dermatologic ointment, cream, lotion, aerosol: Kenalog, Nasacort AQ, Oracort (CAN), Triderm, Trivaris
Dental paste: Oralone

triamcinolone hexacetonide

Intra-articular, intralesional injection: Aristospan Intra-articular, Aristospan Intralesional

PREGNANCY CATEGORY C

Drug classes

Corticosteroid (intermediate acting)
Glucocorticoid
Hormone

Therapeutic actions

Enters target cells and binds to cytoplasmic receptors, thereby initiating many complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

- Systemic: Hypercalcemia associated with cancer
- Short-term management of inflammatory and allergic disorders such as rheumatoid arthritis, collagen diseases (eg, SLE), dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders: Thrombocytopenia purpura, erythroblastopenia
- Ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas
- Trichinosis with neurologic or myocardial involvement

- Pulmonary emphysema with bronchial spasm or edema; diffuse interstitial pulmonary fibrosis; with diuretics in HF with refractory edema and in cirrhosis with refractory ascites
- Postoperative dental inflammatory reactions
- Intra-articular, soft-tissue administration for conditions such as arthritis, psoriatic plaques
- Respiratory inhalant: Control of bronchial asthma requiring corticosteroids in conjunction with other therapy
- Prophylactic therapy in the maintenance treatment of asthma (bid use)
- Dermatologic preparations: To relieve inflammatory and pruritic manifestations of dermatoses that are steroid responsive
- Nasal spray: Treatment of seasonal and perennial allergic-rhinitis symptoms in patients 6 yr and older
- Dental paste: Treatment of oral lesions

Contraindications and cautions

- Contraindicated with infections, especially TB, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections; lactation.
- Use cautiously with pregnancy (teratogenic in preclinical studies), renal or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus.

Available forms

Injection—5, 10, 20, 25, 40, 80 mg/mL; aerosol—100 mcg/actuation; topical ointment—0.025, 0.05, 0.1, 0.5%; cream—0.25, 0.1, 0.5%; lotion—0.025, 0.1%; nasal spray—50, 55 mcg/actuation; dental paste—0.1%; aerosol, foam, topical—0.2% spray

Dosages

Adults

Systemic

Individualize dosage, depending on the severity of the condition and the patient's response. Administer daily dose before 9 AM to minimize adrenal suppression. If long-term therapy is needed, consider alternate-day therapy. After

long-term therapy, withdraw drug slowly to avoid adrenal insufficiency. For maintenance therapy, reduce initial dose in small increments at intervals until the lowest effective dose is reached.

IM (triamcinolone acetonide)

2.5–100 mg/day.

Respiratory inhalant (triamcinolone acetonide)

200 mcg released with each actuation delivers about 100 mcg to the patient. Two inhalations tid–qid, not to exceed 16 inhalations/day.

Nasal spray

Two sprays (220 mcg total dose) in each nostril daily—maximum of four sprays/day.

Adults and pediatric patients

Intra-articular, intralesional

Dose will vary with joint or soft-tissue site to be injected.

- *Triamcinolone acetonide*: 2.5–15 mg.
- *Triamcinolone diacetate*: 5–40 mg intra-articular; 5–48 mg intralesional; do not use more than 12.5 mg per injection site or 25 mg per lesion.
- *Triamcinolone hexacetonide*: 2–20 mg intra-articular; up to 0.5 mg/square inch of affected area intralesional.

Topical dermatologic preparations

Apply sparingly to affected area bid–qid.

Pediatric patients

Systemic

Individualize dosage, depending on the severity of the condition and the patient's response rather than by formulae that correct adult doses for age or body weight. Carefully observe growth and development in infants and children on prolonged therapy.

Respiratory inhalant (triamcinolone acetonide)

200 mcg released with each actuation delivers about 100 mcg to the patient.

6–12 yr: One or two inhalations tid–qid, not to exceed 12 inhalations/day.

Nasal spray

6–12 yr: One spray in each nostril once per day (100–110 mcg dose), maximum dose two sprays/nostril/day.

Topical dermatologic preparations

Apply low-potency form sparingly to affected area bid–qid.

Dental paste

Adults: Press small dab (1/4 inch) to each lesion until thin film develops. May apply two to three times a day, preferably after meals.

Pediatric patients: Use not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	24–48 hr	8–10 hr	1–6 wk

Metabolism: Hepatic; $T_{1/2}$: 2–5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

Effects depend on dose, route, and duration of therapy.

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis, cataracts, increased IOP, glaucoma (long-term therapy)
 - **CV:** Hypotension, shock, hypertension and heart failure secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias
 - **Electrolyte imbalance:** *Sodium and fluid retention*, hypokalemia, hypocalcemia
 - **Endocrine:** Amenorrhea, irregular menses, growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state (long-term effect), increased blood sugar, increased serum cholesterol, decreased T_3 and T_4 levels, HPA suppression with systemic therapy longer than 5 days
 - **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention, nausea, vomiting, *increased appetite, weight gain* (long-term therapy)
 - **Hypersensitivity:** Hypersensitivity or anaphylactoid reactions
 - **Musculoskeletal:** Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
 - **Other:** *Immunosuppression, aggravation, or masking of infections; impaired wound healing*; thin, fragile skin; petechiae, ecchymoses, purpura, striae; subcutaneous fat atrophy
- Intra-articular**
- **Local:** Osteonecrosis, tendon rupture, infection

Intralesional (face and head)

- **Local:** Blindness (rare)

Respiratory inhalants

- **Local:** Oral, laryngeal, and pharyngeal irritation; fungal infections

Topical dermatologic ointments, creams, sprays

- **Local:** Local burning, irritation, acneiform lesions, striae, skin atrophy

Interactions

- **Drug-drug** • Risk of severe deterioration of muscle strength when given to myasthenia gravis patients who are also receiving ambenonium, edrophonium, neostigmine, pyridostigmine • Decreased steroid blood levels with barbiturates, phenytoin, rifampin • Decreased effectiveness of salicylates, oral antidiabetics
- **Drug-lab test** • False-negative nitroblue-tetrazolium test for bacterial infection • Suppression of skin test reactions

Nursing considerations

Assessment

- **History:** Infections; renal or liver disease; hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease; HF; hypertension; thromboembolic disorders; osteoporosis; seizure disorders; diabetes mellitus; pregnancy; lactation
- **Physical:** Weight, T; reflexes and grip strength, affect and orientation, P, BP, peripheral perfusion, prominence of superficial veins; R, adventitious sounds; serum electrolytes, blood glucose

Interventions

- Administer once-a-day doses before 9 AM to mimic normal peak corticosteroid blood levels.
- Increase dosage when patient is subject to stress.
- **Warning** Taper doses when discontinuing high-dose or long-term therapy to allow adrenal recovery.
- Do not give live virus vaccines with immunosuppressive doses of corticosteroids.
- **Warning** Taper systemic steroids carefully during transfer to inhalational steroids; deaths caused by adrenal insufficiency have occurred.

- Use caution when occlusive dressings or tight diapers cover affected area; these can increase systemic absorption when using topical preparations.
- Avoid prolonged use of topical preparations near the eyes, in genital and rectal areas, and in skin creases.

Teaching points

- If using dental paste, press a small dab onto lesion until a thin film develops; do not rub in. You may need to apply two to three times a day, after meals.
- Do not stop taking the drug without consulting your health care provider.
- Avoid exposure to infections.
- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry stools, fever, prolonged sore throat, colds or other infections, worsening of your disorder.

Intra-articular administration

- Do not overuse joint after therapy, even if pain is gone.

Respiratory inhaled

- Do not use during an acute asthmatic attack or to manage status asthmaticus.
- Do not use with systemic fungal infections.
- Do not use more often than prescribed.
- Do not stop using this drug without consulting your health care provider.
- Administer inhalational bronchodilator drug first, if also receiving bronchodilator therapy; rinse mouth after use.

Nasal spray

- Do not spray in eyes.
- Prime pump before first use and again if not used for more than 2 weeks.

Topical dermatologic preparations

- Apply drug sparingly, avoid contact with eyes.
- Report irritation or infection at the site of application.

triamterene

(trye am' ter een)

Dyrenium

PREGNANCY CATEGORY C

Drug class

Potassium-sparing diuretic

Therapeutic actions

Inhibits sodium reabsorption in the renal distal tubule, causing loss of sodium and water and retention of potassium.

Indications

- Edema associated with HF, nephrotic syndrome, hepatic cirrhosis; steroid-induced edema, edema from secondary hyperaldosteronism (alone or with other diuretics for added diuretic or antikaliuretic effects), hypertension
- **NEW INDICATION:** Unlabeled use: Pediatric hypertension

Contraindications and cautions

- Contraindicated with allergy to triamterene, hyperkalemia, renal disease (except nephrosis), liver disease, lactation.
- Use cautiously with diabetes mellitus, hyperuricemia, pregnancy.

Available forms

Capsules—50, 100 mg

Dosages

Adults

Edema: 100 mg bid PO if used alone after meals. Reduce dosage if added to other diuretic or antihypertensive therapy. Maintenance dosage should be individualized, may be as low as 100 mg every other day. Do not exceed 300 mg/day.

Hypertension: Start with 25 mg PO once daily; usual dose 50–100 mg/day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2–4 hr	3 hr	7–9 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, drowsiness, fatigue, *weakness*
- **Dermatologic:** Rash, photosensitivity
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea*
- **GU:** Renal stones, interstitial nephritis
- **Hematologic:** **Hyperkalemia**, blood dyscrasias

Interactions

- **Drug-drug** • Increased hyperkalemia with potassium supplements, diets rich in potassium, ACE inhibitors, other potassium-sparing diuretics • Increased serum levels and possible toxicity with cimetidine, indomethacin, lithium • Increased risk of amantadine toxicity
- **Drug-lab test** • Interference with fluorescent measurement of serum quinidine levels

■ Nursing considerations

Assessment

- **History:** Allergy to triamterene, hyperkalemia, renal or liver disease, diabetes mellitus, pregnancy, lactation
- **Physical:** Skin color, lesions, edema; orientation, reflexes, muscle strength; pulses, baseline ECG, BP; R, pattern, adventitious sounds; liver evaluation, bowel sounds; urinary output patterns; CBC, serum electrolytes, blood sugar, LFTs, renal function tests, urinalysis

Interventions

- Administer with food or milk if GI upset occurs.
- Mark calendars or provide other reminders of drug days for outpatients if alternate-day or 3- to 5-day/wk therapy is optimal for treating edema.
- Administer early in the day so that increased urination does not disturb sleep.
- Measure and record regular weights to monitor mobilization of edema fluid.
- Arrange for regular evaluation of serum electrolytes and BUN.

Teaching points

- Record alternate-day therapy on a calendar, or make dated envelopes. Take the drug ear-

ly in the day as increased urination will occur. The drug may be taken with food or meals if GI upset occurs.

- Weigh yourself on a regular basis, at the same time and in the same clothing, and record the weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; drowsiness (avoid rapid position changes; do not engage in hazardous activities such as driving a car; this problem is often made worse by the use of alcohol); avoid foods that are rich in potassium (eg, fruits, *Sanka*); sensitivity to sunlight and bright lights (wear sunglasses; use sunscreens and protective clothing).
- Report weight change of more than 3 pounds in 1 day, swelling in ankles or fingers, fever, sore throat, mouth sores, unusual bleeding or bruising, dizziness, trembling, numbness, fatigue.

▷ triazolam

(trye ay' zoe lam)

Apo-Triazo (CAN), Gen-Triazolam (CAN), Halcion

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-IV

Drug classes

Benzodiazepine
Sedative-hypnotic

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; main sites of action may be the limbic system and mesencephalic reticular formation; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter.

Indications

- Insomnia characterized by difficulty falling asleep, frequent nocturnal awakenings, or early morning awakening (short-term use: 7–10 days)
- Acute or chronic medical situations requiring restful sleep

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines; pregnancy (risk of congenital malformations, neonatal withdrawal syndrome); labor and delivery (“floppy infant” syndrome); lactation (infants may become lethargic and lose weight).
- Use cautiously with impaired liver or renal function, debilitation, depression, suicidal tendencies.

Available forms

Tablets—0.125, 0.25 mg

Dosages**Adults**

0.125–0.5 mg PO before retiring.

Pediatric patients

Not for use in patients younger than 18 yr.

Geriatric or debilitated patients

Initially, 0.125–0.25 mg PO. Adjust as needed and tolerated.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	30 min–2 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–5.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment* (especially in psychiatric patients, aggressive children, and with high dosage), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion, retrograde amnesia, “traveler’s amnesia,” complex sleep-related behaviors

- **CV:** *Bradycardia, tachycardia*, CV collapse, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **GI:** *Constipation, diarrhea*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes—hepatic impairment, jaundice
- **GU:** *Incontinence, changes in libido, urine retention*, menstrual irregularities
- **Hematologic:** Decreased Hct, blood dyscrasias
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecostasia, **anaphylaxis, angioedema**

Interactions

* **Drug-drug** ⊗ **Warning** Potentially serious to fatal reactions with ketoconazole, itraconazole; avoid this combination.

• Increased CNS depression and sedation with alcohol, cimetidine, omeprazole, disulfiram, hormonal contraceptives • Decreased sedative effects with theophylline, aminophylline, dipylline

* **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

Nursing considerations
Assessment

- **History:** Hypersensitivity to benzodiazepines; pregnancy, lactation; impaired liver or renal function; debilitation; depression, suicidal tendencies
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Arrange for periodic blood counts, urinalyses, and blood chemistry analyses with protracted treatment.
- Caution women of childbearing age to avoid pregnancy; using barrier contraceptives is advised.

⊗ **Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy.

Teaching points

- Take drug exactly as prescribed. Do not drink grapefruit juice while using this drug.
- Do not stop taking drug (in long-term therapy) without consulting your health care provider.
- Avoid alcohol and sleep-inducing and over-the-counter drugs.
- Avoid pregnancy while taking this drug; using contraceptives is advised; serious fetal harm could occur.
- You may experience these side effects: Drowsiness, dizziness (may lessen; avoid driving or engaging in hazardous activities); allergic reaction, swelling; GI upset (take drug with food); depression, dreams, emotional upset, crying; sleep disturbance for several nights after discontinuing the drug, complex sleep-related behaviors.
- Report severe dizziness, allergies, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of extremities, visual changes, difficulty voiding, sleep disorders.

▷ trientine hydrochloride

See Appendix U, *Less commonly used drugs*.

▷ trihexyphenidyl hydrochloride

(trye hex ee fen' i dill)

Apo-Trihex (CAN)

PREGNANCY CATEGORY C

Drug class

Antiparkinsonian (anticholinergic type)

Therapeutic actions

Has anticholinergic activity in the CNS that is believed to help normalize the hypothesized imbalance of cholinergic and dopaminergic neurotransmission created by the loss of dopaminergic neurons in the basal ganglia of the brain of parkinsonism patients; reduces severity of rigidity and reduces to a lesser extent the akinesia and tremor that characterize parkinsonism; less effective overall than levodopa; peripheral anticholinergic effects suppress secondary symptoms of parkinsonism, such as drooling.

Indications

- Adjunct in the treatment of parkinsonism (postencephalitic, arteriosclerotic, and idiopathic)
- Adjuvant therapy with levodopa for the treatment of Parkinson's disease
- Control of drug-induced extrapyramidal disorders

Contraindications and cautions

- Contraindicated with hypersensitivity to trihexyphenidyl; glaucoma, especially angle-closure glaucoma; pyloric or duodenal obstruction, stenosing peptic ulcers, achalasia (megaesophagus); myasthenia gravis; lactation.
- Use cautiously with cardiac arrhythmias, hypertension, hypotension, hepatic or renal impairment, alcoholism, chronic illness, people who work in hot environment, pregnancy, prostatic hypertrophy or bladder neck obstructions.

Available forms

Tablets—2, 5 mg; elixir—2 mg/5 mL

Dosages

Adults

Tablets

- *Parkinsonism*: 1 mg PO the first day. Increase by 2-mg increments at 3- to 5-day intervals until a total of 6–10 mg is given daily. Postencephalitic patients may require 12–15 mg/day. Tolerated best if daily dose is divided into three (or four) doses administered at mealtimes (and bedtime).
- *Concomitant use with levodopa*: Usual dose of each may need to be reduced; however,

trihexyphenidyl has been shown to decrease bioavailability of levodopa. Adjust dosage on basis of response. 3–6 mg/day PO of trihexyphenidyl is usually adequate.

- **Concomitant use with other anticholinergics:** Gradually substitute trihexyphenidyl for all or part of the other anticholinergic and reduce dosage of the other anticholinergic gradually.
- **Drug-induced extrapyramidal symptoms:** Initially, 1 mg PO. Dose of tranquilizer may need to be reduced temporarily to expedite control of extrapyramidal symptoms. Adjust dosage of both drugs subsequently to maintain ataractic effect without extrapyramidal reactions. Usual dose 5–15 mg daily. If reactions are not controlled in a few hours, progressively increase subsequent doses until control is achieved.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Patients older than 60 yr often develop increased sensitivity to the CNS effects of anticholinergic drugs.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	2–3 hr	6–12 hr

Metabolism: Hepatic; $T_{1/2}$: 5.6–10.2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS** (some CNS effects are characteristic of centrally acting anticholinergics): *Disorientation, confusion, memory loss, hallucinations, psychoses, agitation, nervousness, delusions, delirium, paranoia, euphoria, excitement, light-headedness, dizziness, depression, drowsiness, weakness, giddiness, paresthesia, heaviness of the limbs, numbness of fingers, blurred vision, mydriasis, diplopia, increased intraocular tension, angle-closure glaucoma*
- **CV:** Tachycardia, palpitations, hypotension, orthostatic hypotension
- **Dermatologic:** Rash, urticaria, other dermatoses

- **GI:** *Dry mouth, constipation*, dilation of the colon, paralytic ileus, acute suppurative parotitis, nausea, vomiting, epigastric distress
- **GU:** *Urinary retention*, urinary hesitancy, dysuria, difficulty achieving or maintaining an erection
- **Other:** Muscular weakness, muscular cramping, *flushing, decreased sweating*, elevated T

Interactions

- **Drug-drug** • Additive adverse CNS effects; toxic psychosis with phenothiazines • Possible masking of the development of persistent extrapyramidal symptoms, tardive dyskinesia, in patients on long-term therapy with antipsychotics, such as phenothiazines, haloperidol
- Decreased therapeutic efficacy of antipsychotics (phenothiazines, haloperidol)

Nursing considerations

Assessment

- **History:** Hypersensitivity to trihexyphenidyl; glaucoma; pyloric or duodenal obstruction, stenosing peptic ulcers; achalasia; prostatic hypertrophy or bladder neck obstructions; myasthenia gravis, tachycardia, cardiac arrhythmias; hypertension, hypotension; hepatic or renal impairment; alcoholism; chronic illness; work environment; pregnancy, lactation
- **Physical:** Weight, T; skin color, lesions; orientation, affect, reflexes, bilateral grip strength, visual examination, including tonometry; P, BP, orthostatic BP, auscultation; bowel sounds, normal output, liver evaluation; urinary output, voiding pattern, prostate palpation; LFTs, renal function tests

Interventions

- ⊗ **Warning** Decrease dosage or discontinue drug temporarily if dry mouth is so severe that swallowing or speaking becomes difficult.
- Give with caution and arrange dosage reduction in hot weather; drug interferes with sweating and ability of body to maintain body heat equilibrium; anhidrosis and fatal hyperthermia have occurred.
- Ensure that patient voids before receiving each dose if urinary retention is a problem.

Teaching points

- Take this drug exactly as prescribed.
- Use caution in hot weather (this drug makes you more susceptible to heat prostration).
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or engaging in activities that require alertness and visual acuity); nausea (eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips); painful or difficult urination (emptying the bladder immediately before each dose may help); constipation (if maintaining adequate fluid intake and exercising regularly do not help, consult your health care provider).
- Report difficult or painful urination, constipation, rapid or pounding heartbeat, confusion, eye pain, or rash.

▶ trimethobenzamide hydrochloride

(trye meth ob ben' za myde)

Oral preparations: Tigan

Parenteral preparations: Tigan

PREGNANCY CATEGORY C

Drug class

Antiemetic (anticholinergic)

Therapeutic actions

Mechanism of action not understood; antiemetic action may be mediated through the CTZ; impulses to the vomiting center do not appear to be affected.

Indications

- Control of nausea and vomiting

Contraindications and cautions

- Contraindicated with allergy to trimethobenzamide, benzocaine, or similar local anesthetics; uncomplicated vomiting in children (drug may contribute to development of Reye's syndrome or unfavorably influence its outcome; extrapyramidal effects of drugs may obscure diagnosis of Reye's syndrome); pregnancy.

- Use cautiously with lactation; acute febrile illness, appendicitis, encephalitis, gastroenteritis, dehydration, electrolyte imbalance, especially when these occur in children, the elderly, or debilitated; narrow-angle glaucoma; stenosing peptic ulcer; symptomatic prostatic hypertrophy; bronchial asthma; bladder neck obstruction; pyloroduodenal obstruction; cardiac arrhythmias; recent use of CNS-acting drugs (phenothiazine, barbiturates, belladonna alkaloids).

Available forms

Capsules—300 mg; injection—100 mg/mL

Dosages

Adults

Oral

- *Nausea and vomiting:* 300 mg three to four times a day.
- *Postoperative nausea/vomiting or for treatment of gastroenteritis:* 300 mg three to four times a day.

Parenteral

200 mg IM tid–qid.

Pediatric patients

Not recommended.

Geriatric patients

More likely to cause serious adverse reactions in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Duration
Oral	10–40 min	3–4 hr
IM	15 min	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Parkinsonlike symptoms, coma, seizures, opisthotonus, depression, disorientation, *dizziness, drowsiness, headache, blurred vision*
- **CV:** Hypotension
- **GI:** Diarrhea
- **Hematologic:** Blood dyscrasias, jaundice
- **Hypersensitivity:** Allergic-type skin reactions
- **Local:** *Pain following IM injections*

■ Nursing considerations**Assessment**

- **History:** Allergy to trimethobenzamide, benzocaine, or similar local anesthetics; uncomplicated vomiting in children; pregnancy, lactation; acute febrile illness, encephalitis, gastroenteritis, dehydration, electrolyte imbalance; narrow-angle glaucoma; stenosing peptic ulcer; symptomatic prostatic hypertrophy; bronchial asthma; bladder neck obstruction; pyloroduodenal obstruction; cardiac arrhythmias
- **Physical:** Skin color, lesions, texture; T; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC, serum electrolytes

Interventions

- Administer IM injections deep into upper outer quadrant of the gluteal region.
- Ensure adequate hydration.

Teaching points

- Take as prescribed. Avoid excessive dosage.
- Avoid alcohol while taking this drug; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); diarrhea; blurred vision (reversible).
- Report difficulty breathing, tremors, loss of coordination, sore muscles or muscle spasms, unusual bleeding or bruising, sore throat, visual disturbances, irregular heartbeat, yellowing of the skin or eyes.

▶ trimethoprim (TMP)*(trye meth' ob prim)*

Primisol, Proloprim, Trimpex

PREGNANCY CATEGORY C**Drug class**

Antibacterial

Therapeutic actions

Inhibits folic acid reduction to tetrahydrofolate in susceptible bacteria; the bacterial

enzyme involved in this reaction is more readily inhibited than the mammalian enzyme.

Indications

- Uncomplicated UTIs caused by susceptible strains of *Escherichia coli*, *Proteus mirabilis*, *Klebsiella pneumoniae*, *Enterobacter* species, and coagulase-negative *Staphylococcus* species, including *S. saprophyticus*
- Treatment of acute otitis media due to susceptible strains of *Streptococcus pneumoniae* and *Haemophilus influenzae* in children
- Unlabeled uses: With dapsone for treatment of initial episodes of *Pneumocystis jirovecii* (*carinii*) pneumonia in patients who cannot tolerate co-trimoxazole; treatment and prevention of traveler's diarrhea

Contraindications and cautions

- Contraindicated with allergy to trimethoprim, pregnancy (teratogenic in preclinical studies), megaloblastic anemia due to folate deficiency.
- Use cautiously with hepatic or renal impairment, lactation.

Available forms

Tablets—100, 200 mg; solution—50 mg/5 mL

Dosages**Adults and children 12 yr and older**

100 mg PO every 12 hr or 200 mg every 24 hr for 10–14 days for acute uncomplicated UTIs.

Pediatric patients

- *Otitis media*: 10 mg/kg/day in divided doses every 12 hr for 10 days.

Geriatric patients or patients with renal impairment

For creatinine clearance of 15–30 mL/min, 50 mg PO every 12 hr; for creatinine clearance less than 15 mL/min, not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–4 hr

Metabolism: Hepatic; $T_{1/2}$: 8–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Dermatologic:** *Rash*, pruritus, exfoliative dermatitis
- **GI:** *Epigastric distress*, nausea, vomiting, glossitis
- **Hematologic:** Thrombocytopenia, leukopenia, neutropenia, megaloblastic anemia, methemoglobinemia, elevated serum transaminase and bilirubin, increased BUN and serum creatinine levels
- **Other:** Fever

Interactions

★ **Drug-drug** • Increased phenytoin effects if taken concomitantly; increases phenytoin half-life by 51%

■ Nursing considerations

Assessment

- **History:** Allergy to trimethoprim, megaloblastic anemia due to folate deficiency, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin color, lesions; T; status of mucous membranes; CBC; LFTs, renal function tests

Interventions

- Perform culture and sensitivity tests before beginning drug therapy.
- Protect the 200-mg tablets from exposure to light.
- Arrange for regular, periodic blood counts during therapy.
- ⊗ **Warning** Discontinue drug and consult with physician if any significant reduction in any formed blood element occurs.

Teaching points

- Take the full course of the drug; take all the tablets prescribed.
- Have periodic medical checkups, including blood tests.
- You may experience these side effects: Epigastric distress, nausea, vomiting (eat frequent small meals); rash (consult your health care provider for appropriate skin care).

- Report fever, sore throat, unusual bleeding or bruising, dizziness, headaches, rash.

▽ trimipramine maleate

(trye *mi' pra meen*)

Apo-Trimip (CAN), Surmontil

PREGNANCY CATEGORY C

Drug class

TCA (tertiary amine)

Therapeutic actions

Mechanism of action unknown; the TCAs are structurally related to the phenothiazine anti-psychotics (eg, chlorpromazine); TCAs inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; the relation of these effects to clinical efficacy is unknown.

Indications

- Relief of symptoms of depression (endogenous depression most responsive); sedative effects of tertiary amine TCAs may be helpful in patients whose depression is associated with anxiety and sleep disturbance
- Unlabeled use: Duodenal ulcers

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr, pregnancy (limb reduction abnormalities may occur), lactation.
- Use cautiously with EST; preexisting CV disorders (eg, severe CAD, progressive HF, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm (anticholinergic effects of TCAs may exacerbate these conditions); seizure disorders (TCAs lower the seizure threshold); hyperthyroidism (predisposes to CVS toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis); patients with bipo-

lar disorder (may shift to hypomanic or manic phase); elective surgery (TCAs should be discontinued as long as possible before surgery).

Available forms

Capsules—25, 50, 100 mg

Dosages

Adults

- **Hospitalized patients:** Initially, 100 mg/day PO in divided doses. Gradually increase to 200 mg/day as required. If no improvement in 2–3 wk, increase to a maximum dose of 250–300 mg/day.
- **Outpatients:** Initially, 75 mg/day PO in divided doses. May increase to 150 mg/day. Do not exceed 200 mg/day. Total daily dosage may be administered at bedtime. Maintenance dose is 50–150 mg/day given as a single dose at bedtime. After satisfactory response, reduce to lowest effective dosage. Continue therapy for 3 mo or longer to lessen possibility of relapse.

Pediatric patients 12 yr and older

50 mg/day PO with gradual increases up to 100 mg/day.

Pediatric patients younger than 12 yr

Not recommended.

Geriatric patients

50 mg/day PO with gradual increases up to 100 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 7–30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects; confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania,

exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, *seizures*, speech blockage, dysarthria, tinnitus, altered EEG, suicidal ideation

- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, **precipitation of HF, stroke**
- **Endocrine:** Elevated or depressed blood sugar, elevated prolactin levels, SIADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste in mouth, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis, jaundice (rare), elevated transaminase, altered alkaline phosphatase
- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; increased or decreased libido; impotence
- **Hematologic:** Bone marrow depression including agranulocytosis; eosinophilia, purpura, thrombocytopenia, leukopenia
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, facial, tongue), drug fever
- **Withdrawal:** Symptoms with abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight gain or loss, sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine, ranitidine
- Risk of arrhythmias and hypertension with sympathomimetics
- Risk of severe hypertension with clonidine
- Risk of life-threatening cardiac arrhythmias if combined with clarithromycin, fluoroquinolone antibiotics; avoid this combination
- Hyperpyretic crises, severe seizures, hypertensive episodes and deaths with

MAOIs. *Note:* MAOIs and TCAs have been used successfully in some patients resistant to therapy with single agents; however, case reports indicate that the combination can cause serious and potentially fatal adverse effects • Increased adverse effects if combined with alcohol

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; pregnancy; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric disorders; bipolar disorder; elective surgery
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis; CBC, ECG

Interventions

⊗ **Black box warning** Ensure that depressed and potentially suicidal patients have access to limited quantities of the drug. Monitor patients for suicidal ideation, especially when beginning therapy or changing doses; high risk of suicidality in children, adolescents, and young adults.

- Administer major portion of dose at bedtime if drowsiness or severe anticholinergic effects occur.

⊗ **Warning** Reduce dosage if minor side effects develop; discontinue if serious side effects occur.

- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.

Teaching points

- Take drug exactly as prescribed.
- Do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid alcohol, other sleep-inducing drugs, and over-the-counter drugs.

- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; safety measures may need to be taken if severe; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals; practice frequent mouth care; suck sugarless candies); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty in urination, excessive sedation.

DANGEROUS DRUG

▽ **triptorelin pamoate**
(*trip toe rell' in*)

Trelstar Depot, Trelstar LA

PREGNANCY CATEGORY X

Drug classes

Antineoplastic
Hormone
LHRH analogue

Therapeutic actions

An analogue of LHRH; causes a decrease in FSH and LH levels, leading to a suppression of ovarian and testicular hormone production, which causes decreased levels of estrogens (in women) and testosterone (in men); after continuous use, a sustained decrease in FSH and LH levels occurs.

Indications

- Palliative treatment of advanced prostatic cancer when orchiectomy or estrogen administration are not indicated or are unacceptable to the patient
- Treatment of advanced-stage prostatic cancer
- **NEW INDICATION:** Unlabeled use: Central precocious puberty

Contraindications and cautions

- Contraindicated with pregnancy, lactation, hypersensitivity to LHRH or any component.
- Use cautiously with urinary tract obstructions, metastatic vertebral lesions.

Available forms

Injectable suspension—3.75 mg, 11.25 mg, 22.5 mg

Dosages**Adults**

- *Palliative treatment:* 3.75 mg depot injection IM once monthly into buttock.
- *Treatment:* 11.25 mg injection IM every 3 mo into buttock or 22.5 mg IM every 6 mo into buttock.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IM	Slow	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 2.8–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** Insomnia, dizziness, lethargy, anxiety, depression, headache
- **CV:** HF, edema, hypertension, arrhythmia, chest pain, CV events
- **GI:** Nausea, anorexia
- **GU:** *Hot flashes, sexual dysfunction, decreased erections, lower urinary tract symptoms*
- **Other:** **Bone pain**, rash, sweating, cancer, **anaphylaxis, angioedema**

Interactions

* **Drug-drug** • Do not administer with drugs that increase prolactin production—antipsychotics, metoclopramide; risk of severe hyperprolactinemia

■ Nursing considerations**Assessment**

- **History:** Pregnancy, lactation, hypersensitivity to LHRH or other LHRH drugs
- **Physical:** Skin T, lesions; reflexes, affect; BP, P; urinary output; serum testosterone levels, PSA levels

Interventions

- Reconstitute with 2 mL sterile water for injection. Shake well. Withdraw the entire contents of the vial into the syringe and inject immediately.
- Monitor testosterone and PSA levels prior to and periodically during therapy.
- Ensure repeat injection every 3 or 6 mo—it is important to keep as close to this schedule as possible.
- Be aware that patient may be at increased risk for CV events; monitor accordingly.
- Offer appropriate comfort measures (eg, temperature control, analgesics) to help patient cope with hot flashes, urinary retention, and bone pain. Most likely to occur at initiation of therapy.

Teaching points

- This drug must be injected each month or every 3 months.
- Do not take this drug if pregnant; if you are pregnant or want to become pregnant, consult your health care provider.
- You may experience these side effects: Hot flashes (staying in a cool place may help you to cope with this effect); sexual dysfunction, such as regression of sex organs, impaired fertility, decreased erections (it may help to know that these are drug effects; if these become worrisome, consult your health care provider); bone pain, urinary retention, blood in the urine (these effects usually resolve within the first week of treatment; analgesics may be ordered to help you cope with the pain).
- Report chest pain, rapid heartbeat, numbness or tingling, breast pain, difficulty breathing, unresolved nausea and vomiting, signs of infection at the injection site.

Antispasmodic

Therapeutic actions

Competitively blocks muscarinic receptor sites; bladder contraction is mediated by muscarinic receptors—blocking these receptors decreases bladder contraction, relieving bladder spasm.

Indications

- Urinary incontinence, urgency, and frequency caused by overactive bladder

Contraindications and cautions

- Contraindicated with allergy to trospium or any component of the drug; presence of or risk for urinary retention, gastric retention, uncontrolled narrow-angle glaucoma.
- Use cautiously with renal or hepatic impairment, ulcerative colitis, intestinal atony, myasthenia gravis, bladder or gastric outlet obstruction, pregnancy, lactation.

Available forms

Tablets—20 mg; ER capsules **ORC**—60 mg

Dosages

Adults younger than 75 yr

20 mg PO bid taken on an empty stomach, at least 1 hr before meals. Alternatively, 60 mg ER tablet PO once/day.

Adults 75 yr and older

Monitor patient response and adjust dosage down to 20 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

For creatinine clearance less than 30 mL/min, 20 mg/day PO given at bedtime.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	5–6 hr

Metabolism: Hepatic metabolism; $T_{1/2}$: 20 hr

Distribution: May cross placenta; passes into breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dry eyes, dizziness, blurred vision
- **GI:** *Dry mouth, constipation*, abdominal pain, dyspepsia, flatulence, vomiting

- **GU:** Urinary retention
- **Other:** *Fatigue*, decreased sweating

Interactions

• *** Drug-drug** • Increased risk of adverse effects if combined with any other anticholinergic drugs; if this combination is used, monitor patient carefully and adjust dosages accordingly • Potential for altered excretion of other drugs eliminated by tubular secretion (digoxin, morphine, metformin, tenofovir, procainamide, pancuronium, vancomycin); if any of these drugs are given concurrently, monitor patient carefully for increased adverse effects or decreased therapeutic effects of both drugs and adjust dosages accordingly

Nursing considerations

Assessment

- **History:** Allergy to trospium or any component of the drug; presence of or risk for urinary retention, gastric retention, uncontrolled narrow-angle glaucoma, renal or hepatic impairment, ulcerative colitis, intestinal atony, myasthenia gravis, bladder or gastric outlet obstruction; pregnancy, lactation
- **Physical:** Orientation, affect, vision, IOP; GI output, bowel sounds, liver evaluation; normal urinary output, prostate palpation; LFTs, renal function tests

Interventions

- Administer drug on an empty stomach, at least 1 hr before meal. Ensure that patient does not cut, crush, or chew ER form.
- Provide frequent small meals if GI upset is severe.
- Establish safety measures (eg, accompany patient, use side rails) if vision changes occur.
- Provide frequent mouth hygiene and sugarless lozenges if dry mouth is a problem.
- Monitor bowel function and arrange for appropriate bowel program if constipation occurs.

Teaching points

- Take this drug twice a day on an empty stomach, at least 1 hour before your next meal. Do not cut, crush, or chew ER form.

- If you miss a dose, take the next dose as soon as you remember and then again about that time the next day; do not take more than two doses per day.
- Know that you may be at higher risk for developing heat-related problems—sweating may be decreased so your body will not be able to cool off. Avoid excessive heat if at all possible; if you are in a hot environment drink plenty of fluids.
- You may experience these side effects: Dry mouth (sucking on sugarless lozenges and frequent mouth care may help); GI upset, nausea (frequent small meals may help); headache (analgesics may be available to help, consult with your health care provider); dizziness (do not drive a car or operate hazardous machinery if this occurs); urinary retention (emptying your bladder before taking the medicine may help); constipation (if this becomes a problem, consult your health care provider for appropriate remedies).
- Report inability to urinate, abdominal pain, severe constipation, fever.

urofollitropin, purified

See Appendix U, *Less commonly used drugs*.

ursodiol (ursodeoxycholic acid) (*ur soe dye' ole*)

Actigall, URSO 250, URSO DS (CAN), URSO Forte

PREGNANCY CATEGORY B

Drug class

Gallstone-solubilizing drug

Therapeutic actions

A naturally occurring bile acid that suppresses hepatic synthesis of cholesterol and inhibits intestinal absorption of cholesterol, leading to a decreased cholesterol concentration in the bile and a bile that is cholesterol solubilizing and not cholesterol precipitating.

Indications

- Treatment of selected patients with radiolucent, noncalcified gallstones in gallbladders for whom elective surgery is contraindicated
- Prevention of gallstone formation in obese patients experiencing rapid weight loss
- Treatment of primary biliary cirrhosis (tablets only)
- Unlabeled uses: Cholestasis-associated pruritus, primary sclerosing cholangitis

Contraindications and cautions

- Contraindicated with allergy to bile salts, hepatic impairment, calcified stones, radiopaque stones or radiolucent bile pigment stones, unremitting acute cholecystitis, cholangitis, biliary obstruction, gallstone pancreatitis, biliary GI fistula (cholecystectomy required), pregnancy.
- Use cautiously with lactation.

Available forms

Capsules—300 mg; tablets—250, 500 mg

Dosages

Adults

- *Solubilization of gallstones*: 8–10 mg/kg/day PO given in two to three divided doses. Resolution of the gallstones requires months of therapy; condition needs to be monitored with ultrasound at 6-mo and 1-yr intervals.
- *Treatment of biliary cirrhosis*: 13–15 mg/kg/day PO administered in two to four divided doses with food; readjust dosage based on patient response.
- *Prevention of gallstones*: 300 mg PO bid or 8–10 mg/kg/day PO in two to three divided doses.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	Days

Metabolism: Hepatic; T_{1/2}: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Headache, fatigue, anxiety, depression, sleep disorder
- **Dermatologic:** Pruritus, rash, urticaria, dry skin, sweating, hair thinning
- **GI:** *Diarrhea*, cramps, heartburn, constipation, nausea, vomiting, anorexia, epigastric distress, dyspepsia, flatulence, abdominal pain
- **Respiratory:** Rhinitis, cough
- **Other:** Back pain, arthralgia, myalgia

Interactions

★ **Drug-drug** • Absorption decreased if taken with bile acid sequestering agents (cholestyramine, colestipol), aluminum-based antacids

■ Nursing considerations

Assessment

- **History:** Allergy to bile salts, hepatic impairment, calcified stones, radiopaque stones or radiolucent bile pigment stones, unremitting acute cholecystitis, cholangitis, biliary obstruction, gallstone pancreatitis, biliary-GI fistula, pregnancy, lactation
- **Physical:** Liver evaluation, abdominal examination; affect, orientation; skin color, lesions; LFTs, hepatic and biliary radiological studies, biliary ultrasound

Interventions

- Assess patient carefully for suitability of ursodiol therapy. Alternative therapy should be reviewed before using ursodiol.
- Give drug in two to three divided doses.
- Do not administer drug with aluminum-based antacids. If such drugs are needed, administer 2–3 hr after ursodiol.
- Schedule patients for periodic oral cholecystograms or ultrasonograms to evaluate drug effectiveness at 6-mo intervals until resolution, then every 3 mo to monitor stone formation. Stones recur within 5 yr in more than 50% of patients. If gallstones appear to have dissolved, continue treatment for 3 mo and perform follow-up ultrasound.
- Monitor LFTs periodically. Carefully assess patient if any change in liver function occurs.

Teaching points

- Take drug two to four times a day. Take the drug as long as prescribed. It may be needed for a long time.
- This drug may dissolve your gallstones; it does not “cure” the problem that caused the stones, and in many cases, the stones can recur. Medical follow-up care is important.
- Arrange to receive periodic X-rays or ultrasound tests of your gallbladder; you also will need periodic blood tests to evaluate your response to this drug. Keep follow-up appointments.
- Do not take with any aluminum-based antacids.
- You may experience these side effects: Diarrhea; rash (skin care may help); headache, fatigue (request analgesics).
- Report gallstone attacks (abdominal pain, nausea, vomiting), yellowing of the skin or eyes.

▾ ustekinumab

See Appendix U, *Less commonly used drugs*.

▾ valacyclovir hydrochloride

(*val ah sye' kloe ver*)

Valtrex

PREGNANCY CATEGORY B

Drug class

Antiviral

Therapeutic actions

Antiviral activity; inhibits viral DNA replication and deactivates viral DNA polymerase.

Indications

- Treatment of herpes zoster (shingles)
- Episodic treatment of first-episode or recurrent genital herpes in immunocompetent patients
- Suppression of recurrent episodes of genital herpes in HIV patients

- Reduction of risk of heterosexual transmission of genital herpes to healthy partners when combined with safe sex practices
- Treatment of cold sores (herpes labialis) in healthy adults and adolescents
- Unlabeled use: Prevention of cytomegalovirus in patients with renal transplantation

Contraindications and cautions

- Contraindicated with allergy to valacyclovir or acyclovir.
- Use cautiously with pregnancy, renal impairment, thrombotic thrombocytopenic purpura, lactation.

Available forms

Tablets—500 mg, 1 g

Dosages

Adults

- *Herpes zoster*: 1 g tid PO for 7 days; most effective if started within 48 hr of onset of symptoms (rash).
- *Genital herpes*: 1 g PO bid for 7–10 days for initial episode.
- *Episodic treatment of recurrent genital herpes*: 500 mg PO bid for 3 days or 1 g/day for 5 days.
- *Cold sores*: 2 g bid for one day, given 12 hr apart.
- *Suppression of recurrent episodes of genital herpes*: 1 g PO daily; patients with history of less than nine episodes in 1 yr may respond to 500 mg PO daily.
- *Suppression of recurrent episodes in HIV-infected patients*: 500 mg PO bid for 5–10 days.
- *Reduction of risk of transmission*: 500 mg/day PO for the source partner. For HIV-positive patients, 500 mg PO bid.
- *Cold sores*: 2 g PO bid for 1 day.

Pediatric patients

Safety and efficacy not established. Dosages that have been used:

- *Chickenpox*: Children 2–18 yr: 20 mg/kg PO tid for 5 days. Maximum dose, 1 g tid.
- *Cold sores*: Children 12 yr and older: 2 g PO every 12 hr for one day.

Patients with renal impairment

Dosage adjustment variations by indication and CrCl

Indication	CrCl 30–49	CrCl 10–29	CrCl less than 10
Herpes zoster	1 g every 12 hr	1 g every 24 hr	500 mg every 24 hr
Genital herpes			
–initial treatment	1 g every 12 hr	1 g every 24 hr	500 mg every 24 hr
–recurrent episodes	500 mg every 12 hr	500 mg every 24 hr	500 mg every 24 hr
–suppressive therapy	1g every 24 hr	500 mg every 24 hr	500 mg every 24 hr
–suppressive therapy for 9 or fewer episodes	500 mg every 24 hr	500 mg every 48 hr	500 mg every 48 hr

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3 hr

Metabolism: Not metabolized; $T_{1/2}$: 2.5–3.3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness
- **GI:** *Nausea, vomiting*, diarrhea, anorexia
- **GU:** Acute renal failure

Interactions

- **Drug-drug** • Decreased rate of effectiveness with probenecid, cimetidine

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported with *Valtrex* (valacyclovir) and *Valcyte* (valganciclovir); use caution.

Assessment

- **History:** Allergy to valacyclovir, acyclovir; renal disease; lactation; thrombotic thrombocytopenic purpura; pregnancy

- **Physical:** Orientation; urinary output; abdominal examination, normal output; BUN, creatinine clearance

Interventions

- Begin treatment within 48–72 hr of onset of symptoms of shingles.
- Administer without regard to meals; administer with meals to decrease GI upset, if needed.
- Provide appropriate analgesics for headache and discomfort of shingles.
- Advise continued use of safe sex practices.

Teaching points

- Take this drug without regard to meals; if GI upset is a problem, take with meals.
- Take the full course of therapy as prescribed.
- Avoid contact with lesions and avoid intercourse when lesions or symptoms are present to avoid infecting others.
- Start therapy at first sign of an episode when treating recurrent herpes.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, headache, dizziness.
- Report severe diarrhea, nausea, headache, worsening of the shingles.

valganciclovir hydrochloride

(val gan *sigh'* kloe veer)

Valcyte OND

PREGNANCY CATEGORY C

Drug class

Antiviral

Therapeutic actions

Antiviral activity; inhibits viral DNA replication in cytomegalovirus (CMV).

Indications

- Treatment of CMV retinitis in patients with AIDS
- Prevention of CMV infection in high-risk kidney-pancreas, kidney, and heart transplant patients

- Prevention of CMV infection in pediatric patients with kidney or heart transplant at high risk for CMV infection

Contraindications and cautions

- Contraindicated with hypersensitivity to valganciclovir, ganciclovir, or acyclovir; lactation.
- Use cautiously in the elderly; with cytopenia, history of cytopenic reactions, impaired renal function, bone marrow suppression, hemodialysis, pregnancy.

Available forms

Tablets OND—450 mg; oral solution—50 mg/mL

Dosages

Adults

900 mg PO bid for 21 days; maintenance, 900 mg PO daily.

- *Prevention of CMV:* 900 mg daily initiated within 10 days of transplantation and continued for 100 days after transplantation

Pediatric patients 4 mo–16 yr

Dose in mg = $7 \times \text{BSA} \times \text{CrCl}$. Maximum dose, 900 mg/day. May use oral solution or tablets.

Patients with renal impairment

Do not administer to patients on hemodialysis. For patients with renal impairment, see the following table:

CrCl (mL/min)	Initial Dose	Maintenance Dose
60 or more	900 mg PO bid	900 mg/day PO
40–59	450 mg PO bid	450 mg/day PO
25–39	450 mg PO daily	450 mg PO every other day
10–24	450 mg PO every 2 days	450 mg PO twice weekly

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–3 hr

Metabolism: Hepatic transformation to ganciclovir; $T_{1/2}$: 4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, insomnia*, neuropathy, paresthesias, confusion, hallucinations
- **GI:** *Nausea, vomiting*, anorexia, *diarrhea*, abdominal pain
- **Hematologic:** *Neutropenia, anemia*, thrombocytopenia
- **Other:** *Fever*, retinal detachment

Interactions

*** Drug-drug** ⊗ **Warning** Use with extreme caution with cytotoxic drugs because the accumulation effect could cause severe bone marrow depression and other GI and dermatologic problems.

- Increased risk of didanosine toxicity if combined; monitor patient for need to lower didanosine dose.

⊗ **Warning** Extreme drowsiness and risk of bone marrow depression if taken with zidovudine; avoid this combination.

- Increased valganciclovir effects if taken with probenecid • Increased risk of seizures if taken concurrently with imipenem-cilastatin

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has been reported with *Valcyte* (valganciclovir) and *Valtrex* (valacyclovir); use caution.

Assessment

- **History:** Hypersensitivity to valganciclovir, ganciclovir, or acyclovir; cytopenia; history of cytopenic reactions; impaired renal function; pregnancy; lactation
- **Physical:** T, orientation, reflexes, urinary output, CBC, BUN, creatinine clearance

Interventions

- Administer drug with food to maximize absorption and to decrease GI upset.

⊗ **Warning** Do not exceed the recommended dosage or frequency; note that valganciclovir cannot be substituted for ganciclovir capsules on a one-to-one basis.

- Arrange for decreased dosage in patients with impaired renal function.

⊗ **Black box warning** Arrange for CBC before beginning therapy and at least weekly

thereafter. Consult with physician and arrange for reduced dosage if WBC count or platelets fall. Toxicity includes granulocytopenia, anemia, and thrombocytopenia.

⊗ **Warning** Consult with pharmacy for proper disposal of unused tablets. Precautions are required for disposal of nucleoside analogues. Do not cut, crush, or chew tablets. Avoid handling broken tablets.

- Arrange for periodic ophthalmic examinations during therapy. Drug is not a cure of the disease and deterioration may occur.

- Provide comfort measures for patients who develop fever, rash, or headache.

- Advise patients that valganciclovir can decrease sperm production in men and cause birth defects in the fetus. Advise the patient to use some form of contraception during valganciclovir therapy. Men receiving valganciclovir therapy should use some form of barrier contraception during and for at least 90 days after therapy.

⊗ **Black box warning** Advise patient that valganciclovir has caused cancer and fetal damage in animals and that risk is possible in humans.

- Maintain support therapy and program for AIDS patients who are receiving this drug as part of their overall treatment plan.

Teaching points

- Take this drug with food to help the absorption of the drug and possibly decrease GI upset. Swallow tablets whole. Do not cut, crush, or chew them.

- Drink 2 to 3 liters of water each day while taking this drug, unless otherwise instructed by your health care provider.

- Make appointments for frequent blood tests that will need to be done to determine the effects of the drug on your blood count and to determine the appropriate dosage needed. It is important that you keep appointments for these tests.

- Arrange for periodic eye examinations (every 4–6 weeks) during therapy to evaluate progress of the disease. This drug is not a cure for your retinitis.

- If you are also receiving zidovudine, the two drugs cannot be given concomitantly; severe adverse effects may occur.

- If you think you are pregnant or want to become pregnant, consult your health care provider. Use contraception during drug therapy. Male patients should use barrier contraceptives during drug therapy and for at least 90 days after therapy.
- You may experience these side effects: Decreased blood count leading to susceptibility to infection (frequent blood tests will be needed; avoid crowds and exposure to disease as much as possible); birth defects and decreased sperm production (drug cannot be taken during pregnancy); sedation, dizziness, confusion (avoid driving or operating dangerous machinery if these effects occur).
- Report bruising, bleeding, infection, extreme fatigue, edema.

▼ valproic acid (*val proe' ik*)

valproic acid

Apo-Valproic Acid (CAN), Gen-Valproic (CAN), PMS-Valproic Acid (CAN), ratio-Valproic (CAN), Stavzor

Capsules: Depakene **ONC**

sodium valproate

Syrup: Depakene

valproate acid

Injection: Depacon

Capsules: Stavzor **ONC**

divalproex sodium

Tablets, enteric coated:

Depakote **ONC**, Depakote ER **ONC**, Depakote Sprinkle, Divalproex, Epival (CAN)

PREGNANCY CATEGORY D

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not understood: Antiepileptic activity may be related to the metab-

olism of the inhibitory neurotransmitter, GABA; divalproex sodium is a compound containing equal proportions of valproic acid and sodium valproate.

Indications

- *Valproic acid*: Sole and adjunctive therapy in simple (petit mal) and complex absence seizures; acute treatment of manic episodes associated with bipolar disorder; prophylaxis of migraine headaches; adjunctive therapy for multiple seizure disorders
- *Depakote ER*: Treatment of epilepsy in children 10 yr and older; treatment of acute manic or mixed episodes associated with bipolar disorder, with or without psychotic features
- *Depakote ER*: Treatment of bipolar mania
- *Depakote, Depakote ER*: Prophylaxis of migraine headaches
- *Divalproex, sodium valproate injection*: Treatment of complex partial seizures as monotherapy or with other antiepileptics
- Unlabeled uses: Adjunct in symptom management of schizophrenia, treatment of aggressive outbursts in children with ADHD, organic brain syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to valproic acid, hepatic disease, or significant hepatic impairment.
- Use cautiously with children younger than 18 mo; children younger than 2 yr, especially with multiple antiepileptics, congenital metabolic disorders, severe seizures accompanied by severe mental retardation, organic brain disorders (higher risk of developing fatal hepatotoxicity); pregnancy (fetal neural tube defects; do not discontinue to prevent major seizures; discontinuing such medication is likely to precipitate status epilepticus, hypoxia and risk to both mother and fetus); lactation.

Available forms

Capsules—250 mg; DR capsules **ONC**—125, 250, 500 mg; syrup—250 mg/5 mL; DR tablets **ONC**—125, 250, 500 mg; sprinkle capsules—125 mg; injection—100 mg/mL; ER tablets **ONC**—250, 500 mg

Dosages**Adults**

Dosage is expressed as valproic acid equivalents. Initial dose is 10–15 mg/kg/day PO, increasing at 1-wk intervals by 5–10 mg/kg/day until seizures are controlled or side effects preclude further increases. Maximum recommended dosage is 60 mg/kg/day PO. If total dose exceeds 250 mg/day, give in divided doses.

- **Acute mania or bipolar disorder:** Initially, 25 mg/kg/day PO once daily. Dose should be increased rapidly to achieve the lowest therapeutic dose. Maximum dose 60 mg/kg/day PO (*Depakote ER* only).
- **Bipolar mania:** 750 mg PO daily in divided doses; do not exceed 60 mg/kg/day (*Divalproex DR* tablets only).
- **Migraine:** 250 mg PO bid; up to 1,000 mg/day has been used (*Divalproex DR* tablets and *Stavzor* capsules); 500 mg ER tablet once a day.

Pediatric patients 10 yr and older
10–15 mg/kg/day PO.

Pediatric patients 10 yr and younger

Use extreme caution. Fatal hepatotoxicity has occurred. Children younger than 2 yr are especially susceptible. Monitor all children carefully.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–4 hr
IV	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 6–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute vial in 5% dextrose injection, 0.9% sodium chloride injection or lactated Ringer's injection. Stable for 24 hr at room temperature. Discard unused portions.

Infusion: Administer over 60 min, not more than 20 mg/min. Do not use more than 14 days; switch to oral products as soon as possible.

Adverse effects

- **CNS:** *Sedation*, tremor (may be dose-related), emotional upset, depression, psychosis, aggression, hyperactivity, behavioral deterioration, weakness, suicidality
- **Dermatologic:** Transient increases in hair loss, rash, petechiae
- **GI:** *Nausea, vomiting, indigestion*, diarrhea, abdominal cramps, constipation, anorexia with weight loss, increased appetite with weight gain, **life-threatening pancreatitis, hepatic failure**; elevated liver enzyme, serum bilirubin
- **GU:** Irregular menses, secondary amenorrhea
- **Hematologic:** Altered bleeding time; thrombocytopenia; bruising; hematoma formation; frank hemorrhage; relative lymphocytosis; hypofibrinogenemia; leukopenia, eosinophilia, anemia, bone marrow suppression

Interactions

• **Drug-drug** • Increased serum phenobarbital, primidone, ethosuximide, diazepam, zidovudine levels • Complex interactions with phenytoin; breakthrough seizures have occurred with the combination of valproic acid and phenytoin • Increased serum levels and toxicity with salicylates, cimetidine, chlorpromazine, erythromycin, felbamate • Decreased effects with carbamazepine, rifampin, lamotrigine • Decreased serum levels with charcoal • Increased sedation with alcohol, other CNS depressants

• **Drug-lab test** • False interpretation of urine ketone test

Nursing considerations**CLINICAL ALERT!**

Confusion has occurred between DR *Depakote* and *Depakote ER*. Dosage is very different and serious adverse effects can occur; use extreme caution.

Assessment

- **History:** Hypersensitivity to valproic acid; hepatic impairment; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes; bowel sounds,

normal output; CBC and differential, bleeding time tests, LFTs, serum ammonia level, exocrine pancreatic function tests, EEG

Interventions

- Give drug with food if GI upset occurs; substitution of the enteric-coated formulation also may be of benefit; have patient swallow ER tablet whole; do not cut, crush, or chew.

⊗ **Black box warning** Be aware that patient may be at increased risk for suicidal ideation and suicidality; monitor accordingly.

⊗ **Warning** Reduce dosage, discontinue, or substitute other antiepileptics gradually; abrupt discontinuation of all antiepileptics may precipitate absence seizures.

⊗ **Black box warning** Arrange for frequent LFTs; discontinue drug immediately with suspected or apparent significant hepatic impairment; continue LFTs to determine if hepatic impairment progresses in spite of drug discontinuation.

⊗ **Warning** Arrange for patient to have platelet counts, bleeding time determination before therapy, periodically during therapy, and prior to surgery. Monitor patient carefully for clotting defects (bruising, blood-tinged toothbrush). Discontinue if there is evidence of hemorrhage, bruising, or disorder of hemostasis.

- Monitor ammonia levels, and discontinue if there is clinically significant elevation in level.
- Monitor serum levels of valproic acid and other antiepileptics given concomitantly, especially during the first few weeks of therapy. Adjust dosage on the basis of these data and clinical response.

⊗ **Black box warning** Arrange for counseling for women of childbearing age who wish to become pregnant; drug may be teratogenic. Drug is not recommended for women of childbearing age.

⊗ **Black box warning** Discontinue the drug at any sign of pancreatitis; life-threatening pancreatitis has occurred.

⊗ **Warning** Evaluate for therapeutic serum levels—usually 50–100 mcg/mL.

Teaching points

- Take this drug exactly as prescribed. Do not chew tablets or capsules before swallowing

them. Swallow them whole to prevent local irritation of mouth and throat. *Depakote Sprinkle* tablets may be opened and sprinkled on applesauce or pudding.

- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.
- Avoid alcohol and sleep-inducing and over-the-counter drugs. These could cause dangerous effects.
- Have frequent checkups, including blood tests, to monitor your drug response. Keep all appointments for checkups.
- Use contraceptive techniques at all times. If you want to become pregnant, consult your health care provider.
- Wear a medical ID tag to alert emergency medical personnel that you have epilepsy and are taking antiepileptic medication.
- If you have diabetes, this drug may interfere with urine tests for ketones.
- You may experience these side effects: Drowsiness (avoid driving or performing other tasks requiring alertness; take at bedtime); GI upset (take with food or milk, eat frequent small meals; if problem persists, substitute enteric-coated drug); transient increase in hair loss.
- Report bruising, pink stain on the toothbrush, yellowing of the skin or eyes, pale feces, rash, pregnancy, abdominal pain with nausea, vomiting, anorexia, thoughts of suicide.

valsartan

(val sar' tan)

Diovan

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Angiotensin II receptor blocker
Antihypertensive

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the

vascular smooth muscle and adrenal gland; this action blocks the vasoconstricting effect of the renin–angiotensin system as well as the release of aldosterone, leading to decreased BP; may prevent the vessel remodeling associated with the development of atherosclerosis.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- Treatment of HF in patients who are intolerant of ACE inhibitors
- Reduction in CV mortality in stable patients with left ventricular failure or left ventricular dysfunction following MI

Contraindications and cautions

- Contraindicated with hypersensitivity to valsartan, pregnancy (use during second or third trimester can cause injury or even death to fetus), lactation.
- Use cautiously with hepatic or renal impairment, hypovolemia.

Available forms

Tablets—40, 80, 160, 320 mg

Dosages

Adults

- *Hypertension*: 80 mg PO daily; range 80–320 mg/day.
- *HF*: Starting dose is 40 mg bid, titration to 80 mg and 160 mg bid should be done to the highest dose, as tolerated by the patient. Maximum daily dose is 320 mg daily given in divided doses. May be given in combination with other antihypertensives. Consider dosage reduction if used with diuretics.
- *Post-MI left ventricular dysfunction*: Start as early as 12 hr post-MI; 20 mg PO bid, may increase after 7 days to 40 mg PO bid; titrate to 160 mg PO bid if tolerated.

Pediatric patients 6–16 yr

- *Hypertension*: Starting dosage, 1.3 mg/kg PO once daily (up to 40 mg). Target dosage, 1.3–2.7 mg/kg PO once daily (40–160 mg/day).

Patients with severe hepatic or renal impairment

Exercise caution and monitor patient frequently.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, syncope, muscle weakness
- **CV:** Hypotension
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea*, constipation, dry mouth, dental pain
- **Respiratory:** *URI symptoms, cough*, sinus disorders
- **Other:** Back pain, fever, gout, hyperkalemia

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to valsartan; pregnancy, lactation; hepatic or renal impairment; hypovolemia
- **Physical:** Skin lesions, turgor; T; reflexes, affect; BP; R, respiratory auscultation; LFTs, renal function tests

Interventions

- Administer without regard to meals.
- **⊗ Black box warning** Ensure that patient is not pregnant before beginning therapy; suggest use of barrier birth control while using drug; fetal injury and deaths have been reported.
- Find alternative method of feeding infant if drug is being given to nursing mother. Depression of renin-angiotensin system in infants is potentially very dangerous.
- **⊗ Warning** Alert surgeon and mark the patient's chart that valsartan is being given. Blockage of renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.
- Monitor patient closely in any situation that may lead to decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting,

diarrhea—because excessive hypotension can occur.

Teaching points

- Take this drug without regard to meals. Do not stop taking drug without consulting your health care provider.
- Use a barrier method of birth control while using this drug; if you become pregnant or want to become pregnant, consult your health care provider. If you are breast-feeding, you should use another method of feeding the baby while taking this drug.
- You may experience these side effects: Dizziness (avoid driving or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important; consult a dietitian); symptoms of upper respiratory tract infection, cough (do not self-medicate; consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy.

vancomycin hydrochloride

(van koe mye' sin)

Vancocin

PREGNANCY CATEGORY C

PREGNANCY CATEGORY B
(PULVULES)

Drug class

Antibiotic

Therapeutic actions

Bactericidal: Inhibits cell wall synthesis of susceptible organisms, causing cell death.

Indications

- Parenteral: Potentially life-threatening infections not treatable with other less toxic antibiotics
- Severe staphylococci infections in patients who cannot receive or have failed to respond to penicillins and cephalosporins
- Prevention of bacterial endocarditis in penicillin-allergic patients undergoing den-

tal, upper respiratory, GI, or GU surgery or invasive procedures

- Oral: Staphylococcal enterocolitis and antibiotic-associated pseudomembranous colitis caused by *Clostridium difficile*

Contraindications and cautions

- Contraindicated with allergy to vancomycin.
- Use cautiously with hearing loss, renal impairment, pregnancy, lactation.

Available forms

Pulvules—125, 250 mg; powder for oral solution—1, 10 g; powder for injection—500 mg, 750 mg, 1, 5, 10 g; injection solution—500 mg, 1 g

Dosages

Adults

500 mg—2 g/day PO in three or four divided doses for 7–10 days; 500 mg IV every 6 hr or 1 g IV every 12 hr.

- *Pseudomembranous colitis* caused by *C. difficile*: 500 mg to 2 g/day PO in three to four divided doses for 7–10 days or 125 mg PO three to four times a day.

Pediatric patients

40 mg/kg/day PO in three to four divided doses for 7–10 days. 10 mg/kg/dose IV every 6 hr. Do not exceed 2 g/day.

- *Premature and full-term neonates*: Use with caution because of incompletely developed renal function. Initial dose of 15 mg/kg, followed by 10 mg/kg every 12 hr in first week of life and every 8 hr thereafter up to age of 1 mo.
- *Pseudomembranous colitis* caused by *C. difficile*: 40 mg/kg/day in four divided doses PO for 7–10 days. Do not exceed 2 g/day.

Geriatric patients or patients with renal failure

Monitor dosage and serum levels very carefully. Dosage nomogram is available for determining the dose according to creatinine clearance (see manufacturer's insert).

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	Varies
IV	Rapid	End of infusion

Metabolism: $T_{1/2}$: 4–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Not for IM administration. Reconstitute with 10 mL sterile water for injection; 500 mg/mL concentration results. Dilute reconstituted solution with 100–200 mL of 0.9% sodium chloride injection or D₅W for intermittent infusion. For continuous infusion (use only if intermittent therapy is not possible), add 2–4 (1–2 g) vials reconstituted solution to sufficiently large volume of 0.9% sodium chloride injection or D₅W to permit slow IV drip of the total daily dose over 24 hr. Refrigerate reconstituted solution; stable over 14 days. Further diluted solution is stable for 24 hr.

Infusion: For intermittent infusion, infuse every 6 hr over at least 60 min, no faster than 1,000 mg/hr, to avoid irritation, hypotension, throbbing back and neck pain. Give continuously slowly over 24 hr.

Incompatibilities: Do not mix with amobarbital, chloramphenicol, dexamethasone, heparin, barbiturates, warfarin.

Y-site incompatibility: Do not give with foscarnet.

Adverse effects

- **CNS:** *Ototoxicity*
- **CV:** Hypotension (IV administration)
- **Dermatologic:** *Urticaria*, macular rashes
- **GI:** *Nausea*
- **GU:** *Nephrotoxicity*
- **Hematologic:** Eosinophilia, neutropenia
- **Other:** Superinfections; “**red neck** or **red man syndrome**” (sudden and profound fall in BP, fever, chills, paresthesias, erythema of the neck and back)

Interactions

★ **Drug-drug** • Increased neuromuscular blockade with atracurium, pancuronium, tubocurarine, vecuronium • Increased risk of ototoxicity or nephrotoxicity when administered with other ototoxic or nephrotoxic drugs

(aminoglycosides, amphotericin B, bacitracin, cisplatin)

Nursing considerations

Assessment

- **History:** Allergy to vancomycin, hearing loss, renal impairment, pregnancy, lactation
- **Physical:** Site of infection, skin color, lesions; orientation, reflexes, auditory function; BP, perfusion; R, adventitious sounds; CBC, LFTs, renal function tests, auditory tests

Interventions

- ⊗ **Warning** Drug may increase risk of development of multiple drug-resistant organisms; ensure appropriate use of drug.
- Oral solution: Add 115 mL distilled water to contents of 10-g container. Each 6 mL of solution will contain 500 mg vancomycin. Alternatively, dilute the contents of 500-mg vial for injection in 30 mL of water for oral or nasogastric tube administration.
- ⊗ **Warning** Observe the patient very closely when giving parenteral solution, particularly the first doses; “red man” syndrome can occur (see adverse effects); slow administration decreases the risk of adverse effects.
- Culture site of infection before beginning therapy.
- Monitor renal function tests with prolonged therapy.
- ⊗ **Warning** Evaluate for safe serum levels; concentrations of 60–80 mcg/mL are toxic.

Teaching points

- This drug is available only in the IV and oral forms.
- Do not stop taking this drug without notifying your health care provider.
- Take the full prescribed course of this drug.
- You may experience these side effects: Nausea (eat frequent small meals); changes in hearing; superinfections in the mouth, vagina (frequent hygiene measures will help).
- Report ringing in the ears, loss of hearing, difficulty voiding, rash, flushing.

vardenafil hydrochloride

(var den' ab fill)

Levitra, Staxyn

PREGNANCY CATEGORY B

Drug classes

Impotence drug
Phosphodiesterase type 5 inhibitor

Therapeutic actions

Selectively inhibits cyclic guanosine monophosphate (cGMP) specific phosphodiesterase type 5. The mechanism of penile erection involves the release of nitric oxide into the corpus cavernosum of the penis during sexual stimulation. Nitrous oxide activates cGMP, which causes smooth muscle relaxation allowing the flow of blood into the corpus cavernosum. Vardenafil prevents the breakdown of cGMP by phosphodiesterase, leading to increased cGMP levels and prolonged smooth muscle relaxation promoting the flow of blood into the corpus cavernosum.

Indications

- Treatment of ED occurring in the presence of sexual stimulation
- Unlabeled use: Raynaud phenomenon

Contraindications and cautions

- Contraindicated with allergy to any component of the tablet, concurrent use of nitrates or alpha blockers.
- Contraindicated for women or children.
- Use cautiously with hepatic or renal impairment; with anatomic deformation of the penis, with known cardiac disease (effects of sexual activity need to be evaluated), congenital prolonged QT interval, unstable angina; hypotension (systolic pressure less than 90 mm Hg); uncontrolled hypertension (greater than 170/110 mm Hg), severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders.

Available forms

Tablets—2.5, 5, 10, 20 mg; orally disintegrating tablets—10 mg

Dosages

Adults

5–10 mg PO taken 1 hr before anticipated sexual activity; range 5–20 mg PO. Limit use to once per day.

Pediatric patients

Not intended for use in children.

Geriatric patients and those with moderate hepatic impairment

Starting dose of 5 mg PO is suggested.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	30–120 min

Metabolism: Hepatic, T_{1/2}: 4–5 hr

Distribution: Not intended for use in women, no clear studies on crossing the placenta or entering breast milk

Excretion: Feces

Adverse effects

- **CNS:** *Headache*, abnormal vision, dizziness, hypertonia, insomnia, somnolence, vertigo, ischemic optic neuropathy, sudden hearing loss
- **CV:** *Flushing*, angina, chest pain, hypertension, hypotension, **MI**, palpitation, postural hypotension, tachycardia
- **GI:** *Dyspepsia*, diarrhea, abdominal pain, dry mouth, esophagitis, gastritis, GERD
- **GU:** Abnormal ejaculation, priapism
- **Respiratory:** Rhinitis, sinusitis, dyspnea, epistaxis, pharyngitis
- **Other:** Flulike symptoms, edema, pain, rash, sweating

Interactions

*** Drug-drug** ⊗ **Warning** Possible severe hypotension and serious cardiac events if combined with nitrates, alpha blockers; this combination must be avoided.

- Possible increased vardenafil levels and effects if taken with ketoconazole, itraconazole, erythromycin; monitor patient and reduce dosage as needed, usually to 2.5 mg/day PO
- Increased vardenafil serum level if combined with indinavir, ritonavir; if these drugs are being used, limit vardenafil dose to 2.5 mg in a 24-hr period

■ Nursing considerations**Assessment**

- **History:** Allergy to any component of the tablet, concurrent use of nitrates or alpha blockers; unstable angina, hypotension, uncontrolled hypertension; severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders; anatomical deformation of the penis; cardiac disease, congenital prolonged QT interval
- **Physical:** Orientation, affect; skin color, lesions; R, adventitious sounds; P, BP, ECG, LFTs, renal function tests; hearing, vision examinations

Interventions

- Ensure diagnosis of ED and determine underlying causes and other appropriate treatment.
- Advise patient that drug does not work without sexual stimulation. Limit use to once per day.
- Teach patient to contact health care provider about any loss of vision or hearing.
- Remind patient that drug does not protect against STDs and appropriate measures should be taken.

⊗ **Warning** Advise patient to never take this drug with nitrates or alpha blockers; serious and even fatal complications can occur.

Teaching points

- Take this drug 60 minutes before anticipated sexual activity. The drug will have no effect unless there is sexual stimulation.
- This drug will not protect you from sexually transmitted diseases; use appropriate precautions.
- Do not take this drug if you are taking any nitrates or alpha blockers; serious side effects or death can occur.
- Many drugs may interact with vardenafil; always consult your health care provider before taking any drug, including over-the-counter drugs and herbal therapies; dosage adjustments may be needed.
- You may experience these side effects: Headache, dizziness, upset stomach, runny nose; these side effects should go away within a

couple of hours. If side effects persist, consult your health care provider.

- Stop drug and consult your health care provider immediately if you experience sudden loss of vision or hearing.
- Report difficult or painful urination, vision changes, fainting, erection that persists for longer than 4 hours, sudden loss of vision.

▽ varenicline tartrate*(var en' ab klin)*

Chantix

PREGNANCY CATEGORY C

Drug classes

Nicotine receptor antagonist

Smoking deterrent

Therapeutic actions

Selectively binds with specific neuronal nicotinic acetylcholine receptors; acts as an agonist at these sites while preventing nicotine binding to these receptors. This mechanism is thought to aid in smoking cessation.

Indications

- Aid to smoking cessation treatment

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, lactation.
- Use cautiously with pregnancy.

Available forms

Capsules—0.5, 1 mg

Dosages**Adults**

The patient should pick a date to stop smoking and begin drug therapy 1 wk before that date.

Days 1–3, 0.5 mg/day PO; days 4–7, 0.5 mg PO bid; day 8 until the end of treatment, 1 mg PO bid. Drug should be taken after eating with a full glass of water. Treatment should last 12 wk; patients who successfully quit smoking in that time may benefit from another 12 wk to increase the likelihood of long-term

abstinence. Patients who fail to quit smoking during the 12 wk or who relapse after treatment can be treated again when factors leading to failed attempt have been identified and addressed.

Pediatric patients

Not recommended for children younger than 18 yr.

Patients with severe renal impairment

Initially, 0.5 mg/day PO; titrate to 0.5 mg PO bid. If on dialysis, 0.5 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3–4 hr

Metabolism: Minimal; $T_{1/2}$: 24 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Unchanged in urine

Adverse effects

- **CNS:** *Headache, insomnia, abnormal dreams*, somnolence, lethargy, dysgeusia, behavioral changes, suicidal ideation, agitation, depression
- **Dermatologic:** Rash
- **GI:** *Nausea*, abdominal pain, *flatulence*, dyspepsia, *vomiting*, *constipation*, dry mouth, GERD, increased appetite, anorexia
- **Respiratory:** Rhinorrhea, dyspnea, URIs
- **Other:** Fatigue, malaise, asthenia

Interactions

• **Drug-drug** • Increased risk of adverse effects if combined with nicotine transdermal systems and eimetidine; avoid these combinations

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of drug; lactation, pregnancy; smoking history
- **Physical:** Orientation, affect, reflexes; R, breath sounds; abdominal examination

Interventions

⊗ **Black box warning** There is a risk of serious mental health events, including changes in behavior, depressed mood, hostil-

ity, and suicidal thoughts, with drug administration; monitor patient accordingly.

- Instruct patient to pick a day to quit smoking; drug therapy should begin 1 wk before that date.
- Administer drug after patient has eaten, with a full glass of water.
- Provide patient with educational materials and support for smoking cessation.
- Encourage patient to continue efforts at smoking cessation even if a lapse occurs.
- Provide safety measures if insomnia, lethargy occur.
- Suggest use of contraceptive measures; help patient select another method of feeding the baby if she is nursing during drug therapy.
- Consider a second 12-wk course of therapy if patient is successful at smoking cessation to improve the chances of continued abstinence.
- Monitor patient for behavioral changes and suicidal ideation; stop drug and get medical attention if these effects occur.

Teaching points

- This drug reacts with nicotine receptors in your brain to decrease your desire for nicotine and will alter your reaction to nicotine when you do smoke, making it less desirable. You should have support for your efforts to stop smoking.
- You will take *Chantix* after eating with a full glass of water. The dose will need to be adjusted.
- Select a day to stop smoking. Begin taking *Chantix* 1 week before that day. Days 1–3 of that week, you will take 0.5 mg (white tablet) once each day. Days 4–7, you will take 0.5 mg twice a day, once in the morning and once in the evening. From day 8 until you are finished with treatment, you will take 1 mg (blue tablet) twice a day, once in the morning and once in the evening. The course of treatment is usually 12 weeks. If you have good success, you may have another 12-week course to help increase the chances of long-term success.
- If you forget a dose of the drug, take it as soon as you remember; if you remember close to the time for your next dose, just take that dose. Do not double the dose.
- If you have a relapse, keep taking the drug and continue to try to stop smoking.

- It is not known if this drug could affect a fetus. If you are pregnant or are thinking about becoming pregnant, consult your health care provider before using this drug; you should not smoke when you are pregnant.
- It is not known how this drug could affect a nursing baby. If you are breast-feeding a baby, use another method of feeding the baby during drug treatment.
- Stop drug and seek medical help if agitation, depression, or thoughts of suicide occur.
- You may experience these side effects: nausea, insomnia (when starting therapy; they should pass as your body adjusts to the drug; if they should become severe, contact your health care provider).
- Report severe constipation, severe vomiting, failure to quit smoking, behavioral changes, thoughts of suicide.

velaglucerase

See Appendix U, *Less commonly used drugs*.

venlafaxine hydrochloride (*vin lab facts' in*)

Effexor, Effexor XR **OND**

PREGNANCY CATEGORY C

Drug classes

Antidepressant
Anxiolytic

Therapeutic actions

Potentiates the neurotransmitter activity in the CNS; inhibits serotonin, norepinephrine, and dopamine reuptake leading to prolonged stimulation at neuroreceptors.

Indications

- Treatment of major depressive disorder
- Treatment of generalized anxiety disorder (ER only)
- Treatment of social anxiety disorder (ER only)
- Treatment of panic disorder, with or without agoraphobia (ER only)

- Unlabeled uses: PMDD, hot flushes, autism, pain

Contraindications and cautions

- Contraindicated with allergy to venlafaxine, use of MAOIs within last 14 days.
- Use cautiously with pregnancy, lactation, patients whose underlying medical condition might be compromised by increased heart rate (hyperthyroidism, HF, recent MI).

Available forms

Tablets—25, 37.5, 50, 75, 100 mg; ER capsules **OND**—37.5, 75, 150 mg; ER tablets **OND**—37.5, 75, 150, 225 mg

Dosages

Adults

- *Depression*: Starting dose, 75 mg/day PO in two to three divided doses (or once a day, ER capsule) taken with food. May be increased at intervals of no less than 4 days up to 225 mg/day to achieve desired effect; maximum dose 375 mg/day in three divided doses.
- *Transfer to or from MAOI*: At least 14 days should elapse from the discontinuation of the MAOI and the starting of venlafaxine; allow at least 7 days to elapse from the stopping of venlafaxine to the starting of an MAOI.
- *Generalized anxiety disorder/social anxiety*: 75–225 mg/day PO should be taken on a daily basis, not as needed (ER only).
- *Panic disorder*: 37.5 mg/day PO for 7 days, then increase based on patient response to 75 mg/day for 7 days, and then 75 mg/day weekly increases to a maximum of 225 mg/day (ER only).

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

For patients with creatinine clearance of 10–70 mL/min, reduce dosage by 25%–50%. For patients on dialysis, reduce dosage by 50% (give after dialysis completion on dialysis days). For patients with hepatic impairment, reduce total daily dose by 50%, and increase very slowly to achieve desired effect.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	48 hr

Metabolism: Hepatic; $T_{1/2}$: 1.3–2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, dizziness, insomnia, nervousness*, anxiety, tremor, dreams, suicidal ideation
- **CV:** Vasodilation, hypertension, tachycardia
- **Dermatologic:** *Sweating*, rash, pruritus
- **GI:** *Nausea, constipation, anorexia*, diarrhea, vomiting, dyspepsia, *dry mouth*, flatulence
- **GU:** *Abnormal ejaculation*, impotence, urinary frequency
- **Other:** *Headache, asthenia*, infection, chills, chest pain

Interactions

• **Drug-drug** • Increased serum levels and risk of toxicity with MAOIs (within last 14 days), cimetidine • Serotonin syndrome may occur if combined with trazodone • Increased sedation with alcohol

• **Drug-alternative therapy** • Increased sedation and hypnotic effects with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to venlafaxine; use of MAOIs within last 14 days; pregnancy, lactation
- **Physical:** Skin color, T, lesions; reflexes, gait, sensation, cranial nerve evaluation; mucous membranes, abdominal examination, normal output; P, BP, peripheral perfusion

Interventions

- Limit amount of drug available; increased risk of successful suicide attempts with this antidepressant.
- Give with food to decrease GI effects. Ensure that patient swallows ER capsules whole; do not allow patient to cut, crush, or chew them.
- Advise patient to use contraceptives.

⊗ **Black box warning** Monitor patients for suicidal ideation, especially when beginning therapy or changing dosage; high risk in children, adolescents, and young adults.

Teaching points

- Take with food to decrease GI upset. Do not cut, crush, or chew capsules; swallow capsules whole.
- Avoid alcohol while using this drug.
- This drug cannot be taken during pregnancy; use birth control. If you become pregnant, consult your health care provider.
- You may experience these side effects: Loss of appetite, nausea, vomiting, dry mouth (use frequent mouth care; eat frequent small meals; suck sugarless lozenges); constipation (request bowel program); dizziness, drowsiness, tremor (avoid driving or operating dangerous machinery).
- Report rash, hives, increased depression, thoughts of suicide, pregnancy.

⚠ DANGEROUS DRUG

▽ verapamil hydrochloride

(*ver ap' a mill*)

Apo-Verap (CAN), Apo-Verap SR **DNC** (CAN), Calan SR **DNC**, Covera-HS, Gen-Verapamil (CAN), Gen-Verapamil SR **DNC** (CAN), Isoptin SR **DNC**, Nu-Verap (CAN), Verelan **DNC**, Verelan PM **DNC**

PREGNANCY CATEGORY C

Drug classes

Antianginal
Antiarrhythmic
Antihypertensive
Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; calcium is involved in the generation of the action potential in specialized automatic and conducting cells in the heart, in arterial smooth muscle, and in excitation-contraction

coupling in cardiac muscle cells; inhibition of transmembrane calcium flow results in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, the depression of myocardial contractility, and the dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac energy consumption, and in patients with vasospastic (Prinzmetal's) angina, increased delivery of oxygen to myocardial cells.

Indications

- Angina pectoris due to coronary artery spasm (Prinzmetal's variant angina)
- Effort-associated angina
- Chronic stable angina
- Unstable, crescendo, preinfarction angina
- Essential hypertension
- Parenteral: Treatment of supraventricular tachyarrhythmias
- Parenteral: Temporary control of rapid ventricular rate in atrial flutter or atrial fibrillation

Contraindications and cautions

- Contraindicated with allergy to verapamil; sick sinus syndrome, except with ventricular pacemaker; heart block (second- or third-degree); hypotension; pregnancy, lactation.
- Use cautiously with idiopathic hypertrophic subaortic stenosis, cardiogenic shock, severe HF, impaired renal or hepatic function, and in patients with atrial flutter or atrial fibrillation and an accessory to bypass tract.

Available forms

Tablets—40, 80, 120 mg; SR tablets **ORC**—120, 180, 240 mg; ER tablets **ORC**—120, 180, 240 mg; injection—2.5 mg/mL; ER capsules **ORC**—100, 120, 180, 200, 240, 300, 360 mg

Dosages

Adults

Oral

Immediate-release

- **Angina:** 80–120 mg PO tid. Doses of 40 mg PO tid may be used. Maintenance 240–480 mg daily.

- **Arrhythmias:** 240–480 mg/day in divided doses.
- **In digitalized adults:** 240–320 mg/day.
- **Hypertension:** 40 mg to 80 mg PO tid.

ER

- **Capsules:** 120–240 mg/day PO in the morning. Titrate dose to a maximum 480 mg/day.
- **Tablets:** 120–180 mg/day PO in the morning. Titrate to maximum 240 mg every 12 hr.

SR

- 120–180 mg/day PO. Titrate up to a maximum 480 mg PO in the morning.

Parenteral

IV use only. Initial dose, 5–10 mg over 2 min; may repeat dose of 10 mg 30 min after first dose if initial response is inadequate.

Pediatric patients

IV

1 yr and younger: Initial dose, 0.1–0.2 mg/kg over 2 min.

1–15 yr: Initial dose, 0.1–0.3 mg/kg over 2 min. Do not exceed 5 mg. Repeat above dose 30 min after initial dose if response is not adequate. Repeat dose should not exceed 10 mg.

Geriatric patients or patients with renal impairment

Reduce dosage, and monitor patient response carefully. Give IV doses over 3 min to reduce risk of serious side effects. Administer IV doses very slowly, over 2 min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1–2.2 hr	3–7 hr
IV	1–5 min	3–5 min	2 hr

Metabolism: Hepatic; $T_{1/2}$: 3–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation required.

Infusion: Infuse very slowly over 2–3 min.

Y-site incompatibilities: Do not give with albumin, ampicillin, nafcillin, oxacillin, sodium bicarbonate, amphotericin B, hydralazine, aminophylline.

Adverse effects

- **CNS:** *Dizziness*, vertigo, emotional depression, sleepiness, *headache*
- **CV:** *Peripheral edema*, *hypotension*, arrhythmias, bradycardia; AV heart block
- **GI:** *Nausea*, constipation
- **Other:** Muscle fatigue, diaphoresis, rash

Interactions

★ **Drug-drug** ⊗ **Warning** Risk of serious cardiac effects with IV beta blockers; do not give these drugs within 48 hr before or 24 hr after IV verapamil.

- Increased cardiac depression with beta blockers
- Additive effects of verapamil and digoxin to slow AV conduction
- Increased serum levels of digoxin, carbamazepine, prazosin, quinidine
- Increased respiratory depression with atracurium, pancuronium, tubocurarine, vecuronium
- Decreased effects with calcium, rifampin

★ **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to verapamil; sick sinus syndrome; heart block; IHSS; cardiogenic shock, severe HF; hypotension; impaired hepatic or renal function; pregnancy, lactation
- **Physical:** Skin color, edema; orientation, reflexes; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds; liver evaluation, normal output; LFTs, renal function tests, urinalysis

Interventions

⊗ **Warning** Monitor patient carefully (BP, cardiac rhythm, and output) while drug is being titrated to therapeutic dose. Dosage may be increased more rapidly in hospitalized patients under close supervision.

- Ensure that patient swallows SR or ER tablets whole; patient should not cut, crush, or chew them.
- Monitor BP very carefully with concurrent doses of antihypertensives.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- Administer SR or ER form in the morning with food to decrease GI upset.

- Protect IV solution from light.
- Monitor patients with renal or hepatic impairment carefully for possible drug accumulation and adverse reactions.

Teaching points

- Take extended- or sustained-release form in the morning with food; swallow it whole; do not cut, crush, or chew it. Do not drink grapefruit juice while using this drug.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (adjust lighting, noise, and temperature; request medication); dizziness, sleepiness (avoid driving or operating dangerous equipment); emotional depression (reversible); constipation (request aid).
- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, nausea, constipation.

▷ verteporfin

See Appendix U, *Less commonly used drugs*.

▷ vigabatrin

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ vinBLAstine sulfate (VLB)

(*vin blas' teen*)

Velban

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Mitotic inhibitor

Therapeutic actions

Affects cell energy production required for mitosis, has antimitotic effect and causes abnormal mitotic figures.

Indications

- Palliative treatment for lymphocytic lymphoma, histiocytic lymphoma, generalized

Hodgkin's lymphoma (stages III and IV), mycosis fungoides, advanced testicular carcinoma, Kaposi's sarcoma, Letterer-Siwe disease

- Treatment of choriocarcinoma, breast cancer unresponsive to other therapies
- Hodgkin's lymphoma (advanced) alone or in combination therapies
- Advanced testicular germinal-cell cancers alone or in combination therapy

Contraindications and cautions

- Contraindicated with allergy to vinblastine, leukopenia, acute infection, pregnancy, lactation.
- Use cautiously with liver disease.

Available forms

Powder for injection—10 mg; injection—1 mg/mL

Dosages

⊗ **Warning** Do not administer more than once a wk because of leukopenic response.

Adults

Initial dose, 3.7 mg/m² as a single IV dose, followed at weekly intervals by increasing doses at 1.8 mg/m² increments; a conservative regimen follows:

Week	Dose (mg/m ²)
First wk	3.7
Second wk	5.5
Third wk	7.4
Fourth wk	9.25
Fifth wk	11.1

Use these increments until a maximum dose of 18.5 mg/m² is reached; do not increase dose after WBC count is reduced to 3,000/mm³.

- **Maintenance therapy:** When dose produces WBC count of 3,000/mm³, use a dose one increment smaller for weekly maintenance. Do not give another dose until WBC count is 4,000/mm³ even if 7 days have passed. Duration of therapy depends on disease and response; up to 2 yr may be needed.

Pediatric patients

Initial dose, 2.5 mg/m² as a single IV dose, followed at weekly intervals by increasing doses

at 1.25 mg/m² increments; a conservative regimen follows:

Week	Pediatric Dose (mg/m ²)
First wk	2.5
Second wk	3.75
Third wk	5
Fourth wk	6.25
Fifth wk	7.5

Use these increments until a maximum dose of 12.5 mg/m² is reached; do not increase dose after WBC count is reduced to 3,000/mm³.

Patients with hepatic impairment

For serum bilirubin exceeding 3 mg/dL, decrease dose by 50%.

Pharmacokinetics

Route	Onset
IV	Slow

Metabolism: Hepatic; T_{1/2}: 3.7 min, then 1.6 hr, then 24.8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile

IV FACTS

Preparation: Add 10 mL of sodium chloride injection preserved with phenol or benzyl alcohol to the vial for a concentration of 1 mg/mL. Refrigerate drug; opened vials are stable for 28 days when refrigerated.

Infusion: Inject into tubing of a running IV or directly into the vein over 1 min or as a prolonged infusion over up to 96 hr. Rinse syringe and needle with venous blood prior to withdrawing needle from vein (to minimize extravasation). Do not inject into an extremity with poor circulation or repeatedly into the same vein.

Y-site incompatibility: Do not give with furosemide.

Adverse effects

- **CNS:** Numbness, paresthesias, peripheral neuritis, mental depression, loss of deep tendon reflexes, *headache*, seizures, malaise, *weakness*, dizziness
- **Dermatologic:** Topical epilation (loss of hair), vesiculation of the skin

- **GI:** *Nausea, vomiting*, pharyngitis, vesiculation of the mouth, ileus, *diarrhea*, constipation, *anorexia*, abdominal pain, rectal bleeding, hemorrhagic enterocolitis
- **GU:** Aspermia
- **Hematologic:** Leukopenia
- **Local:** *Local cellulitis*, phlebitis, sloughing if extravasation occurs
- **Other:** Pain in tumor site

Interactions

- **Drug-drug** • Decreased serum concentrations of phenytoins • Risk of toxicity if combined with erythromycin
- **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations

CLINICAL ALERT!

Confusion has occurred between vinblastine and vincristine; use extreme caution if giving either drug.

Assessment

- **History:** Allergy to vinblastine, leukopenia, acute infection, liver disease, pregnancy, lactation
- **Physical:** Weight; hair; T; reflexes, gait, sensation, orientation, affect; mucous membranes, abdominal examination, rectal examination; CBC, LFTs, serum albumin

Interventions

- Ensure that patient is not pregnant before administering; advise patients to use contraceptive measures.

⊗ **Black box warning** Do not administer IM or subcutaneously due to severe local reaction and tissue necrosis. Fatal if given intrathecally. Use extreme caution.

⊗ **Black box warning** Watch for irritation and infiltration; extravasation causes tissue damage and necrosis. If it occurs, discontinue injection immediately, and give remainder of dose in another vein. Consult physician to arrange for hyaluronidase injection into local area, after which apply moderate heat to disperse drug and minimize pain.

⊗ **Warning** Avoid contact with the eyes; if contact occurs, immediately wash thoroughly with water.

- Consult with physician if antiemetic is needed for severe nausea and vomiting.
- Check CBC before each dose.

Teaching points

- Prepare a calendar for dates to return for treatment and drug therapy. Avoid grapefruit juice while you are using this drug.
- This drug should not be used during pregnancy. Use birth control. If you become pregnant, consult your health care provider.
- Have regular blood tests to monitor the drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting, mouth sores (use frequent mouth care; eat frequent small meals; maintain nutrition; request an antiemetic); constipation (a bowel program may be ordered); malaise, weakness, dizziness, numbness and tingling (avoid injury); loss of hair, rash (obtain a wig; keep the head covered in extremes of temperature).
- Report severe nausea, vomiting, pain or burning at injection site, abdominal pain, rectal bleeding, fever, chills, acute infection.

DANGEROUS DRUG

▷ **vinCRISTine sulfate**
(**LCR, VCR**)
(*vin kris' teen*)

Vincasar PFS

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Mitotic inhibitor

Therapeutic actions

Mitotic inhibitor: Arrests mitotic division at the stage of metaphase; exact mechanism of action unknown.

Indications

- Acute leukemia
- Hodgkin's lymphoma, non-Hodgkin's lymphoma, rhabdomyosarcoma, neuroblastoma,

Wilms' tumor as part of combination therapy

Contraindications and cautions

- Contraindicated with allergy to vincristine, leukopenia, acute infection, pregnancy, lactation, demyelinating form of Charcot-Marie-Tooth syndrome.
- Use cautiously with neuromuscular disease, diabetes insipidus, hepatic impairment.

Available forms

Injection—1 mg/mL

Dosages

Adults

1.4 mg/m² IV at weekly intervals.

Pediatric patients

1–2 mg/m² IV weekly. Maximum dose, 2 mg/dose.

- *Weight less than 10 kg or body surface area less than 1 m²*: 0.05 mg/kg once per wk.

Geriatric patients or patients with hepatic impairment

For serum bilirubin exceeding 3 mg/dL, reduce dosage by 50%.

Pharmacokinetics

Route	Onset	Peak
IV	Varies	15–30 min

Metabolism: Hepatic; T_{1/2}: 5 min, then 2.3 hr, then 85 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: No further preparation required; drug should be refrigerated.

Infusion: Inject solution directly into vein or into the tubing of a running IV infusion.

Y-site incompatibility: Do not give with furosemide.

Adverse effects

- **CNS:** *Ataxia, cranial nerve manifestations*; foot drop, headache, seizures, bladder neuropathy, paresthesias, sensory impairment, *neuritic pain, muscle wasting*,

SIADH, optic atrophy, transient cortical blindness, ptosis, diplopia, photophobia

- **GI:** *Constipation*, oral ulcerations, abdominal cramps, vomiting, diarrhea, intestinal necrosis
- **GU:** Acute uric acid nephropathy, polyuria, dysuria
- **Hematologic:** *Leukopenia*
- **Local:** Local irritation, cellulitis if extravasation occurs
- **Other:** *Weight loss, loss of hair*, fever, **death** with serious overdose

Interactions

★ **Drug-drug** • Decreased serum levels and therapeutic effects of digoxin • If L-asparaginase is administered first, the hepatic clearance of vincristine may be reduced. Give vincristine 12–24 hr before L-asparaginase to minimize toxicity

★ **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

Nursing considerations

CLINICAL ALERT!

Confusion has occurred between vincristine and vinblastine; use extreme caution if giving either drug.

Assessment

- **History:** Allergy to vincristine, leukopenia, acute infection, neuromuscular disease, diabetes insipidus, hepatic impairment, pregnancy, lactation
- **Physical:** Weight; hair; T; reflexes, gait, sensation, cranial nerve evaluation, ophthalmic examination; mucous membranes, abdominal examination; CBC, serum sodium, LFTs, urinalysis

Interventions

- Ensure that patient is not pregnant before administering; using barrier contraceptives is advised.
- Tell patient to avoid grapefruit juice while being treated with this drug.
- ☒ **Black box warning** Do not administer IM or subcutaneously due to severe local reaction and tissue necrosis. Do not give

intrathecally; drug is fatal if given intrathecally. Use extreme caution.

⊗ **Black box warning** Watch for irritation and infiltration; extravasation causes tissue damage and necrosis. If extravasation occurs, discontinue injection immediately and give remainder of dose in another vein. Consult with physician to arrange for hyaluronidase injection into local area, and apply heat to disperse the drug and to minimize pain.

- Arrange for wig or suitable head covering if hair loss occurs; ensure that patient's head is covered in extremes of temperature.
- Monitor urine output and serum sodium; if SIADH occurs, consult with physician, and arrange for fluid restriction and perhaps a potent diuretic. Dispose of excretions properly.

Teaching points

- Prepare a calendar of dates to return for treatment and additional therapy.
- Avoid grapefruit juice while you are using this drug.
- This drug cannot be taken during pregnancy; use birth control. If you become pregnant, consult your health care provider.
- Have regular blood tests to monitor the drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting, mouth sores (frequent mouth care, frequent small meals may help; maintain nutrition; request an antiemetic); constipation (bowel program may be ordered); sensitivity to light (wear sunglasses; avoid bright lights); numbness, tingling, change in style of walking (reversible; may persist for up to 6 weeks); hair loss (transient; obtain a wig or other suitable head covering; keep the head covered at extremes of temperature).
- Report change in frequency of voiding; swelling of ankles, fingers, and so forth; changes in vision; severe constipation, abdominal pain.

⚠ DANGEROUS DRUG

▶ **vinorelbine tartrate**

(*vin ob rel' been*)

Navelbine

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Mitotic inhibitor

Therapeutic actions

Affects cell energy production required for mitosis; has antimetabolic effect, prevents the formation of microtubules and leads to cell death; cell cycle specific.

Indications

- First-line treatment of ambulatory patients with unresectable advanced non-small-cell lung cancer
- Treatment of stage IV non-small-cell lung cancer alone or with cisplatin
- Treatment of stage III non-small-cell lung cancer with cisplatin
- Unlabeled uses: Breast cancer, ovarian cancer, Hodgkin's lymphoma, desmoid tumors and fibromatosis, advanced Kaposi's sarcoma, non-Hodgkin's lymphoma

Contraindications and cautions

- Contraindicated with allergy to vinca alkaloids, pretreatment granulocyte counts of 1,000 cells/mm³ or less, pregnancy, lactation.
- Use cautiously with liver disease.

Available forms

Injection—10 mg/mL

Dosages

Adults

⊗ **Warning** Do not administer more than once a wk because of leukopenic response.

- *Monotherapy*: Initial dose, 30 mg/m² as single IV dose; repeat once a wk until progression of disease or toxicity limits use.
- *With cisplatin*: 25 mg/m² in combination with cisplatin 100 mg/m² given every 4 wk, or 30 mg/m² with cisplatin 120 mg/m² given on days 1 and 29, then every 6 wk.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

If total serum bilirubin concentration is 2.1–3 mg/dL, reduce dose to 50% of starting dose; if greater than 3 mg/dL, reduce to 25% of starting dose.

Pharmacokinetics

Route	Onset
IV	Slow

Metabolism: Hepatic; $T_{1/2}$: 22–66 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces

IV FACTS

Preparation: Dilute for 50- or 10-mg solution. Supplied as single-use vials only. Discard after withdrawing solution.

Infusion: Inject into tubing of a running IV or directly into the vein over 6–10 min. Rinse syringe and needle with venous blood prior to withdrawing needle from vein (to minimize extravasation). Do not inject into an extremity with poor circulation or repeatedly into the same vein. Follow with 150–250 ml saline or dextrose to decrease phlebitis. If administered via IV piggyback, should be done via central access.

Adverse effects

- **CNS:** Numbness, paresthasias (less common than with other vinca alkaloids); headache, weakness, dizziness
- **Dermatologic:** Topical epilation (loss of hair), vesiculation of the skin
- **GI:** Nausea, vomiting, pharyngitis, vesiculation of the mouth, ileus, diarrhea, constipation, anorexia, abdominal pain, *increased liver enzymes*
- **Hematologic:** **Granulocytopenia, leukopenia**
- **Local:** Local cellulitis, phlebitis, sloughing with extravasation
- **Other:** Myalgia, arthralgia

Interactions

* **Drug-drug** • Acute pulmonary reactions with mitomycin • Increased risk of granulocytopenia with cisplatin • Risk of neuropathies if combined or given sequentially with paclitaxel; monitor patient closely

Nursing considerations Assessment

- **History:** Allergy to vinca alkaloids, leukopenia, acute infection, liver disease, pregnancy, lactation
- **Physical:** Weight; hair; T; reflexes, gait, sensation, orientation, affect; mucous membranes, abdominal examination; CBC, LFTs, serum albumin

Interventions

- Ensure that patient is not pregnant before use; advise patient to use barrier contraceptives.

⊗ **Black box warning** Do not administer IM or subcutaneously—severe local reaction and tissue necrosis occur. Fatal if given intrathecally. Use extreme caution.

⊗ **Black box warning** Watch for irritation and infiltration; extravasation can cause tissue damage and necrosis. If extravasation should occur, discontinue injection immediately and consult physician to arrange for hyaluronidase injection into local area, after which apply moderate heat to disperse drug and minimize pain.

⊗ **Warning** Avoid contact with the eyes; if contact occurs, immediately wash thoroughly with water.

- Consult with physician if antiemetic is needed for severe nausea and vomiting.

⊗ **Black box warning** Check CBC before each dose; severe granulocytosis is possible. Adjust or delay dose as appropriate.

Teaching points

- Prepare a calendar for dates to return for treatment and additional therapy.
- This drug should not be used during pregnancy. Use birth control. If you become pregnant, consult your health care provider.
- Have regular blood tests to monitor the drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting, mouth sores (frequent mouth care, frequent small meals may help; maintain nutrition; request an antiemetic); constipation (bowel program may be ordered); malaise, weakness, dizziness, numbness and tingling (avoid injury); loss of hair, rash

(obtain a wig; keep the head covered in extremes of temperature).

- Report severe nausea, vomiting, pain or burning at injection site, abdominal pain, rectal bleeding, fever, chills, acute infection.

voriconazole (vor ab kon' ab zole)

Vfend

PREGNANCY CATEGORY D

Drug class

Triazole antifungal

Therapeutic actions

Inhibits fungal ergosterol biosynthesis leading to cell membrane rupture and cell death in susceptible fungi.

Indications

- Treatment of invasive aspergillosis
- Treatment of serious fungal infections caused by *Scedosporium apiospermum*, *Pseudallescheria boydii*, and *Fusarium* species in patients intolerant of or refractory to other therapy
- Treatment of esophageal candidiasis
- Treatment of candidemia in nonneutropenic patients with disseminated skin infections and abdominal, kidney, bladder wall, and wound infections

Contraindications and cautions

- Contraindicated with hypersensitivity to voriconazole, treatment with other drugs that could prolong the QTc interval, severe hepatic impairment, galactose intolerance, and in patients taking the following drugs: Ergot alkaloids, sirolimus, rifabutin, rifampin, carbamazepine, and long-acting barbiturates.
- Use cautiously with known allergies to other azoles, pregnancy, lactation.

Available forms

Tablets—50, 200 mg; powder for injection—200 mg to be reconstituted to 10 mg/mL; powder for oral suspension—40 mg/mL

Dosages

Adults

Loading dose of 6 mg/kg IV every 12 hr for two doses, then 3–4 mg/kg IV every 12 hr or 200 mg PO every 12 hr. Switch to oral dose as soon as patient is able:

Weight less than 40 kg: 100 mg PO every 12 hr; may increase to 150 mg PO every 12 hr if needed.

Weight of 40 kg or more: 200 mg PO every 12 hr; may increase to 300 mg PO every 12 hr if needed.

- *Esophageal candidiasis:* 200–300 mg PO every 12 hr (reduce to 100–150 mg PO every 12 hr if weight is less than 40 kg) for 14 days or for at least 7 days following symptom resolution.

Pediatric patients younger than 12 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Peak	Duration
Oral	1–2 hr	96 hr
IV	Onset of infusion	96 hr

Metabolism: Hepatic; $T_{1/2}$: 24 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute powder with 19 mL of water for injection, resulting solution contains 10 mg/mL. Shake the vial until powder is dissolved. Further dilute *Vfend* to obtain a concentration of 5 mg/mL using 0.9% sodium chloride, lactated Ringer's solution, 5% dextrose and lactated Ringer's solution, 5% dextrose and 0.45% sodium chloride, 5% dextrose, 5% dextrose and 20 mEq potassium chloride, 0.45% sodium chloride, 5% dextrose and 0.9% sodium chloride. Do not use if solution is not clear or if it contains particulate matter. Use immediately after reconstitution. Discard any unused solution.

Infusion: Infuse over 1–2 hr at no more than 3 mg/kg/hr.

Incompatibilities: Do not infuse with parenteral nutrition, blood products, electrolyte

supplements, any alkaline solution, other drug infusions.

Adverse effects

- **CNS:** Headache, *visual disturbance*, hallucinations, dizziness
- **CV:** Tachycardia, BP changes, vasodilation, chest pain, peripheral edema, prolonged QTc interval
- **GI:** Nausea, vomiting, diarrhea, dry mouth, abnormal LFTs, abdominal pain
- **Hematologic:** Anemia, thrombocytopenia, leukopenia
- **Other:** *Fever*, chills, rash, pruritus, **anaphylactic reaction, Stevens-Johnson syndrome**

Interactions

* **Drug-drug** ⊗ **Warning** Decreased serum levels and effectiveness of voriconazole if combined with rifampin, rifabutin, carbamazepine, phenobarbital, mephobarbital; avoid these combinations.

⊗ **Warning** Increased serum levels of sirolimus, pimozone, quinidine, ergot alkaloids if taken with voriconazole; avoid these combinations.

⊗ **Warning** Increased plasma concentration of ergot alkaloids, which may lead to ergotism; avoid this combination.

• Possible alterations in serum levels and effectiveness of warfarin, tacrolimus, statins, oral anticoagulants, benzodiazepine, calcium channel blockers, sulfonyleureas, vincristine, vinblastine, when taken with voriconazole; patients should be monitored closely and appropriate dosage adjustments made • Altered serum levels and risk of adverse effects from both drugs when voriconazole is taken concomitantly with phenytoin, omeprazole, protease inhibitors; patients should be monitored frequently and appropriate dosage adjustments made • Increased plasma levels of cyclosporine; reduce cyclosporine dose to one-half of the starting dose and monitor cyclosporine blood levels frequently; after voriconazole therapy ends, increase cyclosporine dose as needed

* **Drug alternative therapy** • Risk of increased serum levels and toxicity if combined

with St. John's wort; this combination is contraindicated

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to *Escherichia coli* products, filgrastim, sickle cell disease, pregnancy, lactation
- **Physical:** Skin color, lesions, hair; T; orientation, affect; abdominal examination, status of mucous membranes; LFTs, renal function tests, CBC, platelets

Interventions

• Obtain baseline liver function before beginning therapy and repeat during the course of therapy. Stop drug at first sign of significant liver toxicity.

⊗ **Warning** Check patient's medications carefully before beginning drug therapy; voriconazole is associated with many drug interactions.

• Administer oral drug on an empty stomach, at least 1 hr before or 2 hr after meals.

• Monitor vision changes. Advise patient not to drive at night or perform potentially hazardous tasks because of possible visual disturbances.

• Protect patient from exposure to strong sunlight while using this drug.

• Women of childbearing age should be advised to use barrier contraceptives while using this drug because of the risk of fetal death or abnormalities.

• Provide appropriate comfort and supportive measures for headache or GI discomfort.

• Arrange for frequent small meals if nausea and vomiting are a problem.

Teaching points

• This drug will be started by IV infusion and then you will switch to an oral form.

• Take the drug on an empty stomach 1 hour before or 2 hours after a meal.

• Avoid exposure to strong sunlight while you are using this drug.

• Do not use St. John's wort while taking this drug.

• Women of childbearing age should use barrier contraceptives while using this

drug; it has been associated with fetal abnormalities.

- Tell any other health care provider that you see that you are taking this drug; it has been associated with many drug interactions when taken with other drugs. Adjustments may be needed.
- You may experience these side effects: Nausea and vomiting (eat frequent small meals); headache, fever (analgesics may be available that will help); visual changes (do not drive at night, avoid performing potentially hazardous tasks while on this drug).
- Report fever, chills, changes in color of stool or urine, visual disturbances.

▼ vorinostat

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▼ warfarin sodium (war'far in)

Apo-Warfarin (CAN), Coumadin,
Gen-Warfarin (CAN), Jantoven

PREGNANCY CATEGORY X

Drug classes

Coumarin derivative
Oral anticoagulant

Therapeutic actions

Interferes with the hepatic synthesis of vitamin K–dependent clotting factors (factors II, prothrombin, VII, IX, and X), resulting in their eventual depletion and prolongation of clotting times.

Indications

- Venous thrombosis and its extension, treatment, and prophylaxis
- Treatment of thromboembolic complications of atrial fibrillation with embolization, and cardiac valve replacement
- Pulmonary embolism, treatment, and prophylaxis
- Prophylaxis of systemic embolization after acute MI

Contraindications and cautions

- Contraindicated with allergy to warfarin; SBE; hemorrhagic disorders; TB; hepatic diseases; GI ulcers; renal disease; indwelling catheters, spinal puncture; aneurysm; diabetes; visceral carcinoma; uncontrolled hypertension; severe trauma (including recent or contemplated CNS, eye surgery; recent placement of IUD); threatened abortion, menometrorrhagia; pregnancy (fetal damage and death); lactation (suggest using heparin if anticoagulation is required).
- Use cautiously with HF; diarrhea; fever; thyrotoxicosis; senile, psychotic, or depressed patients.

Available forms

Tablets—1, 2, 2.5, 3, 4, 5, 6, 7.5, 10 mg; powder for injection—5 mg, reconstitutes to 2 mg/mL

Dosages

Dosage and administration must be individualized for each patient according to patient's prothrombin time (PT) and INR response. Target of therapy is INR of 2–3. IV use is reserved for situations in which oral warfarin is not feasible. Dosages are the same for oral and IV forms.

Adults

Initially, 2–5 mg/day PO. Adjust dosage according to PT response. For maintenance, 2–10 mg/day PO based on INR.

Geriatric patients

Lower doses are usually needed; begin with smaller doses than those recommended for adults, and closely monitor PT ratio or INR.

Pharmacokinetics

Route	Peak	Duration
Oral	1.5–3 days	2–5 days

Metabolism: Hepatic; $T_{1/2}$: 1–2.5 days

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

▼ IV FACTS

Preparation: Reconstitute vial with 2.7 mL of sterile water. Protect from light. Use within 4 hr of reconstitution.

Infusion: Inject slowly over 1–2 min; switch to oral preparation as soon as possible.

Adverse effects

- **Dermatologic:** *Alopecia, urticaria, dermatitis*
- **GI:** *Nausea*, vomiting, anorexia, abdominal cramping, diarrhea, retroperitoneal hematoma, hepatitis, jaundice, mouth ulcers
- **GU:** Priapism, nephropathy, red-orange urine
- **Hematologic:** Granulocytosis, leukopenia, eosinophilia; **hemorrhage**—GI or urinary tract bleeding (hematuria, dark stools; paralytic ileus, intestinal obstruction from hemorrhage into GI tract); petechiae and purpura, bleeding from mucous membranes; hemorrhagic infarction, vasculitis, skin necrosis; adrenal hemorrhage and resultant adrenal insufficiency; compressive neuropathy secondary to hemorrhage near a nerve
- **Other:** Fever, “purple toes” syndrome

Interactions

- * **Drug-drug** • Increased bleeding tendencies with salicylates, chloral hydrate, clofibrate, disulfiram, chloramphenicol, metronidazole, cimetidine, ranitidine, co-trimoxazole, sulfipyrazone, quinidine, quinine, thyroid drugs, glucagon, danazol, erythromycin, androgens, amiodarone, cefotetan, cefazolin, cefoxitin, ceftriaxone, meclizemate, mefenamic acid, famotidine, nizatidine, nalidixic acid, acetaminophen, allopurinol, quinolones, azole antifungals, fluvastatin, simvastatin, lovastatin, NSAIDs, alcohol • Decreased anticoagulation effect may occur with barbiturates, griseofulvin, rifampin, phenytoin, carbamazepine, vitamin K, vitamin E, cholestyramine • Altered effects with methimazole, propylthiouracil • Increased activity and toxicity of phenytoin when taken with oral anticoagulants
- * **Drug-lab test** • Red-orange discoloration of alkaline urine may interfere with some lab tests
- * **Drug-alternative therapy** • Increased risk of bleeding if combined with angelica, cat’s claw, chamomile, chondroitin, feverfew, garlic, ginkgo, goldenseal, grape seed extract, green leaf tea, horse chestnut seed, psyllium, fish oil, vitamin E, and tumeric

■ Nursing considerations Assessment

- **History:** Allergy to warfarin; SBE; hemorrhagic disorders; TB; hepatic diseases; GI ulcers; renal disease; indwelling catheters, spinal puncture; aneurysm; diabetes; visceral carcinoma; uncontrolled hypertension; severe trauma; threatened abortion, menometrorrhagia; pregnancy; lactation; HF; diarrhea; fever; thyrotoxicosis; senility, psychosis, or depression
- **Physical:** Skin lesions, color, T; orientation, reflexes, affect; P, BP, peripheral perfusion, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds, normal output; CBC, urinalysis, guaiac stools, PT, LFTs, renal function tests

Interventions

- Genetic testing can help to determine reasonable dosage. Decreased clearance occurs with CYP2C9*2 and CYP2C9*3 variant alleles.
- Do not use drug if patient is pregnant (heparin is anticoagulant of choice); advise patient to use contraceptives.
- Monitor PT ratio or INR regularly to adjust dosage.
- Administer IV form to patients stabilized on *Coumadin* who are not able to take oral drug. Dosages are the same. Return to oral form as soon as feasible.
- Do not change brand names once stabilized; bioavailability may be a problem.

⊗ **Black box warning** Evaluate patient regularly for signs of blood loss (petechiae, bleeding gums, bruises, dark stools, dark urine). Maintain INR ratio of 2–3, 3–4.5 with mechanical prosthetic valves or recurrent systemic emboli; risk of serious to fatal bleeding exists.

- Do not give patient any IM injections.
- ⊗ **Warning** Double check all drugs ordered for potential drug interactions; dosage of both drugs may need to be adjusted.
- Use caution when discontinuing other drugs; warfarin dosage may need to be adjusted; carefully monitor PT values.
- Keep vitamin K readily available in case of overdose.

- Arrange for frequent follow-up, including blood tests to evaluate drug effects.

⊗ **Warning** Evaluate for therapeutic effects: INR within therapeutic range.

Teaching points

- Many factors may change your body's response to this drug—fever, change of diet, change of environment, other medications. Do not drink alcohol while taking this drug. Your dosage may have to be changed repeatedly. Write down changes that are prescribed.
- Do not start or stop taking any medication without consulting your health care provider. Other drugs can affect your anticoagulant; starting or stopping another drug can cause excessive bleeding or interfere with the desired drug effects.
- Carry or wear a medical ID tag to alert emergency medical personnel that you are taking this drug.
- Avoid situations in which you could be easily injured (contact sports, shaving with a straight razor).
- Have periodic blood tests to check on the drug action. These tests are important.
- Use contraception; do not become pregnant while taking this drug.
- You may experience these side effects: Stomach bloating, cramps (transient); loss of hair, rash; orange-red discoloration to the urine (if upsetting, add vinegar to your urine and the color should disappear).
- Report unusual bleeding (from brushing your teeth, excessive bleeding from injuries, excessive bruising), black or bloody stools, cloudy or dark urine, sore throat, fever, chills, severe headaches, dizziness, suspected pregnancy.

xylometazoline hydrochloride

(zye low met az' oh leen)

Otrivin Nasal Drops or Spray,
Otrivin Pediatric Nasal Drops

PREGNANCY CATEGORY C

Drug class

Nasal decongestant

Therapeutic actions

Acts directly on alpha receptors to produce vasoconstriction of arterioles in nasal passages, which produces a decongestant response; no effect on beta receptors.

Indications

- Topical: Symptomatic relief of nasal and nasopharyngeal mucosal congestion caused by the common cold, hay fever, or other respiratory allergies

Contraindications and cautions

- Contraindicated with allergy to xylometazoline, angle-closure glaucoma, anesthesia with cyclopropane or halothane, thyrotoxicosis, diabetes, hypertension, CV disorders, women in labor whose BP exceeds 130/80 mm Hg.
- Use cautiously with angina, arrhythmias, prostatic hypertrophy, unstable vasomotor syndrome, lactation, pregnancy.

Available forms

Nasal solution—0.05%, 0.1%

Dosages

Adults and patients 12 yr and older

Two or three sprays or 2–3 drops in each nostril every 8–10 hr (0.1% solution).

Pediatric patients 2–12 yr

Two or three drops of 0.05% solution or one spray in each nostril every 8–10 hr (0.05% solution). Do not exceed three doses in 24 hr.

Pharmacokinetics

Route	Onset	Duration
Nasal	5–10 min	5–6 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

Systemic effects are less likely with topical administration than with systemic administration, but because systemic absorption can take place, the systemic effects should be considered.

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, symptoms of paranoid schizophrenia*
- **CV:** Arrhythmias, hypertension resulting in intracranial hemorrhage, CV collapse with hypotension, palpitations, tachycardia, precordial pain in patients with ischemic heart disease
- **GI:** *Nausea, vomiting, anorexia*
- **GU:** Constriction of renal blood vessels, *dysuria, vesical sphincter spasm*, resulting in difficult and painful urination; urinary retention in males with prostatism
- **Local:** *Rebound congestion* with topical nasal application
- **Other:** *Pallor*, respiratory difficulty, orofacial dystonia, sweating

Interactions

- **Drug-drug** • Severe hypertension with MAOIs, TCAs, furazolidone • Additive effects and increased risk of toxicity with urinary alkalinizers • Decreased vasopressor response with reserpine, methyl dopa, urinary acidifiers

■ Nursing considerations

Assessment

- **History:** Allergy to xylometazoline; angle-closure glaucoma; anesthesia with cyclopropane or halothane; thyrotoxicosis, diabetes, hypertension, CV disorders; prostatic hypertrophy, unstable vasomotor syndrome; lactation
- **Physical:** Skin color, T; orientation, reflexes, peripheral sensation, vision; P, BP, auscultation, peripheral perfusion; R, adventitious sounds; urinary output pattern, bladder percussion, prostate palpation; nasal mucous membrane evaluation

Interventions

- **⊗ Warning** Monitor CV effects carefully in hypertensive patients; change in BP may be from additional vasoconstriction. If a nasal decongestant is needed, pseudoephedrine is the drug of choice.

Teaching points

- Do not exceed recommended dose. Demonstrate proper administration technique for topical nasal application. Avoid prolonged use because underlying medical problems can be disguised.
- Rebound congestion may occur when this drug is stopped; drink plenty of fluids, use a humidifier, avoid smoke-filled areas.
- You may experience these side effects: Dizziness, weakness, light-headedness, restlessness, tremor (avoid driving or operating dangerous equipment); urinary retention (empty bladder before taking drug).
- Report nervousness, palpitations, sleeplessness, sweating.

▷ zafirlukast

(zab fur' lub kast)

Accolate

PREGNANCY CATEGORY B

Drug classes

Antiasthmatic

Leukotriene receptor antagonist

Therapeutic actions

Selectively and competitively blocks receptor for leukotriene D₄ and E₄, components of SRS-A, thus blocking airway edema, smooth muscle constriction, and cellular activity associated with inflammatory process that contribute to signs and symptoms of asthma.

Indications

- Prophylaxis and long-term treatment of bronchial asthma in adults and children 5 yr and older
- Unlabeled use: Chronic urticaria

Contraindications and cautions

- Contraindicated with hypersensitivity to zafirlukast or any of its components, acute asthma attacks, status asthmaticus.
- Use cautiously in patients who previously required corticosteroid therapy to control asthma; with hepatic or renal impairment; as oral steroid use is decreased; pregnancy; lactation.

Available forms

Tablets—10, 20 mg

Dosages**Adults and patients 12 yr and older**

20 mg PO bid on an empty stomach 1 hr before or 2 hr after eating.

Pediatric patients 5–11 yr

10 mg PO bid on an empty stomach.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3 hr

Metabolism: Hepatic; $T_{1/2}$: 10 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** *Headache*, dizziness, myalgia, behavior and mood changes
- **GI:** Nausea, diarrhea, abdominal pain, vomiting, liver enzyme elevation
- **Other:** Generalized pain, fever, accidental injury, infection; **Churg-Strauss syndrome** (eosinophilia, vasculitic rash, pulmonary and cardiac complications) when oral steroid dose is reduced

Interactions

★ **Drug-drug** • Increased risk of bleeding with warfarin; these patients should have INR done regularly and warfarin dose decreased accordingly • Potential for increased effects and toxicity of calcium channel blockers, cyclosporine • Decreased effectiveness with erythromycin, theophylline • Possible severe reaction when oral steroid dose is reduced while on zafirlukast; monitor patients very closely

★ **Drug-food** • Bioavailability decreased markedly by presence of food; administer at least 1 hr before or 2 hr after meals

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to zafirlukast; impaired renal or hepatic function; pregnancy, lactation; acute asthma or bronchospasm

- **Physical:** T; orientation, reflexes; R, adventitious sounds; GI evaluation; LFTs, renal function tests

Interventions

- Administer on an empty stomach 1 hr before or 2 hr after meals.
- Ensure that drug is taken continually for optimal effect.

⊗ **Warning** Do not administer for acute asthma attack or acute bronchospasm.

⊗ **Warning** There is a risk of neuropsychiatric events, mood and behavior changes with drug administration. Monitor patient accordingly; discontinue drug if these occur.

Teaching points

- Take this drug on an empty stomach, 1 hour before or 2 hours after meals.
- Take this drug regularly as prescribed; do not stop taking it during symptom-free periods; do not stop taking it without consulting your health care provider.
- Do not take this drug for acute asthma attack or acute bronchospasm; this drug is not a bronchodilator; routine emergency procedures should be followed during acute attacks.
- Avoid use of over-the-counter medications while using this drug; many of them contain products that can interfere with drug or cause serious side effects. If you think that you need one of these products, consult your health care provider.
- You may experience these side effects: Dizziness (use caution when driving or performing activities that require alertness); nausea, vomiting (eat frequent small meals); headache (analgesics may be helpful).
- Report fever, acute asthma attacks, severe headache.

▽ zaleplon*(zal' ab plon)*

Sonata

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-IV

Drug class

Sedative-hypnotic (nonbarbiturate)

Therapeutic actions

Interacts with GABA-B2 receptor complex to cause suppression of neurons leading to sedation and hypnosis.

Indications

- Short-term treatment of insomnia

Contraindications and cautions

- Contraindicated with hypersensitivity to zaleplon, lactation.
- Use cautiously with impaired hepatic or respiratory function, depressed patients, pregnancy, labor and delivery.

Available forms

Capsules—5, 10 mg

Dosages**Adults**

10 mg PO at bedtime. Patient must remain in bed for 4 hr after taking the drug. Do not exceed 20 mg/day.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or debilitated patients

5 mg PO at bedtime. Do not exceed 10 mg/day.

Patients with hepatic impairment

Mild to moderate impairment: 5 mg/day

Severe impairment: Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 1 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, depression, drowsiness, somnolence, abnormal vision, lack of coordination, *short-term memory impairment*, complex sleep-related behaviors
- **GI:** Diarrhea

- **Hypersensitivity:** Generalized allergic reactions; pruritus, rash; **anaphylaxis; angioedema**

Interactions

- *** Drug-drug** • Increased sedation with alcohol or other CNS depressants; avoid this combination • Risk of increased serum levels and toxicity with cimetidine, rifampin

Nursing considerations
Assessment

- **History:** Hypersensitivity to zaleplon, impaired hepatic or respiratory function, pregnancy, labor or delivery, lactation, depression
- **Physical:** T, orientation, affect, reflexes, vision examination; P, BP; bowel sounds, normal output, liver evaluation; LFTs

Interventions

- Do not prescribe or dispense more than 1 month's supply at a time.
- **⊗ Warning** Limit amount of drug dispensed to depressed patients.
- Administer to patient at bedtime; onset of action is rapid and sleep usually occurs within 20 min; encourage patient to remain in bed for 4 hr after taking drug to ensure patient safety.
- Help patients with prolonged insomnia to seek the cause of their problem and not to rely on drugs for sleep (eg, ingestion of stimulants such as caffeine shortly before bedtime, fear).
- Institute appropriate additional measures for rest and sleep (eg, back rub, quiet environment, warm milk, reading).

Teaching points

- Take this drug exactly as prescribed. Do not exceed prescribed dosage. Long-term use is not recommended. Time your drug dose to allow you to go to bed immediately after taking the drug. Drug effects will be felt for 4 hours; after that time you may safely become active again.
- You may experience these side effects: Drowsiness, allergic reactions, swelling, dizziness, blurred vision (avoid driving a car or performing tasks requiring alertness)

or visual acuity if these occur); diarrhea (ensure ready access to bathroom facilities), sleep disorders.

- Report rash, sore throat, fever, bruising, allergic reaction, swelling, complex sleep-related behaviors.

zanamivir

(zan am' ab ver)

Relenza

PREGNANCY CATEGORY C

Drug classes

Antiviral

Neuroaminidase inhibitor

Therapeutic actions

Selectively inhibits influenza virus neuroaminidase; by blocking the actions of this enzyme, there is decreased viral release from infected cells, increased formation of viral aggregates, and decreased spread of the virus.

Indications

- Prevention and treatment of uncomplicated acute illness due to influenza virus in adults and children 7 yr and older who have been symptomatic for 2 days
- Prevention of influenza in patients 5 yr and older
- Unlabeled use: Treatment of H1N1 infection

Contraindications and cautions

- Contraindicated with allergy to any component of the drug.
- Use cautiously with pregnancy, lactation, asthma, COPD, or severe medical conditions.

Available forms

Powder blister for inhalation—5 mg

Dosages

Adults and children 7 yr and older

Treatment: Two inhalations (one 5-mg blister per inhalation administered with a *Diskhaler* device, for a total of 10 mg) bid at 12 hr intervals for 5 days. Should be started within 2 days of onset of flu symptoms; give two doses on the first treatment day, at least

2 hr apart; subsequent doses should be separated by 12 hr.

Adults and children 5 yr and older

Prevention in community outbreak: Two inhalations (10 mg) per day for 28 days. Dose should be given at about the same time each day.

Prevention in household exposure: Two inhalations (10 mg) per day for 10 days. Dose should be given at about the same time each day.

Pharmacokinetics

Route	Onset	Peak
Inhalation	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, dizziness
- **GI:** *Nausea*, vomiting, *diarrhea*, *anorexia*
- **Respiratory:** Cough; *rhinitis*; bronchitis; ear, nose, and throat infections; **bronchospasm; serious respiratory effects**
- **Other:** Flulike symptoms, bacterial infections

■ Nursing considerations

Assessment

- **History:** Allergy to any components of the drug; COPD, asthma; pregnancy, lactation
- **Physical:** T; orientation, reflexes; R, adventitious sounds; bowel sounds

Interventions

- Administer using a *Diskhaler* delivery system. Demonstrate use of system to patient.
- Encourage patient to complete full course of therapy; advise patient that risk of transmission of flu to others is not decreased.
- Administer bronchodilators before using zanamivir if they are due at the same time as zanamivir dose.

⊗ **Warning** Caution patients with asthma or COPD of the risk of bronchospasm; a fast-acting inhaled bronchodilator should be on hand in case bronchospasm occurs; zanamivir should be discontinued and physician

consulted promptly if respiratory symptoms worsen.

Teaching points

- Take this drug every 12 hours, at the same time each day, for as many days as prescribed. Use the *Diskbaler* delivery system provided.
- Take the full course of therapy as prescribed; this drug does not decrease the risk of transmitting the virus to others.
- If a bronchodilator is being used to treat a respiratory problem, the bronchodilator should be used before this drug.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea; headache, dizziness (use caution if driving or operating dangerous machinery).
- Report severe diarrhea, severe nausea, worsening of respiratory symptoms.

ziconotide

See Appendix U, *Less commonly used drugs*.

zidovudine (azidothymidine, AZT, Compound S)

(*zid o vew' den*)

Retrovir

PREGNANCY CATEGORY C

Drug class

Antiviral

Therapeutic actions

Thymidine analogue isolated from the sperm of herring; drug is activated to a triphosphate form that inhibits replication of some retroviruses, including HIV, HTLV III, alpha retrovirus, lymphadenopathy-associated virus.

Indications

- Management of certain adult patients with symptomatic HIV infection in combination with other antiretrovirals
- Prevention of maternal–fetal HIV transmission

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component, pregnancy, lactation.
- Use cautiously with compromised bone marrow, impaired renal or hepatic function.

Available forms

Capsules—100 mg; tablets—300 mg; syrup—50 mg/5 mL; injection—10 mg/mL

Dosages

Adults

Oral

- *Symptomatic HIV infection*: 600 mg daily in divided doses as either 200 mg tid or 300 mg bid. Monitor hematologic indices every 2 wk. If significant anemia (Hgb less than 7.5 g/dL, reduction of more than 25%) or reduction of granulocytes more than 50% below baseline occurs, dose interruption is necessary until evidence of bone marrow recovery is seen. If less severe bone marrow depression occurs, a dosage reduction may be adequate.
- *Prevention of maternal–fetal transmission*: 100 mg PO five times/day until the start of labor.

IV

1 mg/kg 5–6 times/day infused over 1 hr.

Pediatric patients 6 wk–12 yr

4 to less than 9 kg: 24 mg/kg/day PO in two to three divided doses.

9 to less than 30 kg: 18 mg/kg/day PO in two to three divided doses.

30 kg and over: 600 mg/day PO in two to three divided doses.

Infants born to HIV-infected mothers

2 mg/kg every 6 hr starting within 12 hr of birth to 6 wk of age or 1.5 mg/kg IV over 30 min every 6 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	30–90 min
IV	Rapid	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 30–60 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Remove desired dose from vial, and dilute in D₅W to a concentration no greater than 4 mg/mL. Discard after 24 hr. Protect from light.

Infusion: Administer over 60 min; avoid rapid infusion. For a pregnant patient, when labor starts, given to the mother as a single 2 mg/kg dose infused over 1 hr followed by 1 mg/kg/hr given by continuous IV infusion until the umbilical cord is clamped.

Incompatibilities: Do not mix with blood or blood products.

Adverse effects

- **CNS:** *Headache*, insomnia, myalgia, *asthenia*, malaise, dizziness, paresthesias, somnolence
- **GI:** *Nausea*, *GI pain*, *diarrhea*, anorexia, vomiting, dyspepsia, lactic acidosis with severe hepatomegaly
- **Hematologic:** *Agranulocytopenia*, severe anemia requiring transfusions
- **Other:** *Fever*, diaphoresis, dyspnea, *rash*, taste perversion

Interactions

- **Drug-drug** • Increased risk of hematologic toxicity if combined with nephrotoxic, cytotoxic, or bone marrow suppressing drugs, ganciclovir, interferon alfa, probenecid, methadone, phenytoin • Increased risk of neurotoxicity when used with acyclovir • Severe drowsiness and lethargy with cyclosporine
- **Drug-alternative therapy** • Decreased effectiveness if taken with St. John's wort

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Retrovir* (zidovudine) and ritonavir; use caution.

Assessment

- **History:** Life-threatening allergy to any component, compromised bone marrow, impaired renal or hepatic function, pregnancy, lactation
- **Physical:** Skin rashes, lesions, texture; T; affect, reflexes, peripheral sensation; bowel

sounds, liver evaluation; LFTs, renal function tests, CBC and differential

Interventions

⊗ **Black box warning** Monitor hematologic indices every 2 wk; hematologic toxicity has occurred.

- Give the drug around-the-clock; rest periods may be needed during the day due to interrupted sleep.

⊗ **Black box warning** Monitor LFTs; lactic acidosis with severe hepatomegaly is possible.

⊗ **Black box warning** Patient is at increased risk for symptomatic myopathy; monitor accordingly.

Teaching points

- Take drug every 4 hours, around-the-clock. Use an alarm clock to wake you up at night; rest periods during the day may be needed. Do not share this drug; take exactly as prescribed. Take this drug with your other HIV medications.
- Zidovudine is not a cure for AIDS or AIDS-related complex; opportunistic infections may occur; obtain continuous medical care.
- Arrange for frequent blood tests; results of blood counts may indicate dosage needs to be decreased or drug discontinued temporarily.
- Zidovudine does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination; use precautions.
- You may experience these side effects: Nausea, loss of appetite, change in taste (eat frequent small meals); dizziness, loss of feeling (use precautions); headache, fever, muscle aches.
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty breathing, rash.

 **zileuton**
(*zye loot' on*)

Zyflo, Zyflo CR ONG

PREGNANCY CATEGORY C

Drug classes

Antiasthmatic

Leukotriene formation inhibitor

Therapeutic actions

Selectively and competitively blocks the receptor that inhibits leukotriene formation, thus blocking many of the signs and symptoms of asthma (neutrophil and eosinophil migration, neutrophil and monocyte aggregation, leukocyte adhesion, increased capillary permeability, and smooth muscle contraction). These actions contribute to inflammation, edema, mucus secretion and bronchoconstriction caused by cold air challenge in patients with asthma.

Indications

- Prophylaxis and long-term treatment of asthma in adults and children 12 yr and older

Contraindications and cautions

- Contraindicated with hypersensitivity to zileuton or any of its components, acute asthma attacks, status asthmaticus, pregnancy and lactation, severe hepatic impairment.
- Use cautiously with hepatic impairment.

Available formsCR tablets **mc**—600 mg; tablets—600 mg**Dosages****Adults and patients 12 yr and older**

CR tablets, 1,200 mg (2 tablets) PO bid within 1 hr after morning and evening meals for a total daily dose of 2,400 mg. Tablets, 600 mg PO four times daily for a total daily dose of 2,400 mg.

Patients with hepatic impairment

Use caution; contraindicated if liver enzymes (AST, ALT) three or more times normal.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.7 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

Adverse effects

- **CNS:** *Headache*, dizziness, myalgia, behavior and mood changes
- **GI:** Nausea, diarrhea, abdominal pain, vomiting, **elevation of liver enzymes**
- **Other:** Generalized pain, fever, myalgia

Interactions

- *** Drug-drug** • Increased effects of propranolol, theophylline, warfarin; monitor patient and decrease dose as appropriate
- *** Drug-food** • Bioavailability decreased markedly by the presence of food; administer at least 1 hr before or 2 hr after meals

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to zileuton, impaired hepatic function, lactation, pregnancy, acute asthma or bronchospasm
- **Physical:** T; orientation, reflexes; R, adventitious sounds; GI evaluation; LFTs

Interventions

⊗ **Warning** Obtain baseline LFTs before beginning therapy; monitor liver enzymes on a regular basis during therapy; discontinue drug and consult prescriber if enzymes rise more than three times normal.

⊗ **Warning** There is a risk of neuropsychiatric events, including mood and behavior changes with drug administration. Monitor accordingly; discontinue drug if these occur.

- Administer CR tablets within 1 hour after morning and evening meals. Do not cut, crush, or let patient chew CR tablets.

- Ensure that drug is taken continually for optimal effect.

⊗ **Warning** Do not administer for acute asthma attack or acute bronchospasm.

Teaching points

- Take this drug regularly as prescribed; do not stop taking this drug during symptom-free periods; do not stop taking this drug without consulting your health care provider. Continue taking any other antiasthmatics that have been prescribed for you.
- Do not cut, crush, or chew CR tablets; swallow them whole. Take CR tablets

within 1 hour after morning and evening meals.

- Do not take this drug for an acute asthma attack or acute bronchospasm; this drug is not a bronchodilator; routine emergency procedures should be followed during acute attacks.
- Avoid the use of over-the-counter drugs while you are using this medication; many of them contain products that can interfere with or cause serious side effects when used with this drug. If you feel that you need one of these products, consult your health care provider.
- You may experience these side effects: Dizziness (use caution when driving or performing activities that require alertness); nausea, vomiting (eat frequent small meals; take drug with food); headache (analgesics may be helpful).
- Report fever, acute asthma attacks, flulike symptoms, lethargy, pruritus, changes in color of urine or stool.

▼ ziprasidone

(zib praz' i done)

Geodon

PREGNANCY CATEGORY C

Drug classes

Atypical antipsychotic
Benzisoxazole

Therapeutic actions

Mechanism of action not fully understood; blocks dopamine and serotonin receptors in the brain, depresses the reticular activating system; effective in suppressing many of the negative aspects of schizophrenia (blunted affect, social withdrawal, lack of motivation, anger).

Indications

- Treatment of schizophrenia and to delay the time and rate of relapse
- Oral: Treatment of acute bipolar mania including manic or mixed episodes associated with bipolar disorder with or without psychotic features; maintenance treatment, used with lithium and valproate
- IM: Rapid control of agitated behavior and psychotic symptoms in patients with acute schizophrenia exacerbations

- **NEW INDICATION:** Unlabeled uses: Autism, Tourette syndrome

Contraindications and cautions

- Contraindicated with allergy to ziprasidone, prolonged QTc interval, history of severe cardiac disease.
- Use cautiously with renal or hepatic impairment, CV disease, pregnancy, lactation.

Available forms

Capsules—20, 40, 60, 80 mg; powder for injection—20 mg/mL

Dosages

Adults

- **Schizophrenia:** Initially, 20 mg PO bid with food. Adjust as needed. Effective range, 20–80 mg PO bid.
- **Rapid control of agitated behavior:** 10–20 mg IM; doses of 10 mg may be repeated every 2 hr; doses of 20 mg may be repeated in 4 hr. Maximum dose, 40 mg/day.
- **Bipolar mania:** 40 mg PO bid with food. May be increased to 60 or 80 mg PO bid with food.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, drowsiness, sedation, headache*, extrapyramidal reactions
- **CV:** **Arrhythmias**, hypotension, ECG changes, hypertension, prolonged QTc interval
- **GI:** *Nausea, dyspepsia, constipation*, abdominal discomfort, dry mouth
- **GU:** Polyuria
- **Other:** *Fever*, weight gain (not as likely as with other antipsychotics), rash, risk of development of diabetes mellitus

Interactions

★ **Drug-drug** ⊗ **Warning** Increased risk of severe cardiac arrhythmias if taken with other drugs that prolong the QTc interval.

● Additive hypotension when given with anti-hypertensives

★ **Drug-alternative therapy** ● Possibility of increased toxicity if taken with St. John's wort

■ Nursing considerations

Assessment

● **History:** Allergy to ziprasidone, pregnancy, lactation, cardiac disease, hepatic or renal impairment, prolonged QTc interval

● **Physical:** T, weight; reflexes, orientation; P, ECG; bowel sounds, normal output, liver evaluation; normal urine output; urinalysis, LFTs, renal function tests

Interventions

⊗ **Warning** Ensure that patient is not pregnant before beginning therapy; advise patient to use contraceptive measures while using this drug.

⊗ **Black box warning** Increased risk of death if used in elderly patients with dementia-related psychosis; do not use drug in these patients; drug not approved for this use.

- Obtain baseline ECG to rule out prolonged QTc interval; monitor periodically throughout therapy.
- Monitor weight before beginning therapy and periodically during therapy. Weight gain is not usually a concern with this drug.
- Monitor patient regularly for signs and symptoms of diabetes mellitus.
- Follow patients with renal or hepatic impairment carefully throughout therapy.
- Continue other measures used to deal with schizophrenia.

Teaching points

- This drug cannot be taken during pregnancy. If you think you are pregnant, or want to become pregnant, consult your health care provider.
- You may experience these side effects: Somnolence, drowsiness, dizziness, sedation (avoid driving a car, operating machinery, or performing tasks that require concentration); nausea, dyspepsia (eat frequent small meals);

headache (analgesics may be available to help, consult your health care provider).

- Report lethargy, weakness, fever, sore throat, palpitations, return of symptoms.

▼ zoledronic acid

(*zob leb drob' nik*)

Reclast, Zometa

PREGNANCY CATEGORY D

Drug classes

Bisphosphonate
Calcium regulator

Therapeutic actions

A bisphonic acid that inhibits bone resorption, possibly by inhibiting osteoclast activity and promoting osteoclast cell apoptosis; this action leads to a decrease in the release of calcium from bone and a decrease in serum calcium.

Indications

- IV treatment of the hypercalcemia of malignancy (*Zometa*)
- Treatment of Paget's disease of bone in men and women (*Reclast*)
- Treatment of postmenopausal osteoporosis and osteoporosis in men (*Reclast*)
- Prevention of new clinical fractures in patients with low-trauma hip fractures (*Reclast*)
- Treatment of patients with multiple myelomas and patients with documented bone metastases from solid tumors in conjunction with standard antineoplastic therapy (*Zometa*)
- **NEW INDICATION:** Treatment and prevention of glucocorticoid-induced osteoporosis (*Reclast*)
- **NEW INDICATION:** Prevention of osteoporosis in postmenopausal women (*Reclast*)

Contraindications and cautions

- Contraindicated with allergy to any components of the drug or to bisphosphonates; severe renal impairment.
- Use cautiously with renal impairment (do not exceed single doses of 4 mg, and duration

of infusion must not be less than 15 min), hepatic impairment, aspirin-sensitive asthmatic patients, pregnancy, or lactation.

Available forms

Injection—4 mg/5 mL; 5 mg/100 mL (*Reclast*)

Dosages

Adults

Zometa: 4 mg IV as a single-dose infusion of not less than 15 min for hypercalcemia of malignancy with albumin-corrected serum calcium levels of 12 mg/dL or greater. Retreatment may be done with 4 mg IV if needed; a minimum of 7 days should elapse between doses with careful monitoring of serum creatinine levels. Patients with solid tumors should receive 4 mg IV every 3–4 wk to treat bone metastasis.

Reclast: 5 mg IV infused via vented infusion line over at least 15 min. Retreatment may be considered as needed once every 2 yr for osteoporosis.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Zometa: Mild to moderate renal impairment for patients with multiple myeloma and bone metastases from solid tumors (see chart for dosages).

CrCl (mL/min)	Dose
More than 60	4 mg
50–60	3.5 mg
40–49	3.3 mg
30–39	3 mg
Less than 30	Contraindicated

Reclast: If creatinine clearance 35 mL/min or greater, 5 mg over at least 15 min. Not recommended for patients with severe renal failure.

Pharmacokinetics

Route	Onset	Peak
IV	Slow	8 hr

Metabolism: Hepatic; $T_{1/2}$: 0.23 hr then 1.75 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Withdraw solution, equivalent to 4 mg *Zometa*, further dilute in 100 mL 0.9% sodium chloride, 5% dextrose injection. May be refrigerated and stored for up to 24 hr before the time of the end of the infusion. For *Reclast*, no additional preparation needed; use a vented infusion line.

Infusion: Infuse over no less than 15 min.

Incompatibilities: Do not mix with any other drug solution; always administer via a separate line. Physically incompatible with calcium-containing infusions.

Adverse effects

- **CNS:** Agitation, confusion, *insomnia*, anxiety
- **CV:** *Hypotension*
- **GI:** *Nausea, constipation*, vomiting, diarrhea, abdominal pain, anorexia
- **Hematologic:** Hypophosphatemia, hypokalemia, hypomagnesemia, hypocalcemia
- **Respiratory:** *Dyspnea*, coughing, pleural effusion
- **Other:** *Infections* (UTI, candidiasis), *fever*; progression of cancer, osteonecrosis of the jaw, renal impairment

Interactions

* **Drug-drug** • Possible increased risk of hypocalcemia if taken with aminoglycosides, loop diuretics; if this combination is used, monitor serum calcium levels closely

Nursing considerations

Assessment

- **History:** Allergy to components of the drug or any bisphosphonate, hepatic or renal impairment, aspirin-sensitive asthma, pregnancy, lactation
- **Physical:** T, BP, R, orientation and affect, adventitious sounds, CBC and electrolytes, renal function tests

Interventions

- Do not confuse *Reclast* and *Zometa*; dosage varies.
- Arrange for the patient to have a dental examination and any needed preventive treatments before beginning therapy. Avoid any invasive dental work or surgery while on this

drug to decrease risk of osteonecrosis of the jaw.

- Patients who receive zoledronic acid should also receive 500 mg of elemental calcium daily and a multivitamin containing 400 units of vitamin D daily.
- Make sure that patient is well hydrated before use; vigorous saline hydration to establish a urine output of about 2 L/day is suggested.
- Monitor urinary output and assess patient for hydration status continually.

⊗ **Warning** Monitor serum creatinine levels prior to each dose of zoledronic acid; follow dosage guidelines for any indication of renal toxicity.

⊗ **Warning** There is an increased risk of renal impairment and renal failure with drug administration. Check renal function regularly; use caution with other nephrotoxic drugs.

- Ensure that reconstituted solution is infused within 24 hr of reconstitution.
- For *Reclast*, make sure to use a vented infusion line.
- Ensure that drug infuses over not less than 15 min.
- Provide frequent small meals if GI upset occurs.
- Arrange for nutritional consult if nausea and vomiting are persistent.
- Monitor patient for any sign of infection and arrange for appropriate interventions.

Teaching points

- Arrange to have a dental examination and complete any needed treatment before starting this drug.
- This drug must be given by IV infusion; you will be closely monitored prior to and following the infusion.
- If you are returning for infusions every 3–4 weeks or once per year, mark a calendar with your return dates.
- It is important to maintain your fluid levels before using this drug; drink fluids as much as possible to ensure that you are hydrated.
- It is important to take vitamin D and calcium supplements to help prevent osteoporosis and reduce the risk of new fractures.
- Avoid invasive dental procedures and dental surgery.

- You may experience these side effects: Nausea, vomiting (eat frequent small meals); agitation, confusion, anxiety (consult your health care provider if this becomes a problem).
- Report difficulty breathing, muscle pain, tremors, pain at injection site.

zolmitriptan

(zobl mah *trip'* tan)

Zomig **ORC**, Zomig-ZMT

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug

Serotonin selective agonist

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selected patients.

Indications

- Treatment of acute migraine attacks with or without aura

Contraindications and cautions

- Contraindicated with allergy to zolmitriptan, active CAD, Prinzmetal's angina, pregnancy.
- Use cautiously with the elderly and with lactation.

Available forms

Tablets **ORC**—2.5, 5 mg; nasal spray—5 mg; orally disintegrating tablet—2.5, 5 mg

Dosages

Adults

Oral

For tablets or orally disintegrating tablets, 2.5 mg PO at onset of headache or with beginning of aura; may repeat dose if headache persists after 2 hr; do not exceed 10 mg in 24 hr.

Nasal spray

1 spray in nostril at onset of headache or beginning of aura; may repeat in 2 hr if needed. Maximum dose, 10 mg/24 hr.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Use caution; keep doses at 2.5 mg or less. Significant increases in BP can occur.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr
Nasal	15 min	2 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–3.7 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, vertigo, headache, anxiety, malaise or fatigue, weakness, myalgia*
- **CV:** *BP alterations, tightness or pressure in chest*
- **GI:** Abdominal discomfort, dysphagia
- **Other:** *Tingling, warm/hot sensations, burning sensation, feeling of heaviness, pressure sensation, numbness, feeling of tightness, feeling strange, cold sensation*

Interactions

★ **Drug-drug** ⊗ **Warning** Risk of severe effects with an MAOI or within 2 wk of discontinuing an MAOI.

- Prolonged vasoactive reactions with ergot-containing drugs
- Increased risk of toxic effects with cimetidine, hormonal contraceptives
- A serotonin syndrome may occur when sibutramine is coadministered

■ Nursing considerations**Assessment**

- **History:** Allergy to zolmitriptan, active CAD, Prinzmetal's angina, pregnancy, lactation
- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as prophylactic measure. Ensure that patient does not cut, crush, or chew tablets.
- Establish safety measures if CNS or visual disturbances occur.

- Control environment as appropriate to help relieve migraine (eg, lighting, temperature).
- ⊗ **Warning** Monitor BP of patients with possible CAD; discontinue at any sign of angina or prolonged high BP.

Teaching points

- Take this drug exactly as prescribed, at the onset of headache or aura.
- Use drug right after removing from blister package. Do not break, crush, or chew tablet. Place orally disintegrating tablet on your tongue and let it dissolve. If using nasal spray, use one spray only; spray may be repeated after 2 hours if needed.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, contact your health care provider and stop using the drug.
- Continue measures that usually help you during a migraine (adjust lighting, noise).
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or using dangerous machinery); numbness, tingling, feelings of tightness or pressure.
- Report feelings of heat, flushing, tiredness, nausea, swelling of lips or eyelids.

▽ zolpidem tartrate (zol' pib dem)

Ambien, Ambien CR **OND**, Edluar **OND**,
Tovalt ODT **OND**, Zolpimist

PREGNANCY CATEGORY B
(IMMEDIATE-RELEASE)

PREGNANCY CATEGORY C
(ER)

CONTROLLED SUBSTANCE C-IV

Drug class

Sedative-hypnotic (nonbarbiturate)

Therapeutic actions

Modulates GABA receptors to cause suppression of neurons, leading to sedation, anticonvulsant, anxiolytic, and relaxant properties.

Indications

- Short-term treatment of insomnia
- Treatment of insomnia in adults who experience difficulties with sleep onset and sleep maintenance (ER tablets)

Contraindications and cautions

- Contraindicated with hypersensitivity to zolpidem.
- Use cautiously with acute intermittent porphyria, impaired hepatic or renal function, addiction-prone patients, pregnancy, lactation.

Available forms

Tablets—5, 10 mg; ER tablets **ORC**—6.25, 12.5 mg; orally disintegrating tablets **ORC**—5, 10 mg; oral spray—5, 10 mg; sublingual tablet—5, 10 mg

Dosages

Adults

10 mg PO at bedtime. Do not exceed 10 mg/day. ER tablets—12.5 mg/day PO. Oral spray—Two to three sprays in mouth, over tongue at bedtime.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Increased chance of confusion, acute brain syndrome; initiate treatment with 5 mg PO or 6.25 mg/day PO ER tablets.

Pharmacokinetics

Route	Onset	Peak
Oral	45 min	1.6 hr

Metabolism: Hepatic; $T_{1/2}$: 2.6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Seizures, hallucinations, ataxia, EEG changes, pyrexia, *morning drowsiness*, *hangover*, *headache*, *dizziness*, vertigo, acute brain syndrome and confusion; paradoxical excitation, anxiety, depression, nightmares, dreaming, diplopia, blurred vision, *suppression of REM sleep*, REM rebound when drug is discontinued, complex sleep disorders

- **GI:** Esophagitis, vomiting, *nausea*, diarrhea, constipation
- **Hypersensitivity:** Generalized allergic reactions; pruritus, rash
- **Other:** Flulike symptoms, dry mouth, infection, **anaphylaxis**, **angioedema**

Nursing considerations

Assessment

- **History:** Hypersensitivity to zolpidem, acute intermittent porphyria, impaired hepatic or renal function, addiction-prone, lactation, pregnancy
- **Physical:** T; skin color, lesions; orientation, affect, reflexes, vision examination; P, BP; bowel sounds, normal output, liver evaluation; CBC with differential; LFTs, renal function tests

Interventions

⊗ **Warning** Limit amount of drug dispensed to patients who are depressed or suicidal.

⊗ **Warning** Withdraw drug gradually if patient has used drug long-term or if patient has developed tolerance. Supportive therapy similar to that for withdrawal from barbiturates may be necessary to prevent dangerous withdrawal symptoms.

- Place orally disintegrating tablet in patient's mouth; have patient swallow tablet with saliva. Do not allow patient to chew, break, or split tablet.
- Prime oral spray before first use by compressing the container five times. Teach the patient proper administration.

Teaching points

- Take this drug exactly as prescribed. Do not exceed prescribed dosage. Long-term use is not recommended.
- If using oral spray, prime container before initial use by compressing the container five times. Hold container upright and aim it directly into your open mouth. Compress the container completely, spraying over your tongue and directly into your mouth. If drug is not used for 14 or more days, prime the container once before using.
- You may experience these side effects: Drowsiness, allergic reaction, swelling, dizziness, blurred vision (avoid driving or performing

tasks requiring alertness or visual acuity); GI upset (eat frequent small meals), sleep disorders.

- Report rash, sore throat, fever, bruising, allergic reaction, swelling, complex sleep-related behaviors, thoughts of suicide.

▼ zonisamide

(zoh *niss'* ab myde)

Zonegran

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not fully understood; inhibits voltage-sensitive sodium and calcium channels, stabilizing the neuronal membrane and modulating calcium-dependent presynaptic release of excitatory amino acids; may also have dopaminergic effects.

Indications

- Adjuvant therapy in the treatment of partial seizures in adults with epilepsy

Contraindications and cautions

- Contraindicated with lactation, history of sulfonamide hypersensitivity.
- Use cautiously with impaired hepatic, renal, or cardiac function; pregnancy.

Available forms

Capsules—25, 50, 100 mg

Dosages

Adults

Initial dose, 100 mg PO daily as a single dose—not divided—subsequent doses can be divided; may increase by 100 mg/day every 2 wk to achieve control. Maximum dose, 600 mg/day.

Pediatric patients

Not recommended in patients younger than 16 yr.

Patients with renal impairment

Do not use in patients with a glomerular filtration rate of less than 50 mL/min.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–6 hr

Metabolism: Hepatic; $T_{1/2}$: 49.7–130 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness*, insomnia, headache, somnolence, *ataxia*, diplopia, blurred vision, nystagmus, *decrease in mental functioning*
- **Dermatologic:** *Rash*
- **GI:** *Nausea*, vomiting, *dry mouth*, *unusual taste in mouth*
- **Other:** Bone marrow depression, *renal calculi*, oligohydrosis and hyperthermia (pediatric), metabolic acidosis

Interactions

★ **Drug-drug** • Rapid elimination of zonisamide if taken with enzyme-inducing antiepileptics—carbamazepine, phenytoin, phenobarbital, primidone • Increased levels and potential for toxicity with carbamazepine if taken with zonisamide; adjust dosage and monitor patient carefully

■ Nursing considerations

Assessment

- **History:** Lactation; impaired hepatic, renal, or cardiac function; pregnancy
- **Physical:** Weight; T; skin color; lesions; orientation, affect, reflexes; P, BP, perfusion; bowel sounds, normal output; LFTs, renal function test, CBC

Interventions

⊗ **Warning** Monitor drug doses carefully when starting therapy and with each increase in dose; special care will need to be taken when changing the dose or frequency of any other antiepileptic.

⊗ **Warning** There is a risk of metabolic acidosis with drug administration. Measure serum bicarbonate level before and periodically during therapy. Alkali therapy is recommended if drug is needed and acidosis occurs.

⊗ **Black box warning** Patient may be at increased risk for suicidal ideation and suicidality; monitor accordingly.

⊗ **Warning** Taper drug slowly over a 2-wk period when discontinuing.

- Discontinue drug if patient develops acute renal failure or a clinically significant increase in creatinine or BUN level.
- Ensure that patient is well hydrated to prevent formation of renal calculi.
- Provide safety measures if CNS effects occur.

Teaching points

- Take this drug exactly as prescribed. Dosage may be increased slowly.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your health care provider.

- You should wear a medical alert tag at all times so that any emergency medical personnel taking care of you will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Dizziness, drowsiness, decreased mental functioning (avoid driving a car or performing other tasks requiring alertness or visual acuity if this occurs); GI upset (taking the drug with food or milk and eating frequent small meals may help); headache (medication can be ordered); rash (skin care and lotions may be helpful).
- Report yellowing of skin, abdominal pain, changes in color of urine or stools, flank pain, painful urination, thoughts of suicide.

Alternative and complementary therapies

Many dietary supplements and “natural” remedies are used by the public for self-treatment. These substances, many derived from the folklore of various cultures, commonly contain ingredients that have been identified and that have known therapeutic activities. Some of these substances have unknown mechanisms of action but over the years have been reliably used to relieve specific symptoms. There is an element of the placebo effect in using some of these substances. The power of believing that something will work and that there is some control over the problem is often beneficial in achieving relief from pain or suffering. Some of these substances may contain yet unidentified ingredients, which eventually may prove useful in the modern field of pharmacology. Because these products are not regulated or monitored, there is always a possibility of toxic effects. Some of these products may contain ingredients that interact with prescription drugs. A history of the use of these alternative therapies may explain unexpected reactions to some drugs. Drugs that the substance interacts with are in **bold**.

Substance	Reported uses and possible risks
acidophilus (probiotics)	Oral: prevention or treatment of uncomplicated diarrhea Decreased effectiveness of warfarin .
alfalfa	Topical: healing ointment, relief of arthritis pain Oral: treatment of arthritis, hot flashes; strength giving; reduction of cholesterol level Increased risk of bleeding with warfarin ; increased photosensitivity with chlorpromazine ; increased risk of hypoglycemia with anti-diabetic drugs ; loss of effectiveness with hormonal contraceptives or hormone replacement
allspice	Topical: anesthetic for teeth and gums; soothes sore joints and muscles Oral: treatment of indigestion, flatulence, diarrhea, fatigue Risk of seizures with excessive use; decreased iron absorption.
aloe leaves	Topical: treatment of burns, healing of wounds Oral: treatment of chronic constipation Caution: Oral use may cause serious hypokalemia; risk of spontaneous abortion if used in third trimester
androstenedione	Oral, spray: anabolic steroid to increase muscle mass and strength Caution: May increase risk of CV disease and certain cancers.
angelica	Oral: “cure all” for gynecologic problems, headaches, backaches, loss of appetite, and GI spasms; increases circulation in the periphery Risk of bleeding if combined with anticoagulants .
anise	Oral: relief of dry cough, treatment of flatulence May increase iron absorption and cause toxicity.
apple	Oral: control of blood glucose, constipation May interfere with antidiabetic drugs .

Substance	Reported uses and possible risks
arnica	Topical: relief of pain from muscle or soft tissue injury Oral: immune system stimulant May decrease effects of antihypertensives and increase effects of anticoagulants and antiplatelet drugs ; very toxic to children.
ashwagandha	Oral: to improve mental and physical functioning; general tonic; to protect cells during cancer chemotherapy and radiation therapy May increase bleeding with anticoagulants ; may interfere with thyroid replacement therapy. Discourage use during pregnancy and lactation.
astragalus	Oral: to increase stamina, energy; to improve immune function, resistance to disease; to treat upper respiratory tract infection, common cold May increase effects of antihypertensives . Caution against use during fever or acute infection.
barberry	Oral: antidiarrheal, antipyretic, cough suppressant Risk of spontaneous abortion if taken during pregnancy. May increase effects of antihypertensives , antiarrhythmics .
basil	Oral: analgesic, anti-inflammatory, hypoglycemic Risk of increased hypoglycemic effects of antidiabetic drugs .
bayberry	Topical: to promote wound healing Oral: stimulant, emetic, antidiarrheal May block effects of antihypertensives .
bee pollen	Oral: to treat allergies, asthma, impotence, prostatitis; suggested use to decrease cholesterol levels Risk of hyperglycemia; discourage use by diabetic patients or with antidiabetic drugs . May cause allergic reaction in patients allergic to bees.
betel palm	Oral: mild stimulant, digestive aid Increased risk of hypertensive crisis with MAOIs ; blocks heart-rate reduction of beta blockers , digoxin ; alters effects of antiglaucoma drugs .
bilberry	Oral: treatment of diabetes; cardiovascular problems; lowers cholesterol and triglycerides; treatment of diabetic retinopathy; treatment of cataracts, night blindness Increased risk of bleeding with anticoagulants ; disulfiram-like reaction with alcohol .
birch bark	Topical: treatment of infected wounds, cuts Oral: as tea for relief of stomachache Topical form very toxic to children.
blackberry	Oral: as tea for generalized healing; treatment of diabetes Risk of interaction with antidiabetic drugs .

(continued)

Substance	Reported uses and possible risks
black cohosh root	Oral: treatment of PMS, menopausal disorders, rheumatoid arthritis Contains estrogen-like components. Caution against use with hormone replacement therapy or hormonal contraceptives ; discourage use during pregnancy and lactation; may lower blood pressure with sedatives, antihypertensives, anesthetics ; increased risk of fungal infection with immunosuppressants .
bromelain	Oral: treatment of inflammation, sports injuries, upper respiratory tract infection, PMS, and adjunctive therapy in cancer treatment May cause nausea, vomiting, diarrhea, menstrual disorders.
burdock	Oral: treatment of diabetes; atropine-like adverse effects, uterine stimulant May increase hypoglycemic effects of antidiabetic drugs .
capsicum	Topical: external analgesic Oral: treatment of bowel disorders, chronic laryngitis, peripheral vascular disease May increase bleeding with warfarin, aspirin ; increases cough with ACE inhibitors ; increases toxicity with MAOIs ; increases sedation with sedatives .
catnip leaves	Oral: treatment of bronchitis, diarrhea
cat's claw	Oral: treatment of allergies, arthritis; adjunct in the treatment of cancers and AIDS Discourage use during pregnancy and lactation and use by transplant recipients; increased risk of bleeding episodes if taken with oral anticoagulants ; increased hypotension with antihypertensives .
cayenne pepper	Topical: treatment of burns, wounds, relief of toothache
celery	Oral: lowers blood glucose, acts as a diuretic; may cause potassium depletion Advise caution when taken with antidiabetic drugs .
chamomile	Topical: treatment of wounds, ulcer, conjunctivitis Oral: treatment of migraines, gastric cramps, relief of anxiety Contains coumarin—closely monitor patients taking anticoagulants . May cause depression; monitor patients on antidepressants . Cross-reaction with ragweed allergies may occur. Discourage use during pregnancy and lactation.
chaste-tree berry	Oral: progesterone-like effects; used to treat PMS and menopausal problems, and to stimulate lactation Advise caution when taken with hormone replacement therapy and hormonal contraceptives .
chicken soup	Oral: breaks up respiratory secretions, bronchodilator, relieves anxiety
chicory	Oral: treatment of digestive tract problems, gout; stimulates bile secretions

Substance	Reported uses and possible risks
Chinese angelica (dong quai)	Oral: general tonic; treatment of anemias, PMS, menopause, antihypertensive, laxative Use caution with the flu, hemorrhagic diseases. Monitor patients on antihypertensives, vasodilators, or anticoagulants for toxic effects. Advise caution when taken with hormone replacement therapy .
chondroitin	Oral: treatment of osteoarthritis and related disorders (usually combined with glucosamine) Risk of increased bleeding if combined with anticoagulants .
chong cao fungi	Oral: antioxidant; promotes stamina, sexual function Discourage use by children.
coleus forskohlii	Oral: treatment of asthma, hypertension, eczema Urge caution when taken with antihypertensives or antihistamines ; severe additive effects can occur. Discourage use if patient has hypotension or peptic ulcer.
comfrey	Topical: treatment of wounds, cuts, ulcers Oral: gargle for tonsillitis Warn against using with eucalyptus ; monitor liver function.
coriander	Oral: weight loss, lowers blood glucose Advise caution when taken with antidiabetic drugs .
creatine monohydrate	Oral: enhancement of athletic performance Warn against using with insulin ; do not use with caffeine.
dandelion root	Oral: treatment of liver and kidney problems; decreases lactation (after delivery or with weaning); lowers blood glucose Advise caution when taken with antidiabetic drugs, antihypertensives, and quinolone antibiotics .
DHEA	Oral: slows aging, improves vigor ("Fountain of Youth"); androgenic side effects Risk of interactions with alprazolam, calcium channel blockers, and antidiabetic drugs . Screen patients older than 40 yr for hormonally sensitive cancers before use.
di huang	Oral: treatment of diabetes mellitus Risk of hypoglycemia with antidiabetic drugs .
dried root bark of lycium Chinese mill	Oral: lowers cholesterol, lowers blood glucose Advise caution with antidiabetic drugs .
echinacea (cone flower)	Oral: treatment of colds, flu; stimulates the immune system, attacks viruses; causes immunosuppression if used long-term May be liver toxic. Discourage use longer than 12 wk. Caution against taking with liver-toxic drugs or immunosuppressants . Discourage use with antifungals ; serious liver injury could occur. Advise against use by patients with SLE, TB, AIDS.
elder bark and flowers	Topical: gargle for tonsillitis, pharyngitis Oral: treatment of fever, chills

(continued)

Substance	Reported uses and possible risks
ephedra	Oral: increases energy, relieves fatigue May cause serious complications, including death; increased risk of hypertension, stroke, MI; interacts with many drugs; banned by the FDA.
ergot	Oral: treatment of migraine headaches, treatment of menstrual problems, hemorrhage Monitor patient who takes ergot with antihypertensives.
eucalyptus	Topical: treatment of wounds Oral: decreases respiratory secretions suppresses cough Warn against using with comfrey ; very toxic in children.
evening primrose	Oral: treatment of PMS, menopause, rheumatoid arthritis, diabetic neuropathy Discourage use with phenothiazines, antidepressants —increases risk of seizures; discourage use by those with epilepsy, schizophrenia.
false unicorn root	Oral: treatment of menstrual and uterine problems Advise against use during pregnancy and lactation.
fennel	Oral: treatment of colic, gout, flatulence; enhances lactation Significantly decreases levels of ciprofloxacin.
fenugreek	Oral: lowers cholesterol level; reduces blood glucose; aids in healing Advise caution when taken with antidiabetic drugs, anticoagulants.
feverfew	Oral: treatment of arthritis, fever, migraine Advise caution when taken with anticoagulants ; may increase bleeding. Discourage use before or immediately after surgery because of bleeding risk.
fish oil	Oral: treatment of coronary diseases, arthritis, colitis, depression, aggression, attention deficit disorder
gamboge	Oral: appetite suppressant, lowers cholesterol, promotes weight loss Oral use may be unsafe; discourage use.
garlic	Oral: treatment of colds; diuretic; prevention of CAD; intestinal antiseptic; lowers blood glucose; anticoagulant effects; decreases BP Advise caution if patient has diabetes or takes an oral anticoagulant. Known to affect blood clotting. Anemia reported with long-term use.
ginger	Oral: treatment of nausea, motion sickness, postoperative nausea (may increase risk of miscarriage) Affects blood clotting. Warn against use with anticoagulants.
ginkgo	Oral: vascular dilation; increases blood flow to the brain, improving cognitive function; used in treating Alzheimer's disease; antioxidant Can inhibit blood clotting. Seizures reported with high doses. Warn against use with anticoagulants, aspirin, or NSAIDs. Can interact with phenytoin, carbamazepine, phenobarbital, TCAs, MAOIs, and antidiabetic drugs ; advise caution.

Substance	Reported uses and possible risks
ginseng	<p>Oral: aphrodisiac, mood elevator, tonic; antihypertensive; decreases cholesterol levels; lowers blood glucose; adjunct in cancer chemotherapy and radiation therapy</p> <p>May cause irritability if combined with caffeine. Inhibits clotting. Warn against use with anticoagulants, aspirin, NSAIDs. Warn against use for longer than 3 mo. May cause headaches, manic episodes if used with phenelzine, MAOIs. Additive effects of estrogens and corticosteroids. May also interfere with cardiac effects of digoxin. Monitor patient closely if he takes these drugs or an anti-diabetic drug.</p>
glucosamine	<p>Oral: treatment of osteoarthritis and joint diseases, usually combined with chondroitin</p> <p>Monitor glucose levels in diabetic patients.</p>
goldenrod leaves	<p>Oral: treatment of renal disease, rheumatism, sore throat, eczema</p> <p>May decrease effects of diuretics by increasing sodium retention. Advise caution if patient has a history of allergies.</p>
goldenseal	<p>Oral: lowers blood glucose, aids healing; treatment of bronchitis, colds, flulike symptoms, cystitis</p> <p>May cause false-negative test results in those who use such drugs as marijuana and cocaine. Large amounts may cause paralysis. Affects blood clotting; warn against use with anticoagulants. May interfere with antihypertensives, acid blockers, barbiturates. May increase effects of sedatives. Death can result from overdose.</p>
gotu kola	<p>Topical: chronic venous insufficiency</p> <p>Warn against using with antidiabetic drugs, cholesterol-lowering drugs, sedatives.</p>
grape seed extract	<p>Oral: treatment of allergies, asthma; improves circulation; decreases platelet aggregation</p> <p>Advise caution with oral anticoagulants; may increase bleeding.</p>
green tea leaf	<p>Oral: antioxidant, to prevent cancer and cardiovascular disease, to increase cognitive function (caffeine effects)</p> <p>Advise caution with oral anticoagulants; may increase bleeding. May increase BP. Caution against using with milk.</p>
guarana	<p>Oral: decreases appetite, promotes weight loss</p> <p>Advise caution; increases blood pressure, risk of CV events.</p>
guayusa	<p>Oral: lowers blood glucose; promotes weight loss</p> <p>Advise caution with antihypertensives. Decreases absorption of iron. May decrease clearance of lithium.</p>
hawthorn	<p>Oral: treatment of angina, arrhythmias, BP problems; decreases cholesterol</p> <p>Advise caution with digoxin, ACE inhibitors, CNS depressants; may potentiate effects.</p>
hop	<p>Oral: sedative; aids healing; alters blood glucose</p> <p>Discourage use with CNS depressants, antipsychotics.</p>

(continued)

Substance	Reported uses and possible risks
horehound	Oral: expectorant; treatment of respiratory problems, GI disorders Use caution with antidiabetic drugs, antihypertensives.
horse chestnut seed	Oral: treatment of varicose veins, hemorrhoids Advise caution with oral anticoagulants ; may increase bleeding.
hyssop	Topical: treatment of cold sores, genital herpes, burns, wounds Oral: treatment of coughs, colds, indigestion, and flatulence Warn against use by pregnant patients and those with seizures; toxic in children and pets.
jambul	Oral: treatment of diarrhea, dysentery; lowers blood glucose Use caution with CNS depressants.
Java plum	Oral: treatment of diabetes mellitus Advise caution with antidiabetic drugs.
jojoba	Topical: promotion of hair growth, relief of skin problems Toxic if ingested.
juniper berries	Oral: increases appetite, aids digestion; diuretic; urinary tract disinfectant; lowers blood glucose level Advise caution when taken with antidiabetic drugs. Not for use in pregnancy.
kava	Oral: treatment of nervous anxiety, stress, restlessness; tranquilizer Warn against use with alprazolam ; may cause coma. Advise against use with Parkinson's disease or history of stroke. Discourage use with St. John's wort, anxiolytics, alcohol. Risk of serious liver toxicity.
kudzu	Oral: reduces cravings for alcohol ; being researched for use with alcoholics Interacts with anticoagulants, aspirin, antidiabetic drugs, CV drugs.
lavender	Topical: astringent for minor cuts, burns Oral: treatment of insomnia, restlessness Advise caution with CNS depressants. Oil is potentially poisonous.
ledum tincture	Topical: treatment of insect bites, puncture wounds; dissolves some blood clots and bruises
licorice	Oral: prevents thirst, soothes coughs; treats "incurable" chronic fatigue syndrome; treatment of duodenal ulcer. Acts like aldosterone. Blocks spironolactone effects. Can lead to digoxin toxicity because of effects of lowering aldosterone. Advise extreme caution. Contraindicated with renal or liver disease, hypertension, CAD, pregnancy, lactation. Warn against taking with thyroid drugs, antihypertensives, hormonal contraceptives.
ma huang	Oral: treatment of colds, nasal congestion, asthma Contains ephedrine. Warn against use with antihypertensives, antidiabetic drugs, MAOIs, digoxin. Serious adverse effects could occur.

Substance	Reported uses and possible risks
mandrake root	Oral: treatment of fertility problems
marigold leaves and flowers	Oral: relief of muscle tension, increases wound healing Advise against use during pregnancy and breast-feeding.
melatonin	Oral: relief of jet lag, treatment of insomnia, jet lag Advise caution with antihypertensives, benzodiazepines, beta blockers, methamphetamine.
milk thistle	Oral: treatment of hepatitis, cirrhosis, fatty liver caused by alcohol or drug use May affect metabolism and increase toxicity of drugs using CP450, CYP3A4, and CYP2C9 systems.
milk vetch	Oral: improves resistance to disease; adjunct therapy in cancer chemotherapy and radiation therapy
mistletoe leaves	Oral: promotes weight loss; relief of signs and symptoms of diabetes Advise caution with antihypertensives, CNS depressants, immunosuppressants.
momordica charantia (Karela)	Oral: blocks intestinal absorption of glucose; lowers blood glucose; weight loss Advise caution when taken with antidiabetic drugs.
nettle	Topical: stimulation of hair growth, treatment of bleeding Oral: treatment of rheumatism, allergic rhinitis; antispasmodic; expectorant Advise against use during pregnancy and breast-feeding. Increases effects of diuretics.
nightshade leaves and roots	Oral: stimulates circulatory system; treatment of eye disorders
octacosanol	Oral: treatment of parkinsonism, enhancement of athletic performance Advise against use during pregnancy and lactation; avoid use with carbidopa-levodopa.
parsley seeds and leaves	Oral: treatment of jaundice, asthma, menstrual difficulties, urinary infections, conjunctivitis Risk of serotonin syndrome with SSRIs, lithium, opioids ; increased hypotension with antihypertensives.
passionflower vine	Oral: sedative and hypnotic May increase sedation with other CNS depressants, MAOIs. Advise against drinking alcohol while taking this herb. Tell patient not to use with anticoagulants.
peppermint leaves	Oral: treatment of nervousness, insomnia, dizziness, cramps, coughs Topical: rubbed on forehead to relieve tension headaches
psyllium	Oral: treatment of constipation; lowers cholesterol Can cause severe gas and stomach pain; may interfere with nutrient absorption. Avoid use with warfarin, digoxin, lithium —absorption of drug may be blocked. Do not combine with laxatives.

(continued)

Substance	Reported uses and possible risks
raspberry	Oral: healing of minor wounds; control and treatment of diabetes, GI disorders, upper respiratory disorders Advise caution with antidiabetic drugs ; disulfiram-like reaction with alcohol .
red clover	Oral: estrogen replacement in menopause, suppresses whooping cough, asthma Risk of bleeding with anticoagulants, antiplatelet ; discourage use in pregnancy.
red yeast rice	Oral: cholesterol-lowering agent Increased risk of rhabdomyolysis with cyclosporine, fibric acid, niacin, lovastatin, grapefruit juice .
rose hips	Oral: laxative, to boost the immune system and prevent illness Advise caution with estrogens, iron, warfarin .
rosemary	Topical: relief of rheumatism, sprains, wounds, bruises, eczema Oral: gastric stimulation, relief of flatulence, stimulation of bile release, relief of colic Disulfiram-like reaction with alcohol .
rue extract	Topical: relief of pain associated with sprains, groin pulls, whiplash Advise caution with antihypertensive drugs, digoxin, warfarin .
saffron	Oral: treatment of menstrual problems, abortifacient
sage	Oral: lowers BP; lowers blood glucose Advise caution with antidiabetic drugs, anticonvulsants, alcohol .
SAM-e (adomet)	Oral: promotion of general well-being and health May cause frequent GI complaints and headache. Risk of serotonin syndrome with antidepressants .
sarsaparilla	Oral: treatment of skin disorders, rheumatism Advise caution with anticonvulsants .
sassafras	Topical: treatment of local pain, skin eruptions Oral: enhancement of athletic performance, “cure” for syphilis Oil may be toxic to fetus, children, and adults when ingested. Interacts with many drugs.
saw palmetto	Oral: treatment of BPH Warn against use with estrogen-replacement or hormonal contraceptives—may greatly increase adverse effects. May decrease iron absorption. Advise against use with finasteride ; toxicity could occur.
schisandra	Oral: health tonic, liver protectant; adjunct in cancer chemotherapy and radiation therapy Warn against use during pregnancy; causes uterine stimulation. Advise caution with all drugs metabolized in the liver .

Substance	Reported uses and possible risks
squaw vine	Oral: diuretic, tonic, aid in labor and childbirth, treatment of menstrual problems May cause liver toxicity; increased toxicity of digoxin . Disulfiram-like reaction with alcohol .
St. John's wort	Oral: treatment of depression, PMS symptoms; antiviral Topical: to treat puncture wounds, insect bites, crushed fingers or toes Discourage tyramine-containing foods; hypertensive crisis is possible. Thrombocytopenia has been reported. Can increase sensitivity to light; advise against taking with drugs that cause photosensitivity. Severe photosensitivity can occur in light-skinned people. Serious interactions have been reported with SSRIs, MAOIs, kava, digoxin, theophylline, AIDS antiviral drugs, sympathomimetics, anti-neoplastics, hormonal contraceptives . Advise against these combinations.
sweet violet flowers	Oral: treatment of respiratory disorders; emetic Increases effects of laxatives .
tarragon	Oral: weight loss; prevents cancer; lowers blood glucose Advise caution with antidiabetic drugs .
tea tree oil	Topical: antifungal, antibacterial; used to treat burns, insect bites, irritated skin, acne; used as a mouthwash
thyme	Topical: as liniment, gargle; to treat wounds Oral: antidiarrheal, relief of bronchitis, laryngitis May increase sensitivity to light; warn against combining with photosensitivity-causing drugs . Also warn against combining with MAOIs or SSRIs ; may cause serious adverse effects.
turmeric	Oral: antioxidant, anti-inflammatory; used to treat arthritis May cause GI distress. Warn against use with known biliary obstruction. May cause increased bleeding with oral anticoagulants, NSAIDs . Advise caution with immunosuppressants .
valerian	Oral: sedative and hypnotic; reduces anxiety, relaxes muscles Can cause severe liver damage. Warn against use with barbiturates, alcohol, CNS depressants, or antihistamines ; can cause serious sedation.
went rice	Oral: cholesterol- and triglyceride-lowering effects Warn against use in pregnancy, liver disease, alcoholism, or acute infection.
white willow bark	Oral: treatment of fevers Advise caution with anticoagulants, NSAIDs, diuretics .
xuan shen	Oral: lowers blood glucose; slows heart rate; treatment of HF Advise caution when taken with antidiabetic drugs .
yohimbe	Oral: treatment of ED Can affect BP; CNS stimulant; has cardiac effects. Manic episodes have been reported in psychiatric patients. Warn against use with SSRIs, tyramine-containing foods . Advise caution with TCAs .

Preventing miscommunication

Although abbreviations can save time, they also raise the risk of misinterpretation, which can lead to potentially disastrous consequences, especially when dealing with drug administration. To help reduce the risk of being misunderstood, always take the time to write legibly and to spell out anything that could be misread. This caution extends to how you write numbers as well as drug names and other drug-related instructions.

Dosages

When writing a drug dosage, never add a zero **after** a decimal point and always add a zero **before** a decimal point. If you write 1.0 mg instead of the correct 1 mg, the dosage easily could be misread as 10 mg. Likewise, if you write .5 mg instead of the correct 0.5 mg, the dosage could be misread as 5 mg.

Drug names

Be careful with drug names. For instance, if you write MgSO_4 as shorthand for magnesium sulfate, you could be misread as meaning morphine sulfate. The opposite is also true; if you write MS or MSO_4 , meaning morphine sulfate, you could be misread as meaning magnesium sulfate. Instead, make sure to clearly write out all drug names, particularly those that could be dangerous if confused or that could be easily confused.

Common dangerous abbreviations

Try to avoid these common—and dangerous—abbreviations, especially those that appear in color.

Abbreviation	Intended use	Potential misreading	Preferred use
BT	bedtime	May be read as “bid” or twice daily	Spell out “bedtime.”
cc	cubic centimeters	May be read as “u” or units	Use “milliliters,” abbreviated as “mL” or “ml.”
D/C	discharge or discontinue	May lead to premature discontinuation of drug therapy or premature discharge	Spell out “discharge” or “discontinue.”
hs	at bedtime	May read as “half-strength”	Spell out “at bedtime.”
HS	half-strength	May be read as “at bedtime”	Spell out “half-strength.”
IJ	injection	May be read as “IV”	Spell out “injection.”
IN	intranasal	May be read as “IM” or “IV”	Spell out “intranasal” or use “NAS.”
IU	international unit	May be read as “IV” or “10”	Spell out “international unit.”

Abbreviation	Intended use	Potential misreading	Preferred use
μg	microgram	May be read as “mg”	Use “mcg.”
o.d. or O.D.	once daily	May be read as “right eye”	Spell out “once daily.”
per os	by mouth	May be read as “left eye”	Use “PO” or spell out “orally.”
q.d. or QD	daily	May be read as “qid”	Spell out “daily.”
qId	once daily	May be read as “qid”	Spell out “once daily.”
qhs	every bedtime	May be read as “qhr” (every hour)	Spell out “nightly.”
qn	every night	May be read as “qh” (every hour)	Spell out “nightly” or “at bedtime.”
q.o.d. or QOD	every other day	May be read as “q.d.” (daily) or “q.i.d.” (four times daily)	Spell out “every other day.”
SC, SQ	subcutaneous	May be read as “SL” (sublingual) or “5 every”	Spell out “subcutaneous” or use “subcut.”
U or u	unit	May be read as “0” (100 instead of 10U)	Spell out “unit.”
x7d	for 7 days	May be read as “for seven doses”	Spell out “for 7 days.”
o	hour	May be read as a zero	Spell out “hour” or use “hr.”

Patient teaching to prevent medication errors

Medication errors present a constant risk, particularly for patients who take multiple drugs prescribed by multiple health care providers. Health care settings have many safety checks in place to help avoid medication errors. These checks involve the prescriber of the drug, the pharmacist who dispenses the drug, and the nurse who administers it. The most important safety check of all, however, remains with the patient—who is the only person in the system who has all the pertinent information to prevent medication errors, both inside and outside the health care facility.

When being prescribed medications, patients should learn these key points to reduce the risk of medication errors.

Keep a list

Keep a written list of all the drugs you take, including over-the-counter drugs, herbal products, and other supplements. Make sure the list includes brand names, generic names, the amount you take, and how often you take each product. Then make sure to carry this list with you and show it to all your health care providers, including dentists and emergency personnel.

Know your drugs

Make sure you know the reason why you take each of your drugs. This knowledge will help you understand and describe any issues that might arise about your health status or your treatments.

Follow the directions

Carefully read the label of each of your drugs, and follow the directions for taking it safely. Do not stop taking a drug without first consulting the prescriber.

Store carefully

Always store drugs in a dry place, safely out of the reach of children and pets. Storing drugs in the bathroom, where it is often hot and steamy, can cause them to break down. Also, make sure to keep all drugs in their original, labeled containers.

Speak up

You, the patient, are the most important member of your health care team. Tell your health care providers about your health history, allergies (especially drug allergies), medications, and current health problems. Never be afraid to ask questions about your health or your treatments.

Keep children safe

If you are a parent or a child's caregiver, take these steps to prevent medication errors.

- Keep a list of the child's medications, and take it with you to all health care appointments.
- Never give an adult's medication to a child. Children's bodies process drugs differently than adults' and could place them at increased risk for ill effects.
- Read the label carefully before giving any medication, including an over-the-counter product, to a child. Be especially careful if the child is receiving more than one medication.
- For liquid drugs, measure each dose using a special dose-measuring spoon. Do not use a kitchen spoon or flatware to measure medication doses.
- Call your health care provider right away if the child seems to be getting worse or is having trouble with the medication.
- If you have doubts or concerns about how the child is doing, call your health care provider.

APPENDIX D

Important dietary guidelines for patient teaching

Tyramine-rich foods (important to avoid with MAOIs, some antihypertensives)

Aged cheese	Bologna	Liver	Red wine	Smoked fish
Avocados	Caffeinated	Pepperoni	(Chianti)	Yeast
Bananas	beverages	Pickled fish	Ripe fruit	Yogurt
Beer	Chocolate		Salami	

Potassium-rich foods (important to eat with potassium-wasting diuretics)

Avocados	Dried fruit	Nuts	Prunes	Sunflower seeds
Bananas	Grapefruit	Oranges	Rhubarb	Tomatoes
Broccoli	Lima beans	Peaches	<i>Sanka</i> coffee	
Cantaloupe	Navy beans	Potatoes	Spinach	

Calcium-rich foods (important after menopause, in children, in hypocalcemic states)

Bok choy	Canned	Cream soup	Dairy products	Oysters
Broccoli	sardines	(made with	Milk	Spinach
Canned salmon	Clams	milk)	Molasses	Tofu

Urine acidifiers (important in maintaining excretion of some drugs)

Cheese	Eggs	Grains	Poultry	Red meat
Cranberries	Fish	Plums	Prunes	

Urine alkalinizers (important in maintaining excretion of some drugs)

Apples	Berries	Citrus fruit	Milk	Vegetables
--------	---------	--------------	------	------------

Iron-rich foods (important in maintaining RBCs)

Beets	Dried beans	Dried fruit	Leafy green	Organ meats
Cereals	and peas	Enriched grains	vegetables	(liver, heart, kidney)

Low-sodium foods (important in HF, hypertension, fluid overload)

Egg yolks	Honey	Macaroons	Puffed wheat	Sherbet
Fresh fruit	Jam and jelly	Potatoes	Pumpkin	Unsalted nuts
Fresh vegetables	Lean meat	Poultry	Red kidney	
Grits	Lima beans	Puffed rice	beans	

High-sodium foods (important to avoid in HF, hypertension, fluid overload)

Barbecue	Canned	Cured meat	Prepackaged	Snack foods
Beer	seafood	Fast food	dinner	Tomato
Butter	Canned soup	Microwave	Pretzels	ketchup
Buttermilk	Canned	dinner	Sauces	TV dinners
Cake, bread, and other mixes	spaghetti	Pickles	Sauerkraut	
	Cookies			

Drugs that interact with grapefruit juice

Grapefruit juice inhibits the CYP450 3A4 system in the liver, which can cause a decrease in the metabolism of many drugs. Decreasing the metabolism of the drug can lead to increased serum drug levels and toxicity. If any of these drugs are being given, the patient should avoid the use of grapefruit juice. If a patient has been stabilized on one of these drugs and suddenly begins to develop signs of drug toxicity, ask the patient specifically if he has been drinking grapefruit juice. If a patient is receiving one of these drugs, a key point of patient education should be to avoid the use of grapefruit juice. It takes approximately 48 hr for grapefruit juice to be cleared from the body.

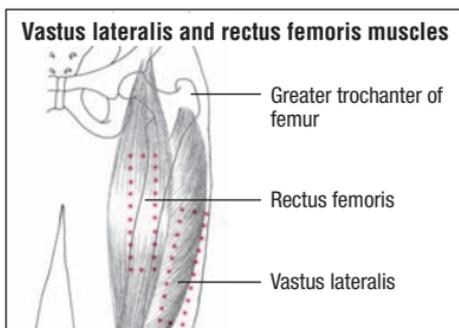

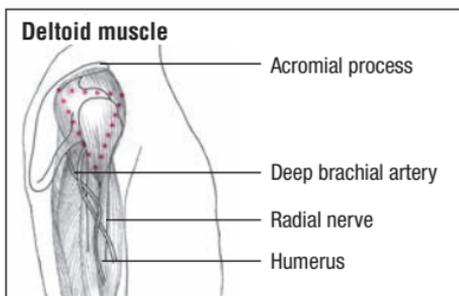

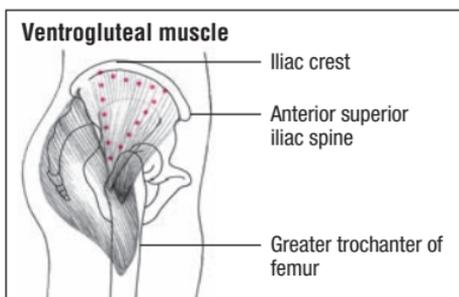

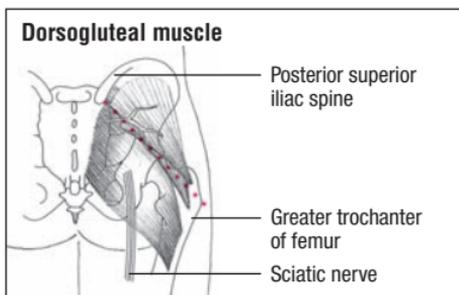

albendazole	fentanyl	sirolimus
alfentanil	fexofenadine	sufentanil
amiodarone	fluoxetine	tacrolimus
amlodipine	fluvastatin	tadalafil
atorvastatin	fluvoxamine	tamoxifen
17 beta-estradiol	indinavir	temsirolimus
budesonide	itraconazole	testosterone
buspirone	losartan	theophylline
caffeine	lovastatin	triazolam
calcium channel blockers	methadone	troleandomycin
carbamazepine	methylprednisolone	verapamil
carvedilol	nelfinavir	vinblastine
cilostazol	nicardipine	vincristine
clarithromycin	nifedipine	warfarin
clomipramine	nimodipine	
cortisol	nisoldipine	
cyclophosphamide	progesterone	
cyclosporine A	quinidine	
dextromethorphan	ritonavir	
diltiazem	saquinavir	
erythromycin	scopolamine	
estrogens	sertraline	
etoposide	sildenafil	
felodipine	simvastatin	

Intramuscular and subcutaneous routes of administration

Choosing an IM injection site

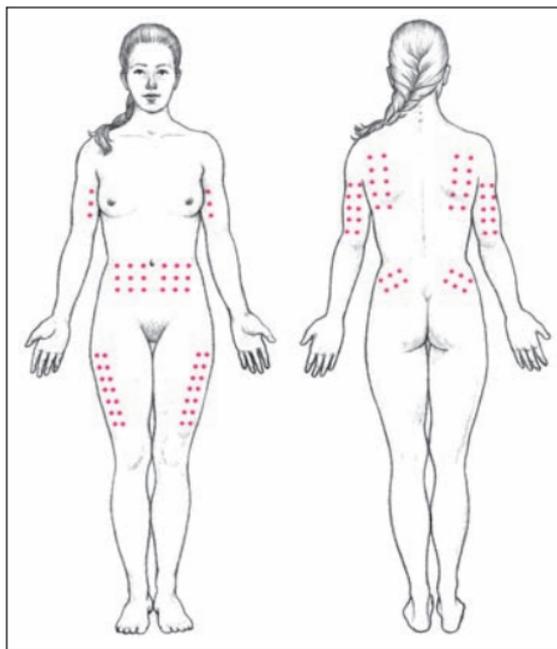

When reviewing sites for IM injection, avoid any site that looks inflamed, edematous, or irritated. Also, avoid using a site that contains moles, birthmarks, scar tissue, or other lesions. Then select an appropriate site, such as one of those shown at right, and consider these guidelines:

- The dorsogluteal and ventrogluteal muscles are used most commonly for IM injections.
- The deltoid muscle may be used for injections of 2 mL or less.
- The vastus lateralis muscle is used most commonly in children.
- The rectus femoris may be used in infants.

Selecting a subcutaneous injection site

To select an appropriate injection site, consider the available areas for subcutaneous injection. These areas offer sites on the abdomen, upper arms, thighs, shoulders, and lower back, as shown here. Also consider the patient's site rotation pattern and plan to use the next available injection site. This promotes drug absorption and helps prevent adverse reactions.

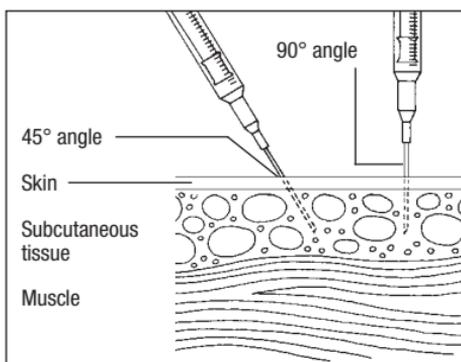

Injecting a subcutaneous drug

While pinching up the patient's skin with your nondominant hand, hold the syringe in your dominant hand and grip the needle sheath with the free fingers of your nondominant hand. Pull the sheath back to uncover the needle, but do not touch the needle. Position the needle with its bevel up.

Tell the patient he will feel a prick as you insert the needle. Do so quickly, in one motion, at a 45° or 90-degree angle, as shown at right. The needle length and the angle you use depend on the amount of subcutaneous tissue at the site. Some drugs, such as heparin, should always be injected at a 90-degree angle.

Release the skin to avoid injecting the drug into compressed tissue and irritating the nerves. Pull the plunger back slightly to check for blood return. If blood appears, withdraw the needle, prepare another syringe, and repeat the procedure. If no blood appears, slowly inject the drug.

Medication disposal guidelines

The White House Office of National Drug Control Policy, the Department of Health and Human Services, and the Environmental Protection Agency have established guidelines for the proper disposal of unused, unneeded, or expired medications to promote consumer safety and protect the environment. It is important that you know how to properly dispose of medications to block access to them by potential abusers and to protect the water supply and environment from possible contamination. When disposing of medications, follow these guidelines.

Disposing in trash

- Take unused, unneeded, or expired medications out of their original containers.
- Mix the medication with an undesirable substance, such as coffee grounds or used kitty litter, and place it in an impermeable, nondescript container, such as an empty can or a sealable storage bag. These steps help keep the medication from being diverted for illicit use or being accidentally ingested by children or animals.
- Place the closed container in your household trash.

Disposing in toilet

- Flush prescription drugs down the toilet **only** if the accompanying patient information specifically instructs you to do so.

Disposing at a hospital or government-sponsored site

- You may be able to return unused, unneeded, or expired prescription drugs to a pharmaceutical take-back location that offers safe disposal. Check with your local hospital, health department, or local government for a site near you.

Calculating pediatric dosages

Children typically require different doses of drugs than adults because children's bodies often handle drugs very differently from adults' bodies. The standard drug dosages listed in package inserts and references such as the *Physician's Desk Reference* refer to the adult dosage. In some cases, a pediatric dosage is suggested, but in many cases it will need to be calculated based on the child's age, weight, or body surface area. The following are some standard formulae for calculating the pediatric dose.

Fried's rule

$$\text{Infant's dose (age younger than 1 yr)} = \frac{\text{infant's age (in mo)}}{150 \text{ mo}} \times \text{average adult dose}$$

Young's rule

$$\text{Child's dose (ages 1–12 yr)} = \frac{\text{child's age (in yr)}}{\text{child's age (in yr)} + 12} \times \text{average adult dose}$$

Clark's rule

$$\text{Child's dose} = \frac{\text{weight of child (lb)}}{150 \text{ lb}} \times \text{average adult dose}$$

Surface area rule

$$\text{Child's dose} = \frac{\text{surface area of child (in square meters)}}{1.73} \times \text{average adult dose}$$

The surface area of a child is determined using a nomogram that determines surface area based on height and weight measurements.

Pediatric dosage calculations should be checked by two persons. Many institutions have procedures for double checking the dosage calculation of those drugs used most frequently in the pediatric area (eg, digoxin).

Federal drug classifications

FDA pregnancy categories

The FDA has established five categories to indicate the potential for a systemically absorbed drug to cause birth defects. The key differentiation among the categories rests upon the degree (reliability) of documentation and the risk-benefit ratio.

Category A: Adequate studies in pregnant women have not demonstrated a risk to the fetus in the first trimester of pregnancy, and there is no evidence of risk in later trimesters.

Category B: Animal studies have not demonstrated a risk to the fetus but there are no adequate studies in pregnant women. *Or*; animal studies have shown an adverse effect, but adequate studies in pregnant women have not demonstrated a risk to the fetus during the first trimester of pregnancy, and there is no evidence of risk in later trimesters.

Category C: Animal studies have shown an adverse effect on the fetus but there are no adequate studies in humans; the benefits from the use of the drug in pregnant women may be acceptable despite its potential risks. *Or*; there are no animal reproduction studies and no adequate studies in humans.

Category D: There is evidence of human fetal risk, but the potential benefits from the use of the drug in pregnant women may be acceptable despite its potential risks.

Category X: Studies in animals or humans demonstrate fetal abnormalities or adverse reaction; reports indicate evidence of fetal risk. The risk of use in a pregnant woman clearly outweighs any possible benefit.

Regardless of the designated Pregnancy Category or presumed safety, no drug should be administered during pregnancy unless it is clearly needed.

DEA schedules of controlled substances

The Controlled Substances Act of 1970 regulates the manufacturing, distribution, and dispensing of drugs that are known to have abuse potential. The DEA is responsible for the enforcement of these regulations. The controlled drugs are divided into five DEA schedules based on their potential for abuse and physical and psychological dependence.

Schedule I (C-I): High abuse potential and no accepted medical use (heroin, marijuana, LSD)

Schedule II (C-II): High abuse potential with severe dependence liability (narcotics, amphetamines, and barbiturates)

Schedule III (C-III): Less abuse potential than Schedule II drugs and moderate dependence liability (nonbarbiturate sedatives, nonamphetamine stimulants, limited amounts of certain narcotics)

Schedule IV (C-IV): Less abuse potential than Schedule III and limited dependence liability (some sedatives, antianxiety agents, and nonnarcotic analgesics)

Schedule V (C-V): Limited abuse potential. Primarily small amounts of narcotics (codeine) used as antitussives or antidiarrheals. Under federal law, limited quantities of certain Schedule V drugs may be purchased without a prescription directly from a pharmacist. The purchaser must be at least 18 years of age and must furnish suitable identification. All such transactions must be recorded by the dispensing pharmacist.

Prescribing physicians and dispensing pharmacists must be registered with the DEA, which also provides forms for the transfer of Schedule I and II substances and establishes criteria for the inventory and prescribing of controlled substances. State and local laws are often more stringent than federal law. In any given situation, the more stringent law applies.

Cardiovascular guidelines

Classification of blood lipid levels

Serum level	Low*	Optimal*	Normal or desirable*	Borderline high*	High*	Very high*
Total cholesterol			Less than 200	200–239	240 or more	
LDL cholesterol		Less than 100	100–129	130–159	160–189	190 or more
HDL cholesterol	Less than 40				60 or more	
Triglycerides			Less than 150	150–199	200–499	500 or more

* In mg/dL.

LDL target goal is determined by the presence of other major cardiovascular risk factors (cigarette smoking, hypertension, low HDL, family history of premature CAD, men 45 years or older, women 55 years or older).

For 0–1 risk factor, goal for total cholesterol is 160 mg/dL; for 2 or more risk factors, goal is less than 130 mg/dL; for persons with congestive heart disease or diabetes, goal is less than 100 mg/dL.

From the Third Report of the National Cholesterol Education Program (NCEP) Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults (Adult Treatment Panel III). U.S. Department of Health and Human Services, National Institutes of Health, National Heart, Lung, and Blood Institute, 2004. Available at <http://www.nhlbi.nih.gov/guidelines/cholesterol/atp3full.pdf>.

Classification of blood pressure

Category	Systolic blood pressure (mm Hg)		Diastolic blood pressure (mm Hg)
Normal	Less than 120	and	Less than 80
Prehypertension	120–139	or	80–89
Hypertension, Stage 1	140–159	or	90–99
Hypertension, Stage 2	160 or more	or	100 or more

From the Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC 7). U.S. Department of Health and Human Services, National Institutes of Health, National Heart, Lung, and Blood Institute, 2003.

Available at <http://www.nhlbi.nih.gov/guidelines/hypertension/jnc7full.pdf>.

APPENDIX K

Normal laboratory values

Test	Conventional units	Systems international units
albumin	3.5–5.0 g/dL	35–50 g/L
aminotransferases		
ALT	7–53 international units/L	0.12–0.88 μ kat/L
AST	11–47 international units/L	0.8–0.78 μ kat/L
ammonia	15–56 mcg/dL	9–33 μ mol/L
amylase	25–115 international units/L	0.42–1.92 μ kat/L
bilirubin		
total	0.3–1.1 mg/dL	5.13–18.80 μ mol/L
direct	0–0.3 mg/dL	0–5.1 μ mol/L
blood gases		
pH	7.35–7.45	7.35–7.45
PO ₂	80–105 mm Hg	10.6–14 kPa
PCO ₂	35–45 mm Hg	4.7–6 kPa
BUN	8–25 mg/dL	2.9–8.9 mmol/L
calcium		
total	8.6–10.3 mg/dL	2.15–2.58 mmol/L
ionized	4.5–5.1 mg/dL	1.13–1.28 mmol/L
chloride	97–110 mEq/L	97–110 mmol/L
coagulation studies		
bleeding time	2.5–9.5 min	150–570 sec
fibrinogen	150–360 mg/dL	1.5–3.6 g/L
PTT	21–32 sec	21–32 sec
prothrombin time	8.2–10.3 sec	8.2–10.3 sec
INR	0.9–1.13	0.9–1.13
thrombin time	11.3–18.5 sec	11.3–18.5 sec
creatinine	0.5–1.7 mg/dL	44–150 μ mol/L
erythrocyte count		
male	4.5–5.7 $\times 10^6$ /mm ³	4.5–5.7 $\times 10^{12}$ /L
female	3.9–5 $\times 10^6$ /mm ³	3.9–5 $\times 10^{12}$ /L
glucose (fasting)	65–109 mg/dL	3.58–6.1 mmol/L
hematocrit		
male	41–50%	138–172 g/L
female	35–46%	120–156 g/L

Always check test results against the values considered normal by the laboratory doing the test. Variations between laboratories are possible.

Test	Conventional units	Systems international units
hemoglobin		
male	13.8–17.2 g/dL	138–172 g/L
female	12–15.6 g/dL	120–156 g/L
hemoglobin A _{1c}	Less than 6% of total Hb	Less than 0.06 of total Hb
iron		
male	45–160 mcg/dL	8.1–31.3 μmol/L
female	30–160 mcg/dL	5.4–31.3 μmol/L
LDH	100–250 international units/L	1.67–4.17 μkat/L
leukocyte count		
total	3.8–9.8 × 10 ³ /μL	3.8–9.8 × 10 ⁹ /L
lymphocytes	1.2–3.3 × 10 ³ /μL	1.2–3.3 × 10 ⁹ /L
mononuclear cells	0.2–0.7 × 10 ³ /μL	0.2–0.7 × 10 ⁹ /L
granulocytes	1.8–6.6 × 10 ³ /μL	1.8–6.6 × 10 ⁹ /L
lipase	10–150 units/L	10–150 units/L
magnesium	1.3–2.2 mEq/L	0.65–1.10 mmol/L
phosphate	2.5–4.5 mg/dL	0.75–1.35 mmol/L
platelet count	140–440 × 10 ³ /μL	140–440 × 10 ⁹ /L
reticulocyte count		
adults	0.5–1.5%	0.005–0.015%
children	2.5–6.5%	
potassium	3.3–4.9 mEq/L	3.3–4.9 mmol/L
sodium	135–145 mEq/L	135–145 mmol/L
uric acid	3–8 mg/dL	179–476 μmol/L

Always check test results against the values considered normal by the laboratory doing the test. Variations between laboratories are possible.

Canadian drug information

Narcotics, controlled drugs, benzodiazepines, and other targeted substances

This table summarizes the requirements for prescribing, dispensing, and record-keeping for narcotics, controlled drugs, benzodiazepines, and other targeted substances. This information is not a comprehensive review; the reader is encouraged to seek additional and confirmatory information (eg, Controlled Drugs and Substances Act, Narcotic Control Regulations, parts G and J of the Food and Drug Regulations, Benzodiazepines, and Other Targeted Substances Regulations). *Reviewed 2010 by the Office of Controlled Substances, Health Canada.*

Classification and description	Legal requirements
Narcotic drugs*	
<ul style="list-style-type: none"> • 1 narcotic (eg, cocaine, codeine, hydromorphone, ketamine, morphine) • 1 narcotic + 1 active non-narcotic ingredient (eg, <i>Novabistex DH</i>, <i>Tylenol No. 4</i>) • All narcotics for parenteral use (eg, fentanyl, pethidine) • All products containing hydrocodone, oxycodone, methadone, or pentazocine • Dextropropoxyphene (eg, <i>Darvon-N</i>, 642) • Nabilone (ie, Cesamet) 	<ul style="list-style-type: none"> • Written prescription required. • Verbal prescriptions not permitted. • Refills not permitted. • Written prescription may be prescribed to be dispensed in divided portions (part-fills). • For part-fills, copies of prescriptions should be made in reference to the original prescription. Indicate on the original prescription: the new prescription number, the date of the part-fill, the quantity dispensed, and the pharmacist's initials. • Transfers not permitted. • Record and retain all documents pertaining to all transactions for at least 2 years in a manner that permits an audit. • Sales reports required except for dextropropoxyphene, propoxyphene. • Report any loss or theft of narcotic drugs within 10 days to the Office of Controlled Substances at the address indicated on the forms.
Narcotic preparations*	
<ul style="list-style-type: none"> • Verbal prescription narcotics: 1 narcotic + 2 or more active non-narcotic ingredients in a recognized therapeutic dose (eg, <i>Fiorinal-C¹/₄</i>, <i>Fiorinal-C¹/₂</i>, <i>Robitussin AC</i>, 282, 292, <i>Tylenol No. 2</i> and <i>No. 3</i>) • Exempted codeine compounds: contain codeine up to 8 mg/solid dosage form or 20 mg/30 mL liquid + 2 or more active non-narcotic ingredients (eg, <i>Atasol-8</i>). 	<ul style="list-style-type: none"> • Written or verbal prescriptions permitted. • Refills not permitted. • Written or verbal prescriptions may be prescribed to be dispensed in divided portions (part-fills). • For part-fills, copies of prescriptions should be made in reference to the original prescription. Indicate on the original prescription: the new prescription number, the date of the part-fill, the quantity dispensed, and the pharmacist's initials. • Transfers not permitted. • Exempted codeine compounds when dispensed pursuant to a prescription follow the same regulations as for verbal prescription narcotics.

*The products noted are examples only.

Classification and description**Legal requirements****Narcotic preparations* (continued)**

- Record and retain all documents pertaining to all transactions for at least 2 years, in a manner that permits an audit.
- Sales reports not required.
- Report any loss or theft of narcotic drugs within 10 days to the Office of Controlled Substances at the address indicated on the forms.

Controlled drugs*

- | | |
|---|--|
| <ul style="list-style-type: none"> • Part I
Amphetamines (eg, <i>Dexedrine</i>, <i>Adderall XR</i>)
Methylphenidate (eg, <i>Biphentin</i>, <i>Concerta</i>, <i>Ritalin</i>)
Pentobarbital (<i>Nembutal</i>)
Preparations: 1 controlled drug + 1 or more active noncontrolled ingredient(s) in a recognized therapeutic dose (eg, <i>Bellergal</i>, <i>Spacetabs</i>) | <ul style="list-style-type: none"> • Written or verbal prescriptions permitted. • Refills not permitted for verbal prescriptions. • Refills permitted for written prescriptions if the prescriber has indicated in writing the number of refills and dates for, or intervals between, refills. • Written or verbal prescriptions may be prescribed to be dispensed in divided portions (part-fills). • For refills and part-fills, copies of prescriptions should be made in reference to the original prescription. Indicate on the original prescription: the new prescription number, the date of the repeat or part-fill, the quantity dispensed, and the pharmacist's initials. • Transfers not permitted. • Record and retain all documents pertaining to all transactions for a period of at least 2 years, in a manner that permits an audit. • Sales reports required except for controlled drug preparations. • Report any loss or theft of controlled drugs within 10 days to the Office of Controlled Substances at the address indicated on the forms. |
| <ul style="list-style-type: none"> • Part II
Barbiturates (eg, phenobarbital)
Butorphanol
Diethylpropion (<i>Tenuate</i>)
Nalbuphine (<i>Nubain</i> injection)
Preparations: 1 controlled drug + 1 or more active noncontrolled ingredient(s) in a recognized therapeutic dose (eg, <i>Fiorinal</i>) • Part III
Anabolic steroids including:
Nandrolone decanoate (eg, <i>Deca-Durabolin</i>)
Testosterone (eg, <i>Androderm</i>)
Testosterone cypionate (eg, <i>Depo-Testosterone</i>)
Testosterone undecanoate (eg, <i>Andriol</i>) | <ul style="list-style-type: none"> • Written or verbal prescriptions permitted. • Refills permitted for written or verbal prescriptions if the prescriber has authorized in writing or verbally (at the time of issuance) the number of refills and dates for, or intervals between, refills. • Written or verbal prescriptions may be prescribed to be dispensed in divided portions (part-fills). • For refills and part-fills, copies of prescriptions should be made in reference to the original prescription. Indicate on the original prescription: the new prescription number, the date of the repeat or part-fill, the quantity dispensed, and the pharmacist's initials. • Transfers not permitted. • Record and retain all documents pertaining to all transactions for a period of at least 2 years, in a manner that permits an audit. • Sales reports not required. • Report the loss or theft of controlled drugs within 10 days to the Office of Controlled Substances at the address indicated on the forms. |

Classification and description	Legal requirements
<i>Benzodiazepines and other targeted substances*</i>	
Alprazolam Bromazepam Chlordiazepoxide Clobazam Diazepam Ethchlorvynol Lorazepam Oxazepam Temazepam Triazolam	<ul style="list-style-type: none"> • Written and verbal prescriptions permitted. • Refills for written or verbal prescriptions permitted if indicated by prescriber and less than 1 yr has elapsed since the day the prescription was issued by the prescriber. • Part-fills permitted as per prescriber's instructions. • For refills or part-fills of prescriptions, record the following information: date of the repeat or part-fill, prescription number, quantity dispensed, and the pharmacist's initials. • Transfer of prescriptions permitted except a prescription that has been already transferred. • Record and retain all documents pertaining to all transactions for a period of at least 2 years, in a manner that permits an audit. • Sales reports not required. • Report any loss or theft of benzodiazepines and other targeted substances within 10 days to the Office of Controlled Substances at the address indicated on the forms.

Adverse reaction reporting: Pharmaceuticals, biologics, natural health products, radiopharmaceuticals

The following is a description of the Canada Vigilance Program. This information is not intended to present a comprehensive review.

Reviewed 2010 by the Marketed Health Products Directorate, Health Canada (Candace Fisher).

Why report? All marketed health products have benefits and risks. Although health products are tested for safety and efficacy before they are licensed, some adverse reactions* may not become evident until the general population uses a health product under “real life” circumstances. By submitting a suspected adverse reaction report, you are contributing to the ongoing collection of safety and effectiveness information that occurs once health products are marketed. Reported adverse reaction information may contribute to:

- the identification of previously unrecognized rare or serious adverse reactions;
- changes in product safety information or other regulatory actions such as withdrawal of a product from the Canadian market;
- international data regarding benefits, risks, or effectiveness of health products;
- health product safety knowledge that benefits all Canadians.

What to report? Health Canada, through the Canada Vigilance Program, is responsible for collecting and assessing adverse reaction reports for the following health products marketed in Canada: Pharmaceuticals (prescription and nonprescription), biologics (including fractionated blood products as well as therapeutic and diagnostic vaccines), natural health products, and radiopharmaceuticals.

You do not have to be certain that a health product caused the reaction in order to report it. Adverse reaction reports are, for the most part, only suspected associations.

The Canada Vigilance Program wants to know about all suspected adverse reactions, but especially if they are:

- **Unexpected adverse reactions**, regardless of their severity (not consistent with product information or labelling).
- **Serious adverse reactions**[†], whether expected or not.
- **Adverse reactions related to recently marketed health products** (on the market for less than 5 years).

How to report to Canada Vigilance? Report any adverse reactions associated with the use of health products to the Canada Vigilance Program by one of the following three ways:

- Call toll-free at 1-866-234-2345
- Report online at www.healthcanada.gc.ca/medeffect
- Complete a Canada Vigilance Reporting Form and:
 - Fax toll-free to 1-866-678-6789 or
 - Mail to Canada Vigilance Program, Health Canada, Postal Locator 0701C, Ottawa, ON K1A 0K9

Postage paid labels, Canada Vigilance Reporting Form, and the adverse reaction reporting guidelines are available on the MedEffect™ Canada Web site at www.healthcanada.gc.ca/medeffect.

About MedEffect™ Canada: MedEffect™ Canada makes it simple and efficient for health professionals and consumers to complete and file adverse reaction reports to the Canada Vigilance Program via Web, phone, fax, or mail and provides centralized access to relevant and reliable health products safety information as it becomes available, in a easy to find, easy to remember location. This includes access to Health Canada's advisories, warnings, and recalls, the Canadian Adverse Reaction Newsletter (CARN), and the Canada Vigilance Online Database.

By subscribing to the MedEffect™ e-Notice you will automatically receive health product advisories warnings and recalls notices as well as the latest issue of the Canadian Adverse Reaction Newsletter by e-mail.

*An adverse reaction is a harmful and unintended response to a health product.

†A serious adverse reaction is one which requires inpatient hospitalization or prolongation of existing hospitalization, causes congenital malformation, results in persistent or significant disability or incapacity, is life-threatening, or results in death. Adverse reactions that require significant medical intervention to prevent one of these outcomes are also considered to be serious.

Commonly used Canadian drugs

cyproterone acetate

ANDROCUR, CYPRONE, CYPROSTAT, PROCUR, AND OTHERS

Drug class and indications

Androgen receptor antagonist, antineoplastic, contraceptive

Treatment of prostate cancer, BPH, priapism, hypersexuality, hirsutism; hormone therapy for male-to-female transgender patients, hot flashes; part of combination oral contraceptives

Dosages and special alerts

25 mg PO bid. Up to 100 mg/day can be used for BPH, priapism, hypersexuality, hirsutism, hormone therapy for male-to-female transgender persons, hot flashes; 300 mg/day PO or IM for prostate cancer; 2 mg with 35 or 50 mcg/day PO ethinyl estradiol for contraception. Not for use in pregnancy. Monitor for liver toxicity; risk increases with higher doses. Risk of adrenal suppression, depression and mood changes, gynecomastia, and sexual dysfunction in males exists. Dosage should be tapered when discontinuing to allow adrenal function to return and to balance testosterone production.

doxylamine succinate and pyridoxine hydrochloride

DICLECTIN

Drug class and indications

Antinausea drug, antihistamine, vitamin

Prevention of nausea and vomiting in pregnancy

Dosages and special alerts

Two DR tablets (10 mg doxylamine, 10 mg pyridoxine/tablet) PO at bedtime. One tablet in the morning and one tablet midday may be added if needed to control nausea and vomiting. Tablet must be swallowed whole; do not cut, crush, or chew tablet. Drug may cause drowsiness, vertigo, nervousness, disorientation. Warn patient to avoid driving or operating dangerous machinery until the effects of the drug are known. Do not combine with alcohol or other CNS depressants. Not for use in patients with epilepsy.

flunarizine hydrochloride

SIBELIUM

Drug class and indications

Antimigraine drug

Prevention of migraine with or without aura

Dosages and special alerts

10 mg/day PO in the evening. 5 mg/day may be tried in patients who experience adverse effects. Not for treatment of acute migraine. Contraindicated for use in patients with history of depression and in patients with pre-existing extrapyramidal disorders. Not recommended for use in pregnancy. Motor disturbances are very common, but these disturbances do not respond to antiparkinsonian drugs. Effects usually reverse with discontinuation of the drug. Sedation and drowsiness may occur. Warn patient to avoid driving or operating dangerous machinery until the effects of the drug are known.

 **flupentixol**

FLUANXOL

Drug class and indications

Antipsychotic, thioxanthene derivative

Maintenance therapy for chronic schizophrenia in patients whose main manifestations do not include excitement, agitation, or hyperactivity

Dosages and special alerts

IM: 20 mg by deep IM injection; a second dose of 20–40 mg IM may be given in 4 to 10 days. If patient is controlled and tolerates the drug well, maintenance dose is 20–40 mg IM every 2–3 wk.

PO: 1 mg PO tid. May be increased to control symptoms to maintenance dose of 3–6 mg/day. Once stabilized, patients may be switched to IM coverage every 2–3 weeks. Contraindicated with CNS depression, blood dyscrasias, pheochromocytoma, liver damage, renal dysfunction. Do not use to treat severe agitation in psychiatric or psychoneurotic patients or to treat elderly patients with agitation. Use cautiously with pregnancy and lactation. Monitor for sedation and extrapyramidal responses. Warn patient to avoid driving or operating dangerous machinery until the effects of the drug are known.

 **L-tryptophan**

TRYPTAN AND OTHERS

Drug class and indications

Amino acid, sleep aid

To improve sleep and enhance mood

Dosages and special alerts

One or two 500-mg tablets PO at bedtime with food; may be increased to a maximum of eight capsules (4 g) per day. The amino acid is converted to serotonin in the brain to promote natural sleep and improve mood. No known contraindications exist. Few adverse effects reported.

 **nitrazepam**

MOGADON

Drug class and indications

Hypnotic, anticonvulsant, benzodiazepine

Symptomatic relief of transient and short-term insomnia characterized by difficulty falling asleep, frequent nocturnal awakenings, or early morning awakenings for a maximum of 7–10 days. May also be useful for the treatment of myoclonic seizures.

Dosages and special alerts

5–10 mg PO before bedtime for a maximum of 7–10 days. Elderly or debilitated patients should start at 2.5 mg/day and should not exceed 5 mg/day PO. *Children treated for myoclonic seizures (up to 30 kg)*: 0.3–1 mg/kg/day PO divided into three doses. Contraindicated with myasthenia gravis, sleep apnea syndrome, known paradoxical reactions to alcohol or sedative medications, hypersensitivity to any benzodiazepine; use extreme caution with history of substance of alcohol abuse. Not recommended during pregnancy. Sedative effects, confusion, and drowsiness are common. Caution patient to avoid driving or operating hazardous machinery. Use of flumazenil (benzodiazepine antagonist) not recommended in patients with epilepsy who are treated with nitrazepam; this combination may precipitate seizures.

petrolatum

Drug class and indications

Emollient, lubricant

To provide a protective barrier to prevent loss of fluid; lubricant to prevent friction and tissue breakdown

Dosages and special alerts

Apply topically to affected areas; used to lubricate and provide a moisture barrier. Apply to intact skin only. Not for ingestion or injection.

zopiclone

IMOVANE, RHOVANE

Drug class and indications

Sedative-hypnotic; cyclopyrrolone derivative

Treatment of insomnia

Dosages and special alerts

7.5 mg PO taken at bedtime. Use cautiously with elderly or debilitated patients, history of depression, pregnancy, lactation and history of substance abuse (may be habit-forming). Monitor for dizziness, sedation, anxiety, nervousness; warn patient to avoid driving or operating hazardous machinery until the effects of the drug are known. Dry mouth, metallic taste may occur; frequent mouth care and sucking sugarless lozenges may help. Be alert for sudden mood changes when drug is stopped.

APPENDIX N

Topical drugs

Topical drugs are agents that are intended for surface use, not ingestion or injection. They may be very toxic if absorbed into the system, but they serve several purposes when used topically.

Pregnancy Category C

Contraindicated with allergy to these drugs, open wounds, or abrasions.

Adverse effects

Local irritation (common), stinging, burning, dermatitis, toxic effects if absorbed systemically.

Teaching points

Apply sparingly to affected area as directed. Do not use with open wounds or broken skin. Avoid contact with eyes. Report any local irritation, allergic reaction, worsening of condition being treated.

Drug	Selected trade names	Instructions and preparations
Acne, rosacea, and melasma products		
adapalene	<i>Differin</i>	Do not use on cuts or any open area. Avoid use on sunburned skin, in combination with other products, or exposure to sun. Apply a thin film to affected area after washing every night at bedtime. Drug is less drying than other products. Available as lotion, cream, gel, or solution; 0.1%, 0.15% concentrations.
alitretinoin	<i>Panretin</i>	Used for treatment of lesions of Kaposi's sarcoma. 1% gel; apply as needed to cover lesions twice daily. Inflammation, peeling, redness may occur.
azelaic acid	<i>Azelex</i> <i>Finacea</i>	Wash and dry skin. Massage a thin layer into affected area twice daily. Wash hands thoroughly after application. Improvement usually occurs within 4 wk. Initial irritation usually occurs but passes with time.
clindamycin	<i>Clindesse</i> <i>Evoclin</i>	2% vaginal cream for the treatment of bacterial vaginitis; one applicatorful (100 mg) given vaginally at any time of the day. 1% foam used for the treatment of acne vulgaris; apply once daily to affected areas that have been washed and are fully dry.
clindamycin and benzoyl peroxide	<i>Acanya</i> <i>BenzaClin</i>	Apply gel to affected areas bid. Wash area and pat dry before application.
clindamycin and tretinoin	<i>Veltin</i> <i>Ziana</i>	Rub pea-size amount over entire face once daily at bedtime. Not for use by patients with colitis. Avoid exposure to sunlight.
dapsone	<i>Aczone Gel</i>	Apply thin layer of gel to affected areas bid. Closely follow Hgb, reticulocyte count in patients with G6PD deficiencies.

(continued)

Drug	Selected trade names	Instructions and preparations
Acne, rosacea, and melasma products (continued)		
fluocinolone acetoneide, hydroquinone, and tretinoin	<i>Tri-Luma</i>	Do not use during pregnancy. Apply to depigmented area of melasma once each evening, at least 30 min before bedtime after cleansing and patting dry; avoid occlusive dressings. Use a sunscreen and protective clothing if outside; skin dryness and peeling may occur.
metronidazole	<i>MetroCream</i> <i>MetroGel</i> <i>MetroLotion</i> <i>Noritate</i>	For treatment of rosacea. Apply cream to affected area bid.
sodium sulfacetamide	<i>Klaron</i>	Apply a thin film bid to affected areas. Wash affected area with mild soap and water; pat dry. Avoid use in denuded or abraded areas.
tazarotene	<i>Tazorac</i>	Avoid use in pregnancy. Apply thin film once daily in the evening. Do not use with irritants or products with high alcohol content. Drying causes photosensitivity.
tretinoin, 0.025% cream	<i>Avita</i>	Apply thin layer once daily. Discomfort, peeling, redness may occur for the first 2–4 wk. Worsened acne may occur in first few wk.
tretinoin, 0.05% cream	<i>Renova</i>	Used for removal of fine wrinkles. Apply thin coat in the evening.
tretinoin, gel	<i>Retin-A* Micro</i>	Apply to cover once daily after cleansing. Exacerbation of inflammation may occur at first. Therapeutic effects usually seen in first 2 wk.
Analgesics		
capsaicin	<i>Axsain</i> <i>Capsin</i> <i>Capzasin</i> <i>Icy Hot PM</i> <i>No Pain-HP</i> <i>Pain Doctor</i> <i>Pain-X</i> <i>Qutenza</i> <i>R-Gel</i> <i>Zostrix</i> <i>Zostrix-HP</i>	Apply not more than tid to qid. Applied locally, provides temporary relief from the pain of osteoarthritis, rheumatoid arthritis, neuralgias. Do not bandage tightly. Stop use and seek health care if condition worsens or persists after 14–28 days. <i>Qutenza</i> : Apply patch to relieve pain of post-herpetic neuralgia.
Antibiotics		
ciprofloxacin and dexamethasone	<i>Ciprodex</i>	Apply drops to ears of child with acute otitis media who has tympanostomy tubes; apply to outer ear canal of patients with acute otitis externa.

Drug	Selected trade names	Instructions and preparations
Antibiotics (continued)		
mupirocin	<i>Bactroban</i>	Used to treat impetigo caused by <i>Staphylococcus aureus</i> , <i>Streptococcus</i> , and <i>Staphylococcus pyogenes</i> . Apply small amount to affected area tid; may be covered with a gauze dressing. Monitor for signs of superinfection; reevaluate if no clinical response in 3–5 days.
mupirocin calcium	<i>Bactroban Nasal</i>	Used to eradicate the nasal colonization of methicillin-resistant <i>S. aureus</i> . Apply one-half of the ointment from single-use tube between nostrils and apply bid for 5 days.
retapamulin	<i>Altamax</i>	Used to treat impetigo. Apply thin layer of ointment to affected area bid for 5 days. May be used on patients 9 mo and older.
Anti-diaper-rash drug		
miconazole, zinc oxide, petrolatum	<i>Vusion</i>	Apply gently to diaper area for 7 days. Verify <i>Candida</i> infection before beginning treatment. Combine with frequent diaper changes and gentle washing.
Antifungals		
butenafine hydrochloride	<i>Mentax</i>	Used to treat intradigital pedia (athlete's foot), tinea corporis, ringworm, tinea cruris. Apply to affected area once a day for 4 wk.
butoconazole nitrate	<i>Gymazole-1</i>	Apply intravaginally as one dose. Culture fungus; if no response, reculture. Ensure use of full course of therapy. May cause irritation, burning.
ciclopirox	<i>Loprox</i> <i>Penlac Nail Lacquer</i>	Used to treat onychomycosis of fingernails and toenails in immunocompromised patients. Apply directly to affected fingernails or toenails.
clotrimazole	<i>Cruex</i> <i>Desenex</i> <i>Lotrimin</i> <i>Mycelex</i>	Clean area before applying. Gently massage into affected area up to twice daily. Use for up to 4 wk. Discontinue if irritation, worsening of condition occurs.
econazole nitrate	<i>Spectazole</i>	Apply locally once or twice daily. Clean area before applying. Treat for 2–4 wk. Discontinue if irritation, burning, or worsening of condition occurs. For athlete's foot, change socks and shoes at least once a day.
gentian violet		Do not apply to active lesions. Apply locally up to twice daily. May stain skin and clothing.
ketoconazole	<i>Nizoral</i>	Apply as shampoo daily. Itching or stinging of the scalp may occur.
naftifine hydrochloride	<i>Naftin</i>	Gently massage into affected area twice daily. Avoid occlusive dressings. Wash hands thoroughly after application. Do not use longer than 4 wk.

(continued)

Drug	Selected trade names	Instructions and preparations
Antifungals (continued)		
oxiconazole	<i>Oxistat</i>	Apply every day up to twice daily. May be needed for up to 1 mo.
sertaconazole nitrate	<i>Ertaczo</i>	Apply to areas between toes affected by tinea pedis and to the surrounding healthy tissue bid for 4 wk.
terbinafine	<i>Lamisil</i>	Apply to area bid until clinical signs are improved, 1–4 wk. Do not use occlusive dressings. Report local irritation. Discontinue if local irritation occurs.
tolnaftate	<i>Absorbine</i> <i>Aftate</i> <i>Genaspor</i> <i>Quinsana Plus</i> <i>Timactin</i>	Apply small amount bid for 2–3 wk; 4–6 wk may be needed if skin is very thick. Clean skin with soap and water before applying drug, dry thoroughly, wear loose, well-fitting shoes, change socks at least four times a day.
Antihistamine		
azelastine hydrochloride	<i>Astelin</i> <i>Astepro</i>	Use two sprays per nostril bid. Avoid use of alcohol and OTC antihistamines; dizziness and sedation can occur.
Antipsoriatics		
anthralin	<i>Dritbo-Scalp</i>	Apply every day only to psoriatic lesions. Use protective dressing. Avoid contact with eyes. May stain fabrics, skin, hair, fingernails.
calcipotriene	<i>Dovonex</i>	Used as a synthetic vitamin D ₂ . Use only for disorder prescribed. Apply thin layer once or twice a day. Monitor serum calcium levels with extended use. May cause local irritation.
calcipotriene and betamethasone	<i>Taclonex</i> <i>Taclonex Scalp</i>	Apply to affected area once daily for up to 4 wk. Maximum, 100 g/wk. Limit treatment area to 30% of body surface. Do not use occlusive dressings on the area.
Antiseborrheics		
chloroxine	<i>Capitol</i>	Do not use on active lesions. Massage into wet scalp; leave lather on for 3 min. May discolor blond, gray, bleached hair.
selenium sulfide	<i>Selsun Blue</i>	Massage 5–10 mL into scalp; rest 2–3 min, rinse, repeat. May damage jewelry; remove jewelry before use. Discontinue use if local irritation occurs.
Antiseptics		
benzalkonium chloride	<i>Benza</i> <i>Mycocide NS</i> <i>Zepbiran</i>	Mix in solution as needed. Spray for preoperative use; store instruments in solution. Thoroughly rinse detergents and soaps from skin before use. Add antirust tablets for instruments stored in solution; dilute solution as indicated for use.

Drug	Selected trade names	Instructions and preparations
Antiseptics		
chlorhexidine gluconate	<i>BactoShield</i> <i>Dyna-Hex</i> <i>Exidine</i> <i>Hibistat</i>	Use for surgical scrub, preoperative skin prep, wound cleansing, preoperative bathing and showering. Scrub or rinse. Leave on for 15 sec; for surgical scrub, leave on for 3 min.
hexachlorophene	<i>pHisoHex</i>	Use for surgical wash, scrub. Apply as wash; do not use with burns or on mucous membranes. Rinse thoroughly. Do not use routinely for bathing infants.
iodine		Wash affected area with solution. Solution is highly toxic; avoid occlusive dressings; stains skin and clothing.
povidone iodine	<i>ACU-dyne</i> <i>Betadine</i> <i>Betagen</i> <i>Etodine</i> <i>Iodex</i> <i>Minidyne</i> <i>Operand</i> <i>Polydine</i>	HIV may be inactivated in this solution. Apply as needed; treated areas may be bandaged. Causes less irritation than iodine and is less toxic.
sodium hypochlorite	<i>Dakin's solution</i>	Apply as antiseptic. <i>Caution:</i> Chemical burns can occur.
thimerosal	<i>Aeroaid</i> <i>Mersol</i>	Used preoperatively and as first aid for abrasions, wounds. Apply every day up to three times per day. Contains mercury compound.
Antivirals		
acyclovir	<i>Zovirax</i>	Apply 0.5-inch ribbon to affected area and rub in gently six times daily for 7 days.
docosanol	<i>Abreva</i>	Used to treat oral and facial herpes simplex cold sores, fever blisters. Apply five times per day for 10 days. Caution patient not to overuse.
imiquimod	<i>Aldara</i>	Used to treat external genital warts and perianal warts. Apply a thin layer to warts and rub in three times per wk at bedtime for 16 wk; remove with soap and water after 6–10 hr. For typical nonhyperkeratotic actinic keratoses on face or scalp in immune-compromised patients, apply cream to affected area before bed twice weekly for 16 wk. For topical treatment of superficial basal cell carcinoma in immune-compromised patients, 10–40 mg applied to lesion five times weekly at bedtime for 6 wk.
	<i>Zyclara</i>	3.75% cream used to treat nonhyperkeratotic, nonhypertrophic, visible, or palpable actinic keratose on the face or balding scalp of adults. Apply once daily to the affected area at bedtime for 2 wk. Treatment cycle is 2 wk of treatment followed by 2 wk of nontreatment.

(continued)

Drug	Selected trade names	Instructions and preparations
Antivirals (continued)		
kunecatechins	<i>Veregen</i>	Used to treat external and perianal warts in immunocompetent patients older than 18 yr. Apply to each wart tid for up to 16 wk; do not cover treated area.
penciclovir	<i>Denavir</i>	Used to treat cold sores in healthy patients. Reserve use for herpes labialis on lips and face; avoid mucous membranes. Use at first sign of cold sore. Apply thin layer to affected area every 2 hr while awake for 4 days.
Burn treatments		
mafenide	<i>Sulfamylon</i>	Apply to a clean, debrided wound, one or two times per day with a gloved hand. Cover burn at all times with drug, reapply as needed. Bathe patient in a whirlpool daily to aid debridement. Continue mafenide until healing occurs; monitor for infection and toxicity—acidosis. May cause marked discomfort on application.
nitrofurazone		Apply directly to burn or place on gauze; reapply daily. Flushing the dressing with sterile saline facilitates removal. Monitor for signs of superinfections; treat supportively. Rash frequently occurs.
silver sulfadiazine	<i>Silvadene</i> <i>SSD cream</i> <i>Thermazene</i>	Apply once or twice a day to a clean, debrided wound. Use a 1/16-inch thickness. Bathe patient in a whirlpool to aid debridement. Dressings are not necessary but may be used; reapply as needed. Monitor for fungal superinfections.
Corticosteroids		
alclometasone dipropionate	<i>Aclovate</i>	Available as ointment and cream in 0.05% concentration.
betamethasone dipropionate	<i>Diprosone</i> <i>Maxivate</i> <i>Taro-Sone (CAN)</i>	Available as ointment, cream, gel, lotion, aerosol in 0.05% concentration.
betamethasone dipropionate augmented	<i>Diprolene</i> <i>Diprolene AF</i> <i>Diprosone</i>	Available as ointment, cream, lotion in 0.05% concentration.
betamethasone valerate	<i>Betaderm (CAN)</i> <i>Beta-Val</i> <i>Luxiq, Prevox B (CAN)</i>	Available as ointment, cream, and lotion in 0.1% concentration.
	<i>Valisone</i>	Available as foam in 0.12% concentration.
ciclesonide	<i>Alvesco</i>	Available as 80 mcg and 160 mcg/actuation, as nasal spray or solution for inhalation.
clobetasol propionate	<i>Clobex</i>	Available as 0.05% spray.

Drug	Selected trade names	Instructions and preparations
Corticosteroids (continued)		
	<i>Cormax</i> <i>Dermovate (CAN)</i> <i>Olux</i> <i>Temovate</i>	Available as ointment, cream, foam, and gel in 0.05% concentration.
clocortolone pivalate	<i>Cloderm</i>	Available as cream in 0.1% concentration.
deseonide	<i>DesOwen</i>	Available as ointment, lotion, and cream in 0.05% concentration.
	<i>Verdeso</i>	Available as foam in 0.05% concentration.
deseoximetasone	<i>Topicort</i>	Available as ointment and cream in 0.25% concentration. Available as cream and gel in 0.05% concentration.
dexamethasone	<i>Aeroseb-Dex</i> <i>DecaSpray</i>	Available as aerosol in 0.01% and 0.04% concentrations.
dexamethasone sodium phosphate		Available as cream in 0.1% concentration.
diflorasone diacetate	<i>Florone</i> <i>Florone E</i> <i>Maxiflor</i> <i>Psorcon E</i>	Available as ointment and cream in 0.05% concentration.
fluocinolone acetonide	<i>Fluonid</i>	Available as solution in 0.01% concentration.
	<i>Synalar</i>	Available as ointment in 0.025% concentration, as cream in 0.01% and 0.025% concentrations, and as solution in 0.01% concentration.
fluocinonide	<i>Fluonex</i> <i>Lyderm Cream (CAN)</i>	Available as cream in 0.05% concentration.
	<i>Lidex</i>	Available as ointment, cream, solution, and gel in 0.05% concentration.
	<i>Vanos</i>	Available as cream in 0.1% concentration.
flurandrenolide		Available as ointment, cream, and lotion in 0.05% concentration and as tape containing 4 mcg/cm ² .
fluticasone fumarate	<i>Veramyst</i>	Available as nasal spray containing 55 mcg/spray.
fluticasone propionate	<i>Cutivate</i>	Available as cream in 0.05% concentration and ointment in 0.005% concentration.
halcinonide	<i>Halog</i>	Available as ointment, cream, and solution in 0.1% concentration.

(continued)

Drug	Selected trade names	Instructions and preparations
Corticosteroids (continued)		
halobetasol propionate	<i>Ultravate</i>	Available as ointment and cream in 0.05% concentration.
hydrocortisone	<i>Bactine Hydrocortisone</i> <i>Cort-Dome</i> <i>Cortizone-5</i> <i>Dermolate</i> <i>Dermtex HC</i>	Available as lotion in 0.25%, 0.5%, 1%, 2%, 2.5% concentrations.
	<i>Cortizone-10</i> <i>Hycort</i> <i>Tegrin-HC</i>	Available as cream, lotion, ointment, and aerosol in 0.5% concentration.
	<i>Hytone</i>	Available as cream, ointment, and solution at 1% concentration.
hydrocortisone acetate	<i>Anusol-HC1</i>	Available as cream in 1% concentration.
	<i>Cortaid</i> <i>Lanacort-5</i>	Available as ointment in 0.5% concentration.
	<i>Cortaid with Aloe</i>	Available as cream in 0.5% concentration.
	<i>Gynecort</i> <i>Lanacort-5</i>	Available as cream in 0.5% concentration.
hydrocortisone buteprate		Available as cream in 0.1% concentration.
hydrocortisone butyrate	<i>Locoid</i>	Available as ointment and cream in 0.1% concentration.
hydrocortisone valerate	<i>Westcort</i>	Available as ointment and cream in 0.2% concentration.
mometasone furoate	<i>Asmanex</i> <i>Twisthaler</i>	Available as powder for oral inhalation at 220 mcg/actuation; for patients 4 yr and older.
	<i>Elocon</i>	Available as ointment, cream, and lotion in 0.1% concentration.
	<i>Nasonex</i>	Available as nasal spray in 0.2% concentration.
prednicarbate	<i>Dermatop</i>	Available as preservative-free cream in 0.1% concentration.
triamcinolone acetonide	<i>Triacet, Triderm</i>	Available as cream in 0.1% concentration and as lotion in 0.025% and 0.1% concentrations.
Emollients		
boric acid ointment	<i>Borofax</i>	Relieves burns, itching, irritation. Apply as needed.

Drug	Selected trade names	Instructions and preparations
Emollients (continued)		
dexpantenol	<i>Pantboder</i>	Relieves itching and aids in healing for mild skin irritations. Apply once or twice daily.
urea	<i>Aquacare</i> <i>Carmol 10</i> <i>Carmol 20</i> <i>Carmol 40</i> <i>Gordon's Urea 40%</i> <i>Nutraplus</i> <i>Ureacin-10</i> <i>Ureacin-20</i>	Apply bid to qid to area affected; rub in completely. Also used to restore nails (<i>Gordon's Urea 40%</i>)—cover with plastic wrap; keep dry and remove in 3–7 days.
vitamins A and D		Relieves minor burns, chafing, skin irritations. Apply locally with gentle massage bid to qid. Consult physician if not improved within 7 days.
zinc oxide	<i>Borofax Skin Protectant</i>	Relieves burns, abrasions, diaper rash. Apply as needed.
Estrogen		
estradiol hemihydrate	<i>Vagifem</i>	For treatment of atrophic vaginitis. Use one tablet inserted vaginally every day for 2 wk; then one tablet inserted vaginally two times per week. Try to taper every 3–6 months.
Growth factor		
becaplermin	<i>Regranex</i>	Increases incidence of healing of diabetic foot ulcers as adjunctive therapy. Apply to diabetic foot ulcers daily; patient must have an adequate blood supply. Risk of cancer increases with prolonged use.
Hair removal product		
eflornithine	<i>Vaniqa</i>	Approved for use in women only. Apply to unwanted facial hair bid for up to 24 wk. Do not wash treated areas until at least 4 hr after treatment.
Hemostatics		
absorbable gelatin (also comes in powder form)	<i>Gelfoam</i>	To prepare paste, add 3–4 mL sterile saline to contents of jar. Apply sponge dry or saturated with saline. Smear or press paste to cut surface; when bleeding stops, remove excess. Apply sponge and leave in place; it will be absorbed. Assess continually for infection; agent may act as site of infection or abscess formation. Do not use with infection.
absorbable fibrin sealant	<i>TachoSil</i>	For use in cardiovascular surgery when control of bleeding by usual techniques is not effective. Apply yellow, active side of patch directly to bleeding area; number of patches needed depends on size of bleeding area. Do not apply intravascularly; do not use with known hypersensitivity to human blood products or horse protein.

(continued)

Drug	Selected trade names	Instructions and preparations
Hemostatics (continued)		
human fibrin sealant	<i>Artiss</i> <i>Evicel</i>	Spray or drip onto tissue in short bursts (0.1–0.2 mL) to produce a thin, even layer. If hemostasis is not complete, a second layer may be applied. Adjunct to decrease bleeding in vascular and liver surgery or used to adhere to autologous skin grafts for burns (<i>Artiss</i>). Monitor patient for anaphylactic reaction.
microfibrillar collagen	<i>Hemopad</i>	Use dry. Apply directly to the source of bleeding; apply pressure. Time will vary from 3–5 min depending on the site. Discard any unused product; monitor for infection; do not use with infection. Remove any excess material once bleeding has been controlled.
thrombin	<i>Thrombinar</i> <i>Thrombostat</i>	Prepare in sterile distilled water or isotonic saline; 100–1,000 units/mL. Mix freely with blood on the surface of injury; contraindicated with any bovine allergies. Watch for any sign of severe allergic reaction in sensitive individuals.
thrombin, recombinant	<i>Recothrom</i>	Apply solution directly to bleeding site with absorbable gelatin sponge; amount needed varies with area to be treated. Reserve use for minor bleeding or oozing. Contraindicated with allergy to hamster or snake proteins.
Immune modulator		
pimecrolimus	<i>Elidel</i>	Treatment of mild to moderate atopic dermatitis in non-immunocompromised patients older than 2 yr in whom conventional therapy is inappropriate or ineffective. Apply thin layer to affected area bid; discontinue if resolution of disease occurs.
Keratolytics		
podofilox	<i>Condylox</i>	Apply every 12 hr for 3 consecutive days. Allow to dry before using area. Dispose of used applicator. May cause burning and discomfort.
podophyllum resin	<i>Podocon-25</i> <i>Podofin</i>	Applied only by physician. Do not use if wart is inflamed or irritated. Very toxic; use minimum amount possible to avoid absorption.
Local anesthetic/analgesic		
lidocaine/tetracaine	<i>Synera</i>	Dermal analgesia for superficial venous access and dermatological procedures. Apply one patch to intact skin 20–30 min before dermal procedure.
Lotions and solutions		
Burow's solution aluminum acetate	<i>Domeboro Powder</i>	Astringent wet dressing for relief of inflammatory conditions, insect bites, athlete's foot, bruises. Dissolve packet or tablet in pint of water, apply every 15–30 min for 4–8 hr; do not use occlusive dressing or in plastic containers.

Drug	Selected trade names	Instructions and preparations
Lotions and solutions (continued)		
calamine lotion		Relieves itching; pain of poison ivy, poison sumac, poison oak, insect bites, and minor skin irritations. Apply to affected area tid to qid.
hamamelis water	<i>A-E-R</i> <i>Witch Hazel</i>	Relieves itching and irritation of vaginal infection, hemorrhoids, postepisiotomy discomfort, posthemorrhoidectomy care. Apply locally up to six times per day.
Nasal corticosteroid		
fluticasone propionate	<i>Flonase</i>	Used as preventive treatment of asthma, not as primary treatment. May take several weeks to work. Clean nasal spray adapter weekly. <i>Adult:</i> Two sprays in each nostril daily. Approved for children 4–11 yr.
	<i>Flovent Diskus</i> <i>Flovent HFA</i>	Used as prophylactic treatment of asthma for patients age 4 and older who require a corticosteroid: 88–220 mcg bid using provided inhalation device or nasal inhalation.
Oral preparation		
amlexanox	<i>Aphbasol</i>	Apply solution or mucoadhesive disc to each aphthous ulcer qid—after meals, at bedtime, following oral hygiene—for 10 days; consult with dentist if ulcers are not healed within 10 days. May cause local pain.
Pediculicides and scabicides		
benzyl alcohol		5% lotion for treatment of head lice in patients 6 mo and older; not for use in infants. Apply to scalp or hair near scalp.
crotamiton	<i>Eurax</i>	For external use. Shake well, and massage into skin of entire body; repeat in 24 hr. Bathe or shower 48 hr after last use. Change bed linens and clothing the next day. Dry-clean contaminated clothing or wash in hot water.
lindane		For external use; not for use in premature neonates. Apply thin layer to entire body; leave on 8–12 hr, then wash thoroughly. Shampoo 1–2 oz into dry hair and leave for 4 min. Reapply after 7 days if signs of live lice recur. Teach hygiene and prevention; treat all contacts. Inform parents that this is a readily communicable disease.
malathion	<i>Ovide Lotion</i>	Avoid use with open lesions. Apply to dry hair; leave on 8–12 hr. Repeat in 7–9 days. Change bed linens and clothing. Treat all contacts. Contains flammable alcohol.
permethrin	<i>Acticin</i> <i>Elimite</i> <i>Nix</i>	For external use, including prophylaxis during head lice epidemics. Thoroughly massage into skin (30 g/adult); wash off after 8–14 hr. Shampoo into freshly washed, rinsed, towel-dried hair. Leave on 10 min; rinse. Notify health care provider if rash, itching worsen.

Ophthalmic drugs

Ophthalmic drugs are intended for direct administration into the conjunctiva of the eye. These drugs are used to treat glaucoma (miotics constrict the pupil and decrease the resistance to aqueous flow), to aid in diagnosis of eye problems (mydriatics dilate the pupil for examination of the retina; cycloplegics paralyze the muscles that control the lens to aid refraction), to treat local ophthalmic infections or inflammation, and to provide relief from the signs and symptoms of allergic reactions.

Pregnancy Category C

Contraindicated in cases of allergy to these drugs. These drugs are seldom absorbed systemically, but caution should be taken with any patient who would have problems with the systemic effects of the drug if it were absorbed systemically.

Adverse effects

Local irritation, stinging, burning, blurring of vision (prolonged when using ointment), tearing; headache.

Dosage

1–2 drops to each eye bid to qid or 0.25–0.5 inch of ointment to each eye is the usual dosage.

Solution or drops

Wash hands thoroughly before administering; do not touch dropper to eye or to any other surface; have patient tilt head backward or lie down and stare upward; gently grasp lower eyelid and pull the eyelid away from the eyeball; instill drop(s) into pouch formed by eyelid; release lid slowly; have patient close eye and look downward; apply gentle pressure to the inside corner of the eye for 3–5 min to retard drainage; do not rub eyes; do not rinse eyedropper. Do not use eyedrops that have changed color; if more than one type of eyedrop is used, separate administration by 5 min.

Ointment

Wash hands thoroughly before administering; hold tube between hands for several minutes to warm the ointment; discard the first cm of ointment when opening the tube for the first time; tilt head backward or lie down and stare upward; gently pull out lower lid to form pouch; place 0.25–0.5 inch of ointment inside the lower lid; have patient close eyes for 1–2 min and roll eyeball in all directions; remove any excess ointment from around eye. If using more than one kind of ointment, wait 10 min before administration.

Teaching points

Teach patient the proper administration technique for the ophthalmic drug ordered; caution patients that transient stinging or burning may occur and that blurring vision may also occur—appropriate safety measures should be taken; sensitivity to sun will occur with mydriatic agents, which cause pupils to dilate; sunglasses may be needed. Report severe eye discomfort, palpitations, nausea, headache.

Drug	Trade names	Usage	Special considerations
alcaftadine	<i>Lastacaft</i>	Prevention of itching associated with allergic conjunctivitis	One drop in each eye daily. Remove contact lenses. Not for use to treat contact lens irritation.
apraclonidine	<i>Iopidine</i>	To control or prevent post-surgical elevations of IOP in patients after argon-laser eye surgery; short-term adjunct in patients on maximum tolerated therapy who need additional IOP reduction	Monitor for the possibility of vasovagal attack; do not give to patients with allergy to clonidine.
azelastine hydrochloride	<i>Optivar</i>	Treatment of ocular itching associated with allergic conjunctivitis	Antihistamine, mast cell stabilizer. <i>3 yr and older</i> : 1 drop bid. Rapid onset, 8 hr duration.
bepotastine besilate	<i>Bepreve</i>	Treatment of ocular itching associated with allergic rhinitis	Apply twice daily. Not for children younger than 2 yr.
besifloxacin	<i>Besivance</i>	Treatment of bacterial conjunctivitis (pinkeye)	1 drop in affected eye tid (6–8 hr apart); use for 7 days.
bimatoprost	<i>Lumigan</i>	Treatment of open-angle glaucoma and ocular hypertension	First- or second-line treatment; darkening of iris may occur; 1 drop daily in the evening.
brimonidine tartrate	<i>Albagan P</i>	Treatment of open-angle glaucoma and ocular hypertension	Selective α_2 -antagonist; minimal effects on CV and pulmonary systems; may stain soft contact lenses. Do not use with MAOIs. 1 drop tid.
brimonidine and timolol	<i>Combigan</i>	Treatment of IOP	1 drop every 12 hr. Do not use with contact lenses.
brinzolamide	<i>Azopt</i>	Decrease IOP in open-angle glaucoma	May be given with other agents; 1 drop tid. Give 10 min apart from other agents.
bromfenac 0.09%	<i>Bromday</i> <i>Xibrom</i>	Treatment of postsurgical inflammation and reduction of ocular pain in patients who have undergone cataract extraction	1 drop in affected eye bid, beginning 24 hr after surgery and continuing for 2 wk. Once daily if using <i>Bromday</i> .
carbachol	<i>Miostat</i>	Direct-acting miotic; for treatment of glaucoma; for miosis during surgery	Surgical dose a one-use only portion; 1 or 2 drops up to tid as needed for glaucoma.

(continued)

Drug	Trade names	Usage	Special considerations
cyclopentolate	<i>AK-Pentolate</i> <i>Cyclogyl</i>	Mydriasis or cycloplegia in diagnostic procedures	Individuals with dark pigmented irides may require higher doses; compress lacrimal sac for 2–3 min after administration to decrease any systemic absorption.
cyclosporine emulsion 0.05%	<i>Restasis</i>	Increases tear production in patients whose tear production is presumed to be suppressed because of ocular inflammation associated with keratoconjunctivitis sicca	1 drop in each eye twice a day, approximately 12 hr apart; remove contact lenses before using.
dexamethasone intravitreal	<i>Ozurdex</i>	Extended-release intravitreal injection for treatment of macular edema following branch retinal artery occlusion or central retinal vein occlusion; treatment of non-infectious uveitis of the posterior segment of the eye	Monitor for infection, retinal detachment, and increased intraocular pressure after injection. Use cautiously with history of ocular herpes simplex.
diclofenac sodium	<i>Voltaren</i>	Photophobia; for use in patients undergoing incisional refractive surgery	Apply 1 drop qid beginning 24 hr after cataract surgery; continue through the first 2 wk postoperatively.
difluprednate	<i>Durezol</i>	Anti-inflammatory and analgesic for treatment of postoperative ocular pain and inflammation	Apply 1 drop to affected eye qid beginning 24 hr after surgery and continuing for 2 wk.
dorzolamide	<i>Trusopt</i>	Treatment of elevated IOP in patients with ocular hypertension or open-angle glaucoma	A sulfonamide; monitor patients on parenteral sulfonamides for possible additive effects. Children: 1 drop in each eye tid.
dorzolamide 2% and timolol 0.5%	<i>Cosopt</i>	Decrease IOP in open-angle glaucoma or ocular hypertension in patients who do not respond to beta blockers alone	Administer 1 drop in affected eye bid. Monitor for cardiac failure; if absorbed, may mask symptoms of hypoglycemia or thyrotoxicosis.
echothiophate		Treatment of open-angle glaucoma, accommodative esotropia; irreversible cholinesterase inhibitor; long-acting.	Given only once or twice a day because of long action; tolerance may develop with prolonged use. Usually responds to a rest period.
emedastine	<i>Emadine</i>	Temporary relief of signs and symptoms of allergic conjunctivitis	1 drop in affected eye or eyes up to qid. Do not wear contact lenses if eyes are red; may cause headache, blurred vision.

Drug	Trade names	Usage	Special considerations
epinastine hydrochloride	<i>Elestat</i>	Prevention of itching caused by allergic conjunctivitis	Remove contact lenses before applying. Instill 1 drop in each eye bid for entire time of exposure, even if itching subsides.
fluocinolone acetonide intravitreal implant	<i>Retisert</i>	Treatment of chronic non-infectious uveitis affecting the posterior segment of the eye	1 surgically implanted insert (releases 0.6 mcg per day for approximately 30 mo). May be replaced after 30 mo if needed.
fluorometholone	<i>Flarex</i> <i>Fluor-Op</i> <i>FML</i>	Topical corticosteroid used for treatment of inflammatory conditions of the eye	Improvement should occur within several days, discontinue if no improvement is seen. Monitor IOP if used longer than 10 days. Discontinue if swelling of the eye occurs.
ganciclovir	<i>Zirgan</i>	Treatment of acute herpetic keratitis	Apply gel to lower conjunctival sac daily.
gatifloxacin	<i>Zymar</i> <i>Zymaxid</i>	Treatment of bacterial conjunctivitis caused by susceptible strains of <i>Corynebacterium propinquum</i> , <i>Staphylococcus aureus</i> , <i>Staphylococcus epidermidis</i> , <i>Streptococcus mitis</i> , <i>Streptococcus pneumoniae</i> , <i>Haemophilus influenzae</i>	Contacts should not be worn during these infections; ensure that patient is not allergic to any quinolone antibiotic. Can cause blurred vision.
homatropine	<i>Homatropine</i> <i>HBr</i> <i>Isopto-</i> <i>Homatropine</i>	Long-acting mydriatic and cycloplegic used for refraction and treatment of inflammatory conditions of the uveal tract or preoperative and postoperative states when mydriasis is required	Individuals with dark pigmented irides may require larger doses; 5–10 min is usually required for refraction.
ketorolac	<i>Acuwail</i> (0.45%)	Treatment of pain and inflammation following cataract surgery	Apply to affected eye bid.
ketotifen	<i>Zaditor</i>	An antihistamine and mast cell stabilizer; provides temporary relief of itching due to allergic conjunctivitis	Remove contact lenses before use—may be replaced within 10 min.
latanoprost	<i>Xalatan</i>	Treatment of open-angle glaucoma or ocular hypertension in patients intolerant or nonresponsive to other agents	Remove contact lenses before and for 15 min after use; allow at least 5 min between this and the use of any other agents; expect burning, blurred vision.

Drug	Trade names	Usage	Special considerations
levobunolol	<i>AKBeta</i> <i>Betagan</i> <i>Liquifilm</i>	Lowering of IOP with chronic, open-angle glaucoma, ocular hypertension	1 or 2 drops bid. Do not combine with other beta blockers.
levofloxacin	<i>Quixin</i>	Treatment of bacterial conjunctivitis caused by susceptible bacteria	1 or 2 drops in affected eye every 2 hr while awake, days 1 and 2; then every 4 hr while awake, up to four times per day for days 3 to 7.
lodoxamide tromethamine	<i>Alomide</i>	Treatment of vernal conjunctivitis and keratitis for patients older than 2 yr	Patients should not wear contact lenses while using this drug; discontinue if stinging and burning persist after instillation.
loteprednol etabonate	<i>Alex (0.2%)</i>	Treatment of postoperative inflammation after ocular surgery	1 or 2 drops qid beginning 24 hr after surgery and continuing for 2 wk. Shake vigorously before use. Discard after 14 days; prolonged use may cause nerve or eye damage.
	<i>Lotemax (0.5%)</i>	Treatment of steroid-resistant ocular disease	1 or 2 drops qid.
loteprednol etabonate/tobramycin	<i>Zylet</i>	Treatment of steroid-responsive inflammatory ocular conditions where there is a risk of superficial bacterial ocular infection	1 or 2 drops into conjunctival sac every 4–6 hr; during first 24–48 hr, dose may increase to every 1–2 hr.
metipranolol	<i>OptiPranolol</i>	Beta blocker; used in treating chronic open-angle glaucoma and ocular hypertension	Concomitant therapy may be needed; caution patient about possible vision changes.
moxifloxacin	<i>Vigamox</i>	Treatment of bacterial conjunctivitis caused by susceptible strains of <i>Corynebacterium</i> species, <i>Micrococcus luteus</i> , <i>Staphylococcus</i> , <i>Staphylococcus aureus</i> , <i>Staphylococcus baemolyticus</i> , <i>Staphylococcus hominis</i> , <i>Staphylococcus warneri</i> , <i>Streptococcus pneumoniae</i> , <i>Streptococcus viridans</i> group, <i>Acinetobacter lwoffii</i> , <i>Haemophilus influenzae</i> , <i>Haemophilus parainfluenzae</i> , <i>Chlamydia trachomatis</i>	Contact lenses should not be worn during these infections; ensure that patient is not allergic to any quinolone antibiotic. Can cause blurred vision.
natamycin	<i>Natacyn</i>	Antibiotic used to treat fungal blepharitis, conjunctivitis, and keratitis; drug of choice for <i>Fusarium solani</i> keratitis	Shake well before each use; store at room temperature; failure to improve in 7–10 days suggests a non-susceptible organism; reevaluate.

Drug	Trade names	Usage	Special considerations
nedocromil sodium	<i>Alocril</i>	Treatment of itching of allergic conjunctivitis	Use at regular intervals through the entire allergic season: 1 or 2 drops in each eye bid.
olopatadine hydrochloride	<i>Patanol</i>	Mast cell stabilizer and antihistamine; provides fast onset of relief of itching due to conjunctivitis with prolonged action	Not for use with contact lenses; headache is a common adverse effect.
pemirolast potassium	<i>Alamast</i>	Prevention of itchy eyes due to allergic conjunctivitis	1 or 2 drops qid.
pilocarpine	<i>Adorbocarpine</i> <i>Piloptic</i> <i>Pilostat</i>	Chronic and acute glaucoma; treatment of mydriasis caused by drugs; direct-acting miotic drug	Can be stored at room temperature for up to 8 wk, then discard. 1 or 2 drops up to six times per day may be needed, based on patient response.
polydimethylsiloxane	<i>AdatoSil 5000</i>	Treatment of retinal detachments where other therapy is not effective or is inappropriate; primary choice for retinal detachment due to AIDS-related CMV retinitis or viral infection	Monitor for cataracts; must be injected into aqueous humor.
rimexolone	<i>Vexol</i>	Corticosteroid; postoperative ocular surgery and for treatment of anterior uveitis	Monitor for signs of steroid absorption.
timolol maleate	<i>Timoptic XE</i>	Treatment of elevated IOP in ocular hypertension or open-angle glaucoma	1 drop in affected eye once a day in the morning.
travoprost	<i>Travatan</i> <i>Travatan Z</i>	Treatment of open-angle glaucoma and ocular hypertension	1 drop in affected eye or eyes each evening; eye discomfort, pain, darkening of iris, growth of eyelashes common.
trifluridine	<i>Viroptic</i>	Antiviral; used to treat primary keratoconjunctivitis and recurrent epithelial keratitis due to herpes simplex virus types 1 and 2	Transient burning and stinging may occur; reconsider drug if improvement is not seen within 7 days. Do not administer for longer than 21 days at a time.
tropicamide	<i>Mydracil</i> <i>Opticyl</i> <i>Tropicacyl</i>	Mydriatic and cycloplegic; used for refraction	1 or 2 drops of 1% solution; repeat in 5 min. May repeat in 30 min for prolonged effects.

APPENDIX P

Laxatives

Laxative use has been replaced by the use of proper diet and exercise in many clinical situations. Most laxatives are available as OTC preparations and are often abused by people who become dependent on them for GI movement.

Indications

Short-term relief of constipation; to prevent straining; to evacuate the bowel for diagnostic procedures; to remove ingested poisons from the lower GI tract; as adjunct in anthelmintic therapy

Drug	Selected trade names	Type
bisacodyl	<i>Bisa-Lax</i> <i>Dulcolax</i>	Stimulant
cascara		Stimulant
castor oil	<i>Emulsoil</i>	Stimulant
docusate	<i>Colace</i> <i>ex-lax Stool Softener</i> <i>Genasoft</i> <i>Phillips' Liqui-Gels</i>	Detergent, softener
glycerin	<i>Fleet BabyLax</i> <i>Sani-Supp</i>	Hyperosmolar agent
lactulose	<i>Cephulac</i> <i>Chronulac</i> <i>Constilac</i> <i>Constulose</i>	Hyperosmolar agent
lubiprostone	<i>Amitiza</i>	Chloride channel activator
magnesium citrate	<i>Citrate of Magnesia</i>	Saline
magnesium hydroxide	<i>Milk of Magnesia</i> <i>MOM</i> <i>Philip's MOM</i>	Saline
magnesium sulfate	<i>Epsom Salts</i>	Saline

Pregnancy Category C

Contraindicated in cases of allergy to these drugs, third trimester of pregnancy, acute abdominal pain.

Adverse effects

Excessive bowel activity, perianal irritation, abdominal cramps, *weakness*, *dizziness*, cathartic dependence

Teaching points

Use as a temporary measure. Swallow tablets whole. Do not take this drug within 1 hr of any other drugs. Report sweating, flushing, muscle cramps, excessive thirst.

Dosage	Onset	Special considerations
10–15 mg PO 2.5 g in water via enema	6–10 hr Rapid	Allergy to tartrazine in <i>Dulcolax</i> tablets; may discolor urine.
325–650 mg PO	6–10 hr	
15–30 mL PO	2–6 hr	May be very vigorous; may cause abdominal cramping.
50–250 mg PO	24–72 hr	Gentle; beneficial with anorectal conditions that are painful and with dry or hard feces.
Rectal suppository; 4 mL liquid by rectum	15–30 min	Insert suppository high into rectum, retain 15 min; insert liquid dispenser and apply gentle, steady pressure until all liquid is gone, then remove.
15–30 mL PO	24–48 hr	Also used for treatment of portal system encephalopathy. May be more palatable mixed with fruit juice, water, or milk.
24 mcg PO bid with food	1–2 hr	May cause nausea, diarrhea; also approved for the treatment of IBS with constipation in women 18 yr and older.
1 glassful PO	0.5–3 hr	Reduce pediatric dosage by one-half.
15–30 mL PO	0.5–3 hr	Take with liquids; flavored varieties vary.
5–10 mL PO	0.5–3 hr	Take mixed with glass of water; reduce pediatric dose to 2.5–5 mL in one-half glass of water.

(continued)

Drug	Selected trade names	Type
mineral oil	<i>Kondremul Plain</i>	Emollient
polycarbophil	<i>Equalactin</i> <i>FiberCon</i> <i>Konsyl Fiber</i>	Bulk
polyethylene glycol	<i>MiraLax</i>	Bulk
polyethylene glycol-electrolyte solution	<i>CoLyte</i> <i>GoLYTELY</i> <i>NuLYTELY</i>	Bulk
polyethylene glycol, sodium sulfate, sodium chloride, potassium chloride, sodium ascorbate, ascorbic acid	<i>MoviPrep</i>	Osmotic
psyllium	<i>Fiberall</i> <i>Hydrocil Instant</i> <i>Metamucil</i>	Bulk
senna	<i>Agoral</i> <i>Black-Draught</i> <i>Fletcher's Castoria</i> <i>Senna-Gen</i> <i>Senokot</i>	Stimulant
sodium chloride, sodium bicarbonate, potassium chloride with bisacodyl tablets	<i>HalfLyteLy and Bisacodyl</i> <i>Bowel Prep Kit</i>	Stimulant Bulk

Dosage	Onset	Special considerations
5–45 mL PO	6–8 hr	Reduce pediatric dose to 5–20 mL. May decrease absorption of fat-soluble vitamins. Use caution to avoid lipid pneumonia with aspiration.
1 g PO 1–4 times per day as needed; do not exceed 6 g per day in adults or 3 g per day in children	12–24 hr	Good with IBS, diverticulitis. Abdominal fullness may occur. Smaller doses more frequently may alleviate discomfort.
Dissolve 17 g in 8 oz water and drink every day for up to 2 wk	48–72 hr	Do not use with bowel obstruction; diarrhea common.
4 L oral solution before GI examination	1 hr	Used as bowel evacuant before GI examinations. Do not use with GI obstruction, megacolon. GI discomfort common.
1 L PO followed by 16 oz of fluid the evening before colonoscopy and repeated the morning of colonoscopy; or 2 L followed by 32 oz of fluid the evening before colonoscopy	1 hr	Maintain hydration. Use caution in patients with history of seizures.
1 tsp or packet in cool water or juice, 1–3 times per day PO in children	12–24 hr	Safest and most physiologic. Ensure that patient has sufficient water to completely swallow dose.
1–8 tablets per day PO at bedtime; suppository by rectum; syrup—10–25 mL PO	6–10 hr	May be very aggressive; abdominal cramps and discomfort may occur.
Swallow 4 bisacodyl tablets; after first bowel movement, or in 6 hr, drink solution at a rate of one 8-oz glass every 10 min to a total of 8 glasses	1–6 hr	Bowel cleansing before colonoscopy.

Combination products by therapeutic class

AMPHETAMINES

dextroamphetamine and amphetamine

CONTROLLED SUBSTANCE C-II

Adderall , Adderall XR

Tablets:

1.25 mg (5-mg tablet), 2.5 mg (10-mg tablet), 5 mg (20-mg tablet), or 7.5 mg (30-mg tablet) each of dextroamphetamine sulfate and saccharate, amphetamine aspartate, and sulfate

ER capsules :

1.25 mg (5-mg capsule), 2.5 mg (10-mg capsule), 3.75 mg (15-mg capsule), 5 mg (20-mg capsule), 6.25 mg (25-mg capsule), or 7.5 mg (30-mg capsule) of each component

Usual adult and pediatric dosage: 5–60 mg PO per day to control symptoms of narcolepsy or ADHD; ER capsules: 10–30 mg per day.

See also **dextroamphetamine**.

ANALGESICS

acetaminophen and codeine

CONTROLLED SUBSTANCE C-III

Tylenol with Codeine

Elixir:

12 mg codeine, 120 mg acetaminophen/5 mL

Tablets:

No. 2: 15 mg codeine, 300 mg acetaminophen

No. 3: 30 mg codeine, 300 mg acetaminophen

No. 4: 60 mg codeine, 300 mg acetaminophen

Usual adult dosage: One or two tablets PO every 4–6 hr as needed or 15 mL every 4–6 hr.

See also **acetaminophen, codeine**.

aspirin and codeine

CONTROLLED SUBSTANCE C-III

Empirin with Codeine

Tablets:

No. 3: 30 mg codeine, 325 mg aspirin

No. 4: 60 mg codeine, 325 mg aspirin

Usual adult dosage: One or two tablets PO every 4–6 hr as needed.

See also **aspirin, codeine**.

▷ codeine, aspirin, caffeine, and butalbital

CONTROLLED SUBSTANCE C-III

Fiorinal with Codeine

Capsules:

30 mg codeine, 325 mg aspirin, 40 mg caffeine, 50 mg butabarbital

Usual adult dosage: One or two capsules PO every 4 hr as needed for pain, up to 6 per day. See also **codeine, aspirin, caffeine, butalbital**.

▷ diclofenac sodium and misoprostol

PREGNANCY CATEGORY X

Arthrotec

Tablets:

'50': 50 mg diclofenac, 200 mcg misoprostol

'75': 75 mg diclofenac, 200 mcg misoprostol

Usual adult dosage:

- *Osteoarthritis:* *Arthrotec* '50' PO tid; *Arthrotec* '50' or '75' PO bid.
 - *Rheumatoid arthritis:* *Arthrotec* '50' PO tid or qid; *Arthrotec* '50' or '75' PO bid.
- See also **diclofenac, misoprostol**.

▷ hydrocodone and aspirin

CONTROLLED SUBSTANCE C-III

Azdone, Damason-P

Tablets:

5 mg hydrocodone, 500 mg aspirin

Usual adult dosage: One tablet PO every 4–6 hr as needed. See also **aspirin**.

▷ hydrocodone bitartrate and acetaminophen

CONTROLLED SUBSTANCE C-III

Anexsia, Co-Gesic, Duocet, Hydrogesic, Lorcet Plus Tablets, Lortab Tablets, Margesic H, Norco, Stagesic, Vicodin, Vicodin ES, Vicodin HP, Zydone

Elixir:

2.5 mg hydrocodone, 167 mg acetaminophen/5 mL

Capsules or tablets:

2.5 mg hydrocodone, 500 mg acetaminophen

5 mg hydrocodone, 500 mg acetaminophen

5, 7.5, 10 mg hydrocodone, 400 mg acetaminophen

7.5 mg hydrocodone, 500 mg acetaminophen

7.5 mg hydrocodone, 650 mg acetaminophen

10 mg hydrocodone, 650 mg acetaminophen

Norco tablets:

5 mg hydrocodone, 325 mg acetaminophen

7.5 mg hydrocodone, 325 mg acetaminophen

10 mg hydrocodone, 325 mg acetaminophen

Usual adult dosage: Check brand-name products to determine specific dosage combinations available. One or two tablets or capsules PO every 4–6 hr, up to 8 per day.

See also **acetaminophen**.

▷ hydrocodone and ibuprofen

CONTROLLED SUBSTANCE C-III

Vicoprofen

Tablets:

2.5 mg hydrocodone, 200 mg ibuprofen

7.5 mg hydrocodone, 200 mg ibuprofen

10 mg hydrocodone, 200 mg ibuprofen

Usual adult dosage: One tablet PO every 4–6 hr as needed.

See also **ibuprofen**.

▷ methylsalicylate and menthol

Salonpas

Dermal patch:

10% methylsalicylate, 3% menthol

Usual adult dosage: Apply one patch to clean, dry affected area; leave on for 8–12 hr. Remove patch and apply another as needed. For relief of pain from sprains, bruises, strains, backache.

See also **methylsalicylate**.

▷ morphine and naltrexone

CONTROLLED SUBSTANCE C-II

Embeda

ER capsules :

20 mg morphine, 0.8 mg naltrexone

30 mg morphine, 1.2 mg naltrexone

50 mg morphine, 2 mg naltrexone

60 mg morphine, 2.4 mg naltrexone

80 mg morphine, 3.2 mg naltrexone

100 mg morphine, 4 mg naltrexone

Usual adult dosage: One or two tablets PO daily when a continuous, around-the-clock analgesic is needed for a prolonged period; capsules may be opened and sprinkled over applesauce.

See also **morphine, naltrexone**.

naproxen and esomeprazole

Vimovo

DR tablets:

375 mg naproxen, 20 mg esomeprazole

500 mg naproxen, 20 mg esomeprazole

Usual adult dosage: One tablet PO twice daily. Not recommended in moderate to severe renal insufficiency or severe hepatic insufficiency. Reduce dose with mild to moderate hepatic insufficiency.

See also **naproxen, esomeprazole**.

naproxen and lansoprazole

Prevacid NapraPAC

Tablet/capsule kits:

375 mg naproxen tablet, 15-mg delayed-release lansoprazole capsule

Usual adult dosage: One naproxen tablet and one lansoprazole capsule PO in the morning before eating with a full glass of water, and one naproxen tablet in the evening with a full glass of water. Combination pack is designed to decrease the incidence of GI bleeding in patients on long-term therapy for treatment of arthritis or ankylosing spondylitis.

See also **naproxen, lansoprazole**.

oxycodone and acetaminophen

CONTROLLED SUBSTANCE C-II

Percocet, Roxicet, Roxilox, Tylox

Tylox capsules:

5 mg oxycodone, 500 mg acetaminophen

Tablets:

2.25, 4.5, 5 mg oxycodone, 325 mg acetaminophen

Usual adult dosage: One or two tablets PO every 4–6 hr as needed.

See also **oxycodone, acetaminophen**.

oxycodone and aspirin

CONTROLLED SUBSTANCE C-II

Percodan, Roxiprin

Tablets:

4.5 mg oxycodone, 325 mg aspirin

Usual adult dosage: One or two tablets PO every 6 hr as needed.

See also **oxycodone, aspirin**.

 **oxycodone and ibuprofen**

CONTROLLED SUBSTANCE C-II

Combunox

Tablets:

5 mg oxycodone, 400 mg ibuprofen

Usual adult dosage: One tablet PO every 6 hr as needed for moderate to severe pain. Do not exceed four tablets in 24 hr or use for more than 7 days.See also **ibuprofen, oxycodone**. **pentazocine and acetaminophen**

CONTROLLED SUBSTANCE C-IV

Talacen

Tablets:

25 mg pentazocine, 650 mg acetaminophen

Usual adult dosage: One tablet PO every 4 hr, up to a maximum 6 tablets per day.See also **pentazocine, acetaminophen**. **tramadol hydrochloride and acetaminophen**

Ultracet

Tablets:

37.5 mg tramadol, 325 mg acetaminophen

Usual adult dosage: Two tablets PO every 4–6 hr as needed. Do not exceed eight tablets per day. Reduce dosage with geriatric or renally impaired patients.See also **tramadol, acetaminophen**.**ANTIACNE DRUGS** **ethinyl estradiol and norethindrone**

Estrostep Fe

Tablets:

1 mg norethindrone, 20 mcg ethinyl estradiol

1 mg norethindrone, 30 mcg ethinyl estradiol

1 mg norethindrone, 35 mcg ethinyl estradiol

Usual adult dosage: One tablet PO each day (21 tablets contain active ingredients and seven are inert).See also **norethindrone, estradiol**.

▽ norgestimate and ethinyl estradiol

Ortho Tri-Cyclen

Tablets:

- 0.18 mg norgestimate, 35 mcg ethinyl estradiol (7 tablets)
- 0.215 mg norgestimate, 35 mcg ethinyl estradiol (7 tablets)
- 0.25 mg norgestimate, 35 mcg ethinyl estradiol (7 tablets)

Usual adult dosage: For women older than 15 yr: One tablet PO per day.

Birth control agent used cyclically (21 tablets contain active ingredients, 7 are inert).

See also **estradiol**.

ANTIBACTERIALS

▽ amoxicillin and clavulanic acid

Augmentin, Augmentin ES-600, Augmentin XR

Tablets:

- '250': 250 mg amoxicillin, 125 mg clavulanic acid
- '500': 500 mg amoxicillin, 125 mg clavulanic acid
- '875': 875 mg amoxicillin, 125 mg clavulanic acid

Powder for oral suspension:

- '125' powder: 125 mg amoxicillin, mg clavulanic acid
- '250' powder: 250 mg amoxicillin, 62.5 mg clavulanic acid
- '400' powder: 400 mg amoxicillin, 57 mg clavulanic acid

Solution (*Augmentin ES-600*):

- 600 mg amoxicillin, 42.9 mg clavulanic acid/5 mL

Chewable tablets:

- '125': 125 mg amoxicillin, 31.25 mg clavulanic acid
- '200': 200 mg amoxicillin, 28.5 mg clavulanic acid
- '250': 250 mg amoxicillin, 62.5 mg clavulanic acid
- '400': 400 mg amoxicillin, 57 mg clavulanic acid

XR tablets:

- 1,000 mg amoxicillin, 62.5 mg clavulanic acid

Usual adult dosage: One 250-mg tablet or one 500-mg tablet PO every 8 hr. For severe infections: 875-mg tablet PO every 12 hr. For those with difficulty swallowing, substitute the 125 mg/5 mL or 250 mg/5 mL for the 500-mg tablet or the 200 mg/5 mL or 400 mg/5 mL for the 875-mg tablet.

Usual pediatric dosage: In children weighing less than 40 kg: 20–40 mg amoxicillin/kg PO per day in divided doses every 8 hr (pediatric dosage is based on amoxicillin content) or every 12 hr; 90 mg/kg per day PO oral solution divided every 12 hr (*Augmentin ES-600*).

See also **amoxicillin**. Clavulanic acid protects amoxicillin from breakdown by bacterial beta-lactamase enzymes and is given only in combination with certain antibiotics that are broken down by beta-lactamase.

co-trimoxazole (TMP-SMZ)

Bactrim, Bactrim DS, Septra, Septra DS, Sulfatrim Pediatric

Tablets:

80 mg trimethoprim (TMP), 400 mg sulfamethoxazole (SMZ)

160 mg TMP, 800 mg SMZ

Oral suspension:

40 mg TMP, 200 mg SMZ per 5 mL

Usual adult dosage:

- *UTIs, shigellosis, acute otitis media*: 160 mg TMP and 800 mg SMZ PO every 12 hr. Treat for up to 14 days (UTI) or for 5 days (shigellosis).
- *Acute exacerbations of chronic bronchitis*: 160 mg TMP and 800 mg SMZ PO every 12 hr for 14 days.
- *Pneumocystis carinii pneumonia*: 20 mg/kg TMP and 100 mg/kg SMZ every 24 hr PO in divided doses every 6 hr. Treat for 14 days.
- *Traveler's diarrhea*: 160 mg TMP and 800 mg SMZ PO every 12 hr for 5 days

Usual pediatric dosage:

- *UTIs, shigellosis, acute otitis media*: 8 mg/kg/day TMP and 40 mg/kg/day SMZ PO in two divided doses every 12 hr. Treat for 10–14 days (UTIs and acute otitis media) or for 5 days (shigellosis).
- *Pneumocystis carinii pneumonia*: 20 mg/kg TMP and 100 mg/kg SMZ every 24 hr PO in divided doses every 6 hr. Treat for 14 days.

Impaired renal function:

CrCl (mL/min)

More than 30

15–30

Less than 15

Dosage

Use standard dosage.

Use one-half of standard dosage.

Not recommended.

See also **sulfamethoxazole, trimethoprim**.

erythromycin and sulfisoxazole

Granules for oral suspension:

Erythromycin ethylsuccinate (equivalent of 200 mg erythromycin activity) and 600 mg sulfisoxazole per 5 mL when reconstituted according to manufacturer's directions

- Usual dosage for acute otitis media: 50 mg/kg per day erythromycin and 150 mg/kg per day sulfisoxazole PO in divided doses qid for 10 days.
- Administer without regard to meals; refrigerate after reconstitution; use within 14 days.

See also **erythromycin, sulfisoxazole**.

imipenem and cilastatin

Primaxin

Powder for injection (IV):

250 mg imipenem, 250 mg cilastatin

500 mg imipenem, 500 mg cilastatin

Powder for injection (IM):

500 mg imipenem, 500 mg cilastatin

- Follow manufacturer's instructions for reconstituting and diluting the drug.
- Administer each 250- to 500-mg dose by IV infusion over 20–30 min; infuse each 1-g dose over 40–60 min. Give 500–750 mg IM every 12 hr. Do not exceed 1,500 mg/day.
- Dosage recommendations based on imipenem. Initially based on type and severity of infection and later on severity of patient's illness, degree of susceptibility of the pathogens, and patient's age, weight, and creatinine clearance. Dosage for adults with normal renal function is 250 mg to 1 g IV every 6–8 hr, not to exceed 50 mg/kg/day or 4 g/day, whichever is less.
- Dosage for patients with renal impairment is based on creatinine clearance and weight. Consult manufacturer's guidelines.
- Imipenem inhibits cell wall synthesis in susceptible bacteria; cilastatin inhibits the renal enzyme that metabolizes imipenem; these drugs are available **only** in the combined form.

▷ piperacillin sodium and tazobactam sodium

Zosyn

Tazobactam is a beta-lactamase inhibitor used in combination with the broad-spectrum penicillin. Powder for injection:

- 2 g piperacillin, 0.25 g tazobactam
- 3 g piperacillin, 0.375 g tazobactam
- 4 g piperacillin, 0.5 g tazobactam

Usual adult dosage: 12 g/1.5 g IV given as 3.375 g every 6 hr.

- Recommended for appendicitis, peritonitis, postpartum endometritis and PID, community-acquired pneumonia, nosocomial pneumonia if agent is responsive in sensitivity testing.
- Reduced dosage required for renal impairment or dialysis.
- Administer by IV infusion over 30 min. Reconstitute with 5 mL of suitable diluent per 1 g piperacillin. Discard after 24 hr.

See also **piperacillin**.

▷ quinupristin and dalfopristin

Synercid

New class of drugs available **only** as this combination product.

Streptogramin antibiotics:

500-mg/10-mL vial contains 150 mg quinupristin, 350 mg dalfopristin

- Treatment of life-threatening, susceptible infections associated with vancomycin-resistant *E. faecium* bacteremia (VREF), complicated skin infections due to *S. aureus*, *S. pyogenes*.
- Skin infections in patients older than 16 yr: 7.5 mg/kg IV every 12 hr for 7 days.
- VREF in patients older than 16 yr: 7.5 mg/kg IV every 8 hr.
- ⊗ **Warning** Dangerous when used with drugs that prolong the QTc interval.
- May cause pseudomembranous colitis.

▷ sulbactam and ampicillin

Unasyn

Powder for injection:

- 1.5-g vial: 1 g ampicillin, 0.5 g sulbactam
- 3-g vial: 2 g ampicillin, 1 g sulbactam

Usual adult dosage: 0.5–1 g sulbactam with 1–2 g ampicillin IM or IV every 6–8 hr.

Pediatric dosage:

Less than 40 kg: 300 mg/kg per day IV in divided doses every 6 hr.

40 kg or more: adult dosage, do not exceed 4 g per day.

See also **ampicillin**. Sulbactam inhibits many bacterial penicillinase enzymes, thus broadening the spectrum of ampicillin; sulbactam is also weakly antibacterial alone.

ticarcillin and clavulanic acid

Timentin

Powder for injection, solution for injection:

3.1-g vial (3 g ticarcillin, 0.1 g clavulanic acid)

Administer by IV infusion over 30 min.

- Dosage for 60-kg adults: 3.1 g (3 g ticarcillin, 0.1 g clavulanic acid) IV every 4–6 hr. Dosage for adults less than 60 kg: 200–300 mg ticarcillin/kg per day IV in divided doses every 4–6 hr.
- Urinary tract infections: 3.1 g (3 g ticarcillin, 0.1 g clavulanic acid) IV every 8 hr.
- Pediatric dosage in children 3 mo and older: 3.1 g (3 g ticarcillin, 0.1 g clavulanic acid) IV every 4–6 hr or 200–300 mg/kg per day IV in divided doses every 4–6 hr.
- Geriatric or renal-failure patients: For patients on hemodialysis, give 2 g IV every 12 hr, supplemented with 3.1 g after each dialysis. For patients with renal impairment, give initial loading dose of 3.1 g, then as follows:

CrCl (mL/min)	Dosage
More than 60	3.1 g IV every 4 hr
30–60	2 g IV every 4 hr
10–30	2 g IV every 8 hr
Less than 10	2 g IV every 12 hr
Less than 10 with hepatic disease	2 g IV every 24 hr

- Continue treatment for 2 days after signs and symptoms of infection have disappeared. Usual duration of therapy is 10–14 days.

See also **ticarcillin**. Clavulanic acid protects ticarcillin from breakdown by bacterial beta-lactamase enzymes and is given only in combination with certain antibiotics that are broken down by beta-lactamase.

ANTI-CORONARY ARTERY DISEASE DRUGS

amlodipine besylate and atorvastatin calcium

Caduet

Tablets:

2.5 mg amlodipine with 10, 20, or 40 mg atorvastatin

5 mg amlodipine with 10, 20, 40, or 80 mg atorvastatin

10 mg amlodipine with 10, 20, 40, or 80 mg atorvastatin

Usual adult dosage: One tablet PO every day, taken in the evening. Dosage should be adjusted using the individual products; then switch to appropriate combination product.

See also **amlodipine, atorvastatin**.

ANTIDEPRESSANTS**▽ chlordiazepoxide and amitriptyline**

Limbitrol, Limbitrol DS 10–25

Tablets:

- 5 mg chlordiazepoxide, 12.5 mg amitriptyline
- 10 mg chlordiazepoxide, 25 mg amitriptyline

Usual adult dosage: 10 mg chlordiazepoxide with 25 mg amitriptyline PO three or four times per day up to six times daily. For patients who do not tolerate higher doses, 5 mg chlordiazepoxide with 12.5 mg amitriptyline PO three or four times per day. Reduce dosage after initial response. See also **amitriptyline, chlordiazepoxide**.

▽ olanzapine and fluoxetine

Symbyax

Capsules:

- 6 mg olanzapine, 25 mg fluoxetine
- 6 mg olanzapine, 50 mg fluoxetine
- 12 mg olanzapine, 25 mg fluoxetine
- 12 mg olanzapine, 50 mg fluoxetine

Usual adult dosage: One capsule PO daily in the evening. See also **fluoxetine, olanzapine**.

▽ perphenazine and amitriptyline

Etrafon, Etrafon-A, Etrafon-Forte

Tablets:

- 2 mg perphenazine, 10 mg amitriptyline
- 2 mg perphenazine, 25 mg amitriptyline
- 4 mg perphenazine; 10 mg amitriptyline
- 4 mg perphenazine, 25 mg amitriptyline
- 4 mg perphenazine, 50 mg amitriptyline

Usual adult dosage: 2–4 mg perphenazine with 10–50 mg amitriptyline PO three or four times per day. Reduce dosage after initial response. See also **amitriptyline, perphenazine**.

ANTIDIABETICS**▽ glipizide and metformin**

Metaglip

Tablets:

- 2.5 mg glipizide, 250 mg metformin
- 2.5 mg glipizide, 500 mg metformin
- 5 mg glipizide, 500 mg metformin

Usual adult dosage: One tablet PO per day with a meal; adjust dose based on patient response. Do not exceed maximum dose of 20 mg glipizide with 2,000 mg metformin per day. See also **glipizide, metformin**.

glyburide and metformin

Glucovance

Tablets:

- 1.25 mg glyburide, 250 mg metformin
- 2.5 mg glyburide, 500 mg metformin
- 5 mg glyburide, 500 mg metformin

Usual adult dosage: One tablet daily PO with a meal, usually in the morning.

Not for initial therapy; drug should be adjusted using the individual products, switching to appropriate dosage of this combination product.

See also **glyburide, metformin.**

pioglitazone and glimepiride

Duetact

Tablets:

- 30 mg pioglitazone with 2 or 4 mg glimepiride

Usual adult dosage: One tablet/day PO with first meal of the day.

See also **pioglitazone, glimepiride.**

pioglitazone and metformin

ACTOplus Met^{OND}

Tablets:

- 15 mg pioglitazone, 500 mg metformin
- 15 mg pioglitazone, 850 mg metformin

ER tablets^{OND}:

- 5 mg pioglitazone, 1,000 mg metformin
- 30 mg pioglitazone, 1,000 mg metformin

Usual adult dosage: One tablet PO once or twice a day with meals based on patient response and glycemic control; ER tablets, once a day.

See also **metformin, pioglitazone.**

repaglinide and metformin

PrandiMet

Tablets:

- 1 mg repaglinide, 500 mg metformin
- 2 mg repaglinide, 500 mg metformin

Usual adult dosage: 1 tablet PO once a day or in divided doses; titrate as needed for glycemic control.

See also **repaglinide, metformin.**

rosiglitazone and glimepiride

Avandaryl

Tablets:

- 4 mg rosiglitazone, 1 mg glimepiride
- 4 mg rosiglitazone, 2 mg glimepiride
- 4 mg rosiglitazone, 4 mg glimepiride
- 8 mg rosiglitazone, 2 mg glimepiride
- 8 mg rosiglitazone, 4 mg glimepiride

Usual adult dosage: 4 mg rosiglitazone with 1 or 2 mg glimepiride PO once daily with first meal of the day. Titrate as needed for glycemic control.

See also **rosiglitazone, glimepiride**.

rosiglitazone and metformin

Avandamet

Tablets:

- 1 mg rosiglitazone, 500 mg metformin
- 2 mg rosiglitazone, 500 mg metformin
- 2 mg rosiglitazone, 1 g metformin
- 4 mg rosiglitazone, 500 mg metformin
- 4 mg rosiglitazone, 1 g metformin

Usual adult dosage: 4 mg rosiglitazone with 500 mg metformin, PO once a day or in divided doses. Not for initial therapy; dosage should be adjusted using individual drugs alone and then switching to the appropriate dosage of the combination product. See package insert for details on adjusting dosage based on use of other agents and previous dosage levels.

See also **metformin, rosiglitazone**.

saxagliptin and metformin

Kombiglyze XR ^{ORAL}

Tablets:

- 5 mg saxagliptin, 500 mg metformin
- 5 mg saxagliptin, 1,000 mg metformin
- 2.5 mg saxagliptin, 1,000 mg metformin

Usual adult dosage: One tablet PO daily. Do not cut, crush, or allow patient to chew tablets.

See also **saxagliptin, metformin**.

sitagliptin and metformin

Janumet

Tablets:

- 50 mg sitagliptin, 500 or 1,000 mg metformin

Usual adult dosage: One tablet PO bid with meals; maximum daily dosage 100 mg sitagliptin, 2,000 mg metformin

See also **sitagliptin, metformin**.

ANTIDIARRHEALS**▷ diphenoxylate hydrochloride and atropine sulfate****CONTROLLED SUBSTANCE C-V**

Logen, Lomanate, Lomotil, Lonox

Tablets:

2.5 mg diphenoxylate hydrochloride, 0.025 mg atropine sulfate

Liquid:

2.5 mg diphenoxylate hydrochloride, 0.025 mg atropine sulfate/5 mL

- Individualized dosage.

Usual adult dosage: 5 mg PO qid.

- Pediatric initial dosage (use only liquid in children 2–12 yr): 0.3–0.4 mg/kg PO daily in four divided doses.

Age (yr)	Weight (kg)	Dose (mL)	Frequency
2	11–14	1.5–3	4 times daily
3	12–16	2–3	4 times daily
4	14–20	2–4	4 times daily
5	16–23	2.5–4.5	4 times daily
6–8	17–32	2.5–5	4 times daily
9–12	23–55	3.5–5	4 times daily

- Reduce dosage as soon as initial control of symptoms is achieved. Maintenance dosage may be as low as one-fourth of the initial dosage.

See also **atropine sulfate**.**ANTIHYPERTENSIVES****▷ aliskiren and amlodipine**

Tekamlo

Tablets:

150 mg aliskiren, 5 mg amlodipine

150 mg aliskiren, 10 mg amlodipine

300 mg aliskiren, 5 mg amlodipine

300 mg aliskiren, 10 mg amlodipine

Usual adult dosage: One tablet PO daily; may give with other antihypertensives. Should give at about the same time each day.See also **aliskiren, amlodipine**.**▷ aliskiren and hydrochlorothiazide**

Tekturna HCT

Tablets:

150 mg aliskiren, 12.5 mg hydrochlorothiazide

150 mg aliskiren, 25 mg hydrochlorothiazide

300 mg aliskiren, 12.5 mg hydrochlorothiazide

300 mg aliskiren, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO daily.

May be given with other antihypertensives. Should be taken at about the same time each day.

See also **aliskiren, hydrochlorothiazide**.

▷ aliskiren and valsartan

Valturna

Tablets:

150 mg aliskiren, 160 mg valsartan

300 mg aliskiren, 320 mg valsartan

Usual adult dosage: One tablet PO daily.

Indicated when hypertension is not controlled by one drug alone.

See also **aliskiren, valsartan**.

▷ amlodipine and benazepril

Lotrel

Capsules:

2.5 mg amlodipine, 10 mg benazepril

5 mg amlodipine, 10 mg benazepril

5 mg amlodipine, 20 mg benazepril

5 mg amlodipine, 40 mg benazepril

10 mg amlodipine, 20 mg benazepril

10 mg amlodipine, 40 mg benazepril

Usual adult dosage: One tablet PO daily in the morning.

Monitor patient for hypotension and adverse effects closely over first 2 wk and regularly thereafter.

See also **amlodipine, benazepril**.

▷ amlodipine and olmesartan

Azor

Tablets:

5 mg amlodipine, 20 mg olmesartan

10 mg amlodipine, 20 mg olmesartan

5 mg amlodipine, 40 mg olmesartan

10 mg amlodipine, 40 mg olmesartan

Usual adult dosage: One tablet PO daily; titrate based on patient response.

See also **amlodipine, olmesartan**.

▷ amlodipine and valsartan

Exforge

Tablets:

5 mg amlodipine, 160 mg valsartan

5 mg amlodipine, 320 mg valsartan

10 mg amlodipine, 160 mg valsartan

10 mg amlodipine, 320 mg valsartan

Usual adult dosage: One tablet PO daily at about the same time each day.

Dosage based on patient response.

See also **amlodipine, valsartan**.

amlodipine, valsartan, and hydrochlorothiazide

Exforge HCT

Tablets:

5 mg amlodipine, 160 mg valsartan, 12.5 mg hydrochlorothiazide

10 mg amlodipine, 160 mg valsartan, 12.5 mg hydrochlorothiazide

5 mg amlodipine, 160 mg valsartan, 25 mg hydrochlorothiazide

10 mg amlodipine, 320 mg valsartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO daily; titrate based on patient response.

See also **amlodipine, hydrochlorothiazide, valsartan**.

atenolol and chlorthalidone

Tenoretic

Tablets:

50 mg atenolol, 25 mg chlorthalidone

100 mg atenolol, 25 mg chlorthalidone

Usual adult dosage: One tablet PO daily in the morning.

Drug should be adjusted using the individual products, then switched to appropriate dosage.

See also **atenolol, chlorthalidone**.

bisoprolol and hydrochlorothiazide

Ziac

Tablets:

2.5 mg bisoprolol, 6.25 mg hydrochlorothiazide

5 mg bisoprolol, 6.25 mg hydrochlorothiazide

10 mg bisoprolol, 6.25 mg hydrochlorothiazide

Usual adult dosage: One tablet daily PO in morning. Initial dose is 2.5/6.25 mg tablet PO daily.

Dosage should be adjusted within 1 wk; optimal antihypertensive effect may require 2–3 wk.

See also **bisoprolol, hydrochlorothiazide**.

candesartan and hydrochlorothiazide

Atacand HCT

Tablets:

16 mg candesartan, 12.5 mg hydrochlorothiazide

32 mg candesartan, 12.5 mg hydrochlorothiazide

Usual adult dosage: One tablet PO daily in the morning.

Drug should be adjusted using the individual products, then switched to appropriate dosage.

See also **candesartan, hydrochlorothiazide**.

chlorthalidone and clonidine

Clorpres

Tablets:

- 15 mg chlorthalidone, 0.1 mg clonidine hydrochloride
- 15 mg chlorthalidone, 0.2 mg clonidine hydrochloride
- 15 mg chlorthalidone, 0.3 mg clonidine hydrochloride

Usual adult dosage: One or two tablets per day PO in the morning; may be given once or twice daily.

Dosage should be adjusted with the individual products, switching to this combination product when patient's condition is stabilized on the dosage of each drug available in this combination.

See also **clonidine**.

enalapril and hydrochlorothiazide

Vaseretic

Tablets:

- 5 mg enalapril maleate, 12.5 mg hydrochlorothiazide
- 10 mg enalapril maleate, 25 mg hydrochlorothiazide

Usual adult dosage: One or two tablets per day PO in the morning.

Dosage should be adjusted with individual products, switching to combination product after patient's condition is stabilized on the dosage of each drug that is available in this combination.

See also **enalapril maleate, hydrochlorothiazide**.

eprosartan and hydrochlorothiazide

Teveten HCT

Tablets:

- 600 mg eprosartan, 12.5 mg hydrochlorothiazide
- 600 mg eprosartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO each day. Dosage should be established with each component alone before using the combination product; if BP is still not controlled, 300 mg eprosartan may be added each evening.

See also **eprosartan mesylate, hydrochlorothiazide**.

fosinopril and hydrochlorothiazide

Monopril-HCT

Tablets:

- 10 mg fosinopril, 12.5 mg hydrochlorothiazide
- 20 mg fosinopril, 12.5 mg hydrochlorothiazide

Usual adult dosage: One tablet PO per day in the morning.

Drug should be adjusted using the individual products, switching to appropriate dosage of this combination product.

See also **fosinopril, hydrochlorothiazide**.

hydrochlorothiazide and benazepril

Lotensin HCT

Tablets:

- 6.25 mg hydrochlorothiazide, 5 mg benazepril
- 12.5 mg hydrochlorothiazide, 10 mg benazepril
- 12.5 mg hydrochlorothiazide, 20 mg benazepril
- 25 mg hydrochlorothiazide, 20 mg benazepril

Usual adult dosage: One tablet per day PO in the morning.

Dosage should be adjusted with the individual products, switching to this combination product once the patient's condition is stabilized.

See also **benazepril, hydrochlorothiazide**.

hydrochlorothiazide and captopril

Tablets:

- 15 mg hydrochlorothiazide, 25 mg captopril
- 15 mg hydrochlorothiazide, 50 mg captopril
- 25 mg hydrochlorothiazide, 25 mg captopril
- 25 mg hydrochlorothiazide, 50 mg captopril

Usual adult dosage: One or two tablets PO daily, 1 hr before or 2 hr after meals.

Dosage should be adjusted with individual products, switching to this combination product when patient's condition is stabilized on the dosage of each drug available in this combination.

See also **captopril, hydrochlorothiazide**.

hydrochlorothiazide and propranolol

Tablets:

- 25 mg hydrochlorothiazide, 40 mg propranolol
- 25 mg hydrochlorothiazide, 80 mg propranolol

Usual adult dosage: One or two tablets PO bid.

Dosage should be adjusted with individual products, switching to combination product when patient's condition is stabilized on the dosage of each drug available in this combination.

See also **hydrochlorothiazide, propranolol**.

irbesartan and hydrochlorothiazide

Avalide

Tablets:

- 150 mg irbesartan, 12.5 mg hydrochlorothiazide
- 300 mg irbesartan, 12.5 mg hydrochlorothiazide
- 300 mg irbesartan, 25 mg hydrochlorothiazide

Usual adult dosage: One or two tablets per day PO.

Dosage should be adjusted with individual products, switching to combination product when patient's condition is stabilized.

See also **hydrochlorothiazide, irbesartan**.

▷ lisinopril and hydrochlorothiazide

Prinzide, Zestoretic

Tablets:

- 10 mg lisinopril, 12.5 mg hydrochlorothiazide
- 20 mg lisinopril, 12.5 mg hydrochlorothiazide
- 20 mg lisinopril, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet per day PO taken in the morning.

Dosage should be adjusted with individual products, switching to combination product when patient's condition is stabilized.

See also **hydrochlorothiazide, lisinopril**.

▷ losartan and hydrochlorothiazide

Hyzaar

Tablets:

- 50 mg losartan, 12.5 mg hydrochlorothiazide
- 100 mg losartan, 12.5 mg hydrochlorothiazide
- 100 mg losartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet per day PO in the morning.

- Not for initial therapy; start using each component and if desired effects are obtained, *Hyzaar* may be used.
- Used to reduce the incidence of CVA in hypertensive patients with left ventricular hypertrophy (not effective for this use in black patients).

See also **hydrochlorothiazide, losartan**.

▷ metoprolol and hydrochlorothiazide

Lopressor HCT

Tablets:

- 50 mg metoprolol, 25 mg hydrochlorothiazide
- 100 mg metoprolol, 25 mg hydrochlorothiazide
- 100 mg metoprolol, 50 mg hydrochlorothiazide

Usual adult dosage: One tablet PO per day.

Drug should be adjusted using the individual products, switching to appropriate dosage of this combination product.

See also **hydrochlorothiazide, metoprolol**.

▷ moexipril and hydrochlorothiazide

Uniretic

Tablets:

- 7.5 mg moexipril, 12.5 mg hydrochlorothiazide
- 15 mg moexipril, 25 mg hydrochlorothiazide

Usual adult dosage: One or two tablets per day 1 hr before or 2 hr after a meal.

Not for initial therapy. Adjust dose to maintain appropriate BP.

See also **hydrochlorothiazide, moexipril**.

nadolol and bendroflumethiazide

Corzide

Tablets:

40 mg nadolol, 5 mg bendroflumethiazide

80 mg nadolol, 5 mg bendroflumethiazide

Usual adult dosage: One tablet PO per day in the morning.

Drug should be adjusted using the individual products, switching to appropriate dosage of this combination product.

See also **bendroflumethiazide, nadolol**.

olmesartan, amlodipine, and hydrochlorothiazide

Tribenzor

Tablets:

40 mg olmesartan, 10 mg amlodipine, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO daily. Not for initial therapy. For use in patients whose blood pressure is not controlled by any two of the drugs in the tablet.

See also **olmesartan, amlodipine, hydrochlorothiazide**

olmesartan medoxomil and hydrochlorothiazide

Benicar HCT

Tablets:

20 mg olmesartan, 12.5 mg hydrochlorothiazide

40 mg olmesartan, 12.5 mg hydrochlorothiazide

40 mg olmesartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO per day in the morning.

Establish dosage with each drug individually, then switch to appropriate dosage of the combined product.

See also **hydrochlorothiazide, olmesartan**.

quinapril and hydrochlorothiazide

Accuretic

Tablets:

10 mg quinapril, 12.5 mg hydrochlorothiazide

20 mg quinapril, 12.5 mg hydrochlorothiazide

Usual adult dosage: One tablet PO per day in the morning.

Drug should be adjusted using the individual products, switching to appropriate dosage of this combination product.

See also **hydrochlorothiazide, quinapril**.

▷ telmisartan and amlodipine

Twynsta

Tablets:

- 40 mg telmisartan, 5 mg amlodipine
- 40 mg telmisartan, 10 mg amlodipine
- 80 mg telmisartan, 5 mg amlodipine
- 80 mg telmisartan, 10 mg amlodipine

Usual adult dosage: One tablet PO daily.

May be used in combination with other drugs.

See also **amlodipine, telmisartan.**

▷ telmisartan and hydrochlorothiazide

Micardis HCT

Tablets:

- 40 mg telmisartan, 12.5 mg hydrochlorothiazide
- 80 mg telmisartan, 12.5 mg hydrochlorothiazide
- 80 mg telmisartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet PO per day; may be adjusted up to 160 mg telmisartan and 25 mg hydrochlorothiazide, based on patient's response.

See also **hydrochlorothiazide, telmisartan.**

▷ trandolapril and verapamil

Tarka

Tablets:

- 1 mg trandolapril, 240 mg verapamil
- 2 mg trandolapril, 180 mg verapamil
- 2 mg trandolapril, 240 mg verapamil
- 4 mg trandolapril, 240 mg verapamil

Usual adult dosage: One tablet PO per day, taken with food.

Dosage should be adjusted with the individual products, switching to this combination product when the patient's condition is stabilized on the dosage of each drug available in combination.

Ensure that patient swallows tablet whole. Do not cut, crush, or chew.

See also **trandolapril, verapamil.**

▷ valsartan and hydrochlorothiazide

Diovan HCT

Tablets:

- 80 mg valsartan, 12.5 mg hydrochlorothiazide
- 160 mg valsartan, 12.5 mg hydrochlorothiazide
- 160 mg valsartan, 25 mg hydrochlorothiazide
- 320 mg valsartan, 12.5 mg hydrochlorothiazide
- 320 mg valsartan, 25 mg hydrochlorothiazide

Usual adult dosage: One tablet per day PO.

Not for initial therapy; start using each component first.
See also **hydrochlorothiazide, valsartan**.

ANTIMIGRAINE DRUGS

▷ acetaminophen and caffeine

MigraTen

Capsules:

325 mg acetaminophen, 100 mg caffeine

Usual adult dosage: Two capsules at onset of migraine; then one every hour until resolved. Maximum, 5 capsules in 12 hr. For tension headache, one to two capsules every 4 hr, up to 8 capsules per day.
See also **acetaminophen**.

▷ ergotamine and caffeine

Cafergot, Migergot

Tablets:

1 mg ergotamine tartrate, 100 mg caffeine

Suppositories:

2 mg ergotamine tartrate, 100 mg caffeine

Usual adult oral dosage: Two tablets at first sign of attack. Follow with one tablet every 30 min, if needed. Maximum dose is six tablets per attack. Do not exceed 10 tablets per wk.

Usual adult rectal dosage: One suppository at first sign of attack; follow with second dose after 1 hr, if needed. Maximum dose is two per attack. Do not exceed five per wk.

Do not combine this drug with ritonavir, nelfinavir, indinavir, erythromycin, clarithromycin, or troleandomycin—serious vasospasm events could occur.

See also **ergotamine**.

▷ sumatriptan and naproxen sodium

Treximet

Tablets:

85 mg sumatriptan, 500 mg naproxen

Usual adult dosage: One tablet PO at the onset of acute migraine.

See also **naproxen, sumatriptan**.

ANTIPARKINSONIANS

▷ levodopa and carbidopa

Parcopa, Sinemet[®], Sinemet CR

Tablets:

100 mg levodopa, 10 mg carbidopa

100 mg levodopa, 25 mg carbidopa

250 mg levodopa, 25 mg carbidopa

Orally disintegrating tablets:

100 mg levodopa, 10 mg carbidopa

100 mg levodopa, 25 mg carbidopa

250 mg levodopa, 25 mg carbidopa

Controlled release tablets :

100 mg levodopa, 25 mg carbidopa

200 mg levodopa, 50 mg carbidopa

Usual adult dosage: Starting dose for patients not presently receiving levodopa: One tablet of 100 mg levodopa/10 mg carbidopa or 100 mg levodopa/25 mg carbidopa PO tid. For patients receiving levodopa: Start combination therapy with the morning dose at least 8 hr after the last dose of levodopa and choose a daily dosage of levodopa and carbidopa that will provide 25% of the previous levodopa daily dose. Dosage must be adjusted based on the patient's clinical response. See manufacturer's directions for adjusting the combination and single-agent drugs. *Orally disintegrating tablets:* Initially, one 100/25-mg tablet PO tid. Place tablet on top of the tongue where it will dissolve within seconds, then have the patient swallow the saliva; no additional liquid is required. Dosage may be increased by one tablet every day or every other day as needed to total daily dose of eight tablets (two tablets qid) as needed to control symptoms.

Carbidopa is available alone only by a specific request to the manufacturer from physicians who have a patient who needs a different dosage of carbidopa than is provided by the fixed combination drug; carbidopa is a peripheral inhibitor of dopa decarboxylase, an enzyme that converts dopa to dopamine, which cannot penetrate the CNS. The addition of carbidopa to the levodopa regimen reduces the dose of levodopa needed and decreases the incidence of certain adverse reactions to levodopa.

See also **carbidopa, levodopa**.

levodopa, carbidopa, and entacapone

Stalevo 50, Stalevo 75, Stalevo 100, Stalevo 125, Stalevo 150, Stalevo 200

Tablets:

50 mg levodopa, 12.5 mg carbidopa, 200 mg entacapone

75 mg levodopa, 18.75 mg carbidopa, 200 mg entacapone

100 mg levodopa, 25 mg carbidopa, 200 mg entacapone

125 mg levodopa, 31.25 mg carbidopa, 200 mg entacapone

150 mg levodopa, 37.5 mg carbidopa, 200 mg entacapone

200 mg levodopa, 50 mg carbidopa, 200 mg entacapone

Usual adult dosage: One tablet every 3–8 hr, based on the patient's clinical response.

See also **carbidopa, entacapone, levodopa**.

ANTIPLATELETS

aspirin and dipyridamole

Aggrenox

Capsules:

25 mg aspirin, 200 mg dipyridamole

Usual adult dosage: One capsule PO bid to decrease risk of CVA in patients with known cerebrovascular disease.

See also **aspirin, dipyridamole**.

ANTIULCER DRUGS

▷ bismuth subsalicylate, metronidazole, and tetracycline

Helidac

Tablets:

262.4 mg bismuth subsalicylate, 250 mg metronidazole, 500 mg tetracycline hydrochloride

Usual adult dosage: One tablet PO qid for 14 days along with a prescribed histamine-2 antagonist. Indicated for the treatment of active duodenal ulcers associated with *Helicobacter pylori* infection.

See also **bismuth subsalicylate, metronidazole, tetracycline.**

▷ lansoprazole, amoxicillin, and clarithromycin

Prevpac

Daily administration pack:

Two 30-mg lansoprazole capsules, four 500-mg amoxicillin capsules, and two 500-mg clarithromycin tablets.

Usual adult dosage: Divide pack equally to take twice daily, morning and evening for 10–14 days.

ANTIVIRALS

▷ abacavir and lamivudine

Epzicom

Tablets:

600 mg abacavir with 300 mg lamivudine

Usual adult dosage: One tablet PO daily, taken without regard to food and in combination with other antiretroviral drugs.

See also **abacavir, lamivudine.**

▷ abacavir, zidovudine, and lamivudine

Trizivir

Tablets:

300 mg abacavir, 300 mg zidovudine, 150 mg lamivudine

Usual adult dosage: One tablet PO bid.

Carefully monitor patient for hypersensitivity reactions.

See also **abacavir, lamivudine, zidovudine.**

▷ efavirenz, emtricitabine, tenofovir

Atripla

Tablets:

600 mg efavirenz, 200 mg emtricitabine, 300 mg tenofovir

Usual adult dosage: One tablet PO at bedtime on an empty stomach.**Pediatric patients:** Not recommended for children younger than 18 yr.**Renal impairment:** Not recommended for patients with moderate or severe renal impairment.See also **efavirenz, emtricitabine, tenofovir**.**▷ emtricitabine and tenofovir disproxil fumarate**

Truvada

Tablets:

200 mg emtricitabine with 300 mg tenofovir

Usual adult dosage: One tablet PO daily, taken without regard to food and in combination with other antiretroviral drugs.See also **emtricitabine, tenofovir**.**▷ lamivudine and zidovudine**

Combivir

Tablets:

150 mg lamivudine, 300 mg zidovudine

Usual adult dose: One tablet PO bid.

Not recommended for children or adults weighing less than 50 kg. May be taken with food.

Does not decrease risk of spreading infections; use caution.

See also **lamivudine, zidovudine**.**BENIGN PROSTATIC HYPERTROPHY DRUGS****▷ dutasteride and tamsulosin**

Jalyn

Capsules:

0.5 mg dutasteride, 0.4 mg tamsulosin

Usual adult dosage: One capsule PO per day.See also **dutasteride, tamsulosin**.**DIURETICS****▷ amiloride and hydrochlorothiazide**

Moduretic

Tablets:

5 mg amiloride, 50 mg hydrochlorothiazide

Usual adult dosage: One or two tablets per day PO with meals.See also **amiloride, hydrochlorothiazide**.

 **hydrochlorothiazide and triamterene**

Dyazide

Capsules:

25 mg hydrochlorothiazide, 37.5 mg triamterene

Usual adult dosage: One or two capsules PO per day or bid after meals.See also **hydrochlorothiazide, triamterene.**

Maxzide, Maxzide-25

Tablets:

25 mg hydrochlorothiazide, 37.5 mg triamterene

50 mg hydrochlorothiazide, 75 mg triamterene

Usual adult dosage: One or two tablets PO per day.See also **hydrochlorothiazide, triamterene** **spironolactone and hydrochlorothiazide**

Aldactazide

Tablets:

25 mg spironolactone, 25 mg hydrochlorothiazide

Usual adult dosage: One to eight tablets PO daily.

Tablets:

50 mg spironolactone, 50 mg hydrochlorothiazide

Usual adult dosage: One to four tablets PO daily.See also **hydrochlorothiazide, spironolactone.**

HEART FAILURE DRUGS **isosorbide dinitrate and hydralazine hydrochloride**

BiDil

Tablets:

20 mg isosorbide dinitrate, 37.5 mg hydralazine

Usual adult dosage: One tablet PO tid; may be increased to two tablets tid. For adjunct therapy in self-identified black patients to improve functional survival.See also **isosorbide dinitrate, hydralazine.**

LIPID-LOWERING DRUGS **ezetimibe and simvastatin**

Vytorin

Tablets:

- 10 mg ezetimibe; 10 mg simvastatin
- 10 mg ezetimibe; 20 mg simvastatin
- 10 mg ezetimibe; 40 mg simvastatin
- 10 mg ezetimibe; 80 mg simvastatin

Usual adult dosage: One tablet PO daily, taken in evening in combination with cholesterol-lowering diet and exercise. Dosage of simvastatin in the combination may be adjusted based on patient response. If given with a bile sequestrant, must be given at least 2 hr before or 4 hr after the bile sequestrant.

See also **ezetimibe, simvastatin**.

niacin and lovastatin

Advicor

Tablets:

- 500 mg niacin, 20 mg lovastatin
- 750 mg niacin, 20 mg lovastatin
- 1,000 mg niacin, 20 mg lovastatin

Usual adult dosage: One tablet daily PO at night.

See also **lovastatin, niacin**.

simvastatin and niacin

Simcor

Tablets:

- 20 mg simvastatin, 500 mg niacin
- 20 mg simvastatin, 750 mg niacin
- 20 mg simvastatin, 1,000 mg niacin

Usual adult dosage: One tablet PO per day; titrate based on lipid levels. Maximum dose 2,000 mg niacin with 40 mg simvastatin per day.

See also **niacin, simvastatin**.

MENOPAUSE DRUGS

drospirenone and estradiol

Angeliq

Tablets:

- 0.5 mg drospirenone, 1 mg estradiol

Usual adult dosage: One tablet each day PO. Monitor potassium level closely.

See also **estradiol**.

drospirenone and ethinyl estradiol

YAZ

Tablets:

- 3 mg drospirenone, 0.02 mg ethinyl estradiol

Usual adult dosage: One tablet each day PO. Monitor potassium level closely. Also approved to treat premenstrual dysphoric disorder, acne.

▷ estradiol and norethindrone (transdermal)

CombiPatch

Patch:

0.05 mg per day estradiol, 0.14 mg per day norethindrone

0.05 mg per day estradiol, 0.25 mg per day norethindrone

Usual adult dosage: Change patch twice a week.

For relief of symptoms of menopause.

See also **estrogens**.

▷ estradiol and norethindrone (oral)

Activella

Tablets:

0.5 mg estradiol, 0.1 mg norethindrone

1 mg estradiol, 0.5 mg norethindrone

Usual adult dosage: One tablet each day.

For treatment of moderate to severe vasomotor symptoms, vulvar and vaginal atrophy, prevention of postmenopausal osteoporosis in women with intact uterus.

See also **estrogens**.

▷ estradiol and norgestimate

Ortho-Prefest

Tablets:

1 mg estradiol, 0.09 mg norgestimate

Usual adult dosage: One tablet per day PO (3 days of pink tablets: estradiol alone; followed by 3 days of white tablets: estradiol and norgestimate combination; continue cycle uninterrupted).

Treatment of moderate to severe symptoms of menopause and prevention of osteoporosis in women with intact uterus.

See also **estradiol**.

▷ estrogen, medroxyprogesterone, and conjugated estrogens

Prempro

Tablets:

0.3 mg conjugated estrogen, 1.5 mg medroxyprogesterone

0.45 mg conjugated estrogen, 1.5 mg medroxyprogesterone

0.625 mg conjugated estrogen, 2.5 mg medroxyprogesterone

0.625 mg conjugated estrogen, 5 mg medroxyprogesterone

Usual adult dosage: One tablet per day PO.

For relief of symptoms of menopause and prevention of osteoporosis in women with intact uterus.

See also **estrogen**.

estrogens and medroxyprogesterone

Premphase

Tablets:

0.625 mg conjugated estrogens, 5 mg medroxyprogesterone

Usual adult dosage: One tablet per day PO.

Treatment of moderate to severe symptoms of menopause and prevention of osteoporosis in women with intact uterus.

See also **estrogen, medroxyprogesterone**.**ethinyl estradiol and norethindrone acetate**

femHRT

Tablets:

2.5 mcg ethinyl estradiol, 0.5 mg norethindrone acetate

5 mcg ethinyl estradiol, 1 mg norethindrone acetate

Usual adult dosage: One tablet per day PO.

Treatment of signs and symptoms of menopause and prevention of osteoporosis in women with intact uterus.

See also **estradiol, norethindrone**.**OPIOID AGONISTS****buprenorphine and naloxone**

CONTROLLED SUBSTANCE C-III

Suboxone

Sublingual tablets:

2 mg buprenorphine, 0.5 mg naloxone

8 mg buprenorphine, 2 mg naloxone

Usual adult dosage: 12–16 mg sublingually once each day following induction with sublingual buprenorphine for treatment of opioid dependence.See also **buprenorphine, naloxone**.**PSYCHIATRIC DRUGS****dextromethorphan and quinidine**

Nuedexta

Capsules:

20 mg dextromethorphan, 10 mg quinidine

Usual adult dosage: One capsule PO daily for 7 days; then one capsule PO every 12 hr for maintenance. To treat pseudobulbar affect associated with neurologic conditions.See also **dextromethorphan, quinidine**.

RESPIRATORY DRUGS

budesonide and formoterol fumarate

Symbicort 80/4.5, Symbicort 160/4.5

Inhalation:

80 mcg budesonide, 4.5 mcg formoterol fumarate

160 mcg budesonide, 4.5 mcg formoterol fumarate

Usual dosage in patients 12 yr and older: Two inhalations bid, morning and evening. Use for long-term maintenance of asthma, not for acute attacks.

See also **budesonide, formoterol**.

fluticasone and salmeterol

Advair Diskus, Advair HFA

Inhalation:

100 mcg fluticasone, 50 mcg salmeterol

250 mcg fluticasone, 50 mcg salmeterol

500 mcg fluticasone, 50 mcg salmeterol

Usual dosage in patients 12 yr and older: One inhalation bid to manage asthma.

Usual dosage in patients 4–11 yr: One inhalation (100 mcg fluticasone, 50 mcg salmeterol) bid in the morning and evening about 12 hr apart.

See also **fluticasone, salmeterol**.

ipratropium and albuterol

Combivent

Metered-dose inhaler:

18 mcg ipratropium bromide, 90 mcg albuterol

Usual adult dosage: Two inhalations four times per day

Not for use during acute attack.

Use caution with known sensitivity to atropine, soy beans, soya lecithin, peanuts.

Treatment of bronchospasm with COPD in patients who require more than a single bronchodilator.

See also **albuterol, ipratropium**.

loratadine and pseudoephedrine

Claritin-D 

ER tablets:

5 mg loratadine, 120 mg pseudoephedrine

Usual adult dosage: One tablet PO every 12 hr.

See also **loratadine, pseudoephedrine**.

Claritin-D 24 Hour OTC

ER tablets:

10 mg loratadine, 240 mg pseudoephedrine

Usual adult dosage: One tablet PO every day.

See also **loratadine, pseudoephedrine.**

 **mometasone and formoterol**

Dulera 100/5, Dulera 200/5

Metered aerosol inhaler:

100 mcg mometasone, 5 mcg formoterol

200 mcg mometasone, 5 mcg formoterol

Usual adult dosage: For maintenance treatment of asthma, 2 inhalations twice a day, AM and PM; rinse mouth after use. For adults only.

See also **mometasone, formoterol.**

TENSION HEADACHE DRUGS **butalbital, acetaminophen, and caffeine**

Esgic-Plus

Capsules:

50 mg butalbital, 500 mg acetaminophen, 40 mg caffeine

Usual adult dosage: One capsule PO every 4 hr as needed, up to six per day. May be habit-forming; avoid driving and dangerous tasks.

See also **acetaminophen, caffeine.**

APPENDIX R

Frequently used combination products by trade name

Many products are available on the market in combination form. Many of these are OTC preparations. It is helpful to have a guide to the ingredients of these products when instructing patients or assessing for drug interactions. The following is a list of brand names, active ingredients, and common usages for various combination products. Nursing process information can be checked by looking up the active ingredients.

Trade name	Active ingredients	Common usage
<i>Acanya</i>	clindamycin, benzoyl peroxide	Anti-acne drug
<i>Accuretic</i>	quinapril, hydrochlorothiazide	Antihypertensive
<i>Actifed Cold & Allergy</i>	pseudoephedrine, triprolidine	Decongestant, antihistamine
<i>ACTOplus Met</i>	pioglitazone, metformin	Antidiabetic
<i>Adderall</i>	dextroamphetamine sulfate and saccharate, amphetamine aspartate and sulfate	Amphetamine
<i>Adderall XL</i>	dextroamphetamine sulfate and saccharate, amphetamine aspartate and sulfate	Treatment of ADHD
<i>Advair Diskus</i>	fluticasone, salmeterol	Antiasthmatic
<i>Advair HFA</i>	fluticasone, salmeterol	Antiasthmatic
<i>Advicor</i>	niacin, lovastatin	Antihyperlipidemic
<i>Advil Cold and Sinus</i>	ibuprofen, pseudoephedrine	Decongestant, analgesic
<i>Aggrenox</i>	aspirin, dipyridamole	Stroke prevention
<i>Aldactazide</i>	spironolactone, hydrochlorothiazide	Diuretic
<i>Alka-Seltzer Plus Cold & Cough</i>	chlorpheniramine, dextromethorphan, phenylephrine	Decongestant, antihistamine, antitussive
<i>Alka-Seltzer Plus Flu Medicine</i>	dextromethorphan, chlorpheniramine, aspirin	Antitussive, analgesic, decongestant
<i>Allegra-D</i>	pseudoephedrine, fexofenadine	Decongestant, antihistamine
<i>Allegra-D 24 hour</i>	pseudoephedrine, fexofenadine	Decongestant, antihistamine
<i>Allerest Maximum Strength</i>	pseudoephedrine, chlorpheniramine	Decongestant, antihistamine

Trade name	Active ingredients	Common usage
<i>Anacin</i>	aspirin, caffeine	Analgesic
<i>Anacin Aspirin-Free</i>	diphenhydramine, acetaminophen	Analgesic
<i>Anexsia</i>	hydrocodone, acetaminophen	Analgesic
<i>Angeliq</i>	drospirenone, estradiol	Menopause
<i>Antrocol</i>	atropine, phenobarbital	Sedative, GI anticholinergic
<i>Apri</i>	ethinyl estradiol, desogestrel	Hormonal contraceptive
<i>Atacand HCT</i>	candesartan, hydrochlorothiazide	Antihypertensive
<i>Atripla</i>	efavirenz, emtricitabine, tenofovir	Antiviral
<i>Augmentin</i>	amoxicillin, clavulanic acid	Antibiotic
<i>Augmentin ES-600</i>	amoxicillin, clavulanic acid	Antibiotic
<i>Augmentin XR</i>	amoxicillin, clavulanic acid	Antibiotic
<i>Avalide</i>	irbesartan, hydrochlorothiazide	Antihypertensive
<i>Avandamet</i>	rosiglitazone, metformin	Antidiabetic
<i>Avandaryl</i>	rosiglitazone, glimepiride	Antidiabetic
<i>Aviane</i>	estradiol, levonorgestrel	Hormonal contraceptive
<i>Azdone</i>	hydrocodone, aspirin	Analgesic
<i>Azor</i>	amlodipine, olmesartan	Antihypertensive
<i>Bactrim</i>	trimethoprim, sulfamethoxazole	Antibiotic
<i>Bayer Plus Extra Strength</i>	aspirin, calcium carbonate	Analgesic
<i>Bayer Select Maximum Strength Backache</i>	magnesium tetrahydrate, aspirin	Analgesic
<i>Bayer Select Maximum Strength Night Time Pain Relief</i>	acetaminophen, diphenhydramine	Analgesic
<i>Benadryl Allergy & Sinus</i>	diphenhydramine, pseudoephedrine, acetaminophen	Decongestant
<i>Benicar HCT</i>	olmesartan, hydrochlorothiazide	Antihypertensive
<i>BenzaClin</i>	clindamycin, benzoyl peroxide	Anti-acne drug

(continued)

Trade name	Active ingredients	Common usage
<i>Beyaz</i>	drosperinone, ethinyl estradiol, levomefolate	Hormonal contraceptive
<i>BiDil</i>	isosorbide dinitrate, hydralazine	Heart failure
<i>Bromo Seltzer</i>	acetaminophen, sodium bicarbonate, citric acid	Analgesic, antacid
<i>Bronkaid Dual Action</i>	theophylline, ephedrine, guaifenesin	Antiasthmatic
<i>Bufferin</i>	aspirin, magnesium carbonate, calcium carbonate, magnesium oxide	Analgesic, antacid
<i>Caduet</i>	amlodipine, atorvastatin	CAD prevention
<i>Cafergot</i>	ergotamine, caffeine	Antimigraine
<i>Cheracol Plus</i>	codeine, guaifenesin, alcohol	Antitussive, expectorant
<i>Chlor-Trimeton Allergy-D 8-Hr</i>	pseudoephedrine, chlorpheniramine	Antihistamine, decongestant
<i>Chlor-Trimeton Allergy-D 12-H</i>	pseudoephedrine, chlorpheniramine	Antihistamine, decongestant
<i>Ciprodex</i>	ciprofloxacin, dexamethasone	Antibiotic, corticosteroid
<i>Claritin-D 12 Hour</i>	loratadine, pseudoephedrine	Decongestant, antihistamine
<i>Claritin-D 24 Hour</i>	loratadine, pseudoephedrine	Decongestant, antihistamine
<i>Clorpres</i>	chlorthalidone, clonidine	Antihypertensive
<i>Co-Gesic</i>	hydrocodone, acetaminophen	Analgesic
<i>CombiPatch</i>	estrogen, norethindrone	Menopause drug
<i>Combivent</i>	ipratropium, albuterol	Antiasthmatic, COPD drug
<i>Combivir</i>	lamivudine, zidovudine	Antiviral
<i>Combunox</i>	oxycodone, ibuprofen	Analgesic
<i>Comtrex Acute Head Cold & Sinus Pressure Relief</i>	pseudoephedrine, brompheniramine, acetaminophen	Antihistamine, decongestant, analgesic
<i>Comtrex Cough & Cold Relief</i>	pseudoephedrine, dextromethorphan, chlorpheniramine, acetaminophen	Decongestant, antitussive, analgesic, antihistamine
<i>Contac Day & Night</i>	pseudoephedrine, diphenhydramine, acetaminophen	Decongestant, antihistamine, analgesic

Trade name	Active ingredients	Common usage
<i>Coricidin "D" Cold, Flu & Sinus</i>	chlorpheniramine, acetaminophen, pseudoephedrine	Antihistamine, decongestant, analgesic
<i>Coricidin HBP Cold & Flu Tablets</i>	chlorpheniramine, acetaminophen	Antihistamine, analgesic
<i>Corzide</i>	nadolol, bendroflumethiazide	Antihypertensive
<i>Cryselle</i>	ethinyl estradiol, norgestrel	Hormonal contraceptive
<i>Cyclessa</i>	desogestrel, ethinyl estradiol	Hormonal contraceptive
<i>Cyclomydril</i>	cyclopentolate, phenylephrine	Ophthalmic
<i>Cylex</i>	methenamine, sodium salicylate, benzoic acid	Urinary anti-infective
<i>Damason-P</i>	hydrocodone, aspirin	Analgesic
<i>Deconamine</i>	pseudoephedrine, chlorpheniramine	Antihistamine, decongestant
<i>Dermoplast</i>	benzocaine, menthol, methylparaben	Local anesthetic
<i>Di Gel</i>	magnesium hydroxide, aluminum hydroxide, magnesium carbonate, simethicone	Antacid, anti-gas
<i>Dilaudid Cough Syrup</i>	hydromorphone, guaifenesin	Antitussive
<i>Dimetapp</i>	brompheniramine, pseudoephedrine	Antihistamine, decongestant
<i>Dimetapp Cold & Allergy</i>	pseudoephedrine, brompheniramine	Antihistamine, decongestant
<i>Diovan HCT</i>	valsartan, hydrochlorothiazide	Antihypertensive
<i>Doxidan</i>	docusate, phenolphthalein	Laxative
<i>Dristan Cold Multi-Symptom</i>	phenylephrine, chlorpheniramine, acetaminophen	Antihistamine, decongestant
<i>Drixelal Allergy Sinus</i>	pseudoephedrine, dexbrompheniramine, acetaminophen	Antihistamine, decongestant
<i>Duetact</i>	pioglitazone, glimepiride	Antidiabetic
<i>Dulera 100/5, 200/5</i>	mometasone, formoterol	Antiasthmatic

(continued)

Trade name	Active ingredients	Common usage
<i>Duocet</i>	hydrocodone, acetaminophen	Analgesic
<i>Dyazide</i>	triamterene, hydrochlorothiazide	Diuretic
<i>Embeda</i>	morphine, naltrexone	Analgesic
<i>Empirin with Codeine</i>	aspirin, codeine	Analgesic
<i>Epzicom</i>	abacavir, lamivudine	Antiviral
<i>Esgic Plus</i>	butalbital, acetaminophen, caffeine	Anti-tension headache
<i>Eurostep FE</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>Etrafon</i>	perphenazine, amitriptyline	Antidepressant
<i>Excedrin Extra Strength</i>	aspirin, acetaminophen, caffeine	Analgesic
<i>Excedrin P.M.</i>	acetaminophen, dimenhydramine	Analgesic
<i>Exforge</i>	amlodipine, valsartan	Antihypertensive
<i>Exforge HCT</i>	amlodipine, valsartan, hydrochlorothiazide	Antihypertensive
<i>Femcon Fe</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>femHRT</i>	ethinyl estradiol, norethindrone	Menopause drug
<i>Fioricet</i>	acetaminophen, butalbital, caffeine	Analgesic
<i>Fiorinal</i>	aspirin, butalbital, caffeine	Analgesic
<i>Fiorinal with Codeine</i>	aspirin, butalbital, caffeine, codeine	Analgesic
<i>Fosamax Plus D</i>	alendronate, cholecalciferol	Osteoporosis
<i>Gaviscon</i>	aluminum hydroxide, magnesium carbonate	Antacid
<i>Gelusil</i>	aluminum hydroxide, magnesium hydroxide, simethicone	Antacid
<i>Glucovance</i>	glyburide, metformin	Antidiabetic
<i>Granulex</i>	trypsin, Balsam Peru, castor oil	Topical enzyme
<i>Haley's MO</i>	mineral oil, magnesium hydroxide	Laxative
<i>Helidac</i>	bismuth subsalicylate, metronidazole, tetracycline	Antiulcer
<i>Hydrogesic</i>	hydrocodone, acetaminophen	Analgesic

Trade name	Active ingredients	Common usage
<i>Hyzaar</i>	losartan, hydrochlorothiazide	Antihypertensive
<i>Inderide</i>	hydrochlorothiazide, propranolol	Antihypertensive
<i>Jalyn</i>	dutasteride, tamsulosin	BPH drug
<i>Janumet</i>	sitagliptin, metformin	Antidiabetic
<i>Junel 21 Day 1/20</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>Junel 21 Day 1.5/30</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>Junel Fe 1/20</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>Junel Fe 1.5/30</i>	ethinyl estradiol, norethindrone	Hormonal contraceptive
<i>Kariva</i>	ethinyl estradiol, desogestrel	Hormonal contraceptive
<i>Kombiglyze XR</i>	saxigliptin, metformin	Antidiabetic
<i>Kondremul Plain</i>	mineral oil, Irish moss, glycerin, acacia	Laxative
<i>Librax</i>	chlordiazepoxide, clidinium	Anticholinergic, antispasmodic
<i>Limbitrol DS 10-25</i>	chlordiazepoxide, amitriptyline	Antidepressant
<i>Logen</i>	diphenoxylate, atropine	Antidiarrheal
<i>Lomanate</i>	diphenoxylate, atropine	Antidiarrheal
<i>Lomotil</i>	diphenoxylate, atropine	Antidiarrheal
<i>Lonox</i>	diphenoxylate, atropine	Antidiarrheal
<i>Lopressor HCT</i>	metoprolol, hydrochlorothiazide	Antihypertensive
<i>Lorcet Plus Tablets</i>	hydrocodone, acetaminophen	Analgesic
<i>Lortab Tablets</i>	hydrocodone, acetaminophen	Analgesic
<i>Lo Seasonique</i>	levonorgestrel, estradiol	Hormonal contraceptive
<i>Lotensin HCT</i>	hydrochlorothiazide, benazepril	Antihypertensive
<i>Lotrel</i>	amlodipine, benazepril	Antihypertensive
<i>Low-Ogestrel</i>	ethinyl estradiol, norgestrel	Hormonal contraceptive
<i>Lufyllin GG</i>	dyphylline, guaifenesin	Bronchodilator, expectorant
<i>Lybrel</i>	norgestrel, estradiol	Hormonal contraceptive

(continued)

Trade name	Active ingredients	Common usage
<i>Malarone</i>	atovaquone, proguanil	Antimalarial
<i>Margesic H</i>	hydrocodone, acetaminophen	Analgesic
<i>Maxitrol</i>	dexamethasone, neomycin, polymyxin B	Ophthalmic

Hormonal contraceptives

Usual dosage for oral contraceptives: Take one tablet PO daily for 21 days, beginning within 5 days of the first day of menstrual bleeding (day 1 of the cycle is the first day of menstrual bleeding). Inert tablets or no tablets are taken for the next 7 days. Then start a new course of 21 days.

Suggested measures for missed doses of oral contraceptives:

One tablet missed: Take tablet as soon as possible, or take two tablets the next day.

Two consecutive tablets missed: Take two tablets daily for the next 2 days, then resume the regular schedule.

Three consecutive tablets missed: Begin a new cycle of tablets 7 days after the last tablet was taken; use an additional method of birth control until the start of the next menstrual period.

Postcoital contraception (“morning after” pills): Safe and effective for emergency contraception. Dosing regimen starts within 72 hr of unprotected intercourse with a follow-up dose of the same number of pills 12 hr after the first dose.

Ovral: two white tablets

Nordette: four light orange tablets

Lo/Ovral: four white tablets

Triphasil: four yellow tablets

Plan B: 0.75 mg levonorgestrel; take one tablet within 72 hr of sexual intercourse, take the second tablet 12 hr later.

Plan B One-Step: 1.5 mg levonorgestrel; take one tablet within 72 hr of unprotected sexual intercourse. Available OTC for patients 17 yr and older.

Ella (ulipristal): 30 mg tablet; take within 5 days of unprotected sexual intercourse. A progesterone agonist/antagonist.

Oral contraceptives

Trade name	Combination
Monophasic	
<i>Alesse, Aviane, Lessina</i>	20 mcg estradiol and 0.10 mg levonorgestrel
<i>Apri, Desogen, Ortho-Cept, Reclipsen</i>	30 mcg ethinyl estradiol and 0.15 mg desogestrel
<i>Balziva, Femcon Fe chewable tablets, Ovcon-35, Zenchent</i>	35 mcg ethinyl estradiol and 0.4 mg norethindrone
<i>Beyaz</i>	3 mg drospirinone, 0.2 mg ethinyl estradiol, and 0.45 mg levomefolate; must monitor potassium levels.
<i>Brevicon, Modicon, Necon 0.5/35, Zenchent</i>	35 mcg ethinyl estradiol (estrogen) and 0.5 mg norethindrone (progestin)
<i>Cryselle, Lo/Ovral, Low-Ogestrel</i>	30 mcg ethinyl estradiol (estrogen) and 0.3 mg norgestrel
<i>Kelnor 1/35, Zovia 1/35E</i>	35 mcg ethinyl estradiol (estrogen) and 1 mg ethynodiol diacetate (progestin)

Trade name	Combination
Monophasic (continued)	
<i>Zovia 1/50E</i>	50 mcg ethinyl estradiol (estrogen) and 1 mg ethynodiol diacetate (progestin)
<i>Jolessa, Levora 0.15/30, Nordette, Portia</i>	30 mcg ethinyl estradiol (estrogen) and 0.15 mg levonorgestrel (progestin)
<i>Junel Fe 1/20, Junel 21 Day 1/20, Loestrin 21 1/20, Loestrin Fe 21 1/20, Microgestin Fe 1/20</i>	20 mcg ethinyl estradiol (estrogen) and 1 mg norethindrone (progestin)
<i>Junel Fe 1.5/30, Junel 21 Day 1.5/30, Loestrin 21 1.5/30, Loestrin Fe 1.5/30, Microgestin Fe 1.5/30</i>	30 mcg ethinyl estradiol (estrogen) and 1.5 mg norethindrone acetate (progestin)
<i>Kariva, Mircette</i>	20 mcg ethinyl estradiol (estrogen) and 0.15 mg desogestrel (proestin)
<i>Lessina, Lutera, Sronyx</i>	0.10 mg levonorgestrel and 0.02 mg ethinyl estradiol
<i>Lo Loestrin Fe</i>	10 mcg ethinyl estradiol (estrogen) and 1.5 mg norethindrone acetate (progestin)
<i>Lo Seasonique</i>	0.1 mg levonorgestrel and 0.02 mg ethinyl estradiol (84 tablets); 0.01 mg ethinyl estradiol (7 tablets)
<i>Lybrel</i>	0.09 mg levonorgestrel and 0.02 mg ethinyl estradiol in continual use to eliminate menstrual periods
<i>MonoNessa, Ortho-Cyclen, Sprintec</i>	35 mcg ethinyl estradiol (estrogen) and 0.25 mg norgestimate (progestin)
<i>Necon 1/35, Norinyl 1+35, Ortho-Novum 1/35</i>	35 mcg ethinyl estradiol (estrogen) and 1 mg norethindrone (progestin)
<i>Necon 1/50, Norinyl 1+50</i>	50 mcg mestranol (estrogen) and 1 mg norethindrone (progestin)
<i>Ogestrel, Ovral-28</i>	50 mcg ethinyl estradiol (estrogen) and 0.5 mg norgestrel (progestin)
<i>Ortho-Novum 1/50, Ovcon-50</i>	50 mcg ethinyl estradiol (estrogen) and 1 mg norethindrone acetate (progestin)
<i>Quasense, Seasonale, Seasonique</i>	0.15 mg levonorgestrel and 0.03 mg ethinyl estradiol taken as 84 days active tablets, 7 days inactive
<i>Solia</i>	30 mcg ethinyl estradiol and 0.15 mg desogestrel
<i>Yasmin</i>	3 mg drospirenone (progestin) and 30 mcg ethinyl estradiol (estrogen); must monitor potassium levels

Biphasic

<i>Necon 10/11, Ortho-Novum 10/11</i>	phase 1—10 tablets: 0.5 mg norethindrone and 35 mcg ethinyl estradiol; phase 2—11 tablets: 1 mg norethindrone and 35 mcg ethinyl estradiol
---------------------------------------	---

Trade name	Combination
Triphasic (continued)	
	phase 2—5 tablets, 0.075 mg levonorgestrel (progestin) and 40 mcg ethinyl estradiol (estrogen);
	phase 3—10 tablets, 0.125 mg levonorgestrel (progestin) and 30 mcg ethinyl estradiol (estrogen)

Multiphasic

<i>Natazia</i>	phase 1—2 tablets, 3 mg estradiol valerate
	phase 2—5 tablets, 2 mg estradiol valerate and 2 mg dienogest
	phase 3—17 tablets, 2 mg estradiol valerate and 3 mg dienogest
	phase 4—2 tablets, 1 mg estradiol valerate

Implantable system

Trade name	Combination
<i>Implanon</i>	68 mg etonogestrel implanted subdermally in inner aspect of non-dominant upper arm. Left in place for no longer than 3 yr and then must be removed. New implants may then be inserted.

Injectable contraceptives

Trade name	Combination
<i>Depo-Provera</i>	150 mg medroxyprogesterone Give 1-mL injection deep IM, repeated every 3 mo.

Intrauterine systems

Trade name	Combination
<i>Mirena</i>	52 mg levonorgestrel inserted into the uterus for up to 5 yr. (Also approved to treat heavy menstrual bleeding in women using an intrauterine system for contraception.)

Transdermal system

Trade name	Combination
<i>Ortho Evra</i>	6 mg norelgestromin, 0.75 ethinyl estradiol in a patch form, which releases 150 mcg norelgestromin and 20 mcg ethinyl estradiol each 24 hr for 1 wk. Patch is applied on the same day of the wk for 3 consecutive wk, followed by a patch-free week.

Vaginal ring

Trade name	Combination
<i>NuvaRing</i>	0.12 mg etonogestrel (progestin), 0.015 mg ethinyl estradiol (estrogen) per day; insert ring into vagina on or before the 5th day of menstrual period; remove after 3 wk. Insert new ring after 1-wk rest.

Commonly used biologicals

▷ diphtheria and tetanus toxoids, combined, adsorbed (DT, Td) (available in adult and pediatric preparations)

Therapeutic actions

Contains reduced dose of inactivated diphtheria toxin and full dose of inactivated tetanus toxin to provide adequate immunization in adults without the severe sensitivity reactions caused when full pediatric doses of diphtheria toxoid are given to adults.

Indications

- Active immunization of adults and children 7 yr and older against diphtheria and tetanus. *Trivalent DTP* is preferred for use in most children; DT can be used for children 6 wk and older when pertussis vaccine is contraindicated.

Adverse effects

Fretfulness; drowsiness; anorexia; vomiting; transient fever; malaise; generalized aches and pains; edema of injection area with redness, swelling, induration, pain (may persist for a few days); hypersensitivity reactions.

Dosage

Two primary IM doses of 0.5 mL each given at 4- to 8-wk intervals, followed by a third 0.5-mL IM dose given in 6–12 mo. Routine booster of 0.5 mL IM every 10 yr for maintenance of immunity.

Nursing considerations

- Use caution in pregnant women. **Pregnancy Category C**—safety not established.
- Defer administration of routine immunizing or booster doses in case of acute infection.
- Arrange to interrupt immunosuppressive therapy if emergency booster doses of *Td* are required after injury.
- Not for treatment of acute tetanus or diphtheria infections.
- Administer by IM injection only; avoid subcutaneous or IV injection. Deltoid muscle is the preferred site. Do not administer into the same site more than once.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection in case of hypersensitivity reactions.
- Provide comfort measures to help patient cope with discomforts of injection: analgesics, warm soaks for injection site, small meals, environmental control—temperature, stimuli.
- Provide patient with written record of immunization and reminder of when booster injection is needed.

diphtheria and tetanus toxoids and acellular pertussis vaccine, adsorbed (DTaP, Tdap)

Adacel, Boostrix, Daptacel, Infanrix, Tripedia

Therapeutic actions

Provides detoxified diphtheria and tetanus toxins and acellular pertussis vaccine to stimulate an immunologic response in children leading to an active immunity against these diseases.

Indications

- Primary immunization of children 6 wk and older–7 yr. Induction of immunity against diphtheria, tetanus, and pertussis. Immunization of adults against pertussis.

Adverse effects

Hypersensitivity reactions; erythema, induration, redness, pain, swelling of the injection area; nodule at the injection site, which may persist for several weeks; temperature elevations, malaise, chills, irritability, fretfulness, drowsiness, anorexia, vomiting, persistent crying; rarely—fatal reactions.

Dosage

- As primary immunization: 3 IM doses of 0.5 mL at 4- to 8-wk intervals. Start doses by 6–8 wk of age; finish by 7th birthday. Use the same vaccine for all three doses.
- Fourth dose: 0.5 mL IM at 15–20 mo, at least 6 mo after previous dose.
- Fifth dose: 0.5 mL IM at 4–6 yr or preferably before entry into school (*Infanrix*, *Tripedia*, *Daptacel*). If fourth dose was given after the 4-yr birthday, the preschool dose may be omitted.
- Booster injections: 10–64 yr (*Boostrix*) 0.5 mL IM; 11–64 yr (*Adacel*) 0.5 mL IM. Allow at least 5 yr between last of the series and booster dose.

Nursing considerations

- Do not use for treatment of acute tetanus, diphtheria, or whooping cough infections.
 - Do not administer primary series to any person 7 yr or older.
 - Do not attempt routine immunization with DTaP if the child has a personal history of CNS disease or convulsions.
 - Do not administer DTaP after recent blood transfusions or receipt of immune globulin, in immunodeficiency disorders or with immunosuppressive therapy, or to patients with malignancy.
 - Question the parent concerning occurrence of any signs or symptoms of adverse reactions after the previous dose before administering a repeat dose of the vaccine. If temperature higher than 39°C (103°F), convulsions with or without fever, alterations of consciousness, focal neurologic signs, screaming episodes, shock, collapse, somnolence, or encephalopathy has occurred, DTP is contraindicated and diphtheria and tetanus toxoids without pertussis should be used for immunization.
 - Administer by IM injection only. Avoid subcutaneous or IV injection. Midlateral muscle of the thigh is the preferred site for infants; deltoid muscle is the preferred site for older children. Do not administer at same site more than once.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection in case of hypersensitivity reactions.
- DTaP products are not generically equivalent and are not interchangeable. Use vaccines from the same manufacturer for at least the first three doses.
 - Provide comfort measures and teach parents to provide comfort measures to help the patient cope with the discomforts of the injection: analgesics, warm soaks for injection site, small meals, environmental control—temperature, stimuli.

- Provide parent with written record of immunization and reminder of when booster injection is needed.

diphtheria and tetanus toxoids and acellular pertussis adsorbed, hepatitis B (recombinant), and inactivated poliovirus vaccine combined

Pediarix

Therapeutic actions

Contains diphtheria and tetanus toxoids, acellular pertussis vaccine, recombinant antigenic hepatitis B vaccine and inactivated poliovirus vaccine in one injection to stimulate active immunity against these diseases in children who have received all doses of the vaccine.

Indications

- Active immunization against diphtheria, tetanus, pertussis, hepatitis B virus, and poliomyelitis caused by poliovirus Types 1, 2, and 3 as a three-dose primary series in infants born to HBsAg-negative mothers.

Adverse effects

Hypersensitivity reactions: erythema, induration, redness, pain, swelling of the injection area; nodule at the injection site, which may persist for several weeks; temperature elevations, malaise, chills, irritability, fretfulness, drowsiness, anorexia, vomiting, persistent crying; rarely—fatal reactions.

Dosage

- Infants with hepatitis B surface antigen (HBsAg)—negative mothers, three 0.5-mL doses IM given at 6- to 8- (preferably 8-) wk intervals beginning at 2 mo.
- Children previously vaccinated with one dose of hepatitis B vaccine should receive the three-dose series.
- Children previously vaccinated with one or more doses of *Infanrix* or *IPV: Pediarix* may be used to complete the series.

Nursing considerations

- Administer only to children of HbsAg-negative mothers.
- Do not administer to children with immunodeficiency, immunosuppression, or malignancy.
- Do not administer to any person younger than 6 wk or older than 7 yr.
- Do not administer if patient is febrile.
- Administer by IM injection only; avoid subcutaneous or IV injection. Midlateral muscle of the thigh is the preferred site for infants; deltoid muscle is the preferred site for older children.
- Shake the vial vigorously to suspend the drug; do not use if particles are apparent; do not enter the vial; discard any unused portion.
- Do not administer into the same site more than once.

⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection because of risk of hypersensitivity reactions.

- Provide comfort measures and teach parents to provide comfort measures to help the patient cope with the discomforts of the injection: analgesics, warm soaks for the injection site, small meals, environmental control—temperature, stimuli.
- Provide parents with written record of immunization and reminder of when booster injections are needed.

- Do not use this drug as a booster injection after the completion of the three-shot series; use appropriate single vaccines for boosters.

diphtheria and tetanus toxoids and acellular pertussis adsorbed and inactivated poliovirus vaccine

Kinrix

Therapeutic actions

Contains diphtheria and tetanus toxoids, acellular pertussis, and inactivated poliovirus in one injection to stimulate active immunity against these diseases in children.

Indications

- Active immunization against diphtheria, tetanus, pertussis, and poliomyelitis as the fifth dose in the diphtheria, tetanus, acellular pertussis series and the fourth dose in the inactivated poliovirus series in children 4–6 yr whose previous immunizations have been with *Infanrix* or *Pediarix* for the first three doses and *Infanrix* for the fourth dose.

Adverse effects

Hypersensitivity reactions; local reactions at injection site, including warmth, redness, swelling, pain; headache; nausea; myalgia; fever; URI symptoms.

Dosage

One IM injection of 0.5 mL.

Nursing considerations

- Drug is contraindicated with severe allergic reaction to any other vaccine, encephalopathy, and progressive neurologic diseases.
- Ensure that patient has received other immunizations in the series before administration.
- Use cautiously in patients with latex allergy.
- Children at high risk for seizures should receive an antipyretic at time of administration.
- Do not administer if patient is febrile or shows signs of active infection.
- Do not mix in syringe with other vaccines; administer at different sites than other vaccines.
- Provide comfort measures and teach parents to provide comfort measures (analgesics, antipyretics, warm packs to injection site, small meals, environmental control of temperature and stimuli) to help patient cope with effects of the injection.
- Provide parents with a written record of the immunization.

diphtheria and tetanus toxoids and acellular pertussis adsorbed, inactivated poliovirus vaccine, and Haemophilus b conjugate (tetanus toxoid conjugate) vaccine

Pentacel

Therapeutic actions

Contains diphtheria and tetanus toxoids, acellular pertussis, inactivated poliovirus and *Haemophilus b* conjugate vaccine in one injection to stimulate active immunity against these diseases in children.

Indications

- Primary active immunization of children between 6 wk and 4 yr against diphtheria, tetanus, pertussis, poliomyelitis, and *H. influenza* b.

Adverse effects

Hypersensitivity reactions; local reactions at injection site, including warmth, redness, swelling, pain; headache; nausea; myalgia; fever; URI symptoms.

Dosage

Four-dose series of IM injections of 0.5 mL beginning as early as 6 wk and then every 4–8 wk. A booster dose of *Daptacel* should be given at 4–6 yr.

Nursing considerations

- Contraindicated with severe allergic reaction to any other vaccine, encephalopathy, progressive neurologic diseases.
- Children at high risk for seizures should receive an antipyretic at time of administration.
- Do not administer if patient is febrile or shows signs of active infection.
- Do not mix in syringe with other vaccines; administer at different sites than other vaccines.
- Provide comfort measures and teach parents to provide comfort measures (analgesics, antipyretics, warm packs to injection site, small meals, environmental control of temperature and stimuli) to help patient cope with effects of the injection.
- Provide parents with a written record of the immunization and a date to return for the second dose in the series.

Haemophilus b conjugate vaccine

ActHIB, Hiberix, Liquid PedvaxHIB

Therapeutic actions

Provides antigenic combination of *Haemophilus* b conjugate vaccine to stimulate an immunologic response in children, leading to an active immunity against these diseases.

Indications

- Active immunization of infants and children against *H. influenzae* b for primary immunization and routine recall; 2–71 mo (*PedvaxHIB*), 2–18 mo (*ActHIB* with DPT), or 15–18 mo (*ActHIB* with *Tripedia*).

Adverse effects

Hypersensitivity reactions; erythema, induration, redness, pain, swelling of the injection area; nodule at the injection site, which may persist for several weeks; temperature elevations, malaise, chills, irritability, fretfulness, drowsiness, anorexia, vomiting, persistent crying; rarely—fatal reactions.

Dosage

ActHIB: Reconstitute with DTP, *Tripedia*, or saline.

- 2–6 mo: 3 IM injections of 0.5 mL at 2, 4, and 6 mo; 0.5 mL at 15–18 mo and DPT alone at 4–6 yr.
- 7–11 mo: 2 IM injections of 0.5 mL at 8-wk intervals; booster dose at 15–18 mo.
- 12–14 mo: 0.5 mL IM with a booster 2 mo later.
- 15–18 mo: 0.5 mL IM, booster of *Tripedia* at 4–6 yr.

Hiberix

- 15 mo–4 yr: Booster dose: 0.5 mL IM as a single dose.

Booster dose at 15 mo or older but not less than 2 mo from last dose. Unvaccinated children 15–71 mo: 0.5 mL IM.

PedvaxHIB

- 2–14 mo: 2 IM injections of 0.5 mL at 2 mo of age and 2 mo later; 0.5-mL booster at 12 mo (if 2 doses complete before 12 mo, not less than 2 mo after last dose).
- 15 mo or older: 0.5 mL IM, single injection.

Nursing considerations

- Do not administer to children with immunodeficiency, immunosuppression, or malignancy.
- Do not administer to adults.
- Do not administer in the presence of febrile illness.
- Administer by IM injection only. Avoid subcutaneous or IV injection. Midlateral muscle of the thigh is the preferred site for infants; deltoid muscle is the preferred site for older children. Do not administer at same site more than once.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection in case of hypersensitivity reaction.
- Provide comfort measures and teach parents to provide comfort measures to help patient cope with the discomforts of the injection: analgesics, warm soaks for injection site, small meals, environmental control—temperature, stimuli.
- Provide parents with written record of immunization and reminder of when booster injection is needed.
- Conjugate vaccines can be given simultaneously with other routine vaccines using separate sites and syringes.

Haemophilus b conjugate vaccine with hepatitis B surface antigen (recombinant)

Comvax

Therapeutic actions

Provides antigenic hepatitis B vaccine to stimulate an immunologic response in children, leading to an active immunity against the disease.

Indications

- Active immunization of infants, 6 wk–15 mo and children against hepatitis B, for primary immunization and routine recall for ages 2–15 mo.

Adverse effects

Hypersensitivity reactions: erythema, induration, redness, pain, swelling of the injection area; nodule at the injection site, which may persist for several weeks; temperature elevations, malaise, chills, irritability, fretfulness, drowsiness, anorexia, vomiting, persistent crying; rarely—fatal reactions.

Dosage

- Infants with hepatitis B surface antigen (HBsAg)—negative mothers: Three 0.5-mL IM doses at 2, 4, and 12–15 mo.
- Children previously vaccinated with one or more doses of hepatitis B vaccine or *Haemophilus b* vaccine: 0.5-mL IM doses at 2, 4, and 12–15 mo.

Nursing considerations

- Administer only to children of HBsAg-negative mothers.
- Do not administer to children with immunodeficiency, immunosuppression, or malignancy.

- Do not administer to adults.
- Do not administer if patient has febrile illness.
- Administer by IM injection only. Avoid subcutaneous or IV injection. Midlateral muscle of the thigh is the preferred site for infants; deltoid muscle is the preferred site for older children.
- Do not administer into same site more than once.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection because of risk of hypersensitivity reactions.
- Provide comfort measures and teach parents to provide comfort measures to help patient cope with the discomforts of the injection: analgesics, warm soaks for injection site, small meals, environmental control—temperature, stimuli.
- Provide parents with written record of immunization and reminder of when booster injection is needed.
- Conjugate vaccines can be given simultaneously with other routine vaccines, using separate sites and syringes.

▶ hepatitis A vaccine, inactivated

Havrix, Vaqta

Therapeutic actions

Contains hepatitis A antigen that stimulates production of specific antibodies against hepatitis A virus (HAV), which protects against HAV infection. The immunity does not protect against hepatitis caused by other agents.

Indications

- Active immunization of adults and children 12 mo and older against disease caused by HAV in situations that warrant immunization (eg, travel, institutionalization); used with immune globulin for immediate and long-term protection against hepatitis A.

Adverse effects

Transient fever; edema of injection area with redness, swelling, induration, pain (may persist for a few days); upper respiratory illness, headache, rash.

Dosage

- Adults: *Havrix*—1440 ELISA units (1 mL) IM; same dose booster in 6–12 mo. *Vaqta*—50 units (1 mL) IM; same dose booster in 6–18 mo.
- Pediatric patients 12 mo–18 yr: 25 units/0.5 mL IM with a repeat dose in 6–18 mo. (*Vaqta*); 720 ELISA units (0.5 mL) IM; repeat dose in 6–12 mo (*Havrix*).

Nursing considerations

- Use caution in pregnancy. **Pregnancy Category C**—safety not established.
- Defer administration in case of acute infection.
- Administer by IM injection only. Deltoid muscle is the preferred site; do not give in the gluteal site.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection in case of hypersensitivity reaction.
- Provide comfort measures to help patient cope with the discomforts of the injection (analgesics, warm soaks for injection site, small meals, environmental control of temperature and stimuli).
- Provide patient with written record of immunization and timing for booster immunization.

hepatitis A inactivated and hepatitis B recombinant vaccine

Twinrix

Therapeutic actions

Provides inactivated hepatitis A antigens that stimulate production of specific antibodies against hepatitis A virus (HAV), which protect against hepatitis A, and inactivated human hepatitis B surface antigen particles, which stimulate active immunity and production of antibodies against hepatitis B surface antigens.

Indications

- Active immunization against disease caused by HAV and hepatitis B virus in persons 18 yr and older who want protection against or are at high risk of exposure to the viruses.

Adverse effects

Soreness, swelling, erythema, warmth, induration at injection site; malaise, fatigue, headache, nausea, vomiting, dizziness; myalgia, arthralgia, rash, low-grade fever; pharyngitis, rhinitis, cough; lymphadenopathy; hypotension; dysuria.

Dosage

- Three doses (1 mL by IM injection) given on a 0-, 1-, and 6-month schedule.
- Accelerated dosage: Four doses (1 mL by IM injection) on days 0, 7, 21, and 30, followed by booster dose at 12 mo.
- Safety for use in patients younger than 18 yr not established.

Nursing considerations

- Do not administer to any patient with a known hypersensitivity to hepatitis A vaccine or hepatitis B vaccine or any components used in the solution.
- Use cautiously with bleeding disorders, immunosuppression, pregnancy, and lactation.

Pregnancy Category C—safety not established.

- Postpone injection in the presence of moderate to severe illness.
- Administer IM, preferably in the deltoid region. Do not administer in the gluteal region.
- Shake vial or syringe well before withdrawal; observe for any particulate matter or discoloration. Should appear as a white, homogenous, turbid suspension; discard if it appears otherwise.
- Administer drug as provided; do not dilute.
- Provide comfort measures—analgesics, antipyretics, care of injection site—to help patient cope with the effects of the injection.
- Provide patient with a written record of the immunization and the dates that repeat vaccinations and antibody tests are needed.

hepatitis B immune globulin (HBIG)

HepaGam B, HyperHEP B S/D, Nabi-HB

Therapeutic actions

Globulin contains a high titer of antibody to hepatitis B surface antigen (HBsAg), providing a passive immunity to HBsAg.

Indications

- Postexposure prophylaxis following parenteral exposure (accidental “needle-stick”), direct mucous membrane contact (accidental splash), or oral ingestion (pipetting accident) involving

HBsAg-positive materials such as blood, plasma, serum, or sexual exposure to an HBsAg-positive person.

- Prophylaxis in infants born to HBsAg-positive mothers.
- Adjunct to hepatitis B vaccine when rapid achievement of protective levels of antibodies is desirable.
- Prevention of hepatitis B recurrence after liver transplant in HBsAg-positive transplant recipients (HepaGam B).

Adverse effects

Hypersensitivity reactions; tenderness, muscle stiffness at the injection site; urticaria, angioedema; fever, chills, nausea, vomiting, chest tightness.

Dosage

- Perinatal exposure: 0.5 mL IM within 12 hr of birth; repeat dose at 1 mo and 6 mo after initial dose.
- Percutaneous exposure: 0.06 mL/kg IM immediately (within 7 days) and repeat 28–30 days after exposure. Usual adult dose is 3–5 mL.
- Individuals at high risk of infection: 0.06 mL/kg IM at same time (but at a different site) as hepatitis B vaccine is given.
- *HepaGam B* after liver transplant: 20,000 international units IV at 2 mL/min. Give first dose with liver transplant and then daily on days 1–7, every 2 wk from day 14 through 12 wk, and monthly from month 4 onward.
- Sexual exposure: A single dose of 0.06 mL/kg IM within 14 days of last sexual contact.

Nursing considerations

- Do not administer to patients with history of allergic response to gamma globulin or with anti-immunoglobulin A antibodies.
 - Use caution in pregnant women. **Pregnancy Category C**—safety not established. Use only if benefits outweigh potential unknown risks to the fetus.
 - HBIG may be administered at the same time or up to 1 mo preceding hepatitis B vaccination without impairing the active immune response from the vaccination.
 - Administer IM in the deltoid region or anterolateral aspect of upper thigh. Do not administer IV.
 - Administer the appropriate dose as soon after exposure as possible (within 7 days is preferable); repeat 28–30 days after exposure.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures to help patient deal with discomfort of drug therapy—analgesics, antipyretics, environmental control.

hepatitis B vaccine

Engerix-B, Recombivax HB

Therapeutic actions

Provides inactivated human hepatitis B surface antigen particles to stimulate active immunity and production of antibodies against hepatitis B surface antigens using surface antigen produced by yeast.

Indications

- Immunization against infection caused by all known subtypes of hepatitis B virus, especially those at high risk for infection—health care personnel, military personnel identified to be at risk, prisoners, users of illicit drugs, populations with high incidence (Eskimos,

Indochinese refugees, Haitian refugees), morticians and embalmers, persons at increased risk because of their sexual practices (repeated STDs, homosexually active males, prostitutes), patients in hemodialysis units, patients requiring frequent blood transfusions, residents of mental institutions, household contacts of people with persistent hepatitis B antigenemia.

- All infants, adolescents 11–12 yr, and older unvaccinated adolescents at high risk.

Adverse effects

Soreness, swelling, erythema, warmth, induration at injection site; malaise, fatigue, headache, nausea, vomiting, dizziness; myalgia, arthralgia, rash; low-grade fever, pharyngitis, rhinitis, cough; lymphadenopathy; hypotension; dysuria.

Dosage

- *Birth–10 yr*: Initial dose—0.5 mL IM, followed by 0.5 mL IM at 1 mo and 6 mo after initial dose.
- *11–19 yr*: 0.5 mL IM, followed by 0.5 mL IM at 1 mo and 6 mo after initial dose.
- *Adults*: Initial dose—1 mL IM, followed by 1 mL IM at 1 mo and 6 mo after initial dose, all types.
- *Dialysis or predialysis patients*: Initial dose—40 mcg IM; repeat dose at 1 mo, 2 mo, and 6 mo after initial dose (*Engerix-B*). Or, 40 mcg IM; repeat dose at 1 mo and 6 mo (*Recombivax HB*).
- Revaccination (a booster dose should be considered with anti-HBs levels less than 10 international units/mL 1–2 mo after third dose). *Children younger than 10 yr*: 10 mcg. *Adults and patients older than 10 yr*: 20 mcg. *Hemodialysis patients (when antibody testing indicates need)*: two 20-mcg doses.

Nursing considerations

- Do not administer to any patient with known hypersensitivity to any component of the vaccine or allergy to yeast.
 - Use caution in pregnant or nursing women. **Pregnancy Category C**—safety not established. Use only if clearly needed and benefits outweigh potential unknown effects.
 - Use caution in any patient with active infection. Delay use of vaccine if possible. Use with caution in any patient with compromised cardiopulmonary status or patients in whom a febrile or systemic reaction could present a significant risk.
 - Administer IM, preferably in the deltoid muscle in adults or the anterolateral thigh muscle in infants and small children. Do not administer IV or intradermally; subcutaneous route may be used in patients who are at high risk for hemorrhage following IM injection, but increased incidence of local effects has been noted.
 - Shake vaccine container well before withdrawing solution; no dilution is needed. Use vaccine as supplied. Vaccine appears as a slightly opaque, white suspension. Refrigerate vials; do not freeze.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of severe anaphylactic reaction.
- Provide comfort measures—analgesics, antipyretics, care of injection site—to help patient cope with effects of the drug.
 - Provide patient or parent with a written record of the immunization and dates that repeat injections and antibody tests are needed.

human papillomavirus recombinant vaccine, bivalent types 16 and 18

Cervarix

Therapeutic actions

Human papillomavirus capsid proteins that generate the formation of immunoglobulin G—neutralizing antibodies directed against those strains of human papillomavirus.

Indications

- Prevention of diseases caused by oncogenic human papillomavirus types 16 and 18 in young girls and women ages 10–25 yr, including cervical cancer, cervical intraepithelial neoplasia grade 2 or worse, adenocarcinoma in situ, and cervical intraepithelial neoplasia grade 1.

Adverse effects

Injection site reactions (pain, redness, swelling), fatigue, headache, myalgia, GI symptoms, arthralgia, syncope.

Dosage

Three doses of 0.5 mL IM given at 0, 1, and 6 months.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
- Do not administer with antiviral medications or other immunizations or immune suppressants.
- Do not administer if patient has febrile illness or active infection.
- Do not administer to patient with known allergy to components of drug or to latex.
- Do not administer to women who are pregnant unless the benefit clearly outweighs the risk.
- ⊗ **Warning** Have epinephrine 1:1000 immediately available at time of injection in case of anaphylactic reaction.
- Observe patient for 15 minutes following vaccine administration; syncope is common and may occur with any dose of the series.
- Provide comfort measures (analgesics, rest, decongestants) to help patient cope with discomforts of immunization.
- Ensure that patient understands the importance of regular cervical cancer screening throughout life.
- Provide patient with written record of immunization; give patient a reminder for return dates to complete the series.

human papillomavirus recombinant vaccine, quadrivalent

Gardasil

Therapeutic actions

Noninfectious, recombinant virus particles that stimulate antibody production to human papillomavirus types 6, 11, 16, and 18; providing humoral immunity to virus that cause such diseases as cervical cancer, genital warts, cervical adenocarcinoma in situ, cervical intraepithelial neoplasia, vulvar intraepithelial neoplasia, vaginal intraepithelial neoplasia, cervical intraepithelial neoplasia.

Indications

- Prevention of diseases caused by human papillomavirus types 6, 11, 16, and 18 in young girls and women ages 9–26 yr, including cervical cancer, precancerous genital lesions, genital warts, and vaginal and vulvar cancer.
- Prevention of genital warts caused by human papillomavirus types 6 and 11 in men and boys 9–26 yr.

Adverse effects

Injection site reactions (redness, warmth, swelling, bruising, pain), dizziness, diarrhea, nasal congestion, myalgia, arthralgia, fever, fainting.

Dosage

- Three separate IM injections of 0.5 mL each, second dose 2 mo after the initial dose and last dose 6 mo after the first dose; for girls and women 9–26 yr.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
- Do not administer with any antiviral drugs or with other immunizations or immune suppressants.
- Do not administer if patient has febrile illness or active infection.
- Do not administer to patient allergic to any component of the drug; do not repeat injections in patients who experience hypersensitivity reactions.
- Do not administer to women who are pregnant. **Pregnancy Category B.**
- Administer by IM injection in the deltoid or upper thigh. Shake well before using; do not use if drug is discolored or contains particulate matter.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Have patient remain seated or lying down for 15 min after vaccination for safety; fainting, twitching, and seizurelike activity have occurred.
- Provide comfort measures (analgesics, rest, decongestants) to help the patient cope with discomforts of immunization.
- Ensure that patients understand the importance of regular cervical cancer screening throughout life.
- Provide patient with written record of immunization and reminders for second and third injections.

▷ immune globulin intramuscular (IG; gamma globulin; IGIM)

GamaSTAN S/D

immune globulin intravenous (IGIV)

Carimune NF, Flebogamma 5%, Gammagard Liquid, Gamunex, Iivegam EN, Octagam, Privigen

immune globulin subcutaneous (IGSC, SCIG)

Gamunex-C, Hizentra, Vivaglobin

Therapeutic actions

Contains human globulin (16.5% IM, 10% subcutaneously, 5% IV), which provides passive immunity through the presence of injected antibodies. IM gamma globulin involves a 2- to

5-day delay before adequate serum levels are obtained. IV gamma globulin provides immediate antibody levels. Mechanism of action in idiopathic thrombocytopenic purpura not determined.

Indications

- Prophylaxis after exposure to hepatitis A, measles (rubeola), varicella, rubella; IM route is preferred.
- Prophylaxis for patients with immunoglobulin deficiency—subcutaneously, IM; IV if immediate increase in antibodies is necessary.
- Idiopathic thrombocytopenic purpura. IV route has produced temporary increase in platelets in emergency situations (*Carimune NF*, *Gamunex*).
- Kawasaki syndrome (*Iveegam EN*).
- Primary immune deficient diseases (*Octagam*, *Vivaglobin*).
- Primary humoral immunodeficiencies (*Flebogamma*, *Gamunex-C*, *Iveegam EN*).
- Maintenance treatment of patients with primary immunodeficiencies (*Carimune NF*).
- Treatment of chronic inflammatory demyelinating polyneuropathy (*Gamunex*, *Gamunex-C*).
- Treatment of idiopathic thrombocytopenic purpura (*Gamunex-C*)
- Treatment of chronic inflammatory demyelinating polyneuropathy (*Gamunex-C*)

Adverse effects

Tenderness, muscle stiffness at injection site; urticaria, angioedema, nausea, vomiting, chills, fever, chest tightness; anaphylactic reactions, precipitous fall in blood pressure—more likely with IV administration. Risk of acute renal failure with IV products.

Dosage

- Hepatitis A: 0.02 mL/kg IM for household and institutional contacts. Persons traveling to areas where hepatitis A is common: 0.02 mL/kg IM if staying less than 2 mo; 0.06 mL/kg IM repeated every 5 mo for prolonged stay.
- Measles (rubeola): 0.25 mL/kg IM if exposed less than 6 days previously; immunocompromised child exposed to measles: 0.5 mL/kg to a maximum of 15 mL IM given immediately.
- Varicella: 0.6–1.2 mL/kg IM given promptly if zoster immune globulin is unavailable.
- Rubella: 0.55 mL/kg IM given to those pregnant women who have been exposed to rubella and will not consider a therapeutic abortion may decrease likelihood of infection and fetal damage.
- Immunoglobulin deficiency: Initial dosage of 1.3 mL/kg IM, followed in 3–4 wk by 0.66 mL/kg IM every 3–4 wk; some patients may require more frequent injections.
- *Carimune NF*: 0.2 g/kg IV once a mo.
- *Octagam/Flebogamma*: 300–600 mg/kg IV every 3–4 wk.
- Patients with primary immune deficiency, idiopathic thrombocytopenic purpura, chronic inflammatory demyelinating polyneuropathy: 100–200 mg/kg subcutaneously every wk. Or, initially $1.37 \times$ previous IGIV dose (grams)/number of weeks between IGIV doses (*Gamunex-C*). Adjust dosage based on patient's response.

Nursing considerations

⊗ **Black box warning** Risk of renal dysfunction, renal failure, or death exists. Monitor patient accordingly.

- Do not administer to patients with history of allergy to gamma globulin or antiimmunoglobulin A antibodies.
- Use IM gamma globulin with caution in patients with thrombocytopenia or any coagulation disorder that would contraindicate IM injections. Use only if benefits outweigh risks.
- Use with caution in pregnant women. **Pregnancy Category C**—safety not established.
- Administer 2 wk before or 3 mo after immune globulin administration because antibodies in the globulin preparation may interfere with the immune response to the vaccination.

⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction, which is more likely with IV immune globulin, large IM doses, and repeated injections.

- Refrigerate drug; do not freeze. Discard partially used vials.
- Administer IM preparation by IM injection only; do not administer subcutaneously or intradermally.
- Check manufacturer's guidelines before using any immune globulin.
- Administer IV preparation with extreme caution.
- Do not mix immune globulin with any other medications.
- Monitor patient's vital signs continuously and observe for any symptoms during IV administration. Adverse effects appear to be related to the rate of infusion.
- Teach patient doing home subcutaneous injections for primary immune deficiency the proper administration technique and disposal of needles and syringes. Proper storage is based on brand being used.
- Provide comfort measures or teach patient to provide comfort measures—analgesics, antipyretics, warm soaks to injection site—to help patient to cope with the discomforts of drug therapy.
- Provide patient with written record of injection and dates for follow-up injections as needed.

influenza A (H1N1) 2009 monovalent vaccine

Therapeutic actions

Inactivated type A influenza (H1N1 variant) virus antigens that stimulate production of antibodies specific to the antigens used.

Indications

- Active immunization against influenza caused by pandemic (H1N1) 2009 virus for patients 6 mo and older.

Adverse effects

Injection site reactions (redness, warmth, swelling, bruising, pain), headache, diarrhea, rhinitis, fever, flulike syndrome.

Dosage

0.5 mL IM as a single injection. Dose varies by manufacturer; check prescribing information carefully.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
- Do not administer with antiviral medications or other immunizations or immune suppressants.
- Caution patient who has just received the vaccine to avoid people who are immune suppressed; the disease could be transmitted to them and they could become ill.
- Do not administer to patient with febrile illness or active, untreated tuberculosis.
- Do not administer to patients with known allergy to components of drug, eggs or chicken protein, neomycin, or polymyxin or to those who have had a life-threatening reaction to influenza vaccine.
- Do not administer to women who are pregnant unless the benefit clearly outweighs the risk.
- Administer by IM injection; inspect solution for particulate matter or discoloration.

⊗ **Warning** Have epinephrine 1:1000 immediately available at time of injection in case of anaphylactic reaction.

- Provide comfort measures (analgesics, rest, decongestants) to help patient cope with discomforts of the immunization.
- Provide patient with written record of immunization.

influenza A (H1N1) 2009 monovalent vaccine live, intranasal

Therapeutic actions

Live, attenuated type A influenza (H1N1 variant) virus antigens that stimulate production of antibodies specific to the antigens used.

Indications

- Active immunization of patients ages 2–49 yr against influenza caused by pandemic (H1N1) 2009 virus.

Adverse effects

Runny nose, nasal complications, fever, sore throat, decreased appetite, irritability, muscle aches, headache, lethargy.

Dosage

Children and adults 10–49 yr: 0.2 mL (0.1 mL in each nostril).

Children 2–9 yr: Two doses of 0.2 mL each (0.1 mL in each nostril) approximately 1 month apart.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
 - Do not administer with antiviral medications or other immunizations or immune suppressants.
 - Caution patient who has just received vaccine to avoid people who are immune suppressed; the disease could be transmitted to them and they could become ill.
 - Do not administer to patient with febrile illness or active, untreated tuberculosis,
 - Do not administer to patients with known allergy to components of drug, eggs or chicken protein, gentamicin, gelatin, or arginine or to those who have had a life-threatening reaction to influenza vaccine.
 - Do not administer to patients with asthma or to children younger than 5 yr with recurrent wheezing, which could be exacerbated by the vaccination.
 - Do not administer to women who are pregnant unless the benefit clearly outweighs the risk.
-  **Warning** Have epinephrine 1:1000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures (analgesics, rest, decongestants) to help patient cope with discomforts of the immunization.
 - Provide patient with written record of immunization. If patient is 2–9 yr, give parents a reminder to return for second dose.

influenza virus vaccine

Afluria, Fluarix, FluLaval, Fluvirin, Fluzone, Fluzone High Dose

Therapeutic actions

Inactivated influenza virus antigens stimulate an active immunity through the production of antibodies specific to the antigens used; the antigens used vary from yr to yr depending on

which influenza virus strains are anticipated to be prevalent. The 2010 version includes H1N1 (swine flu) strains.

Indications

- Prophylaxis for patients 6 mo and older, including those at high risk for developing complications from infection with influenza virus, including adults and children with chronic cardiovascular or pulmonary disorders, chronic metabolic disorders, renal impairment, anemia, immunosuppression, asthma; residents of long-term care facilities; medical personnel with extensive contact with high-risk patients, to prevent their transmitting the virus to these patients; children on long-term aspirin therapy who are at high risk of developing Reye's syndrome; people who provide essential community services (to decrease the risk of disruption of services).
- Active immunization against influenza caused by influenza virus types A and B in children 6 mo and older (*Fluzone*), children 4 yr and older (*Fluvirin*), children 3–17 yr and adults (*Fluarix*), adults 18 yr and older (*FluLaval*), adults 65 yr and older at high risk for complications (*Fluzone High Dose*).
- Priority active immunization in patients at high risk for influenza complications when dosages are limited.

Adverse effects

Tenderness, redness, and induration at the injection site; fever, malaise, myalgia; allergic responses—flare, wheal, respiratory symptoms; Guillain-Barré syndrome.

Dosage

- 6–35 mo: Split virus or purified surface antigen only—0.25 mL IM repeated in 4 wk.
- 3–8 yr: Split virus or purified surface antigen only—0.5 mL IM repeated in 4 wk.
- 9 yr and older: Split virus or purified surface antigen—0.5 mL IM.
- 18 yr and older (*Fluarix*): 0.5 mL IM using the prefilled syringe. Shake the syringe before use.
- 65 yr and older (*Fluzone High Dose*): 0.5 mL IM.

Nursing considerations

- Do not administer to patients with sensitivities to eggs, chicken, chicken feathers, or chicken dander. If an allergic condition is suspected, administer a scratch test or an intradermal injection (0.05–0.1 mL) of vaccine diluted 1:100 in sterile saline. A wheal greater than 5 mm justifies withholding immunization.
- Do not administer to patient with a hypersensitivity to any component of the vaccine or history of Guillain-Barré syndrome.
- Do not administer to infants and children at the same time as diphtheria, tetanus toxoid, and pertussis vaccine (DTP) or within 14 days after measles virus vaccine.
- Delay administration in the presence of acute respiratory disease or other active infection or acute febrile illness.
- Use caution in pregnant women. **Pregnancy Category C**—safety not established. Delay use until the second or third trimester to minimize concern over possible teratogenicity.
- Monitor patient for enhanced drug effects and possible toxicity of theophylline, warfarin sodium for as long as 3 wk after vaccine injection.
- Administer IM only. The deltoid muscle is preferred for adults and older children, the anterolateral aspect of the thigh for infants and younger children.
- Consider the possible need for amantadine for therapeutic use for patients in high-risk groups who develop illness compatible with influenza during a period of known influenza A activity in the community.

⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.

- Provide comfort measures or teach patient to provide comfort measures—analgesics, antipyretics, warm soaks to injection site—to help patient cope with effects of the drug.
- Provide patient with written record of vaccination and dates of second injection as appropriate.
- Do not use vaccine supplies remaining from previous years for current year vaccination.

influenza virus vaccine, H5N1

H5N1

Therapeutic actions

Contains inactivated type A influenza virus H5N1, which induces antibodies against this viral strain and blocks attachment of the virus to respiratory cells.

Indications

- Active immunization of persons 18–64 yr at increased risk of exposure to H5N1 influenza (avian flu) virus.

Adverse effects

Hypersensitivity reactions; injection site reactions, including warmth, redness, swelling, pain; headache; nausea; fever; symptoms of URI.

Dosage

- *Adults 18–64 yr:* 1 mL IM into deltoid muscle of upper arm, followed by 1 mL IM 21–35 days later.

Nursing considerations

- Virus is grown in chicken eggs; use caution in patients allergic to chickens.
- Use caution in pregnant women; vaccine is **Pregnancy Category C**. Use only if potential benefit outweighs risk to fetus.
- Do not mix in syringe with other vaccines or inject at same site as other vaccines.
- Provide comfort measures as needed, such as analgesics, antipyretics, and warm packs to injection site.
- Give patient a written record of the vaccination and a date to return for the second dose.

influenza virus vaccine, live, intranasal

FluMist

Therapeutic actions

Contains attenuated virus reassortants of the three most commonly encountered viruses each year, as determined by the US Public Health Service; administered intranasally, these antigens produce a protective immunity against these strains.

Indications

- Active immunization for prevention of disease caused by influenza A and B viruses in healthy children, adolescents, and adults 2–49 yr.

Adverse effects

Irritability, *headache*; vomiting; sore throat, *runny nose, cough*; fever, chills, muscle aches, decreased activity, tiredness.

Dosage

- 2–8 yr, *not previously vaccinated*: Two doses (0.2 mL each) intranasally, given as one spray (0.1 mL) per nostril, at least 1 month apart.
- 2–8 yr, *previously vaccinated*: One dose (0.2 mL) intranasally, given as one spray (0.1 mL) per each nostril.
- 9–49 yr: One dose (0.5 mL) intranasally each flu season.
- 5–8 yr *not previously vaccinated with FluMist*: Two doses (0.5 mL each), given 60 days apart \pm 14 days.
- 5–8 yr *previously vaccinated with FluMist*: One dose (0.5 mL) per flu season.

Nursing considerations

- Do not administer to anyone with immunodeficiency, immunosuppression, or malignancy.
- Do not administer with any antiviral drugs or with other immunizations.
- Do not administer to a patient with febrile illness.
- Do not administer with aspirin or aspirin-related products in children; these products could mask Reye's syndrome.
- Do not administer to women who are pregnant or nursing a baby. **Pregnancy Category C.**
- Administer this vaccine as one spray in the nostril.
- Provide comfort measures and teach patients to provide comfort measures to help the patient cope with the discomforts of the immunization (analgesics, rest, decongestants).
- Caution patients that they may be able to transmit influenza after they have received the vaccine; they should avoid close contact with any people who may be immunocompromised.
- Provide parents with written record of immunization and reminder that the vaccine is needed every year just before flu season.

measles (rubeola) virus vaccine, live, attenuated

Attenuvax

Therapeutic actions

Attenuated measles virus produces a modified measles infection and stimulates an active immune reaction with antibodies to the measles virus.

Indications

- Immunization against measles (rubeola) immediately after exposure to natural measles; more effective if given before exposure—children 15 mo and older (immunization with trivalent MMR vaccine is the preferred product for routine vaccinations).
- Revaccination for children immunized before age 12 mo or vaccinated with inactivated vaccine alone.
- Prophylaxis for high school or college age persons in epidemic situations or for adults in isolated communities where measles is not endemic.

Adverse effects

Moderate fever, rash; high temperature (less common); febrile convulsions, Guillain-Barré syndrome, ocular palsies (less common); burning or stinging wheal or flare at injection site.

Dosage

Inject the total volume of the reconstituted vaccine or 0.5 mL of multi-dose vial subcutaneously into the outer aspect of the upper arm; dose is the same for all patients.

Nursing considerations

- Do not administer to patients with a history of anaphylactic hypersensitivity to neomycin (contained in injection), to patients with immune deficiency conditions (immunosuppressive therapy with corticosteroids, antineoplastics; neoplasms; immunodeficiency states), to patients receiving immune serum globulin.
- Do not administer to pregnant women. **Pregnancy Category C**—advise patients to avoid pregnancy for 3 mo following vaccination. If measles exposure occurs during pregnancy, provide passive immunity with immune serum globulin.
- Use caution if administering to children with history of febrile convulsions, cerebral injury, or other conditions in which stress due to fever should be avoided.
- Use caution if administering to patient with a history of sensitivity to eggs, chicken, chicken feathers.
- Do not administer within 1 mo of immunization with other live virus vaccines; may be administered concurrently with monovalent or trivalent polio vaccine, rubella vaccine, mumps vaccine.
- Do not administer for at least 3 mo following blood or plasma transfusions or administration of serum immune globulin.
- Monitor for possible depression of tuberculin skin sensitivity; administer test before or simultaneously with vaccine.
- Administer with a sterile syringe free of preservatives, antiseptics, and detergents for each injection (these may inactivate the live virus vaccine). Use a 23-gauge, 5/8-inch needle.
- Refrigerate unconstituted vial; protect from exposure to light. Use only the diluent supplied with the vaccine and reconstitute just before using. Discard reconstituted vaccine if not used within 8 hr.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures or teach patient or parent to provide comfort measures to help patient to cope with the discomforts of drug therapy: analgesics, antipyretics, warm soaks to injection site.
- Provide patient or parent with a written record of immunization.

measles, mumps, rubella vaccine, live (MMR)

M-M-R II

Therapeutic actions

Attenuated measles, mumps, and rubella viruses produce a modified infection and stimulate an active immune reaction with antibodies to these viruses.

Indications

- Immunization against measles, mumps, rubella in children older than 15 mo and adults.

Adverse effects

Moderate fever, rash, burning or stinging wheal or flare at injection site, high temperature; less common: febrile convulsions, Guillain-Barré syndrome, ocular palsies.

Dosage

0.5 mL reconstituted vaccine subcutaneously into the outer aspect of the upper arm. Dose is the same for all patients. Booster dose is recommended on entry into school and again at entry into junior high school.

Nursing considerations

- Do not administer to patients with a history of anaphylactic hypersensitivity to neomycin (contained in injection), to patients with immune deficiency conditions (immunosuppressive therapy with corticosteroids, antineoplastics; neoplasms; immunodeficiency states), to patients receiving immune serum globulin.
- Do not administer to pregnant women. **Pregnancy Category C**—advise patients to avoid pregnancy for 3 mo following vaccination. If measles exposure occurs during pregnancy, provide passive immunity with immune serum globulin.
- Use caution if administering to children with history of febrile convulsions, cerebral injury, or other conditions in which stress due to fever should be avoided.
- Use caution if administering to patient with a history of sensitivity to eggs, chicken, chicken feathers.
- Do not administer within 1 mo of immunization with other live virus vaccines; may be administered concurrently with monovalent or trivalent polio vaccine, rubella vaccine, mumps vaccine.
- Do not administer for at least 3 mo following blood or plasma transfusions or administration of serum immune globulin.
- Monitor for possible depression of tuberculin skin sensitivity. Administer the test before or simultaneously with the vaccine.
- Administer with a sterile syringe free of preservatives, antiseptics, and detergents for each injection (these may inactivate the live virus vaccine). Use a 25-gauge, 5/8-inch needle.
- Refrigerate unconstituted vial. Protect from exposure to light. Use only the diluent supplied with the vaccine and reconstitute just before using. Discard reconstituted vaccine if not used within 8 hr.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures or teach patient or parent to provide comfort measures to help patient cope with the discomforts of drug therapy (analgesics, antipyretics, warm soaks to injection site).
- Provide patient or parent with a written record of immunization.
- Trivalent measles, mumps, and rubella vaccine is the vaccination of choice for routine vaccinations. Another combination—rubella and mumps vaccine (*Biavax II*)—is used for specific situations.

▷ measles, mumps, rubella, and varicella virus vaccine, live

ProQuad

Therapeutic actions

Attenuated measles, mumps, rubella, and varicella viruses produce a modified infection and stimulate an active immune reaction with antibodies to these viruses.

Indications

- Active immunization of children ages 12 mo–12 yr, for the prevention of measles, mumps, rubella, and varicella virus infections.

Adverse effects

Irritability; diarrhea, fever, chills, muscle aches, injection site reactions; less common—fever, convulsions, ocular palsies.

Dosage

0.5 mL by subcutaneous injection; allow 1 mo to elapse between the administration of any vaccine containing measles antigens and the administration of *ProQuad*; if a second varicella vaccine is needed, allow 3 mo between administration of the two doses.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
- Do not administer with any antiviral medications or with other immunizations or immune suppressants.
- Do not administer in the presence of febrile illness or with active, untreated TB.
- Do not administer to a patient with known allergy to any component of the drug, gelatin, or neomycin.
- Do not administer with aspirin or aspirin-related products in children. These products could mask the presence of Reye's syndrome; advise parents not to use aspirin for 6 wk following the vaccination.
- Do not administer to women who are pregnant or nursing. **Pregnancy Category C**—safety not established.
- Administer by subcutaneous injection only; inspect solution for particulate matter.
- Administer immediately after reconstituting with provided sterile water.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures or teach parents to provide comfort measures to help the patient cope with the discomforts of the immunization (analgesics, rest, decongestants).
- Provide parents with written record of immunization.

meningococcal vaccine

Menactra, Menomune A/C/Y/W-135, Menveo

Therapeutic actions

Capsular polysaccharides from *Neisseria meningitidis* serogroups A, C, Y, and W-135, which will induce production of bactericidal antibodies to these serogroups of bacteria to provide active immunization.

Indications

- Active immunization to prevent invasive meningococcal disease caused by *N. meningitidis* serogroups A, C, Y, and W-125; control of outbreaks of serogroup C disease (*Menomune*).

Adverse effects

Injection-site reactions (pain, redness, swelling), fever, chills, headache, malaise, fatigue, anorexia, Guillain-Barré syndrome.

Dosage

- *Menactra*: 2–55 yr: 0.5 mL IM in the deltoid region as one dose.
- *Menomune*: 2–55 yr: 0.5 mL IM; may give booster in 3–5 yr.
- *Menveo*: 11–55 yr: 0.5 mL IM as one dose.

Nursing considerations

- Do not administer to patient with immunodeficiency/suppression or malignancy.
- Do not administer with antivirals or other immunizations or immune suppressants.
- Do not administer if patient has febrile illness or active infection.

- Do not administer to patient with known allergy to components of drug or to latex.
- Do not administer to women who are pregnant unless the benefit clearly outweighs the risk.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures (analgesics, rest, decongestants) to help patient cope with discomforts of immunization.
- Provide patient with written record of immunization.

mumps virus vaccine, live

Mumpsvox

Therapeutic actions

Viral antigen stimulates active immunity through production of antibodies to the mumps virus.

Indications

- Immunization against mumps in children older than 12 mo and adults. (Trivalent measles, mumps, and rubella vaccine is the drug of choice for routine vaccinations.)

Adverse effects

Fever, parotitis, orchitis; purpura and allergic reactions such as wheal and flare at injection site; febrile seizures, unilateral nerve deafness, encephalitis—rare; anaphylactic reactions.

Dosage

Inject total volume (0.5 mL) of reconstituted vaccine subcutaneously into the outer aspect of the upper arm; each dose contains not less than 20,000 TCID₅₀ (Tissue Culture Infectious Doses) of mumps virus vaccine. (Vaccine is available only in single-dose vials of diluent.)

Nursing considerations

⊗ **Black box warning** Be aware that the trivalent measles, mumps, and rubella vaccine is preferred.

- Do not administer to patients with history of hypersensitivity to neomycin (each single-dose vial of vaccine contains 25 mcg neomycin); immune deficiency conditions. **Pregnancy Category C**—advise patient to avoid pregnancy for 3 mo after vaccination.
- Use caution if administering to a patient with history of allergy to eggs, chicken, or chicken feathers.
- Delay administration in the presence of active infection.
- Do not administer within 1 mo of immunization with other live virus vaccines, but it may be administered concurrently with live monovalent or trivalent polio vaccine, live rubella vaccine, live measles vaccine.
- Do not administer for at least 3 mo following blood or plasma transfusions or administration of serum immune globulin.
- Monitor for possible depression of tuberculin skin sensitivity; administer test before or simultaneously with the vaccine.
- Administer with a sterile syringe free of preservatives, antiseptics, and detergents for each injection (these may inactivate the live virus vaccine). Use a 25-gauge, 5/8-inch needle.
- Refrigerate unconstituted vial. Protect from exposure to light.
- Use only the diluent supplied with the vaccine and reconstitute just before using. Discard reconstituted vaccine if not used within 8 hr.

⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.

- Provide comfort measures or teach patient or parent to provide comfort measures to help patient cope with the discomforts of drug therapy (analgesics, antipyretics, warm soaks to injection site).
- Provide patient or parent with a written record of vaccination.

pneumococcal vaccine, polyvalent

Pneumovax 23

Therapeutic actions

Polysaccharide capsules of the 23 most prevalent or invasive pneumococcal types stimulate active immunity through antipneumococcal antibody production against the capsule types contained in the vaccine.

Indications

- Immunization against pneumococcal pneumonia and bacteremia caused by the types of pneumococci included in the vaccine, specifically in children older than 2 yr and adults with chronic illnesses or who are immunocompromised and at increased risk for pneumococcal infections.
- Prophylaxis in children 2 yr and older with asymptomatic or symptomatic HIV infections.
- Prophylaxis in community groups at high risk for pneumococcal infections—institutionalized persons, groups in an area of outbreak, patients at high risk of influenza complications, including pneumococcal infection.

Adverse effects

Erythema, induration, soreness at injection site; fever, myalgia; acute febrile reactions, rash, arthralgia (less common); paresthesias, acute radiculoneuropathy (rare); anaphylactic reaction.

Dosage

One 0.5-mL dose subcutaneously or IM. Not recommended for children younger than 2 yr.

Nursing considerations

- Do not administer to patients with hypersensitivity to any component of the vaccine or with previous immunization with any polyvalent pneumococcal vaccine.
- Do not administer less than 10 days before or during treatment for Hodgkin's lymphoma.
- Use caution if administering to patients who are nursing or pregnant. **Pregnancy Category C**—safety not established.
- Use caution if administering to patients with cardiac, pulmonary disorders; systemic reaction could pose a significant risk.
- May be administered concomitantly with influenza virus vaccine by separate injection in the other arm.
- Administer subcutaneously or IM only, preferably in the deltoid muscle or lateral mid-thigh; do not give IV.
- Refrigerate vials. Use directly as supplied; do not dilute (reconstitution is not necessary).
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide or teach patient to provide appropriate comfort measures—analgesics, antipyretics, warm soaks to injection site—to help patient to cope with effects of the drug therapy.
- Provide patient with written record of immunization and caution patient not to have another polyvalent pneumococcal vaccine injection.

pneumococcal 13-valent conjugate vaccine (diphtheria CRM₁₉₇ protein)

Pprevnar-13

Therapeutic actions

Stimulates active immunity against disease caused by *Streptococcus pneumoniae* by introduction of seven capsular serotypes.

Indications

- Prevention of invasive *S. pneumoniae* disease in infants and toddlers; for use in all children younger than 23 mo. For high-risk populations age 24–59 mo, including children with sickle cell anemia, HIV, functional or anatomic asplenia, other immunocompromised conditions, and Native Americans and Alaskan natives.
- Active immunization of infants and toddlers against otitis media caused by vaccine serotypes.
- Prevention of otitis media caused by resistant strains.

Adverse effects

Fretfulness; drowsiness; anorexia; vomiting; transient fever; malaise; generalized aches and pains; edema of injection area with redness, swelling, induration, pain (may persist for a few days); hypersensitivity reactions.

Dosage

0.5 mg IM, preferably injected in the anterolateral aspect of the thigh in infants and the deltoid muscle of the upper arm in older children.

- 7–11 mo: Three doses with two doses at least 4 wk apart and last dose at older than 1 yr of age.
- 12–23 mo: Two doses spaced at least 2 mo apart.
- 24 mo–9 yr: One dose.

Nursing considerations

- Defer administration of routine immunizing or booster doses in case of acute infection or febrile illness.
- Not for treatment of acute pneumococcal infections.
- Shake vigorously before use. Do not use if a uniform suspension is not attained.
- Administer by IM injection only; avoid subcutaneous or IV injection. Do not inject vaccine in gluteal area.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection because of risk of hypersensitivity reactions.
- Provide comfort measures to help patient cope with the discomforts of the injection (analgesics, warm soaks for injection site, small meals, environmental control of temperature and stimuli).
- Provide parent with written record of immunization and reminder of when additional injections are needed.

poliovirus vaccine, inactivated (IPV, Salk)

IPOL

Therapeutic actions

Inactivated, attenuated sterile suspension of three types of poliovirus used to produce antibody response against poliomyelitis infection.

Indications

- Prevention of poliomyelitis caused by poliovirus types 1, 2, and 3 as routine immunization of infants and children.

Adverse effects

Local reaction at site of injection within 48 hr.

Dosage

- *Children*: 0.5 mL subcutaneously at 2 mo, 4 mo, and 6–18 mo. A booster dose is needed at time of entry into elementary school.
- *Adults*: Not usually needed in adults in the United States; if unimmunized adult is exposed, is traveling to a high-risk area, or is a household contact of children receiving IPV (inactivated poliovirus vaccine; Salk vaccine) immunization is recommended. 0.5 mL subcutaneously; two doses given at 1- to 2-mo intervals and a third dose given 6–12 mo later. Previously vaccinated adults at risk for exposure should receive a 0.5-mL dose of this drug.

Nursing considerations

- Do not administer to patients with known hypersensitivity to streptomycin or neomycin (each dose contains less than 25 mcg of each).
- Defer administration in the presence of persistent vomiting or diarrhea and in patients with acute illness or any advanced debilitating condition.
- Do not administer to any patient with immune deficiency conditions; do not administer shortly after immune serum globulin (ISG) unless necessary because of travel or exposure; if given with or shortly after ISG dose should be repeated after 3 mo.
- Use caution if administering to pregnant patients. **Pregnancy Category C**—safety not established; use only if clearly needed and benefits outweigh potential unknown effects on the fetus.
- Refrigerate vaccine. Do not freeze.
- Provide patient or parent with a written record of the vaccination and information on when additional doses are needed.

▷ Rh₀ (D) immune globulin

HyperRHO S/D Full Dose, RhoGAM, Ultra-Filtered Plus

Rh₀ (D) immune globulin micro-dose

HyperRHO S/D Minidose, MICRhoGAM, Ultra-Filtered Plus

Rh₀ (D) immune globulin IV (human) (Rh₀ D IGIV)

Rhophylac, WinRho SDF

Therapeutic actions

Suppresses the immune response of nonsensitized Rh₀-negative individuals who receive Rh₀-positive blood as the result of a fetomaternal hemorrhage or a transfusion accident; each vial of Rh₀-immune globulin completely suppresses immunity to 15 mL of Rh-positive packed RBCs (about 30 mL whole blood); each vial of Rh₀ immune globulin micro-dose suppresses immunity to 2.5 mL Rh-positive packed RBCs.

Indications

- Prevention of sensitization to the Rh₀ factor.
- To prevent hemolytic disease of the newborn (erythroblastosis fetalis) in a subsequent pregnancy—mother must be Rh₀ negative; mother must not be previously sensitized to Rh₀

factor; infant must be Rh₀ positive and direct antiglobulin negative—used at full-term delivery, for incomplete pregnancy, for antepartum prophylaxis in case of abortion or ectopic pregnancy.

- To prevent Rh₀ sensitization in Rh₀-negative patients accidentally transfused with Rh₀-positive blood.
- To raise platelet count in Rh₀-positive adults with intact spleen and immune thrombocytopenic purpura (ITP).

Adverse effects

Pain and soreness at injection site.

Dosage

- *Postpartum prophylaxis*: One vial IM or IV (*WinRho SDF*) within 72 hr of delivery.
- *Antepartum prophylaxis*: One vial IM or IV (*WinRho SDF*) at 28 wk gestation and one vial within 72 hr after an Rh-incompatible delivery to prevent Rh isoimmunization during pregnancy.
- *Following amniocentesis, miscarriage, abortion, ectopic pregnancy at or beyond 13 wk gestation*: One vial IM or IV.
- *Transfusion accidents*: Multiply the volume in mL of Rh-positive whole blood administered by the Hct of the donor unit and divide this volume (in mL) by 15 to obtain the number of vials to be administered. If results of calculation are a fraction, administer the next whole number of vials.
- *ITP*: 250 international units/kg IV at 2 mL/15–60 sec.
- *Spontaneous abortion, induced abortion, or termination of ectopic pregnancy up to and including 12 wk gestation (unless the father is Rh negative)*: One vial micro-dose IM given as soon as possible after termination of pregnancy.

Nursing considerations

⊗ **Black box warning** There is risk of intravascular hemolysis and death when drug is used for ITP (*WinRho*). Monitor dipstick urinalysis at baseline, then at 2, 4, and 8 hr; ask patient to report back pain, chills, or discolored urine.

- Rh₀ globulin is not needed in Rh₀-negative mothers if the father can be determined to be Rh₀ negative.
- Do not administer to the Rh₀-positive postpartum infant, to an Rh₀-positive individual, to an Rh₀-negative individual previously sensitized to the Rh₀ antigen (if it is not known whether a woman is Rh₀ sensitized, administer the Rh₀ globulin).
- Before administration, determine the infant's blood type and arrange for a direct antiglobulin test using umbilical cord, venous, or capillary blood; confirm that the mother is Rh₀ negative.

⊗ **Warning** Do not administer *HyperRHO S/D*, *RhoGam* IV; administer IM within 72 hr after Rh₀-incompatible delivery, miscarriage, abortion, or transfusion.

- For IM use, prepare one vial dose by withdrawing entire contents of vial; inject entire contents.
- For IM use, prepare two or more vial doses using 5- to 10-mL syringes. Withdraw contents from the vials to be administered at one time and inject. Contents of the total number of vials may be injected as a divided dose at different injection sites at the same time, or the total dosage may be divided and injected at intervals, as long as the total dose is administered within 72 hr postpartum or after a transfusion accident.
- Refrigerate vials; do not freeze.
- Provide appropriate comfort measures if injection sites are painful.
- Reassure patient and explain what has been given and why; the patient needs to know what was given in the event of future pregnancies.

rotavirus vaccine, live, oral pentavalent

Rotarix, RotaTeq

Therapeutic actions

Live, reassortant rotaviruses that replicate in the small intestine and stimulate an active immunity to prevent rotavirus gastroenteritis.

Indications

- Prevention of rotavirus gastroenteritis in infants and children.

Adverse effects

Irritability; diarrhea, vomiting, fever, pneumonia, gastroenteritis, UTI.

Dosage

- Three ready-to-use liquid pouch doses (2 mL each) PO starting at age 6–12 wk, with subsequent doses at 4–10 wk intervals (third dose should not be given after age 32 wk) (*RotaTeq*).
- Two doses of 1 mL each PO beginning at age 6 wk. Allow 4 wk before the second dose. Series must be completed by age 24 wk (*Rotarix*).

Nursing considerations

- Do not administer to anyone with immunodeficiency, immunosuppression, or malignancy.
- Do not administer in the presence of febrile illness.
- Do not administer to a patient with a known allergy to any component of the drug.
- Do not administer to women who are pregnant or nursing. **Pregnancy Category C.**
- Do not have close contact with people with malignancies or who are immune compromised; live virus may shed.
- Provide comfort measures or teach parents to provide comfort measures to help patient cope with discomforts of immunization. Provide analgesics, fluids, and limited diet.
- Provide parents with written record of immunization.

rubella virus vaccine, live

Meruvax II

Therapeutic actions

Live virus stimulates active immunity through development of antibodies against the rubella virus.

Indications

- Immunization against rubella—children 12 mo of age to puberty, adolescent and adult males, nonpregnant adolescent and adult females, rubella-susceptible women in the postpartum period, leukemia patients in remission whose chemotherapy has been terminated for at least 3 mo, susceptible persons traveling abroad.
- Revaccination of children vaccinated at younger than 12 mo.

Adverse effects

Burning, stinging at injection site; regional lymphadenopathy, urticaria, rash, malaise, sore throat, fever, headache, polyneuritis—symptoms similar to natural rubella; arthritis, arthralgia—often 2–4 wk after receiving the vaccine.

Dosage

Inject total volume of reconstituted vaccine subcutaneously into the outer aspect of the upper arm; each dose contains not less than 1,000 TCID₅₀ (Tissue Culture Infectious Doses) of rubella.

Nursing considerations

⊗ **Black box warning** Be aware that the measles, mumps, and rubella vaccine is preferred for immunization.

- Do not administer to patients with a history of anaphylactic hypersensitivity to neomycin (each dose contains 25 mcg neomycin), to patients with immune deficiency conditions, to patients receiving immune serum globulin or blood transfusions.
- Do not administer to pregnant women. **Pregnancy Category C**—advise patients to avoid pregnancy for 3 mo following vaccination.
- Defer administration in the presence of acute respiratory or other active infections; susceptible children with mild illnesses may be vaccinated.
- Do not administer within 1 mo of immunization with other live virus vaccines, except that rubella vaccine may be administered concurrently with live monovalent or trivalent polio vaccine, live measles virus vaccine, live mumps vaccine.
- Do not administer for at least 3 mo following blood or plasma transfusions or administration of serum immune globulin.
- Monitor for possible depression of tuberculin skin sensitivity; administer the test before or simultaneously with the vaccine.
- Refrigerate vials and protect from light. Reconstitute using only the diluent supplied with the vial; use as soon as possible after reconstitution; discard reconstituted vaccine if not used within 8 hr.
- Provide or instruct patient to provide appropriate comfort measures to help patient cope with the adverse effects of the drug—analgesics, antipyretics, fluids, rest.
- Provide patient or parent with a written record of immunization; advise that revaccination is not necessary.

smallpox vaccine

Therapeutic actions

A live-virus preparation of vaccinia virus prepared from calf lymph, which stimulates immunity and cellular hypersensitivity to the smallpox virus.

Indications

- Active immunization against smallpox disease.

Adverse effects

Fever, regional lymphadenopathy, malaise; generalized rashes (erythematous, urticarial non-specific) spread of inoculation to sites other than site administered; rarely: Stevens-Johnson syndrome or other severe reactions including encephalitis, encephalopathy, progressive vaccinia, eczema vaccinatum with severe disability or death.

Dosage

- Primary vaccination: Using the vaccinating needle, two or three punctures into a prepared, dried area on the upper deltoid muscle or the posterior aspect of the arm over the triceps muscle onto which a drop of the live vaccine has been placed. Inspect the site for reaction after 6–8 days; if a major reaction has occurred, the site will scab over and heal, leaving a scar. If a mild or equivocal reaction has occurred, review the vaccination technique and repeat the process using 15 punctures into the area where a drop of vaccine has been placed.

Nursing considerations

- Follow the procedure for reconstitution of the vaccine precisely. Date vial and store only up to 15 days.
- Using strict sterile technique and wearing protective gloves, follow guidelines for use of the vaccine: clean and dry area, place one drop of vaccine on the area, and use the supplied bifurcated needle to puncture the skin enough to see blood appear.
- Dispose of the needles and vaccine appropriately.
- Do not administer if the patient has a febrile illness.
- Do not administer by IM, subcutaneous, or IV routes.
- Do not administer to anyone with allergies to any component of the vaccine, including polymyxin B sulfate, dihydrostreptomycin, chlortetracycline, or neomycin.
- Do not administer to anyone with eczema or with a past history of eczema or those with household contact with people who have eczema or exfoliative skin conditions.
- Do not administer to anyone taking systemic corticosteroids or immunosuppressive drugs or who is immunocompromised.
- Do not administer to anyone who is pregnant or to household contacts of anyone who is pregnant. **Pregnancy Category C.**
- Provide comfort measures and teach parents to provide comfort measures to help the patient cope with the discomforts of the injection: analgesics, small meals, environmental control (of temperature and stimuli).
- Leave the vaccination area uncovered, or cover the area with a loose bandage until the scab has fallen off and the area is healing. Do not use salves or lotions on the site. Caution the patient not to touch or scratch the area. Strict handwashing technique is advised after changing the dressing or touching the area. Bandages should be disposed of properly to avoid contact with other areas or other people.
- Arrange for the patient to have the site inspected 6–8 days after the inoculation. If a major reaction does not occur, the patient should be revaccinated.
- Provide parents with written record of immunization and reminder of when booster injection is needed.

typhoid vaccine

Typhim Vi, Typhoid Vaccine HP, Vivotif Berna

Therapeutic actions

Contains live attenuated strains of typhoid bacteria; produces a humoral antibody response against the causative agent of typhoid fever. Precise mechanism of action is not understood.

Indications

- Active immunization against typhoid fever (*Typhim Vi*, *Vivotif Berna*).
- Immunization of adults and children against disease caused by *Salmonella typhi* (routine immunization is not recommended in the United States but is recommended for travelers, workers in microbiology fields, or those who may come into household contact with typhoid fever).

Adverse effects

Transient fever; edema of injection area with redness, swelling, induration, pain (may persist for a few days); headache, malaise.

Dosage

- Parenteral (HP). *Older than 10 yr*: 2 doses of 0.5 mL subcutaneously at intervals of 4 wk or longer. *10 yr or younger*: Two doses of 0.25 mL subcutaneously at 4-wk or longer intervals.

- Booster dose (given every 3 yr in cases of continued exposure). *Older than 10 yr*: 0.5 mL subcutaneously or 0.1 mL intradermally. *6 mo–10 yr*: 0.25 mL subcutaneously or 0.1 mL intradermally.
- Parenteral (*Typhim Vi*). *Children 2 yr and older*: 0.5 mL IM; booster dose every 2 yr: 0.5 mL IM.
- Oral (*Vivotif Berna*). *Patients older than 6 yr*: One capsule on days 1, 3, 5, and 7 taken 1 hr before a meal with a cold or lukewarm drink. There are no data on the need for a booster dose at this time; 4 capsules on alternating days—once every 5 yr is suggested.
- Complete vaccine regimen 1–2 wk before potential exposure.

Nursing considerations

- Use caution with pregnancy. **Pregnancy Category C**—safety not established.
- Defer administration in case of acute infection, GI illness, nausea, vomiting.
- Have patient swallow capsules whole; do not chew. All four doses must be taken to ensure antibody response.
- Administer *Typhim Vi* parenteral doses by IM injection; deltoid muscle is the preferred site. *Typhoid Vaccine HP* is administered subcutaneously. Booster doses may be given intradermally.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection because of risk of hypersensitivity reactions.
- Provide comfort measures to help patient cope with the discomforts of the injection (analgesics, warm soaks for injection site, small meals, environmental control of temperature and stimuli).
- Provide patient with written record of immunization and information on booster immunization if appropriate.
- Vaccines must be kept refrigerated. Do not freeze injectable products.

varicella virus vaccine, live

Varivax

Therapeutic actions

Contains live attenuated varicella virus obtained from human or guinea pig cell cultures. Varicella virus causes chickenpox in children and adults. Vaccine produces an active immunity to the virus; longevity of immunity is not known.

Indications

- Active immunization of adults and children 12 mo or older against chickenpox (varicella).

Adverse effects

Transient fever; edema of injection area with redness, swelling, induration, pain (may persist for a few days); upper respiratory illness, cough, rash.

Dosage

- *Adult and patients 13 yr and older*: 0.5 mL subcutaneously in the deltoid area followed by 0.5 mL 4–8 wk later.
- *Children 1–12 yr*: Single 0.5-mL dose subcutaneously.

Nursing considerations

- Use caution with allergy to neomycin or gelatin; use caution in pregnancy. **Pregnancy Category C**—safety not established.
- Defer administration in case of acute infection and for at least 5 mo after plasma transfusion or receipt of immune globulin, other immunizations.

- Do not administer salicylates for up to 6 wk after immunization; cases of Reye's syndrome have been reported.
- Use reconstituted vaccine within 30 min. Only use diluent supplied.
- Administer by subcutaneous injection. Outer aspect of upper arm is preferred site.
- ⊗ **Warning** Arrange for epinephrine 1:1,000 to be immediately available at time of injection because of risk of hypersensitivity reactions.
- Provide comfort measures to help patient cope with the discomforts of the injection (analgesics, warm soaks for injection site, small meals, environmental control of temperature and stimuli).
- Provide patient with written record of immunization. It is not known whether booster immunization will be needed.

zoster vaccine, live

Zostavax

Therapeutic actions

Attenuated, live varicella-zoster virus causes a boost in the varicella-zoster virus immunity in older individuals; stimulating production of their own varicella-zoster virus antibodies. Herpes zoster, which causes shingles, is a reactivation of the varicella-zoster virus that causes chickenpox.

Indications

Prevention of herpes zoster (shingles) in patients older than 60 yr.

Adverse effects

Injection site reactions (redness, warmth, swelling, bruising, pain), headache, diarrhea, rhinitis, fever, flulike symptoms.

Dosage

One injection of the single-dose vaccine by subcutaneous injection in the upper arm. Vaccine should be frozen and reconstituted, using the supplied diluent, immediately after removal from the freezer; administer immediately after reconstituting.

Nursing considerations

- Do not administer to anyone with immunodeficiency/suppression or malignancy.
- Do not administer with any antiviral medications or with other immunizations or immune suppressants.
- Caution patient to avoid people who are immune suppressed after they receive the vaccine; the disease could be transmitted to them and they could become ill.
- Do not administer in the presence of febrile illness or with active, untreated tuberculosis.
- Do not administer to a patient with known allergy to any component of the drug, gelatin, or neomycin.
- Do not administer to women who are pregnant; recommend use of contraceptive measures at time of vaccination and for 3 mo after the injection. **Pregnancy Category C**—safety not established.
- Administer by subcutaneous injection only; inspect solution for particulate matter.
- Administer immediately after reconstituting with provided diluent.
- ⊗ **Warning** Have epinephrine 1:1,000 immediately available at time of injection in case of anaphylactic reaction.
- Provide comfort measures to help the patient cope with the discomforts of the immunization—analgesics, rest, decongestants.
- Provide patient with written record of immunization.

Other biologicals

Name	Indications	Instructions
Immune globulins		
anti-thymocyte globulin (<i>Thymo-globulin</i>)	Treatment of renal transplant acute rejection in conjunction with immunosuppression.	1.5 mg/kg/day for 7–14 days as 6-hr IV infusion for first dose and at least 4 hr each subsequent dose. Store in refrigerator and use within 4 hr of reconstitution.
botulism immune globulin (<i>BabyBIG</i>)	Treatment of patients younger than 1 yr with infant botulism caused by toxin A or B.	1 mL/kg as a single IV infusion as soon as diagnosis has been made.
cytomegalovirus immune globulin IV (CMV-IGIV) (<i>Cyto-Gam</i>)	Attenuation of primary CMV disease following renal, lung, liver, pancreas, and heart transplant.	15 mg/kg IV over 30 min, increase to 30 mg/kg IV for 30 min, then 60 mg/kg IV to a maximum of 150 mg/kg. Infuse at 72 hr, 2 wk, and then 4, 6, 8, 12, and 16 wk. Monitor for allergic reactions. Use within 6 hr of entering vial. Administer through an IV line with an in-line filter (15 micron).
lymphocyte, immune globulin (<i>Atgam</i>)	Management of allograft rejection in renal transplants; treatment of aplastic anemia.	10–30 mg/kg/day IV adult transplant; 5–25 mg/kg/day IV pediatric transplant, 10–20 mg/kg/day IV for 8–14 days for aplastic anemia. Stable for up to 12 hr after reconstitution. Administer a skin test prior to administration of first dose.
rabies immune globulin (<i>HyperRab SD, Imogam Rabies-HT</i>)	Passive protection against rabies in nonimmunized patients with exposure to rabies.	20 international units/kg IM as single dose at same time as rabies vaccine. Infuse wound area if possible. Never give in same site as vaccine. Refrigerate vial.
tetanus immune globulin (<i>BayTet</i>)	Passive immunization against tetanus, useful at time of injury.	250 units IM. Do not give IV. Arrange proper medical care of wound.
vaccina immune globulin IV (<i>VIGIV</i>)	Treatment or modification of vaccinia infections.	2 mL/kg (100 mg/kg) IV.
Antitoxins and antivenins		
antivenin (crotalidae) polyvalent	Neutralize the venom of pit vipers, including rattlesnakes, copperheads.	20–40 mL IV; up to 100–150 mL IV in severe cases. Removal of venom should be done at once; antivenin to rare breeds of snake may be available from the CDC.
antivenin (micrurus fulvius)	Neutralize the venom of coral snakes in the United States.	30–50 mL by slow IV injection. Give first 1 to 2 mL over 3–5 min and observe for allergic reaction. Flush with IV fluids after antivenin has been infused. May require up to 100 mL.

(continued)

Name	Indications	Instructions
Antitoxins and antivenins (continued)		
Black Widow spider species antivenin (<i>Antivenin Latrodectus mactans</i>)	Treatment of symptoms of Black Widow spider bites.	2.5 mL IM; may be given IV in 10–50 mL saline over 15 min. Ensure supportive therapy and use of muscle relaxants.
crotalidae polyvalent immune fab (ovine) (<i>CroFab</i>)	Treatment of rattlesnake bites.	4–6 vials IV; may be repeated based on patient response. Dilute each vial with 10 mL sterile water, then with 250 mL 0.9% sodium chloride. Give each 250 mL over 60 min. Contains specific antibody fragments that bind to four different rattlesnake toxins. Removal of venom should be done at once. Monitor patient carefully for hypersensitivity reaction. Most effective if given within first 6 hr after snake bite.
Bacterial vaccines		
BCG (<i>TICE BCG</i>)	Exposure to TB of skin test—negative infants and children; treatment of groups with high rates of TB; travel to areas with high rates of endemic TB.	0.2–0.3 mL percutaneous using a sterile multipuncture disc. Refrigerate, protect from light; keep the vaccination site clean until reaction disappears.
Viral vaccines		
Japanese encephalitis vaccine (<i>JE-VAX</i>)	Active immunization in persons older than 1 yr who will reside or travel in areas where it is endemic or epidemic.	3 subcutaneous doses of 1 mL given at days 0, 7, and 30; children 1–3 yr: three subcutaneous doses of 0.5 mL. Refrigerate vial. Do not remove rubber stopper. Do not travel within 10 days of vaccination.
Japanese encephalitis vaccine, inactivated, adsorbed (<i>Ixiaro</i>)	Active immunization for prevention of disease caused by Japanese encephalitis virus (JEV) in patients 17 yr and older	2 doses of 0.5 mL each IM, given 28 days apart. Series should be completed at least 1 week before exposure to JEV. Contains protamine sulfate; not for use in pregnant or nursing women.
rabies vaccine (<i>Imovax Rabies, RabAvert</i>)	Preexposure rabies immunization for patients in high-risk area; postexposure antirabies regimen in conjunction with rabies immunoglobulin.	Preexposure: 1 mL IM on days 0, 7, and 21 or 28. Postexposure: 1 mL IM on days 0, 3, 7, 14, and 28. Refrigerate. If titers are low, booster may be needed.
yellow fever vaccine (<i>YF-Vax</i>)	Immunization of travelers to endemic areas.	0.5 mL subcutaneously. Booster dose suggested every 10 yr. Use cautiously with allergy to chicken or egg products.

Less commonly used drugs

abatacept

Orencia

Drug class and indications

Immune modulator, antiarthritic

Reduction of the signs and symptoms, including major clinical response, slowing the progression of structural damage, and improving physical function in adult patients with moderately to severely active rheumatoid arthritis who have had an inadequate response to one or more disease-modifying antirheumatic drugs, as monotherapy or in combination with other drugs other than tumor necrosis factor (TNF) antagonists.

Reduction of signs and symptoms of moderately active polyarticular juvenile idiopathic arthritis in children 6 yr and older as monotherapy or in combination with methotrexate.

Dosages and special alerts

Adults: Less than 60 kg: 500 mg IV over 30 min, repeated at 2 and 4 wk, then every 4 wk. 60–100 kg: 750 mg IV over 30 min, repeated at 2 and 4 wk, then every 4 wk. More than 100 kg: 1 g IV over 30 min, repeated at 2 and 4 wk, then every 4 wk. Pediatric patients: Less than 75 kg: 10 mg/kg IV over 30 min repeated at 2 and 4 wk, then every 4 wk. Maximum dose: 1,000 mg. 75–100 kg: 750 mg IV over 30 min, repeated at 2 and 4 wk, then every 4 wk. More than 100 kg: 1,000 mg IV over 30 min, repeated at 2 and 4 wk, then every 4 wk. Risk of serious infection with TNF antagonists; do not give with live vaccines.

acitretin

Soriatane

Drug class and indications

Antipsoriatic agent; retinoic acid
Treatment of severe psoriasis.

Dosages and special alerts

25–50 mg/day PO with the main meal. Numerous adverse effects. Stop drug when lesions resolve. Do not crush capsules. Do not allow patient to donate blood. Monitor vision periodically; protect patient from sun exposure. ☒ **Black box warning** Pregnancy category X; do not give to pregnant women.

adalimumab

Humira

Drug class and indications

Antiarthritic, monoclonal antibody

Reduction of the signs and symptoms of and inhibition of the progression of structural damage in adults with moderately to severely active rheumatoid arthritis and in children 4 yr and older with moderately to severely active polyarticular rheumatoid arthritis.

Reduction of the signs and symptoms of active arthritis in patients with psoriatic arthritis.

Reduction of the signs and symptoms of active ankylosing spondylitis.

■ **NEW INDICATION:** Reduction of signs and symptoms of Crohn's disease in adults.

■ **NEW INDICATION:** Treatment of moderate to severe plaque psoriasis when other therapies are ineffective.

Dosages and special alerts

Adults: Maintenance therapy—40 mg subcutaneously every other wk, may be increased to 40 mg subcutaneously every wk in patients not on methotrexate. Pediatric patients ages 4–17 yr: Weighing 15 to less than 30 kg: 20 mg subcutaneously every other wk. Weighing 30 kg or more: 40 mg subcutaneously every other wk. Use cautiously with immunosuppressants; severe infection can occur. Avoid use in pregnancy. Monitor for CNS effects, demyelinating disease has been reported. ☒ **Black box warning** High risk of infection.

adenosine

Adenocard, Adenoscan

Drug class and indications

Antiarrhythmic, diagnostic agent

Conversion to sinus rhythm of paroxysmal supraventricular tachycardias (*Adenocard*); with thallium, assessment of patients with suspected CAD (*Adenoscan*).

Dosages and special alerts

Conversion of arrhythmias in patients weighing more than 50 kg: 6 mg by rapid IV bolus; for repeat dose, use 12 mg by IV bolus within 1–2 min. May be repeated a second time. *Patients weighing less than 50 kg:* 0.05–0.1 mg/kg as rapid IV bolus, may give another bolus in 1–2 min, increased by 0.05–0.1 mg/kg. Maximum single dose, 0.3 mg/kg. *Cardiac assessment:* 140 mcg/kg/min IV, infused over 6 min. Inject thallium at 3 min. Maintain emergency equipment on standby, and monitor continually. Have methylxanthines available as antidote.

agalsidase beta

Fabrazyme

Drug class and indications

Enzyme

Treatment of Fabry's disease.

Dosages and special alerts

1 mg/kg body weight IV every 2 wk; infused at a rate of no more than 0.25 mg/min. Infusion reactions are common; antipyretics and corticosteroids are given before the infusion; fever and chills may occur later. Continue regular regimen for treatment of Fabry's disease.

DANGEROUS DRUG**aldesleukin**

Proleukin

Drug class and indications

Antineoplastic

Metastatic renal cell carcinoma in adults. Treatment of adult metastatic melanoma.

Dosages and special alerts

600,000 international units/kg IV every 8 hr, given over 15 min as two 50-day cycles; total of 14 doses, followed by 9 days of rest, then 14 more doses; can be retreated after 7 wk if tumor shrinkage occurs. Monitor for capillary leak syndrome with third spacing of fluids and hypotension; GI bleeding has been reported.

alefacept

Amevive

Drug class and indications

Immunosuppressant

Treatment of adults with moderate to severe chronic plaque psoriasis who are candidates for systemic therapy or phototherapy.

Dosages and special alerts

7.5 mg as an IV bolus once a wk or 15 mg IM given once a wk; recommended course is 12 weekly injections. An additional 12-wk course may be initiated if CD4+ T lymphocytes are within normal range and 12 wk have passed since first course. Patient has increased risk of infection; monitor closely.

DANGEROUS DRUG**alemtuzumab**

Campath

Drug class and indications

Monoclonal antibody, antineoplastic

Treatment of B cell chronic lymphocytic leukemia in patients treated with alkylating agents who have failed fludarabine therapy.

Dosages and special alerts

3 mg/day as a 2-hr IV infusion, increase up to 30 mg/day as a 2-hr infusion three times weekly, every other day for 12 wk. Premedicate with diphenhydramine and acetaminophen. Ensure that the patient is well hydrated.

⊗ **Black box warning** Monitor patient for bone marrow suppression, infusion reactions. Prophylactic antibiotic and antiviral therapy may be used to prevent serious infections.

alglucosidase alfa

Lumizyme, Myozyme

Drug class and indications

Enzyme, Pompe's disease drug

To improve ventilator-free survival in patients with infantile-onset Pompe's disease (*Myozyme*).

- **NEW INDICATION:** Treatment of patients 8 yr and older with late-onset Pompe's disease without cardiac hypertrophy (*Lumizyme*).

Dosages and special alerts

20 mg/kg by IV infusion administered over 4 hr, every 2 wk. Because of a high risk of infusion reaction, infusion should be started as 1mg/kg/hr and then increased by 2 mg/kg/hr every 30 min, based on patient tolerance, to a maximum of 7 mg/kg/hr. Do not infuse in solution with any other drug. Monitor carefully for hypersensitivity reaction, cardiorespiratory failure.

⊗ **Black box warning** Risk of life-threatening allergic reactions; ensure medical support is readily available. ⊗ **Black box warning** *Lumizyme* is only available through *Lumizyme ACE* program because of risk of rapid disease progression.

alpha₁-proteinase inhibitor

Aralast, Prolastin, Prolastin C, Zemaira

Drug class and indications

Blood product

Aralast/Prolastin

Treatment of congenital alpha₁-antitrypsin deficiency, chronic treatment of adults with early evidence of panacinar emphysema.

Zemaira

Chronic augmentation and maintenance therapy in patients with alpha₁-proteinase inhibitor deficiency and clinical evidence of emphysema.

Dosages and special alerts**Aralast/Prolastin**

60 mg/kg IV once a wk to achieve functional levels of alpha₁-proteinase inhibitor in lower respiratory tract. Monitor for possible hepa-

titis related to the use of human blood products.

Prolastin C

0.08 mL/Kg/min IV once a wk.

Zemaira

60 mg/kg IV weekly, infused over 15 min. Monitor for any sign of hypersensitivity reactions; drug should be discontinued if these occur. Warn the patient that product is made from human plasma and possible viral infection could occur—rash, drowsiness, chills, and joint pain should be reported immediately.

alpha₁-proteinase inhibitor (human)

Glassia

Drug class and indicationsAlpha₁-proteinase inhibitor

Chronic augmentation therapy and maintenance therapy in adult patients with emphysema due to congenital deficiency of alpha₁-proteinase inhibitor.

Dosages and special alerts

60 mg/kg by IV infusion over 60–80 min once a wk. Do not mix with other drugs or diluting solutions. May contain large amounts of IgA; do not use in patients with known hypersensitivity to IgA. Human blood product; risk of transmitting infectious agents. Transfusion reactions have been reported; reduce rate and monitor patient closely. Headache and dizziness are most common adverse reactions.

DANGEROUS DRUG**altretamine**

Hexalen

Drug class and indications

Antineoplastic

Used as a single agent for the palliative treatment of patients with persistent or recurrent ovarian cancer following first-line treatment with cisplatin or alkylating agents.

Dosages and special alerts

260 mg/m²/day PO given for 14 or 21 consecutive days of a 28-day cycle given as divided

doses with meals and at bedtime. Consider an antiemetic or decreased dose if severe nausea or vomiting occur. ☒ **Black box warning** Monitor blood counts and neurological status frequently; risk of cytopenias, infections.

alvimopan

Entereg

Drug class and indications

Peripheral mu-opioid receptor antagonist

To accelerate upper and lower GI recovery following partial large- or small-bowel resection surgery with primary anastomosis.

Dosages and special alerts

12 mg PO given 30 min to 5 hr before surgery followed by 12 mg PO bid for up to 7 days to a maximum of 15 doses. For use in hospitalized patients only. Contraindicated in patients with more than 7 consecutive days of opioid therapy before treatment. Patients recently exposed to opioids will be more sensitive to drug effects and may experience nausea, vomiting, and diarrhea. Not recommended for patients with severe hepatic or renal disease. Risk of MI exists.

ambrisentan

Letairis

Drug class and indications

Endothelin receptor antagonist, antihypertensive

Treatment of pulmonary artery hypertension in patients with class II or III symptoms to improve exercise capacity and delay clinical worsening.

Dosages and special alerts

Initially, 5 mg/day PO; may be increased to 10 mg/day if needed and tolerated. Not recommended with moderate to severe hepatic impairment; risk of severe liver injury. Pregnancy category X; use of two forms of contraception advised. Available only through Letairis Access Program. ☒ **Black box warning** Potential for severe liver injury; not for use in pregnancy.

amifostine

Ethyol

Drug class and indications

Cytoprotective drug

Reduction of renal toxicity associated with repeated administration of cisplatin in patients with advanced ovarian cancer; reduction of incidence of xerostomia in patients receiving radiation for head and neck cancer.

Unlabeled use: Protection of lung fibroblasts from effects of paclitaxel.

Dosages and special alerts

910 mg/m² IV daily as a 15-min infusion. Start within 30 min of starting chemotherapy. Monitor BP carefully; severe hypotension has been reported.

aminolevulinic acid hydrochloride

Levulan Kerastick

Drug class and indications

Photosensitizer

Treatment of nonkeratotic actinic keratoses of the face and scalp.

Dosages and special alerts

Must be applied in timing with blue light photodynamic illuminator; clean and dry area to be treated, break ampule, and apply solution with applicator provided. Light treatment must be done within the next 14–18 hr. One application of solution and one dose illumination per treatment site per 8-wk treatment session.

antihemophilic factor, recombinant

Advate, Xyntha

Drug class and indications

Antihemophilia drug

Prevention and control of bleeding episodes in hemophilia A; perioperative management of patients with hemophilia A.

Dosages and special alerts

Dosage is based on serum factor VIII level needed and body weight. See manufacturer's details. Antihemophilic factor required (international units) = body wt (kg) \times desired factor VIII increase (% of normal) \times 0.5.

antithrombin, recombinant

ATryn

Drug class and indications

Coagulation inhibitor

Prevention of perioperative and peripartum thromboembolic events in patients with hereditary antithrombin (AT) deficiency.

Dosages and special alerts

Loading dose given as a 15-min IV infusion based on AT level and body weight; maintenance dose given by continuous IV infusion to maintain AT activity levels between 80% and 120% of normal; perioperative: $100 - \text{baseline AT} \div 2.3$ (for loading dose) or 10.2 (for maintenance) \times body weight in kg; pregnant women: $100 - \text{baseline AT} \div 1.3$ (loading dose) or 5.4 (maintenance) \times body weight in kg. Contraindicated with allergy to goats or goat products; risk of hemorrhage and injection site reactions. Coagulation parameters must be followed closely.

DA N G E R O U S D R U G**antithrombin III**

Thrombate III

Drug class and indications

Coagulation inhibitor

Treatment of patients with hereditary antithrombin III deficiency in connection with surgical or obstetric procedures or when they have thromboembolism.

Replacement therapy in congenital antithrombin III deficiency.

Dosages and special alerts

Dosage units = desired antithrombin level (%)—baseline ATIII level (%) \times body weight

(kg) divided by 1.4 every 2–8 days. Dosage varies greatly; frequent blood tests are needed.

apomorphine

Apokyn

Drug class and indications

Dopamine agonist, antiparkinsonism drug

Intermittent treatment of hypomobility, “off” episodes (drug wearing off) caused by advanced Parkinson's disease.

Dosages and special alerts

2 mg by subcutaneous injection, increased slowly while monitoring BP to achieve control; maximum dose 6 mg. Give 300 mg trimethobenzamide PO tid from 3 days before starting apomorphine to completion of at least 2 mo of therapy. Monitor patient for prolonged QT interval. GI effects common.

DA N G E R O U S D R U G**argatroban**

Argatroban

Drug class and indications

Anticoagulant

Prophylaxis or treatment of thrombosis in heparin-induced thrombocytopenia; as an anticoagulant in patients at risk of heparin-induced thrombocytopenia undergoing percutaneous coronary intervention (PCI).

Dosages and special alerts

Dilute to concentration of 1 mg/mL; administer 2 mcg/kg/min as a continuous infusion. Monitor aPTT, usually achieves desired level within 1–3 hr; adjust dose of infusion to maintain a steady state aPPT that is 1.5–3 times the initial baseline value; do not exceed 10 mcg/kg/hr. Reduce initial dose to 0.5 mcg/kg/min with hepatic impairment. With PCI—25 mcg/kg/min with a bolus of 350 mcg/kg over 3–5 min. Excessive bleeding and hemorrhage may occur; monitor patient carefully for any sign of excess bleeding, decrease infusion rate or stop drug if excessive bleeding occurs.

DANGEROUS DRUG**arsenic trioxide**

Trisenox

Drug class and indications

Antineoplastic

Induction and remission of acute promyelocytic leukemia in patients refractory to retinoid or anthracycline chemotherapy and whose leukemia is characterized by t(15;17) translocation or PML/RAR-alpha gene expression.

Dosages and special alerts

Induction: 0.15 mg/kg/day IV until bone marrow remission (maximum, 60 doses). Consolidation: 0.15 mg/kg/day IV starting 3–6 wk after completion of induction (maximum, 25 doses over 5 wk). Cardiac and CNS toxicity common; baseline and weekly ECG; bi-weekly electrolytes, CBC with differential and clotting profiles advised.

Avoid seafood and many alternative therapies (arsenic in many of these). Advise patient to avoid pregnancy, driving, or dangerous activities. ☒ **Black box warning** Drug can be highly toxic and carcinogenic.

auranofin

Ridaura

Drug class and indications

Gold compound, antirheumatic

Management of adults with active classic or definite rheumatoid arthritis who have insufficient response to or intolerance to NSAIDs.

Dosages and special alerts

3 mg PO bid or 6 mg/day PO as a single dose; after 6 mo may be increased to 3 mg PO tid; do not exceed 9 mg/day. Monitor lung function, renal status, and blood counts. Protect patient from sunlight and UV exposure; systemic corticosteroids can be used for mild reactions. ☒ **Black box warning** Discontinue drug at first sign of toxicity; severe bone marrow suppression, renal toxicity, and diarrhea are possible.

DANGEROUS DRUG**azacitidine**

Vidaza

Drug class and indications

Antineoplastic

Treatment of myelodysplastic syndrome including refractory anemias and chronic myelomonocytic leukemia.

Dosages and special alerts

75 mg/m²/day by subcutaneous injection for 7 days every 4 wk; patients should receive at least four cycles. May be increased to 100 mg/m²/day if no benefit after two cycles. Pre-medicate for nausea and vomiting. Monitor blood counts and adjust dosage as needed. Pregnancy should be avoided, and men taking this drug should not father children.

basiliximab

Simulect

Drug class and indications

Immunosuppressant, monoclonal antibody

Prophylaxis of acute rejection in renal transplant patients in combination with cyclosporine and corticosteroids.

Dosages and special alerts

Two doses of 20 mg IV with the first dose 2 hr before transplant, then 4 days after transplant. Drug must be given in combination with other immunosuppressant drugs. GI effects common.

DANGEROUS DRUG**BCG intravesical**

TheraCys, Tice BCG

Drug class and indications

Antineoplastic

Treatment and prophylaxis for carcinoma in situ of the urinary bladder; prophylaxis of primary or recurrent Ta and T1 papillary tumors following transurethral resection; administered intravesically only.

Dosages and special alerts

Do not drink fluids for 4 hr before treatment; empty bladder before treatment. Instill 1 ampule, diluted as indicated in saline solution by catheter, allow to flow slowly. Have patient lie down for first hr, turning side to side, and then stay upright for 1 hr. Try to retain solution for 2 hr, and void retained solution trying not to splash liquid. Increase fluid intake for next few days. Monitor patient for local discomfort and reactions and for bone marrow depression and infection. ☒ **Black box warning** Take precautions when handling drug; infection can occur.

DANGEROUS DRUG**bevacizumab**

Avastin

Drug class and indications

Monoclonal antibody, antineoplastic

Used with 5-fluorouracil for first-line or second-line treatment of patients with metastatic carcinoma of the colon or rectum.

Used with paclitaxel and carboplatin for first-line treatment of unresectable, locally advanced recurrent or metastatic non-squamous, non-small-cell lung cancer.

Treatment of glioblastoma multiforme with progression following standard therapy.

Treatment of metastatic renal cell carcinoma with interferon-alfa.

Dosages and special alerts

For colon cancer, 5–10 mg/kg as an IV infusion every 14 days until disease progression is detected. First infusion over 90 min; second over 60 min; then infuse over 30 min. For lung cancer, 15 mg/kg as an IV infusion every 3 wk. For breast cancer: 10 mg/kg as an IV infusion every 14 days. Monitor blood counts and nutritional state. Patient may need treatment for constipation. ☒ **Black box warning** High risk of serious to fatal GI perforations; risk of serious to fatal hemorrhage; reports of serious wound-healing complications. Monitor patient very closely.

DANGEROUS DRUG**bexarotene**

Targretin

Drug class and indications

Antineoplastic

Treatment of the cutaneous manifestations of cutaneous T-cell lymphoma in patients refractory to at least one other systemic therapy.

Dosages and special alerts

300 mg/m² PO daily; may be increased to 400 mg/m² PO daily. Risk of serious pancreatitis, photosensitivity. ☒ **Black box warning** Pregnancy category X.

bicalutamide

Casodex

Drug class and indications

Antiandrogen

Treatment of advanced prostatic carcinoma in combination with LHRH analogue.

Dosages and special alerts

50 mg/day PO at the same time each day. Monitor liver function regularly. Administer only with LHRH analogue.

DANGEROUS DRUG**bivalirudin**

Angiomax

Drug class and indications

Anticoagulant; thrombin inhibitor

Anticoagulation of patients undergoing percutaneous transluminal angioplasty who have unstable angina and who are receiving aspirin.

Treatment of patients with, or at risk for heparin-induced thrombocytopenia and thrombosis syndromes who are undergoing percutaneous cardiac intervention.

Dosages and special alerts

0.75 mg/kg IV bolus, then 1.75 mg/kg/hr IV for duration of procedure; infusion can be continued for 4 hr after procedure. After 4 hr, IV infusion of 0.2 mg/kg/hr may be used for up to 20 hr, if needed. Reduce dosage with

renal impairment. Give with aspirin. Monitor for excessive bleeding, which would indicate need to discontinue drug.

DANGEROUS DRUG

bortezomib

Velcade

Drug class and indications

Antineoplastic

Treatment of multiple myeloma or mantle cell lymphoma in patients who have received at least one prior therapy, or in those previously untreated.

Dosages and special alerts

1.3 mg/m²/dose IV twice weekly for 2 wk (days 1, 4, 8, and 11) followed by a 10-day rest (days 12–21); then repeat the cycle. Use lower dose with hepatic impairment. Monitor for peripheral neuropathies and thrombocytopenia; provide appropriate safety measures.

botulinum toxin type B (rimabotulinumtoxin B)

Myobloc

Drug class and indications

Skeletal muscle relaxant, direct acting

Reduction of the severity of abnormal head position and neck pain associated with cervical dystonia.

Dosages and special alerts

2,500–5,000 units IM, injected locally into affected muscles. Blocks cholinergic transmission between the nerve and muscle. Monitor for lack of muscle function, infection at injection site. ☒ **Black box warning** Not for use in treatment of muscle spasms or cerebral palsy. Risk of botulinum toxicity if drug spreads from area of injection.

C1 inhibitor (human)

Cinryze

Drug class and indications

Proteinase inhibitor, blood product

Routine prophylaxis against angioedema attacks in adults and adolescents with hereditary angioedema.

Dosages and special alerts

1,000 units IV every 3–4 days at rate of 1 mL/min. Monitor for immediate, potentially life-threatening hypersensitivity reactions (have epinephrine readily available). Associated risks include thrombotic events in patients with risk factors for thrombosis and potential for infectious agents in product because it is made from human plasma.

cabazitaxel

Jevtana

Drug class and indications

Microtubular inhibitor, antineoplastic

In combination with oral prednisone for the treatment of patients with hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen.

Dosages and special alerts

25 mg/m² as a 1-hr IV infusion every 3 wk. Pretreat with IV antihistamine, corticosteroid, and H₂ antagonist 30 min before each infusion; an antiemetic is also suggested.

☒ **Black box warning** Severe hypersensitivity reactions have occurred; discontinue drug and support patient if these occur. Do not give to patient with a history of sensitivity reaction to this drug or to polysorbates.

☒ **Black box warning** Severe neutropenia and deaths due to neutropenia have been reported; monitor neutrophil count and withhold drug as appropriate. Patient may experience GI disturbances, renal failure, hepatic failure. Drug is pregnancy category D; not for use in pregnant women. Elderly patients are more likely to experience severe effects; monitor accordingly.

canakinumab

Ilaris

Drug class and indications

Interleukin blocker

Treatment of cryopyrin-associated periodic syndrome in patients 4 yr and older, including familial cold autoinflammatory syndrome.

Treatment of Muckle-Wells syndrome.

Dosages and special alerts

40 kg and more: 150 mg by subcutaneous injection; 15–40 kg: 2 mg/kg by subcutaneous injection; children 15–40 kg with inadequate response: dose may be increased to 3 mg/kg. Injections are given every 8 wk. Patient may be at increased risk for infections. Do not give live vaccines to patient using this drug. URI symptoms are most common adverse effect.

carglumic acid

Carbaglu

Drug class and indications

Carbamoyl phosphate synthetase 1 activator

Adjunctive therapy for the treatment of acute hyperammonemia due to the deficiency of hepatic *N*-acetylglutamate synthase; maintenance treatment of chronic hyperammonemia due to this deficiency.

Dosages and special alerts

100–250 mg/kg/day PO; adjust dosage based on patient response. Divide daily dose into two to four doses, and give before meals or feedings. Monitor ammonia levels regularly. Before treatment, protein is limited in the diet; once ammonia levels are stable, protein can be introduced. Patient may experience GI upset, fever, headache.

caspofungin acetate

Cancidas

Drug class and indications

Echinocandin, antifungal

Treatment of invasive aspergillosis in patients who are unresponsive to or who cannot tolerate standard therapy.

Treatment of esophageal candidiasis.

Treatment of candidemia and other *Candida* infections.

Empirical treatment when fungal infection is suspected in febrile and neutropenic patients.

Dosages and special alerts

Single loading dose of 70 mg IV, followed by daily IV infusion of 50 mg/day for at least 14 days. No loading dose is given for esophageal candidiasis. Monitor for IV complications. Use with cyclosporin is not recommended.

ceftaroline fosamil

Teflaro

Drug class and indications

Cephalosporin

Treatment of acute bacterial skin and skin-structure infections caused by susceptible isolates of *Staphylococcus aureus* (including methicillin-susceptible and methicillin-resistant infections), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Klebsiella oxytoca*; community-acquired bacterial pneumonia caused by *S. pneumoniae*, *S. aureus* (methicillin-susceptible isolates only), *Haemophilus influenzae*, *K. pneumoniae*, *K. oxytoca*, *E. coli*.

Dosages and special alerts

600 mg IV infused over 1 hr for 5–14 days (skin infections) or 5–7 days (community-acquired pneumonia). Decrease dose with renal impairment. Risk of *Clostridium difficile* diarrhea. Direct Coombs' test seroconversion has been reported; consider discontinuing drug if anemia develops during treatment. GI upset, rash commonly occur. Pregnancy category B.

cellulose sodium phosphate (CSP)

Calcbind

Drug class and indications

Antilithic, resin exchange drug

Absorptive hypercalcaemia type 1 (recurrent calcium oxalate or calcium phosphate stones).

Dosages and special alerts

15 g/day PO (5 g with each meal) in patients with urinary calcium exceeding 300 mg/day; reduce to 10 g/day PO (5 g with supper and 2.5 g with other meals) when urinary calcium falls to less than 150 mg/day. Caution patient to continue diet to moderate calcium oxalate intake; give supplemental magnesium gluconate while giving this drug; suspend powder in water, soft drink, or fruit juice and give 1 hr before the meal; urge patient to increase fluid intake.

certolizumab pegol

Cimzia

Drug class and indications

Tumor necrosis factor blocker, immune modulator

Reduction of the signs and symptoms of Crohn's disease; maintenance of clinical response in adult patients with moderately to severely active disease who responded inadequately to conventional therapy.

■ **NEW INDICATION:** Treatment of moderately to severely active rheumatoid arthritis in adults.

Dosages and special alerts

400 mg subcutaneously, repeated at wk 2 and 4; if clinical response occurs, maintenance dose of 400 mg subcutaneously every 4 wk.

⊗ **Black box warning** Associated risks include serious infections, malignancies, and CNS demyelinating disorder. Prescreen for TB and hepatitis B and monitor patient closely.

cetorelix acetate

Cetrotide

Drug class and indications

Fertility drug

Inhibition of premature LH surges in women undergoing controlled ovarian stimulation.

Dosages and special alerts

3 mg subcutaneously given with gonadotropins when serum estradiol levels show appropriate stimulation; if HCG is not given within

4 days, continue giving 0.25 mg/day subcutaneously until HCG is given or 0.25 mg subcutaneously morning or evening of stimulation day 5, or morning of stimulation day 6, continue daily until HCG is given. Patient or significant other should learn to give subcutaneous injections using the proper technique. Given only as part of overall fertility program.

DANGEROUS DRUG**cetuximab**

Erbix

Drug class and indications

Monoclonal antibody, antineoplastic

Monotherapy or in combination with irinotecan for the treatment of advanced epidermal growth factor receptor-expressing colorectal carcinoma.

With radiation for the treatment of locally or regionally advanced squamous cell carcinoma of the head and neck.

Monotherapy for recurrent or metastatic squamous cell cancer of the head and neck after failure of platinum therapy.

Dosages and special alerts

400 mg/m² IV as a loading dose, infused over 120 min; weekly maintenance of 250 mg/m² IV infused over 60 min. Premedication with an antihistamine is recommended. Monitor for acute infusion reaction; interstitial pulmonary disease and dermatologic toxicity.

cevimeline hydrochloride

Evxac

Drug class and indications

Parasympathomimetic

Treatment of symptoms of dry mouth in patients with Sjögren's syndrome.

Dosages and special alerts

30 mg PO tid; administer with food if GI upset is severe; monitor swallowing; monitor patient for dehydration and provide supportive therapy.

chenodioli

Chenix

Drug class and indications

Gallstone solubilizer

Treatment of selected patients with radiolucent gallstones in well-opacifying gallbladders when elective surgery is contraindicated.

Dosages and special alerts

13–16 mg/kg/day in two doses, AM and PM. Start with 250 mg PO bid for 2 wk, then increase by 250 mg/day each wk. Monitor liver function carefully. Discontinue if hepatitis occurs; caution patient to use barrier contraceptives and avoid pregnancy.

chlorproPAMIDE**Drug class and indications**

Antidiabetic, sulfonyleurea (first generation)

Adjunct to diet to lower blood glucose level in patients with type 2 diabetes mellitus.

Dosages and special alerts

250 mg/day PO. For maintenance therapy, 100–250 mg/day; do not exceed 750 mg/day. Not for pediatric use. May increase risk of CV events. Watch for possible hypoglycemia.

choline magnesium trisalicylate

Tricosal

Drug class and indications

NSAID, salicylate, antipyretic, analgesic

Treatment of osteoarthritis, rheumatoid arthritis; relief of moderate pain, fever.

Dosages and special alerts

Adults: For arthritis, 1.5–2.5 g/day PO in divided doses; do not exceed 4.5 g/day. For pain or fever, 2–3 g/day PO in divided doses.

Pediatric patients: Base dosage on patient's age; see manufacturer's guidelines. Usually 217.5–652.5 mg PO every 4 hr as needed.

GI effects common; give with meals to decrease them. Dizziness can also occur.

chorionic gonadotropin alfa (recombinant)

Ovidrel

Drug class and indications

Fertility drug

Induction of ovulation in infertile females who have been pretreated with FSH.

Induction of final follicular maturation and early luteinization in infertile women who have undergone pituitary desensitization and who have been appropriately pretreated with FSH.

Dosages and special alerts

250 mcg subcutaneously given 1 day following the last dose of a follicle-stimulating agent. Administer only when adequate follicular development has occurred. Do not administer if there is an excessive ovarian response. Inject into stomach area. Alert patient to risk of multiple births; patient should report shortness of breath, sudden abdominal pain, nausea, vomiting.

cidofovir

Vistide

Drug class and indications

Antiviral

Treatment of CMV retinitis in AIDS patients.

Dosages and special alerts

5 mg/kg IV infused over 1 hr once per wk for 2 wk; then 5 mg/kg IV every 2 wk. Probenecid must be given orally, 2 g PO before dose and 1 g at 2 and 8 hr after each dose. Maintain hydration. ☒ **Black box warning** Monitor renal function closely; renal toxicity is common. Monitor neutrophils.

DANGEROUS DRUG**clofarabine**

Clolar

Drug class and indications

Antimetabolite, antineoplastic

Treatment of patients ages 1–21 yr with ALL after at least two relapses from other regimens.

Dosages and special alerts

52 mg/m² by IV infusion over 2 hr daily for 5 consecutive days; repeat every 2–6 wk, based on recovery of baseline function. GI toxicity, bone marrow suppression, risk of infection are common.

coagulation factor VIIa (recombinant)

NovoSeven RT

Drug class and indications

Antihemophilic

Treatment of bleeding episodes in hemophilia A or B patients with inhibitors to factor VIII or factor IX.

Dosages and special alerts

90 mcg/kg as an IV bolus every 2 hr until hemostasis is achieved; continue dosing at 3- to 6-hr intervals after hemostasis in severe bleeds. Monitor for early signs of hypersensitivity reactions (hives, wheezing, hypotension, anaphylaxis).

collagenase clostridium histolyticum

Xiaflex

Drug class and indications

Proteinase enzyme

Treatment of adults with Dupuytren's contraction with a palpable cord.

Dosages and special alerts

0.58 mg injected into the palpable cord; approximately 24 hr later, perform a finger extension procedure if the contraction still exists. May be repeated up to three times per cord at 4-wk intervals. Risk of tendon rupture and serious injury if injected into tendons, nerves, or other structures of the hand. Use with caution in patients taking anticoagulants. Patient

may experience swelling and bruising at the injection site.

cosyntropin

Cortrosyn

Drug class and indications

Diagnostic agent

Diagnostic tests of adrenal function.

Dosages and special alerts

0.25–0.75 mg IV or IM or as an IV infusion of 0.04 mg/hr. Monitor for seizures, anaphylactoid reactions, excessive adrenal effects. Monitor plasma and urinary corticosteroid levels to determine adrenal function.

cromolyn sodium

Crolom, Nalcrom (CAN), NasalCrom

Drug class and indications

Antiallergy drug

Prevention and treatment of allergic rhinitis, allergy eye disorders (ophthalmic).

Dosages and special alerts

1 spray in each nostril three to six times a day, as needed, or 1 to 2 drops in each eye four to six times a day as needed. Do not wear soft contact lenses if using ophthalmic preparation. Encourage continued use for optimal effects.

dabigatran etexilate mesylate

Pradaxa DMC

Drug class and indications

Direct thrombin inhibitor

To reduce the risk of stroke and systemic embolism in patients with nonvalvular atrial fibrillation.

Dosages and special alerts

Creatinine clearance greater than 30 mL/min, 150 mg PO bid; creatinine clearance of 15–30 mL/min, 75 mg PO bid. Capsules should not be chewed, broken, or opened; discontinue tem-

porarily before invasive procedures when possible. Risk of bleeding; monitor accordingly. Not to be combined with rifampin. Gastritis may occur.

dalfampridine

Amypra DMC

Drug class and indications

Potassium channel blocker

To improve walking in patients with multiple sclerosis (MS).

Dosages and special alerts

10 mg PO bid, approximately 12 hr apart; not for use with renal impairment. Tablet must be swallowed whole, not cut, crushed, or chewed. Not for use in pregnancy or breastfeeding or in children. Patient may experience nausea, dizziness, headache, insomnia, balance disorder, relapse of MS.

dapsone

Drug class and indications

Leprostatic

Treatment of Hansen's disease.

Treatment of dermatitis herpetiformis.

Dosages and special alerts

50–100 mg/day PO (leprosy). 50 mg/day PO (dermatitis herpetiformis); 50–300 mg/day has been used. Children should not receive more than 100 mg/day. Monitor patients for bone marrow suppression and for the development of resistance if relapse occurs. Give with food to decrease GI upset. Drug will need to be used for prolonged time.

darunavir

Prezista

Drug class and indications

Antiviral, protease inhibitor

Treatment of adults with advanced HIV disease with progression of disease following antiretroviral treatment; used with 100 mg ritonavir and combinations of other HIV drugs.

Dosages and special alerts

600 mg PO bid with ritonavir 100 mg PO bid with food. Interacts with many other drugs; check drug regimen carefully before starting therapy. Monitor patient for rash, bone marrow suppression. Watch for increased bleeding in patients with hemophilia and glucose alterations in diabetics.

DANGEROUS DRUG

dasatinib

Sprycel

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of adults in all phases of CML (chronic, accelerated, or myeloid or lymphoid blast phase) with resistance or intolerance to prior treatment, given with imatinib.

Treatment of adults with Philadelphia chromosome–positive acute lymphoblastic leukemia with resistance or tolerance to prior therapy and chronic phase.

Dosages and special alerts

140 mg/day PO in two equally divided doses, one morning and one evening, without food. Tablets should be swallowed whole, not cut, crushed, or chewed. Monitor patient for edema, excessive bleeding, bone marrow suppression. Advise use of barrier contraceptives for both men and women using the drug.

DANGEROUS DRUG

DAUNOrubicin citrate

DaunoXome

Drug class and indications

Antineoplastic

First-line treatment of advanced HIV-associated Kaposi's sarcoma.

Dosages and special alerts

40 mg/m² IV, infused over 1 hr; repeat every 2 wk. Decrease dose with renal or hepatic impairment. Monitor for extravasation; severe damage can occur. Do not use during

pregnancy. ☒ **Black box warning** Cardiac toxicity possible; monitor ECG and enzymes, and decrease dosage as needed.

DANGEROUS DRUG**decitabine**

Dacogen

Drug class and indications

Antineoplastic antibiotic

Treatment of patients with myelodysplastic syndromes.

Dosages and special alerts

15 mg/m² IV, infused over 3 hr every 8 hr for 3 days. Repeat cycle every 6 wk for at least four cycles; may be continued as long as it benefits the patient. Premedicate patient with antiemetics. Monitor patient carefully for GI disturbances, bone marrow suppression.

deferasirox

Exjade

Drug class and indications

Chelate

Treatment of chronic iron overload due to blood transfusion (transfusional hemosiderosis) in patients 2 yr and older.

Dosages and special alerts

20 mg/kg/day PO. Therapy should be started when a patient has evidence of chronic iron overload as with transfusions of 100 mL/kg packed red cells. Maintenance: monthly serum ferritin levels should be drawn and dosage adjusted in steps of 5–10 mg/kg. If serum ferritin levels fall below 500 mcg/L, consider stopping therapy. Do not exceed 30 mg/kg/day. Monitor for changes in vision and hearing. ☒ **Black box warning** May cause hepatic or renal impairment, including fatal reactions. Monitor LFTs, renal function prior to, weekly for 2 wk, then monthly during therapy.

deferoxamine mesylate

Desferal

Drug class and indications

Chelate

Treatment of acute iron toxicity and chronic iron overload.

Dosages and special alerts

Acute toxicity: 1 g IM or IV, followed by 0.5 g every 4 hr for 2 doses, then every 4–12 hr based on patient response.

Chronic overload: 0.5–1 g IM qid; 2 g IV with each unit of blood or 20–40 mg/kg/day as a continuous subcutaneous infusion over 8–24 hr. IM preferred for acute intoxication; slow IV infusion for chronic overload. Monitor serum iron levels. Note that injection can be very painful.

degarelix

Degarelix for Injection

Drug class and indications

GnRH receptor antagonist, antineoplastic

Treatment of advanced prostate cancer.

Dosages and special alerts

Initially, 240 mg by subcutaneous injection, given as two separate 120-mg injections, followed by maintenance dose of 80 mg subcutaneously every 28 days. Pregnancy category X. Risk of prolonged QT interval. Injection site reactions, hot flashes, weight gain are common.

denileukin diftitox

Ontak

Drug class and indications

Biological protein

Treatment of cutaneous T-cell lymphoma in patients whose cells express the CD25 component of the IL-2-receptor.

Dosages and special alerts

Adults: 9 or 18 mcg/kg/day IV over at least 15 min for 5 consecutive days every 21 days. Monitor for capillary leak syndrome.

☒ **Black box warning** Severe hypersensitivity reactions may occur; have life-support equipment available.

DANGEROUS DRUG**desirudin**

Iprivask

Drug class and indications

Anticoagulant; thrombin inhibitor

Prevention of DVT in patients undergoing elective hip replacement.

Dosages and special alerts15 mg every 12 hr by subcutaneous injection, initial dose given 5–15 min before surgery but after induction of anesthesia; give for 9–12 days. Administer by deep subcutaneous injection; alternate sites. Monitor blood clotting daily and protect from injury. ☒ **Black box****warning** Risk of epidural or spinal hematomas with long-term or permanent paralysis. Carefully weigh benefits and risks before using epidural or spinal anesthesia or spinal puncture.**DANGEROUS DRUG****dexmedetomidine hydrochloride**

Precedex

Drug class and indications

Sedative, hypnotic

Sedation of initially intubated and mechanically ventilated patients during treatment in an ICU setting.

Dosages and special alerts

1 mcg/kg infused over 10 min, then 0.2–0.7 mcg/kg/hr using a controlled infusion device for up to 24 hr; drug is not indicated for use longer than 24 hr.

dexrazoxane

Totect

Drug class and indications

Lyophilizate

Treatment of extravasation resulting from IV anthracycline chemotherapy.

Dosages and special alertsGiven IV once daily for 3 days. *Day 1:* 1,000 mg/m²; maximum dose, 2,000 mg. *Day 2:* 1,000 mg/m²; maximum dose, 2,000 mg. *Day 3:* 500 mg/m²; maximum dose, 1,000 mg. Infuse over 1–2 hr. Reduce dose by 50% in patients with creatinine clearance less than 40 mL/min. Monitor patient for bone marrow suppression, fever, and pain and burning at injection site. Do not give to pregnant women or nursing mothers.**dihydroergotamine mesylate**

D.H.E. 45, Migranal

Drug class and indications

Ergot derivative, antimigraine drug

Acute treatment of migraine headaches with or without aura; acute treatment of cluster headache (parenteral).

Dosages and special alerts

1 mg IM, IV, or subcutaneously at first sign of headache; may repeat at 1-hr intervals for a total of 3 mg. Or one spray (0.5 mg) in each nostril followed by another spray in each nostril 15 min later for a total of 3 mg. Be aware of possible coronary artery vasoconstriction. Numbness, tingling are common. If patient has nausea or vomiting, give drug with an antiemetic.

dimercaprol

BAL in Oil

Drug class and indications

Antidote, chelate

Treatment of arsenic, gold, mercury poisoning.

Treatment of acute lead poisoning when used with calcium edetate disodium.

Treatment of acute mercury poisoning if used within the first 1–2 hr.

Dosages and special alerts

2.5–5 mg/kg IM qid for 2 days, taper to bid for 10 days. Can cause severe renal damage; alkalinize urine to increase chelated complex excretion. Use extreme caution with children.

dipyridamole

Dipridacot (CAN), Persantine

Drug class and indications

Antianginal, antiplatelet, diagnostic agent

With warfarin to prevent thromboembolism in patients with prosthetic heart valves; diagnostic aid to assess CAD in patients unable to exercise.

Dosages and special alerts

75–100 mg PO qid to prevent thromboembolism. For CAD, 0.142 mg/kg/min IV, infused over 4 min. Continually monitor patient receiving IV form. Give oral drug at least 1 hr before meals. Warn patient about possible light-headedness.

dornase alfa

Pulmozyme

Drug class and indications

Cystic fibrosis drug

Management of respiratory symptoms of cystic fibrosis in conjunction with other drugs; treatment of advanced cystic fibrosis.

Dosages and special alerts

2.5 mg daily through a nebulizer; may increase to 2.5 mg bid in patients 5 yr or older. Store drug in the refrigerator. Make sure the patient knows how to use the nebulizer properly. Continue other treatments for cystic fibrosis.

doxercalciferol

Hectorol

Drug class and indications

Vitamin D analogue

Reduction of elevated intact parathyroid hormone (iPTH) levels in the management of secondary hyperparathyroidism in patients undergoing chronic renal dialysis; secondary hyperparathyroidism in patients with stage 3 or 4 chronic kidney disease who do not need dialysis.

Dosages and special alerts

With dialysis: 10 mcg three times per wk at dialysis. Maximum, 20 mcg three times per wk. Regulate dose by iPTH levels. Monitor carefully for hypercalcemia (arrhythmias, seizures, calcifications). Without dialysis: 1 mcg PO daily; adjust dosage based on PTH levels. Maximum dose, 3.5 mcg/day.

droperidol**Drug class and indications**

General anesthetic

Dosages and special alerts

2.5 mg IM or IV. Use caution with renal or hepatic failure. Monitor patient for hypotension. Onset 3–10 min, recovery 2–4 hr; patient may have drowsiness, chills, or hallucinations during recovery. ☒ **Black box warning** May prolong QT interval; monitor appropriately.

ecallantide

Kalbitor

Drug class and indications

Plasma kallikrein inhibitor

Treatment of acute attacks of hereditary angioedema in patients 16 yr and older.

Dosages and special alerts

30 mg by subcutaneous injection given as three 10-mg injections; may be repeated once in 24 hr. ☒ **Black box warning** Risk of severe anaphylaxis; should only be given by health care provider familiar with anaphylaxis and with full medical support readily available. Patient may also experience headache, nausea, diarrhea, injection-site reactions.

eculizumab

Soliris

Drug class and indications

Monoclonal antibody, complement inhibitor

Treatment of patients with paroxysmal nocturnal hemoglobinuria to reduce hemolysis.

Dosages and special alerts

600 mg IV over 35 min every 7 days for first 4 wk, followed by 900 mg IV as fifth dose 7 days later, and then 900 mg IV every 14 days.

⊗ **Black box warning** Patient must have had recent meningococcal vaccine before starting therapy; drug increases risk of infection. Monitor patient for early signs of meningococcal infection. Stopping drug can cause serious hemolysis; must monitor patient for 8 wk after stopping drug.

eltrombopag

Promacta

Drug class and indications

Thrombopoietin receptor agonist

Treatment of chronic immune idiopathic thrombocytopenic purpura in patients who have insufficient response to conventional therapies, including splenectomy.

Dosages and special alerts

50 mg PO once daily; may be increased to a maximum 75 mg/day. Patients of eastern Asian ancestry or with mild to moderate hepatic dysfunction should be started on 25 mg/day PO. May increase the risk of bone marrow–related malignancies; monitor CBC carefully. ⊗ **Black box warning** Risk of severe to fatal hepatotoxicity exists; monitor patient very closely and adjust dosage or discontinue drug if liver enzymes start to rise. Drug available only through limited distribution programs.

DANGEROUS DRUG**epirubicin hydrochloride**

Ellence

Drug class and indications

Antineoplastic, antibiotic

Adjunctive therapy in patients with evidence of axillary node tumor involvement after resection of primary breast cancer.

Dosages and special alerts

100–120 mg/m² IV given in repeated 3- to 4-wk cycles, all on day 1; given with cyclo-

phosphamide and 5-fluorouracil. Premedicate with antiemetics and antibiotics; encourage patient to drink plenty of fluids. Alert patient that hair loss may occur. ⊗ **Black box warning** Cardiac toxicity can occur; obtain baseline ECG. Monitor for bone marrow suppression. Severe local cellulitis can occur with extravasation; discontinue immediately if burning or stinging occurs.

epoprostenol sodium (prostacyclin, PGX, PGI₂)

FloLAN, Veletri

Drug class and indications

Prostaglandin

Treatment of primary pulmonary hypertension in patients unresponsive to standard therapy.

Dosages and special alerts

2 ng/kg/min with increases in increments of 2 ng/kg as tolerated using a portable infusion pump through a central venous catheter; 20–40 ng/kg/min common dosage after 6 mo of continuous therapy. Teach patient and significant other the proper maintenance and use of infusion pump, ensure that therapy is continuous. Headache, muscle aches, and pains are common.

ergotamine tartrate

Ergomar

Drug class and indications

Ergot derivative, antimigraine drug

Prevention or abortion of vascular headaches, such as migraine and cluster headaches.

Dosages and special alerts

One tablet (2 mg) under the tongue soon after the first symptoms, with subsequent doses at 30-min intervals. Do not exceed 3 tablets/day or 10 mg/week. Nausea and numbness and tingling are common. CV effects, including chest pain, may occur. Drug is pregnancy category X.

eribulin mesylate

Halaven

Drug class and indications

Microtubular inhibitor, antineoplastic

Treatment of patients with metastatic breast cancer who have previously received at least two chemotherapeutic regimens for the treatment of metastatic disease.

Dosages and special alerts

1.4 mg/m² IV over 2–5 min on days 1 and 8 of a 21-day cycle. Do not administer with dextrose-containing solutions. Reduce dosage in patients with hepatic or renal impairment. Not for use in pregnancy or breast-feeding. Monitor patient for bone marrow suppression, which is common; adjust dosage as needed. Establish baseline ECG as QT-interval prolongation may occur; do not administer with other drugs that prolong QT interval. Watch for peripheral neuropathy; manage with dose delay or dosage adjustment. Alopecia may occur; GI upset is common.

DANGEROUS DRUG**erlotinib**

Tarceva

Drug class and indications

Monoclonal antibody, antineoplastic

Treatment of patients with locally advanced or metastatic non–small-cell lung cancer after failure of at least one course of chemotherapy.

In combination with gemcitabine for first-line treatment of locally advanced, unresectable, or metastatic pancreatic cancer.

Dosages and special alerts

Non–small-cell lung cancer: 150 mg/day PO on an empty stomach. Monitor for potentially serious interstitial lung disease. GI effects are common.

Pancreatic cancer: 100 mg/day PO on an empty stomach with IV gemcitabine. Risk of GI perforation, Stevens-Johnson syndrome, ocular disorders.

ethacrynic acid

Edecrin

Drug class and indications

Loop, high ceiling diuretic

Treatment of edema associated with HF, cirrhosis, renal disease; acute pulmonary edema; ascites associated with malignancy, idiopathic edema, lymphedema; short-term management of congenital heart disease in children.

Dosages and special alerts

50–200 mg/day PO, based on patient response. IV use in adults: 50 mg IV run slowly over several min to a maximum of 100 mg. Oral use in children, 25 mg/day, adjust in 25 mg increments as needed. Give oral dose with food or milk. Monitor weight and output regularly. Monitor potassium levels and provide replacement as needed.

everolimus

Afinitor

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of advanced renal cell carcinoma after failure with sunitinib or sorafenib.

■ **NEW INDICATION:** Treatment of subependymal giant-cell astrocytoma in patients who are not candidates for surgery.

Dosages and special alerts

10 mg PO once daily with food. May be decreased to 5 mg/day to manage adverse effects or with moderate hepatic impairment. Pregnancy category D; fetal harm can occur. Risk of pneumonitis, serious to fatal infections, oral ulcerations, and elevations in blood glucose, lipid, and serum creatinine levels. Patients must be monitored very closely. Avoid use with strong CYP3A4 inhibitors; increase dose to a maximum 20 mg/day if drug must be given with strong CYP3A4 inducers. Do not give live vaccines to patient taking this drug.

DANGEROUS DRUG**exemestane**

Aromasin

Drug class and indications

Antineoplastic

Treatment of advanced breast cancer in postmenopausal women whose disease has progressed following tamoxifen therapy.

Dosages and special alerts

25 mg PO every day with meals. May be antagonized by estrogens. Avoid use during premenopause or with renal or hepatic impairment. Hot flashes, GI upset, anxiety, depression, headache are common.

ferumoxytol

Feraheme

Drug class and indications

Iron replacement product

Treatment of iron deficiency anemia in adults with chronic renal failure.

Dosages and special alerts

500 mg IV, followed by 500 mg IV 3–8 days later depending on patient response. Infuse as undiluted injection at 30 mg/sec (1 mL/sec). May be readministered if indicated by persistent or recurrent anemia. Risk of iron overload; blood pressure changes are common. Monitor patient carefully for possible hypersensitivity reactions for 30 min after infusion. Drug is a superparamagnetic iron oxide that can alter MRI results and interpretation for up to 3 mo following administration; does not interfere with CAT scans or regular X-rays.

fibrinogen concentrate, human

RiaSTAP

Drug class and indications

Coagulation factor

Treatment of acute bleeding episodes in patients with congenital fibrinogen deficiency, including afibrinogenemia and hypofibrinogenemia.

Dosages and special alerts

70 mg/kg by slow IV injection, not to exceed 5 mL/min; dosage adjusted to a target fibrinogen level of 100 mg/dL. Risk of thrombotic events, severe hypersensitivity reactions. Drug is prepared from pooled human plasma; patient should be aware of potential infection risk.

fingolimod

Gilenya

Sphingosine 1-phosphate receptor modulator

Treatment of patients with relapsing forms of multiple sclerosis (MS) to reduce frequency of clinical exacerbations and to delay the accumulation of physical disability.

Dosages and special alerts

0.5 mg PO once daily. Observe patient for 6 hr after first dose to monitor for bradycardia. Bradycardia and AV blocks may occur; baseline ECG and regular monitoring are recommended. Respiratory spirometry is recommended before and periodically during therapy. Patient may be at increased risk for infection; monitor closely. Macular edema may occur; patient should report any change in vision. Drug has caused fetal harm; suggest the use of contraceptives during and for 2 months after completing therapy. Monitor patient with hepatic impairment closely because of increased risk of adverse effects.

DANGEROUS DRUG**floxuridine**

FUdR

Drug class and indications

Antimetabolite, antineoplastic

Palliative management of GI adenocarcinoma metastatic to the liver that is incurable by surgery or other means.

Dosages and special alerts

0.1–0.6 mg/kg/day per intra-arterial infusion; continue until adverse effects occur, and resume when adverse effects resolve. Monitor bone marrow status; warn patient of possible severe GI effects.

fludrocortisone acetate

Florinef Acetate

Drug class and indications

Corticosteroid, hormone, mineralocorticoid

Partial replacement therapy in primary and secondary adrenocortical insufficiency.

Treatment of salt-losing adrenogenital syndrome with glucocorticoid therapy.

Dosages and special alerts

Adrenocortical insufficiency: 0.1 mg/day PO; may decrease to 0.05 mg/day PO if hypertension occurs. Salt-losing adrenogenital syndrome: 0.1–0.2 mg/day PO. Always use in conjunction with glucocorticoid therapy. Risk of increased fluid volume, headaches, tendon contractures. Discontinue at any sign of overdose (hypertension, edema, excessive weight gain, increased heart size). If infants or children are maintained on long-term therapy, monitor growth and development closely.

follitropin alfa

Gonal-F

Drug class and indications

Fertility drug

Induction of ovulation, stimulation, and development of multiple follicles for in vitro fertilization.

Also used to increase spermatogenesis in men with hypogonadism.

Dosages and special alerts

Ovulation induction: 75 international units/day subcutaneously, increase by 37.5 international units/day after 14 days; may increase again after 7 days; do not exceed 35 days of treatment.

Follicle development: 150 international units/day subcutaneously on days 2 or 3 and continue for 10 days. In patients whose endogenous gonadotropin levels are suppressed, initiate at 225 international units/day subcutaneously. Adjust dose after 5 days based on patient response; dosage should be adjusted no more than every 3–5 days and by no more than 75–150 international units at each

adjustment. Maximum, 450 international units/day; then give 5,000–10,000 units HCG. *Spermatogenesis:* 150 international units subcutaneously three times per wk in conjunction with HCG. May increase to 300 international units three times per wk, as needed. May administer up to 18 mo for adequate effect. Pregnancy category X. Explain risk of multiple births; risk of arterial thromboembolism.

follitropin beta

Follistim, Puregon (CAN)

Drug class and indications

Fertility drug

Induction of ovulation, stimulation and development of multiple follicles for in vitro fertilization.

Dosages and special alerts

Ovulation induction: 75 international units/day subcutaneously, increase by 37.5 international units/day after 14 days; do not exceed 35 days of treatment.

Follicle development: 150–225 international units/day subcutaneously or IM for at least 4 days of treatment. Adjust dose based on ovarian response; then give 5,000–10,000 international units. HCG: maintenance dosage of 375–600 international units/day subcutaneously or IM may be necessary. Drug is pregnancy category X. Give subcutaneously in navel or abdomen. Warn patients of risk of multiple births.

fomepizole

Antizol

Drug class and indications

Antidote

Antidote for antifreeze (ethylene glycol) poisoning or for use in suspected poisoning.

Antidote for methanol poisoning.

Dosages and special alerts

15 mg/kg loading dose followed by doses of 10 mg/kg every 12 hr for 12 doses given as a slow IV infusion over 30 min. Start immediately after diagnosis is made. Headache,

nausea, and dizziness are common. Consider hemodialysis as added therapy.

galsulfase

Naglazyme

Drug class and indications

Enzyme

Treatment of patients with mucopolysaccharidosis VI to improve walking and stair climbing capacity.

Dosages and special alerts

1 mg/kg once weekly by IV infusion, diluted and infused over 4 hr. Patient should receive antihistamine with or without an antipyretic 30–60 min before the infusion begins.

ganirelix acetate

Antagon

Drug class and indications

Fertility drug

Inhibition of premature LH surges in women undergoing controlled ovarian overstimulation as part of a fertility program.

Dosages and special alerts

250 mcg subcutaneously once daily starting on day 2 or 3 of the cycle. Drug is pregnancy category X. Teach patient to administer subcutaneous injections. Abdominal pain is a common adverse effect.

DANGEROUS DRUG

gefitinib

Iressa

Drug class and indications

Antineoplastic

Monotherapy for treatment of patients with locally advanced or metastatic non–small-cell lung cancer who have been receiving the drug and have been doing well. No longer available for initiating therapy.

Dosages and special alerts

250 mg/day PO with or without food. Monitor pulmonary function; potentially fatal

interstitial lung disease possible. Eye pain and corneal erosion also reported.

glatiramer acetate

Copaxone

Drug class and indications

MS drug

Reduction of frequency of relapses in patients with relapsing or remitting MS.

Treatment of patients who have experienced a first clinical episode of MS and who have MRI features consistent with MS.

Dosages and special alerts

20 mg/day by subcutaneous injection; rotate injection sites. Photosensitivity may occur.

gold sodium thiomalate

Aurolate

Drug class and indications

Gold compound, antirheumatic

Treatment of selected, early cases of adult and juvenile rheumatoid arthritis.

Dosages and special alerts

Weekly IM injections: 10 mg IM wk 1, 25 mg IM wk 2 and 3; then 25–50 mg/wk IM to a total dose of 1 g. Maintenance injections of 25–50 mg IM every other wk for 2–30 wk, may change to every third or fourth wk if response is adequate. Pediatric dosing: 10 mg IM test dose, then 1 mg/kg/wk IM; do not exceed 50 mg/dose. Injection reactions are common. Protect patient from sunlight and UV exposure; systemic corticosteroids can be used to manage mild reactions. ⊗ **Black box warning** Monitor lung, renal function and blood counts; discontinue at first sign of toxicity.

gonadorelin hydrochloride

Factrel

Drug class and indications

Diagnostic agent

Evaluation of functional capacity and response of the gonadotropes of the anterior pituitary.

Testing for suspected gonadotropin deficiency.

Evaluating residual activity following pituitary removal or irradiation.

Dosages and special alerts

100 mg subcutaneously or IV; in females, perform test days 1–7 of the menstrual cycle; have patient report any difficulty breathing.

DANGEROUS DRUG

histrelin implant

Vantas

Drug class and indications

Gonadotrophic-releasing hormone used as antineoplastic.

Palliative treatment of advanced prostate cancer.

Dosages and special alerts

One implant inserted subcutaneously and left in for 12 mo. May be removed and a new implant inserted after 12 mo. Monitor for insertion site reactions. Patient may be at increased risk for CV events, including MI and stroke. Monitor accordingly.

hyaluronic acid derivatives

Euflexxa, Hyalgan, Orthovisc, Supartz, Synvisc, Synvisc One

Drug class and indications

Glycosamine polysaccharide

Treatment of pain in osteoarthritis of the knee in patients who have failed to respond to other therapies.

Dosages and special alerts

2 mL by intra-articular injection in knee once weekly for a total of 3–5 injections. Use caution with latex allergies. Joint swelling may occur; avoid strenuous activities or prolonged weight bearing for 48 hr. Headache may occur.

hyaluronidase

Amphadase, Hylenex, Vitrase

Drug class and indications

Enzyme

Used to increase absorption and dispersion of injected drugs.

For hypodermoclysis.

Used as an adjunct in subcutaneous urography for improving the resorption of radiopaque agents.

Dosages and special alerts

Absorption of injected drugs: Adults: Add 150 units of hyaluronidase to the injection solution. Pediatric patients: Add 150 units of hyaluronidase to the injection solution, may be added to small amounts up to 200 mL. Do not administer with dopamine or alpha adrenergic drugs. Monitor the patient for local reactions.

Hypodermoclysis: Adults: 150 units injected under the skin, close to the clysis. Pediatric patients younger than 3 yr: limit single clysis to 200 mL; premature infants or during the neonatal period: do not exceed 25 mL/kg at a rate no greater than 2 mL/min. Use care to avoid overhydration by controlling rate and volume. Do not administer with dopamine or alpha adrenergic drugs. Monitor the patient for local reactions.

Adjunct to subcutaneous urography: 75 units injected subcutaneously over each scapula, followed by injection of the contrast media at the same sites.

hydroflumethiazide

Drug class and indications

Thiazide diuretic (available in combination products only)

Treatment of hypertension; adjunct therapy for edema associated with HF, cirrhosis, renal impairment, corticosteroid or estrogen therapy.

Dosages and special alerts

Hypertension: 50–100 mg/day PO.

Edema: Initially, 50 mg PO bid; maintenance, 25–50 mg/day PO.

Give early in the day so increased urination will not affect sleep; give with food or meals to decrease GI upset.

hydroxocobalamin

Cyanokit

Drug class and indications

Antidote

Treatment of known or suspected cyanide poisoning.

Dosages and special alerts

5 g (2 vials) by IV infusion over 15 min; a second dose may be given if needed by IV infusion over 15–120 min, based on patient condition. Warn patient that urine will be red for up to 5 wk after treatment. Skin and mucous membranes may be red up to 2 wk after treatment; protect from sun exposure during this period.

hydroxyethyl starch in sodium chloride

Voluven

Drug class and indications

Colloid, plasma expander

Treatment and prophylaxis of hypovolemia.

Dosages and special alerts

Begin infusion slowly to monitor patient for anaphylactic reaction; base daily dosage and rate of infusion on patient's blood loss, hemodynamics, and hemodilution effects. Up to 50 mL/kg/day (3,500 mL for a 70-kg patient). For children, 7–25 mL/kg/day has been used. Monitor patient very closely, and adjust rate based on response. Watch for hypervolemia and anaphylactoid reactions.

hylan b gel

Hylaform

Drug class and indications

Polysaccharide, cosmetic drug

Correction of moderate to severe facial wrinkles or folds.

Dosages and special alerts

Injected into the dermal layer to correct wrinkles or folds; may need to be repeated over time. Monitor for infection. Avoid sun exposure immediately after injection.

DANGEROUS DRUG

ibrutinomab

Zevalin

Drug class and indications

Monoclonal antibody, antineoplastic

Treatment of patients with relapsed or refractory low-grade follicular transformed B-cell non-Hodgkin's lymphoma.

Treatment of patients with previously untreated follicular non-Hodgkin lymphoma who experience relapse to first-line therapy.

Dosages and special alerts

Single infusion of 250 mg/m² rituximab preceding a fixed dose of 5 mCi/kg ibrutinomab as a 10-min IV push. Administer a second cycle 7–9 days later. Premedicate with acetaminophen and diphenhydramine before each rituximab infusion. **⊗ Black box warning** Risk of serious infusion reactions, including fatalities; serious prolonged cytopenias; and cutaneous and mucocutaneous reactions. Monitor patient continuously.

idursulfase

Elaprase

Drug class and indications

Enzyme, Hunter's syndrome drug

Treatment of patients with Hunter's syndrome (mucopolysaccharidosis II).

Dosages and special alerts

0.5 mg/kg IV every week, infused over 1–3 hr. First infusion should be at 8 mL/hour (must be diluted in 100 mL of 0.9% sodium chloride injection) for the first 15 min; then increase by 8 mL/hr at 15-min intervals if patient tolerates infusion; do not exceed 100 mL/hr. Risk of serious anaphylactoid reactions; start therapy slowly, and monitor patient closely. Drug improves walking capacity.

iloprost

Ventavis

Drug class and indications

Vasodilator

Treatment of pulmonary arterial hypertension in patients with New York Heart Association class III to IV symptoms to improve composite endpoints.

Dosages and special alerts

2.5 mcg inhaled using the *ProDose* or *I-neb AAD system*. May be increased to 5 mcg; repeat inhalation 6–9 times/day while awake. Maximum dose 45 mcg/day. Monitor exercise and activity tolerances.

incobotulinumtoxin AXeomin UNC**Drug class and indications**

Neuromuscular blocker

Treatment of adults with cervical dystonia to decrease severity of abnormal head position and neck pain; treatment of blepharospasm in adults previously treated with botulinum toxin A.

Dosages and special alerts

Cervical dystonia: 120 units per treatment session injected into sternocleidomastoid, splenius capitis, levator scapulae, scalenus, and/or trapezius muscles. *Blepharospasm*: 1.25–2.5 units per injection site as a starting dose; mean dose, 5.6 units per injection and up to six injections per eye. Do not inject into areas that show signs of infection. Patient may experience weakness, injection-site pain, headache, visual impairment. Use cautiously in pregnancy, lactation, with concomitant use of spectinomycin, aminoglycosides, muscle relaxants, or neuromuscular blockers as adverse effects may be potentiated.

infliximab

Remicade

Drug class and indications

Monoclonal antibody

Used to reduce the signs and symptoms of moderate to severe Crohn's disease in adults and children who do not respond adequately to conventional therapy.

Treatment of rheumatoid arthritis (RA) together with methotrexate as a first-line therapy.

Treatment of patients with fistulizing Crohn's disease.

Used to reduce signs and symptoms, inhibit structural damage, and improve physical functioning of active arthritis in patients with psoriatic arthritis.

Used to reduce the signs and symptoms, and decrease the corticosteroid use in patients with moderately to severely active ulcerative colitis.

Dosages and special alerts

5 mg/kg IV over 2 hr given once (Crohn's disease). May repeat dose with fistulating or psoriatic arthritis disease at 2 wk and 6 wk after first dose, then every 8 wk with psoriatic arthritis or Crohn's disease. 3 mg/kg IV followed by 3 mg/kg at 2 and 6 wk, then every 8 wk (RA). 5 mg/kg IV at 0, 2, and 6 wk for induction, followed by 5 mg/kg IV every 8 wk for maintenance (ulcerative colitis). Do not use in patients with allergy to mouse protein. Discontinue if lupus-like reaction occurs. **⊗ Black box warning** There is an increased risk of malignancies and infections; monitor patient closely.

insoluble Prussian blue

Radiogardase

Drug class and indications

Ferric hexacyanoferrate

Treatment of patients with known or suspected contamination with radioactive cesium or radioactive or nonradioactive thallium to increase their rates of elimination.

Dosages and special alerts

Adults and children 12 yr and older: 3 g PO tid. Children 2–12 yr: 1 g PO tid. Prevent constipation; stool will be blue. If capsules

cannot be swallowed, contents may be added to food and eaten. Alert patient that teeth and mouth may become blue. Protect others from contamination by flushing toilet several times with each use, washing hands carefully, and cleaning up any spilled urine, blood, or feces.

interferon alfacon-1

Infergen

Drug class and indications

Interferon, immune modulator

Treatment of chronic hepatitis C in patients 18 yr and older with compensated liver disease and HCV antibodies.

Dosages and special alerts

9 mcg by subcutaneous injection three times per wk for 24 wk; at least 48 hr should separate doses. Monitor for possible severe adverse reactions. Monitor for suicidal ideation and take appropriate precautions. Tell female patients to use contraceptives. Treat nausea and vomiting as needed.

interferon alfa-n3

Alferon N

Drug class and indications

Immunomodulator

Treatment of condylomata acuminata (venereal and genital warts).

Dosages and special alerts

0.05 mL per wart two times per wk for 8 wk. Maximum 0.5 mL per treatment session.

iron sucrose

Venofer

Drug class and indications

Iron salt

Treatment of iron deficiency anemia in patients undergoing chronic hemodialysis or peritoneal dialysis who are receiving supplemental erythropoietin therapy and non-

dialysis dependent chronic renal failure patients with or without erythropoietin.

Dosages and special alerts

100 mg (5 mL) IV, one to three times per wk, during dialysis. Administer slowly, 1 mL over 2–5 min. Non-dialysis patients receive 1,000 mg IV over 14 days given as 200 mg IV on 5 different days. Serious to fatal hypersensitivity reactions have occurred. Administer test dose and monitor patient carefully during administration.

isocarboxazid

Marplan

Drug class and indications

MAOI

Treatment of depression (not a first choice for initial treatment).

Dosages and special alerts

Up to 40 mg PO daily. Dosage can usually be reduced after 3–4 wk because drug effects are cumulative. Not a first-line treatment for depression because of potential for serious adverse effects and food interactions. Might be useful in patients unable to tolerate newer and safer antidepressants. Patient must be given list of tyramine-containing foods.

ivermectin

Stromectol

Drug class and indications

Anthelmintic

Treatment of intestinal strongyloidiasis.
Treatment of onchocerciasis.

Dosages and special alerts

Strongyloidiasis: 200 mcg/kg PO as a single dose.

Onchocerciasis: 150 mcg/kg PO as a single dose; may be repeated in 3–12 mo if needed. Give with a full glass of water. Nausea and vomiting very common. Instruct patient to use barrier contraceptives while on this drug.

ixabepilone

Ixempra

Drug class and indications

Antineoplastic, microtubule inhibitor

As monotherapy or with capecitabine for the treatment of metastatic or locally advanced breast cancer after failure of anthracycline and a taxane.

Dosages and special alerts

40 mg/m² IV infused over 3 hr every 3 wk. Pre-medicate with corticosteroids. ☒ **Black box warning** Severe liver failure possible; monitor for bone marrow suppression, neuropathies, cardiac effects.

lanreotide acetate

Somatuline Depot

Drug class and indications

Hormone, growth hormone (GH) inhibitor

Long-term treatment of acromegaly in patients who have had inadequate response to or cannot be treated with surgery or raditaion therapy.

Dosages and special alerts

Initially, 90 mg (range, 60–120 mg) subcutaneously every 4 wk for 3 mo; adjust dosage based on GH or insulin growth factor-1 level. Reduce dose with renal or hepatic impairment. Risk of gallstones, thyroid suppression, hypoglycemia, hyperglycemia, bradycardia. Monitor GH and insulin growth factor-1 serum levels to establish dosage.

lanthanum carbonate

Fosrenol

Drug class and indications

Phosphate binder

Reduction of serum phosphate levels in patients with end stage renal disease.

Dosages and special alerts

750–1,500 mg/day PO in divided doses taken with meals. Titrate to achieve desired serum

phosphate levels. Chew tablets thoroughly. GI upset may occur.

DANGEROUS DRUG**lapatinib**

Tykerb

Drug class and indications

Kinase inhibitor, antineoplastic

With capecitabine, for treatment of patients with advanced or metastatic breast cancer whose tumors overexpress HER2 and who have received treatment including an anthracycline, a taxane, and trastuzumab.

■ **NEW INDICATION:** In combination with letrozole for treatment of hormone-positive and HER2-positive advanced breast cancer in postmenopausal women for whom hormonal therapy is indicated.

Dosages and special alerts

1,250 mg (5 tablets) PO once daily on days 1–21. On days 1–14, given with capecitabine 2,000 mg/m²/day PO in two doses about 12 hr apart. Give in repeating 21-day cycle. Reduce lapatinib dosage to 750 mg/day PO with severe hepatic impairment. Stop drug if left ventricular ejection fraction (LVEF) is grade 2 or higher or it falls below lower limit of normal; may be restarted at 1,000 mg/day after at least 2 wk if LVEF returns to normal. Monitor heart function. Rash and GI upset common. Numerous drug interactions possible; avoid grapefruit juice.

laronidase

Aldurazyme

Drug class and indications

Enzyme

Treatment of patients with Hurler and Hurler-Scheie forms of mucopolysaccharidosis 1 and for patients with Scheie form who have moderate to severe symptoms.

Dosages and special alerts

0.58 mg/kg IV, infused over 3–4 hr, once each wk. Infusion reaction common, antipyretic and antihistamine given 60 min before infusion helps; regular follow-up essential; drug

improves respiratory function and walking capacity.

lenalidomide

Revlimid

Drug class and indications

Immune modulator, antianemic

Treatment of patients with transfusion-dependent anemia due to low or intermediate-1-risk myelodysplastic syndromes associated with a deletion of 5q cytogenetic abnormality with or without additional cytogenetic abnormalities.

Treatment of multiple myeloma, with dexamethasone, in patients who have received at least one other therapy.

Dosages and special alerts

Patients with anemia: 10 mg/day PO with water. Dosage may need to be lowered based on patient response and blood counts. Female patients must be tested to ensure that they are not pregnant and must agree to use two forms of contraception while using this drug. Male patients must agree to use contraceptive measures while using this drug.

Patients with multiple myeloma: 25 mg/day PO on days 1–21 of a 28-day cycle with dexamethasone 40 mg/day PO on days 1–4, 9–12, and 17–20 for first four cycles; for remaining cycles, given only on days 1–4.

Patients with renal impairment: Patient should be monitored closely and dosage adjusted downward as needed. Associated with serious birth defects; only dispensed through the Revassist Program and requires frequent pregnancy tests and signed agreement of understanding of risks; risk of PE, DVTs. Patient cannot donate blood or sperm.

DANGEROUS DRUG

lepirudin

Refludan

Drug class and indications

Anticoagulant

Treatment of heparin-induced thrombocytopenia associated with thromboembolic

disease; a rare allergic reaction to heparin; directly inhibits thrombin.

Dosages and special alerts

0.4 mg/kg initial IV bolus followed by a continuous infusion of 0.15 mg/kg for 2–10 days. Monitor for bleeding from any sites; watch for hepatic injury. Reduce dosage with renal failure. Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo, or ginseng therapy.

levoleucovorin

Drug class and indications

Folate analogue, rescue drug

To diminish the toxicity and counteract the effects of impaired methotrexate elimination and of inadvertent overdosage of folic acid antagonists after high-dose methotrexate therapy in osteosarcoma.

Dosages and special alerts

Serum methotrexate level of 10 micromolars at 24 hr, one micromolar at 48 hr, and less than 0.2 micromolar at 72 hr after methotrexate administration: 7.5 mg IV every 6 hr for 60 hr. (Ten doses starting at 24 hr after start of methotrexate.)

Serum methotrexate level remaining about 0.2 micromolar at 72 hr and more than 0.05 micromolar at 96 hr after methotrexate administration: Continue 7.5 mg IV every 6 hr until the methotrexate level is less than 0.05 micromolar.

Serum methotrexate level of 50 micromolars or more at 24 hr or 5 micromolars or more at 48 hr after administration, or a 100% or greater increase in serum creatinine level at 24 hr after methotrexate administration: 75 mg IV every 3 hr until methotrexate is less than 1 micromolar. Then 7.5 mg IV every 3 hr until methotrexate is less than 0.5 micromolar.

Inadvertent methotrexate overdose: 7.5 mg IV every 6 hr beginning within 24 hr of overdosage. Continue until methotrexate levels are within nontoxic range. Administer slowly because of high calcium levels in solution.

lincomycin hydrochloride

Lincocin

Drug class and indications

Lincosamide antibiotic

Treatment of serious infections that are responsive to lincomycin, when less toxic antibiotics are not effective.

Dosages and special alerts

Adult: 500 mg PO every 6–8 hr, or 600 mg IM every 12–24 hr, or 600 mg–1 g IV every 8–12 hr. Pediatric: 30–60 mg/kg/day PO, or 10 mg/kg IM every 12–24 hr, or 10–20 mg/kg/day IV in divided doses. Serious colitis can occur; have metronidazole or vancomycin and corticosteroids available; monitor for stomatitis.

lurasidone hydrochloride

Latuda

Drug class and indications

Atypical antipsychotic

Treatment of adults with schizophrenia.

Dosages and special alerts

40 mg PO once daily; may titrate up to a maximum of 80 mg/day. Should be taken with food. ☒ **Black box warning** Increased risk of death if used in elderly patients with dementia-related psychosis; not approved for this use. Risk of tardive dyskinesia, weight gain, hyperglycemia to diabetes, dyslipidemia, bone marrow suppression, orthostatic hypotension. Increased risk of suicidality during use. Do not use with ketoconazole, rifampin, diltiazem, or related drugs.

lutropin

Luveris

Drug class and indications

Luteinizing hormone, fertility drug

Used in combination with *Gonal-f* to stimulate follicle development in hypogonado-

tropic hypogonadal women as part of a fertility regimen.

Dosages and special alerts

75 international units subcutaneously daily with 75–150 international units *Gonal-f* for up to 14 days per cycle. Monitor for ovarian overstimulation; there is a risk for multiple births.

mecasermin

Increlex

Drug class and indications

Insulin growth factor-1

Long-term treatment of growth failure in children with severe primary insulin growth factor-1 deficiency or with growth hormone gene deletion who have developed neutralizing antibodies to growth hormone.

Dosages and special alerts

Dosage is based on individual response and glucose levels. Initially, 0.04–0.08 mg/kg (40–80 mcg/kg) bid by subcutaneous injection; may be increased by 0.04 mg/kg per dose to a maximum dose of 0.12 mg/kg bid. Hypoglycemia is common, monitor patient and ensure that patient eats after administration; tonsillar hypertrophy is common.

mesna

Mesnex

Drug class and indications

Cytoprotective drug

Prophylaxis to reduce the incidence of ifosfamide-induced hemorrhagic cystitis.

Unlabeled use: Reduction of the incidence of cyclophosphamide-induced hemorrhagic cystitis.

Dosages and special alerts

20% ifosfamide dose IV at the time of ifosfamide injection and at 4 and 8 hr after that. Timing needs to be exact. Monitor for any signs of bladder hemorrhage.

methazolamide

Neptazanexi

Drug classes and indications

Glaucoma drug, carbonic anhydrase inhibitor

Adjunct treatment of chronic open angle glaucoma, secondary glaucoma.

Preoperative use in acute angle-closure glaucoma where delay in surgery is desired to lower IOP.

■ **NEW INDICATION:** Lowering of IOP in conditions where lowering pressure would be beneficial (*Neptazanexi*).

Dosages and special alerts

50–100 mg PO bid or tid as needed to achieve best results. Administer with food if GI upset is a problem. Arrange for regular evaluation of IOP.

methoxsalen

8-MOP, Oxsoralen, Oxsoralen-Ultra, Uvadex

Drug class and indications

Psoralen

Symptomatic treatment of severe disabling psoriasis refractory to other forms of therapy; repigmentation of vitiliginous skin.

Treatment of cutaneous cell lymphoma.

Unlabeled use: With ultraviolet A radiation (UVAR), treatment of mycosis fungoides.

Orphan drug use: With UVAR photophoresis to treat diffuse systemic sclerosis; prevention of acute rejection of cardiac allografts.

Dosages and special alerts

Oral: Dosage varies with weight; dosing must be timed to coincide with UV light exposure. Do not expose patient to additional UV light. GI effects are very common.

methsuximide

Celontin

Drug class and indications

Antiepileptic, succinimide

Control of absence seizures when refractory to other drugs.

Dosages and special alerts

300 mg/day PO for the first wk; may increase to a maximum of 1.2 g/day as needed. Reduce dosage slowly, do not stop suddenly. Discontinue drug if rash, altered blood count, unusual depression or aggression occurs. May be used with other antiepileptic drugs. Increased risk of suicidality.

methylaltrexone bromide

Relistor

Drug class and indications

Opioid receptor antagonist, laxative

Treatment of opioid-induced constipation in patients with advanced illness receiving palliative care when response to laxative therapy has not been sufficient.

Dosages and special alerts

Dosage depends on weight. 38–less than 62 kg: 8 mg by subcutaneous injection every other day. 62–114 kg: 12 mg by subcutaneous injection every other day. If weight falls outside the above limits: 0.15 mg/kg per dose by subcutaneous injection every other day. Reduce dose by one-half with severe renal impairment. Monitor for severe diarrhea.

metirosine

Demser

Drug class and indications

Enzyme inhibitor

Preoperative preparation for surgery for pheochromocytoma.

Management of pheochromocytoma when surgery is contraindicated.

Chronic treatment of malignant pheochromocytoma.

Dosages and special alerts

250–500 mg PO qid. Preoperative: 2–3 g/day PO for 5–7 days. Maximum, 4 g/day. Ensure a liberal intake of fluids. Severe diarrhea may occur; use antidiarrheals if needed.

midodrine

ProAmatine

Drug class and indications

Alpha agonist, antihypertensive

Treatment of symptomatic orthostatic hypotension in patients whose lives are impaired by this disorder and who have not responded to other therapy.

Dosages and special alerts

10 mg PO tid during daytime hours when upright; reduce dose to 2.5 mg PO tid with renal impairment. Risk of bradycardia, paresthesia, pruritus, dysuria, chills. Patient should empty bladder before taking drug. Patient should report changes in vision, pounding headache, very slow heart rate.

miglustat

Zavesca

Drug class and indications

Enzyme inhibitor

Treatment of adult patients with mild to moderate type I Gaucher's disease for whom enzyme replacement is not a therapeutic option.

Dosages and special alerts

100 mg PO tid at regular intervals. Monitor for diarrhea, weight loss, and tremor; dosage may need to be reduced. Drug is pregnancy category X and it may also alter men's fertility. Caution patient about tremor development.

milnacipran

Savella

Drug class and indications

Selective serotonin and norepinephrine reuptake inhibitor

Management of fibromyalgia in adults.

Dosages and special alerts

Initially, 12.5 mg/day PO; increase over 1 wk to recommended dose of 50 mg PO bid. Doses up to 200 mg/day have been used.

⊗ **Black box warning** Increased risk of

suicidality; monitor patient accordingly. Avoid use with MAO inhibitors and in patients with uncontrolled narrow-angle glaucoma. Serotonin syndrome has been reported. Headache, nausea, constipation, dizziness, insomnia, dry mouth, and palpitations are common.

DANGEROUS DRUG**mitotane**

Lysodren

Drug class and indications

Antineoplastic

Treatment of inoperable hormone-secreting or hormone-non-secreting adrenal cortical carcinomas.

Dosages and special alerts

2–6 g/day PO in divided doses tid to qid, slowly increased to 9–10 g/day; if no benefits are seen by 3 mo, consider another form of treatment. Birth defects have been reported with use; suggest use of contraceptives. ⊗ **Black box warning** Discontinue temporarily in times of severe stress; adrenal hormone replacement may be needed in times of stress.

nefazodone**Drug class and indications**

Antidepressant

Treatment of depression.

Dosages and special alerts

200 mg/day PO in divided doses, may be increased at 1-wk intervals to 300–600 mg/day. Limit available doses for severely depressed patients, and take suicide precautions. Use caution to assure at least 14 days between MAOI and nefazodone use and at least 7 days between stopping nefazodone and starting MAOIs. ⊗ **Black box warning** Watch for signs of hepatic impairment, and stop drug immediately if they occur. Increased risk of suicidality, suicidal ideation.

DANGEROUS DRUG**nelarabine**

Arranon

Drug class and indications

Antimitotic drug, antineoplastic

Treatment of patients with T-cell acute lymphoblastic leukemia and T-cell lymphoblastic lymphoma whose disease has not responded to or has relapsed following treatment with at least two chemotherapy regimens.

Dosages and special alerts

Adults: 1,500 mg/m² IV over 2 hr on days 1, 3, and 5; repeat every 21 days. Pediatric patients: 650 mg/m² IV over 1 hr daily for 5 consecutive days; repeat every 21 days. Bone marrow suppression common. ☒ **Black box warning** Watch for neurologic toxicity, including neuropathies and demyelination disorders.

nesiritide

Natrecor

Drug class and indications

Human B-type natriuretic peptide, vasodilator

Treatment of patients with acutely decompensated HF with dyspnea at rest or with minimal activity.

Dosages and special alerts

2 mcg/kg IV bolus followed by a continuous infusion of 0.01 mcg/kg/min for no longer than 48 hr. Monitor patient continuously. Discontinue if serious hypotension occurs, which could worsen condition. Maintain hydration. Replace any reconstituted solution every 24 hr.

nilotinib

Tasigna

Drug class and indications

Kinase inhibitor, antineoplastic

Initial treatment of chronic phase and accelerated phase Philadelphia chromosome-positive CML in adults resistant to or intolerant of prior therapy that included imatinib or for treatment at first diagnosis.

Dosages and special alerts

400 mg PO bid, about 12 hr apart, without food. Dosage may need adjustment based on myelosuppression during therapy. Watch for prolonged QT interval, bone marrow suppression, and possible liver toxicity.

nimodipine**Drug class and indications**

Calcium channel blocker

Improvement of neurologic deficits due to spasm following a subarachnoid hemorrhage (SAH) from ruptured congenital intracranial aneurysm.

Dosages and special alerts

60 mg PO every 4 hr, beginning within 96 hr of SAH for 21 consecutive days. Monitor for cardiac effects (arrhythmias, hypotension). If patient is unable to take oral medications, remove contents of capsule using a needle and empty contents into nasogastric tube; flush with 30 mL normal saline.

nitazoxanide

Alinia

Drug class and indications

Antiprotozoal

Treatment of diarrhea caused by *Cryptosporidium parvum* in patients 1 yr and older.

Treatment of *Giardia lamblia* in pediatric patients 1–11 yr.

Dosages and special alerts

Patients 12–47 mo: 5 mL (100 mg nitazoxanide) PO every 12 hr for 3 days. Patients 4–11 yr: 10 mL (200 mg nitazoxanide) PO every 12 hr for 3 days. Patients 12 yr and older: 500 mg (tablet or suspension) PO every 12 hr for 3 days taken with food. Obtain stool for ova and parasite testing before beginning therapy. To reconstitute, tap bottle until all powder flows freely; add about 24 mL of water to bottle and shake vigorously to suspend powder; add remaining 24 mL of water and shake vigorously again. Use cautiously with diabetic

patients; suspension contains sucrose. Give drug with food. Advise parents to use good hand-washing technique and to dispose of diapers properly, when appropriate.

ofatumumab

Arzerra

Drug class and indications

Cytotoxic monoclonal antibody, antineoplastic

Treatment of chronic lymphocytic leukemia refractory to standard therapy.

Dosages and special alerts

12 doses given by IV infusion using the following schedule: 300 mg, followed in 1 wk by 2,000 mg/wk for seven doses, followed 4 wk later by 2,000 mg every 4 wk for four doses. Premedicate patient with acetaminophen, antihistamines, and IV corticosteroids. Infusion reaction is common; bone marrow suppression and infections, including progressive multifocal leukoencephalopathy and activation of hepatitis B, can occur; rash and GI effects are most common.

olsalazine sodium

Dipentum

Drug class and indications

Anti-inflammatory

Maintenance of remission of ulcerative colitis in patients intolerant to sulfasalazine.

Dosages and special alerts

1 g/day PO, divided into two doses. Give with meals. Monitor patient for renal impairment. Abdominal pain common.

omalizumab

Xolair

Drug class and indications

Monoclonal antibody, antiasthmatic

To decrease asthma exacerbation in patients 12 yr and older with moderate to severe persistent asthma who have a positive skin test to a perennial airborne allergen,

who are not controlled by inhaled corticosteroids.

Dosages and special alerts

150–375 mg by subcutaneous injection every 2–4 wk, based on body weight and pretreatment immunoglobulin E levels. Discontinue and arrange for appropriate therapy at first sign of severe allergic reaction. Solution is thick; complete injection may take 5–10 sec. Do not use during pregnancy or lactation.

⊗ **Black box warning** Anaphylaxis with bronchospasm, hypotension, syncope, urticaria, and edema may occur. Monitor patient after administration; have medical support readily available.

oprelvekin

Neumega

Drug class and indications

Interleukin

Prevention of severe thrombocytopenia and reduction of platelet transfusions following myelosuppressive chemotherapy in patients with nonmyeloid malignancies at high risk to develop severe thrombocytopenia.

Dosages and special alerts

50 mcg/kg/day subcutaneously starting 1 day after chemotherapy and continuing for 14–21 days or until platelet count is at least 50,000 cells/mm³. Protect patient from exposure to infection; urge the use of contraceptives. ⊗ **Black box warning** Drug may cause severe allergic reaction, including anaphylaxis.

DANGEROUS DRUG

oxaliplatin

Eloxatin

Drug class and indications

Antineoplastic

Treatment of patients with metastatic carcinoma of the colon or rectum whose disease has progressed during or within 6 mo of completion of first-line therapy with 5-fluorouracil (5-FU)/leucovorin (LV) and irinotecan;

first-line therapy for advanced colorectal cancer with 5-FU and LV.

Dosages and special alerts

85 mg/m² IV infusion in 250–500 mL D₅W with leucovorin 200 mg/m² in D₅W both given over 2 hr followed by 5-FU 400 mg/m² IV bolus over 2–4 min, followed by 5-FU 600 mg/m² IV infusion in 500 mL D₅W as a 22-hr continuous infusion on day 1, then leucovorin 200 mg/m² IV infusion over 2 hr followed by 5-FU 400 mg/m² bolus given over 2–4 min, followed by 5-FU 600 mg/m² IV infusion in 500 mL D₅W as a 22-hr continuous infusion on day 2; repeat cycle every 2 wk. Pre-medicate with antiemetics and dexamethasone. Monitor for potentially dangerous anaphylactic reactions.

palifermin

Kepivance

Drug class and indications

Keratinocyte growth factor

To decrease the incidence and duration of severe oral mucositis in patients with hematologic malignancies receiving myelotoxic chemotherapy requiring hematopoietic stem cell support.

Dosages and special alerts

60 mcg/kg/day by IV bolus infusion for 3 consecutive days before and 3 consecutive days after chemotherapy regimen. Monitor for rash and mouth changes such as taste alteration.

DANGEROUS DRUG

panitumumab

Vectibix

Drug class and indications

Monoclonal antibody, antineoplastic

Treatment of epidermal growth factor receptor–expressing metastatic colorectal carcinoma with disease progressing with or after chemotherapy regimens containing fluoropyrimidine, cisplatin, and irinotecan.

Dosages and special alerts

6 mg/kg IV over 60 min every 14 days; doses larger than 1,000 mg should be given over 90 min. Dosage should be adjusted in patients experiencing infusion reactions or severe adverse reactions. ☒ **Black box warning** Monitor patient for possibly severe infusion reactions, dermatological toxicity, pulmonary fibrosis.

paricalcitol

Zemlar

Drug class and indications

Vitamin

Prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Dosages and special alerts

0.04–0.1 mcg/kg injected during dialysis, not more often than every other day. Patients not on dialysis: 1–2 mcg/day PO or 2–4 mcg PO three times a wk, based on parathyroid levels. Monitor for hypercalcemia, treat appropriately. Ensure adherence to dietary regimen and use of calcium supplements.

pazopanib

Votrient

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of advanced renal cell carcinoma.

Dosages and special alerts

800 mg/day PO without food (at least 1 hr before or 2 hr after meals). Not for use with severe hepatic impairment; limit to 200 mg/day with moderate hepatic impairment. Prolongs QT interval. Fatal hemorrhagic events have been reported. Arterial thrombotic events, some fatal; GI perforations and fistulas; hypertension; hypothyroidism; and proteinuria have occurred. Pregnancy Category D; advise use of contraceptives. Diarrhea, depigmentation of hair, and GI effects are common. Patient must be monitored very carefully.

pegaptanib

Macugen

Drug class and indications

Monoclonal antibody

Treatment of neovascular (wet) age-related macular degeneration.

Dosages and special alerts

0.3 mg once every 6 wk by intravitreal injection into the affected eye. Monitor for vision changes, eye infection, retinal detachment, and traumatic cataract.

DANGEROUS DRUG**pegaspargase**

Oncaspar

Drug class and indications

Antineoplastic

Treatment of ALL in patients hypersensitive to native forms of L-asparaginase or as a component of a multi-drug regimen.

Dosages and special alerts

2,500 international units/m² IM or IV every 14 days. Associated with pancreatitis, bone marrow depression, and renal toxicity. Monitor patient closely. Save IV use for extreme situations. IM use is preferred.

peginterferon alfa-2a

Pegasys

Drug class and indications

Interferon

Treatment of adults with hepatitis C who have compensated liver disease and who have not been treated with interferon alfa.

Dosages and special alerts

180 mcg subcutaneously once each wk for 48 wk. Adjust dosage with low neutrophil counts, low platelet counts, and for patients on dialysis or who have impaired liver function. Interstitial pneumonitis has been reported; monitor lung function closely. Cardiac dysfunction and hepatic impairment can occur. Protect patient from exposure to infection.

peginterferon alfa-2b

Peg-Intron

Drug class and indications

Interferon

Treatment of patients older than 18 yr with chronic hepatitis C, who have not received alpha interferon and who have compensated liver function.

Treatment of hepatitis C in patients who have not received interferons; given with ribavirin.

Unlabeled use: Renal carcinoma.

Dosages and special alerts

1 mcg/kg subcutaneously once per wk for 1 yr; flu-like symptoms common. Monitor bone marrow and liver function.

pegloticaste

Krystexxa

Drug class and indications

PEGylated uric-acid specific enzyme

Treatment of chronic gout in adult patients refractory to conventional therapy.

Dosages and special alerts

8 mg by IV infusion over no less than 120 min every 2 wk; do not give as IV push or bolus. Monitor serum uric-acid levels carefully. Pre-medicate with antihistamines and corticosteroids. Contraindicated with G6PD deficiencies. Administer in setting prepared to support patient if anaphylaxis occurs. Gout flare may occur during treatment; alert patient. Infusion reactions are common as well as GI symptoms. Use in pregnancy only if benefits outweigh risks; do not use in breast-feeding women.

pegvisomant

Somavert

Drug class and indications

Human growth hormone analogue

Treatment of acromegaly in patients who have had no adequate response to surgery or radiation and other standard therapies or

patients for whom these therapies are not appropriate.

Dosages and special alerts

40 mg by subcutaneous injection as a loading dose; then 10 mg/day by subcutaneous injection. Local reactions to the injection are common; rotate sites regularly and monitor for infection. Monitor liver function and blood glucose levels regularly.

DANGEROUS DRUG

pemetrexed

Alimta

Drug class and indications

Antifolate antineoplastic given with cisplatin
Treatment of patients with malignant mesothelioma whose disease is unresectable or who are not candidates for surgery.

Treatment of locally advanced or metastatic non–small-cell lung cancer as a single agent after prior chemotherapy or with cisplatin for first-line treatment.

Dosages and special alerts

500 mg/m² IV infused over 10 min on day 1, followed by 75 mg/m² cisplatin (treatment of mesothelioma only) IV over 2 hr; repeat cycle every 21 days. Pretreat with corticosteroid, folic acid, and vitamin B₁₂. Monitor for bone marrow suppression and GI effects.

penicillamine

Cuprimine, Depen

Drug classes and indications

Chelate, antirheumatic

Treatment of severe, active rheumatoid arthritis when other therapies fail, Wilson's disease, cystinuria when other measures fail.

Dosages and special alerts

125–250 mg/day PO; may be increased to 1 g/day if needed. Serious bone marrow depression, myasthenic syndrome, polymyositis can occur; discontinue if drug fever occurs; Monitor patient closely; push fluids with cystinuria.

pentetate calcium trisodium (Ca-DTPA)

penetate zinc trisodium (Zn-DTPA)

Drug class and indications

Chelate

Treatment of patients with known or suspected internal contamination with plutonium, americium, or curium, to increase rates of elimination.

Dosages and special alerts

1 g Ca-DTPA IV followed in 24 hr by 1 g Zn-DTPA IV using a slow IV push over 3–4 min. Pediatric patients: 14 mg/kg/day IV (not to exceed 1 g/dose), first using Ca-DTPA, then switching to Zn-DTPA 24 hr after initial dose. Use precautions for handling wastes to avoid contamination of others. Nursing mothers should express breast milk and dispose of it properly. Encourage hydration to improve elimination of the radioactive materials.

pentosan polysulfate sodium

Elmiron

Drug class and indications

Bladder protectant

Relief of bladder pain associated with interstitial cystitis.

Dosages and special alerts

100 mg PO tid on an empty stomach. May cause loss of hair (suggest wearing a wig); increased bleeding (is a low–molecular-weight heparin).

DANGEROUS DRUG

pentostatin (2' deoxycoformycin [DCF])

Nipent

Drug class and indications

Antineoplastic; antibiotic

Treatment of adults with alpha interferon refractory hairy cell leukemia, chronic

lymphocytic leukemia, cutaneous T-cell lymphoma, peripheral T-cell lymphoma.

Dosages and special alerts

4 mg/m² IV every other wk, decrease to 2 mg/m² with renal impairment. Hydrate patient before each dose and monitor closely.

⊗ **Black box warning** Associated with fatal pulmonary toxicity and bone marrow depression.

pilocarpine hydrochloride

Salagen

Drug class and indications

Parasympathomimetic; mouth and throat product

Treatment of symptoms of xerostomia from salivary gland dysfunction caused by radiation therapy for cancer of the head and neck.

Dosages and special alerts

5–10 mg PO tid. Can cause blurred vision, parasympathomimetic effects. Monitor susceptible patients carefully.

pimozide

Orap

Drug class and indications

Antipsychotic; diphenylbutylpiperidine

Suppression of severely compromising motor or phonic tics in patients with Tourette syndrome who have not responded to other therapy.

Dosages and special alerts

1–2 mg/day PO; up to a maximum of 10 mg/day. Monitor for prolonged QTc interval. Has been associated with severe cardiac complications; may cause dizziness, sedation, Parkinson-like symptoms.

plerixafor

Mozobil

Drug class and indications

Hematopoietic stem cell mobilizer

Mobilization of hematopoietic stem cells to the peripheral blood for collection and subsequent autologous transplantation in patients with non-Hodgkin lymphoma and multiple myeloma in combination with a granulocyte-colony stimulating factor (G-CSF).

Dosages and special alerts

Start therapy after patient has received G-CSF once daily for 4 days; 0.24 mg/kg by subcutaneous injection, repeated for up to 4 consecutive days. Administer approximately 11 hours before apheresis. In severe renal impairment, reduce dose to 0.16 mg/kg. May mobilize leukemic cells; do not use in leukemia. Monitor blood counts and watch for potential splenic rupture. Headache, dizziness, nausea, vomiting, and injection site reactions are common.

polidocanol

Asclera

Drug class and indications

Sclerosing agent

Treatment of uncomplicated spider veins, and reticular veins in the lower extremities. No experience in treating varicose veins over 3 mm in diameter.

Dosages and special alerts

IV injections at the site of the varicose vein; dosage varies with size and extent of varicosity. Usual dose, 0.1–0.3 mL per varicose vein; maximum volume per session, 10 mL. Must be administered by health care professional familiar with this therapy. Patient may experience mild local reactions at injection sites.

poly-L-lactic acid

Sculptra

Drug classes and indications

Polymer, cosmetic device

Restoration and correction of the signs of lipoatrophy in patients with HIV syndrome.

Dosages and special alerts

0.1–0.2 mL injected intradermally at each injection site. Up to 20 injections per cheek may be needed; re-treat periodically. Do not use if any sign of skin infection is present. Apply ice packs to area immediately after injection and for first 24 hr; massage injection sites daily.

DANGEROUS DRUG**porfimer sodium**

Photofrin

Drug class and indications

Antineoplastic

Photodynamic therapy for palliation of patients with completely or partially obstructing esophageal cancer or transitional cancer who cannot be treated with laser alone, transitional cell carcinoma in situ of urinary bladder, endobronchial non–small-cell lung cancer.

Dosages and special alerts

2 mg/kg IV given as a slow injection over 3–5 min; must be followed in 40–50 hr and again in 96–120 hr by laser therapy. Monitor for pleural effusion and respiratory complications. Avoid any contact with the drug. Protect patient from exposure to light for 30 days after treatment.

pralatrexate

Folotylin

Drug class and indications

Folate analogue metabolic inhibitor, antineoplastic

Treatment of relapsed or refractory peripheral T-cell lymphoma.

Dosages and special alerts

30 mg/m² as an IV push over 3–5 min once weekly for 6 wk in a 7-wk cycle. Patient should also receive vitamin B₁₂, 1 mg IM every 8–10 wk, and folic acid, 1–1.25 mg/day PO. Pregnancy Category X. Bone marrow suppression is common. Mucositis can be severe; dosage may need to be modified.

praziquantel

Biltricide

Drug class and indications

Anthelmintic

Treatment of *Schistosoma* infections, liver flukes.

Orphan drug use: treatment of neurocysticercosis.

Dosages and special alerts

3 doses of 20–25 mg/kg PO as a one-day treatment; allow 4–6 hr between doses. Administer with food. Do not cut, crush, or chew tablets; swallow whole. GI upset is common.

DANGEROUS DRUG**procarbazine hydrochloride**

Matulane

Drug class and indications

Antineoplastic

Used in combination with other antineoplastics for treatment of stage III and IV Hodgkin's lymphoma (part of MOPP chemotherapy regimen).

Dosages and special alerts

2–4 mg/kg/day PO for the first wk, and then 4–6 mg/kg/day PO. Maintenance dosage: 1–2 mg/kg/day. Monitor bone marrow and adjust dosage accordingly. Stress need for barrier contraceptives. Advise patient to avoid alcohol and foods high in tyramine.

propantheline bromide

Pro-Banthine

Drug class and indications

Anticholinergic, antimuscarinic, parasympatholytic, antispasmodic

Adjunct therapy in the treatment of peptic ulcer.

Unlabeled uses: antisecretory and antispasmodic.

Dosages and special alerts

7.5–15 mg PO 30 min before meals and at bedtime. Pediatric patients: 1.5 mg/kg/day PO in divided doses tid to qid as an antisecretory or 2–3 mg/kg/day PO in divided doses every 4–6 hr and at bedtime as an antispasmodic. Not approved for peptic ulcer. Monitor patient's hydration. Control environment to prevent hyperpyrexia. Encourage patient to void before each dose because urine retention can occur.

DANGEROUS DRUG**protein C concentrate (human)**

Ceprotin

Drug class and indications

Blood product, anticoagulant

Replacement therapy for patients with severe congenital protein C deficiency to prevent and treat venous thrombosis and purpura fulminans.

Dosages and special alerts

Initially, 100–120 international units/kg by IV injection. Then 60–80 international units/kg IV every 6 hr for three more doses. Maintenance dose, 45–60 international units/kg IV every 6–12 hr based on patient response. Monitor patient closely for possibly severe allergic reaction. Risk of disease transmission in blood products.

quinine sulfate

Qualaquin

Drug class and indications

Cinchonan, antimalarial

Treatment of uncomplicated *Plasmodium falciparum* malaria.

Dosages and special alerts

648 mg (two capsules) PO every 8 hr for 7 days. Not for use in children. Reduce dosage with severe renal impairment. Cinchonism causes vision changes, dizziness, sweating, tinnitus, headache, progressing to GI problems. Use caution with prolonged QT interval. Not for treating nocturnal leg cramps. Risk of seri-

ous to life-threatening blood-related reactions; use with caution.

ranibizumab

Lucentis

Drug class and indications

Monoclonal antibody, ophthalmic agent

Treatment of patients with neovascular (wet) age-related macular degeneration.

■ **NEW INDICATION:** Treatment of macular edema following retinal vein occlusion.

Dosages and special alerts

0.5 mg (0.05 mL) by intravitreal injection once every mo; may be changed to once every 3 mo after the first four injections if monthly injections are not feasible. Monitor patient carefully for detached retina, increased IOP. Patient should be anesthetized before injection and should receive antibiotic treatment.

rasburicase

Elitek

Drug class and indications

Enzyme

Initial management of plasma uric acid levels in patients with leukemia, lymphoma, and solid tumor malignancies who are receiving anti-cancer therapy expected to result in tumor lysis and subsequent elevation of plasma uric acid.

Dosages and special alerts

0.15 or 0.2 mg/kg IV as a single daily infusion over 30 min for 5 days. Chemotherapy should be started 4–24 hr after the first dose. Blood drawn to monitor uric acid levels must be collected in pre-chilled, heparinized vials and kept in an ice-water bath. Analysis must be done within 4 hr.

rifabutin

Mycobutin

Drug class and indications

Antibiotic

Prevention and treatment of disseminated *Mycobacterium avium* complex disease in patients with advanced HIV infection.

Dosages and special alerts

Adults: 300 mg PO daily. Children: 5 mg/kg/day. GI effects, bone marrow depression common. Body fluids turn a reddish-orange; contact lenses may be stained. Do not use with active TB.

rilonacept

Arcalyst

Drug class and indications

Interleukin blocker, anti-inflammatory drug
Treatment of cryopyrin-associated periodic syndromes, including familial cold autoinflammatory syndrome and Muckle-Wells syndrome in adults and children 12 yr and older.

Dosages and special alerts

Adults: Loading dose of 320 mg given as two 160-mg (2-mL) subcutaneous injections given at different sites; then once-weekly subcutaneous injections of 160 mg (2 mL). Pediatric patients 12–17 yr: Loading dose of 4.4 mg/kg up to a maximum of 320 mg subcutaneously. May be given in divided doses if necessary; then once-weekly injections of 2.2 mg/kg up to a maximum 160 mg. Monitor lipid levels. Risk of severe infection exists.

riluzole

Rilutek

Drug class and indications

Amyotrophic lateral sclerosis (ALS) drug

Treatment of ALS; extends survival time or time to tracheostomy.

Orphan drug use: Treatment of Huntington's disease.

Dosages and special alerts

50 mg PO every 12 hr. Slows disease but does not cure it. Take on an empty stomach at the same time each day. Protect drug from light. Commonly causes nausea and vomiting.

DANGEROUS DRUG

rituximab

Rituxan

Drug class and indications

Antineoplastic, monoclonal antibody

First-line treatment or treatment of relapsed or refractory, low-grade or follicular CD20-positive non-Hodgkin's B-cell lymphoma.

With methotrexate, to reduce signs and symptoms of moderately to severely active rheumatoid arthritis in patients with inadequate response to tumor necrosis factor antagonists.

Dosages and special alerts

Lymphoma in adults: 375 mg/m² IV, once weekly for four or eight doses.

Arthritis: Two 1,000-mg infusions separated by 2 wk, given with methotrexate.

Premedicate patient with acetaminophen and diphenhydramine to decrease fever, chills associated with infusion. Protect patient from exposure to infection. Monitor for reactivation of hepatitis B; discontinue use if viral hepatitis occurs. ☒ **Black box warning** Fatal infusion reactions, severe cutaneous reactions, and tumor lysis syndrome are possible.

romidepsin

Istodax

Drug class and indications

Histone deacetylase inhibitor, antineoplastic

Treatment of patients with cutaneous T-cell lymphoma who have received at least one prior systemic therapy.

Dosages and special alerts

14 mg/m² IV over a 4-hr period on days 1, 8, and 15 of a 28-day cycle. Repeat every 28 days if patient tolerates drug and benefits from it effects. Pregnancy category D. Associated with ECG changes, including prolonged QT interval. Binds to estrogen receptors and may cause fetal harm. May negate effects of hormonal contraceptives; use of barrier contraceptives is advised. May cause GI upset and bone marrow depression.

romiplostim

Nplate

Drug class and indications

Thrombopoietin receptor agonist

Treatment of thrombocytopenia in patients with chronic immune thrombocytopenic purpura who have insufficient response to corticosteroids, immunoglobulins, or splenectomy.

Dosages and special alerts

1 mcg/kg by subcutaneous injection once a wk; adjust dosage in increments of 1 mcg/kg to achieve platelet count of 50×10^9 . Maximum weekly dose is 10 mcg/kg. Risk of thrombosis, reticulin deposition in the bone marrow, and hematologic malignancies. Patient must be enrolled in the *Nplate* NEXUS program; drug must be administered by a health care provider enrolled in the program. Not for use in pregnant or nursing women.

rufinamide

Banzel

Drug class and indications

Antiepileptic, sodium channel blocker

Adjunctive treatment of seizures associated with Lennox-Gastaut syndrome in adults and children 4 yr and older.

Dosages and special alerts

Adults: Initially, 400–800 mg/day PO in two equally divided doses. Increase to a target 3,200 mg/day PO in two equally divided doses. Pediatric patients age 4 and older: Initially, 10 mg/kg/day PO in two equally divided doses to a target of 45 mg/kg/day or 3,200 mg/day, whichever is less. Monitor for suicidal ideation and mood changes. Hormonal contraceptives may not be effective if combined with this drug.

sacrosidase

Sucraid

Drug class and indications

Enzyme

Oral replacement of genetically determined sucrase deficiency.

Dosages and special alerts

15 kg or less: 1 mL or 22 drops per meal or snack. More than 15 kg: 2 mL or 44 drops per meal or snack. Do not use in patients with known allergy to yeast. Refrigerate bottle; discard 4 wk after opening.

sapropterin dihydrochloride

Kuvan

Drug class and indications

Coenzyme factor, phenylalanine reducer

With diet, to reduce blood phenylalanine level in patients with hyperphenylalaninemia caused by tetrahydrobiopterin-responsive phenylketonuria.

Dosages and special alerts

4 yr and older: Starting dose 10 mg/kg/day PO once daily. May be adjusted to 5–20 mg/kg/day based on blood phenylalanine level. Dissolve tablets in water or apple juice and have patient drink within 15 min. Monitor phenylalanine level and adjust dosage as needed. Must be used with dietary restrictions.

secretin

ChiRhoStim

Drug class and indications

Diagnostic agent

Stimulation of pancreatic secretions to aid in the diagnosis of pancreatic exocrine dysfunction.

Stimulation of gastrin secretion to aid in the diagnosis of gastrinoma.

Dosages and special alerts

0.2–0.4 mcg/kg IV over 1 min.

sevelamer hydrochloride

Renagel

Drug class and indications

Calcium-phosphate binder

Reduction of serum phosphorus levels in hemodialysis patients in end-stage renal disease.

Dosages and special alerts

One to four tablets with each meal based on serum phosphorus levels; may be increased by one tablet per meal to achieve desired serum phosphorus level. Does not cause increase in calcium levels.

sipuleucel-T

Provenge

Drug class and indications

Cellular immunotherapy

Treatment of asymptomatic or minimally symptomatic metastatic castrate-resistant (hormone refractory) prostate cancer.

Dosages and special alerts

Administer IV over 60 min; do not use a cell filter. Administer three doses at approximately 3-wk intervals. Premedicate with oral acetaminophen and an antihistamine. Risk of acute infusion reactions; closely monitor patient during administration. Universal precautions are required. Patient may experience chills, fever, headache, nausea, joint pain.

sirolimus

Rapamune

Drug class and indications

Immunosuppressant

Prophylaxis for organ rejection in renal transplants in conjunction with adrenal corticosteroids and cyclosporine.

Dosages and special alerts

Dosage based on weight. Less than 40 kg: Loading dose of 3 mg/m² then 1 mg/m²/day PO. 40 kg or more: Loading dose of 6 mg PO as soon after transplant as possible, and then daily dose of 2 mg PO in combination with cyclosporine and corticosteroids. Monitor liver and renal function closely; changes could indicate need to change dose or discontinue drug. ☒ **Black box warning** Drug is

associated with these risks: Increased susceptibility to infections, graft loss and hepatic artery thrombosis with liver transplant, bronchial anastomotic dehiscence in lung transplants.

sodium ferric gluconate complex

Ferlecit

Drug class and indications

Iron product

Treatment of iron deficiency in patients undergoing chronic hemodialysis who are also receiving erythropoietin therapy.

Dosages and special alerts

Test dose: 2 mL diluted in 50 mL 0.9% sodium chloride for injection, given IV over 60 min. Adults: 10 mL diluted in 100 mL 0.9% sodium chloride for injection given IV over 60 min. Most patients will initially require 8 doses given at sequential dialysis sessions, then periodic use based on hematocrit. Flushing and hypertension are common effects.

sodium phenylacetate/sodium benzoate

Ammonul

Drug class and indications

Urea substitute, ammonia reducer

Adjunctive therapy in the treatment of hyperammonemia and associated encephalopathy in patients with deficiencies in enzymes associated with the urea cycle.

Dosages and special alerts

0–20 kg: 2.5 mL/kg; more than 20 kg: 55 mL/m². Given IV through a central line with arginine. Patients not responsive will require hemodialysis.

somatropin, rDNA origin

Zorbtive

Drug class and indications

Human growth hormone

Treatment of short-bowel syndrome in patients receiving specialized nutritional support.

Dosages and special alerts

Adults: 0.1 mg/kg/day subcutaneously to a maximum of 8 mg/day for a total of 4 wk. Swelling and arthralgias may limit use; reduce dose by 50%. Monitor for glucose intolerance and intracranial hypertension.

DANGEROUS DRUG

sorafenib tosylate

Nexavar

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of patients with advanced renal cell carcinoma, hepatocellular carcinoma.

Dosages and special alerts

Adults: 400 mg PO bid on an empty stomach (1 hr before or 2 hr after eating). Swallow tablets whole. Patients with adverse drug reactions: Temporarily stop drug, or reduce dose to 400 mg/day PO and monitor patient closely. Not recommended for pediatric patients. Monitor for skin reactions, hand-foot syndrome, hypertension.

streptomycin sulfate

Drug class and indications

Antibiotic

Treatment of tularemia, plague, subacute bacterial endocarditis (if less toxic agents are not appropriate).

Fourth drug in the treatment of TB.

Dosages and special alerts

Adults: 15 mg/kg/day IM, or 25–30 mg/kg IM 2 or 3 times a wk. Pediatric patients: 20–40 mg/kg/day IM or 25–30 mg/kg/IM 2 or 3 times a wk.

Tularemia: 1–2 g/day IM for 7–14 days.

Plague: 2 g/day IM in two divided doses for at least 10 days.

Tinnitus, dizziness, ringing in the ears, hearing loss are common. Monitor patient for renal toxicity, injection site infections.

DANGEROUS DRUG

streptozocin

Zanosar

Drug classes and indications

Alkylating drug, antineoplastic

Treatment of metastatic islet cell carcinoma of the pancreas.

Dosages and special alerts

500 mg/m² IV for 5 consecutive days every 6 wk, or 1,000 mg/m² IV once per wk for 2 wk, and then increase to 1,500 mg/m² IV each wk. Bone marrow suppression likely; monitor counts carefully and reduce dosage as needed. ☒ **Black box warning** Monitor for renal and liver toxicity. Special handling of toxic drug required.

DANGEROUS DRUG

sunitinib

Sutent

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of GI stromal tumor if patient is intolerant to or tumor progresses after imatinib therapy.

Treatment of advanced renal cell carcinoma.

Dosages and special alerts

50 mg/day PO for 4 wk, followed by 2 wk of rest; repeat cycle. Monitor patient carefully for GI disturbances, bone marrow suppression; dosage adjustment may be needed. ☒ **Black box warning** Risk of serious to fatal hepatotoxicity. Monitor LFTs closely.

talco, USP

Sterile Talc Powder

Drug class and indications

Sclerosing drug

To decrease the recurrence of malignant pleural effusion.

Dosages and special alerts

5 g in 50–100 mL sodium chloride injection injected into a chest tube after pleural fluid

has been drained. Clamp chest tube and have patient change positions for 2 hr; unclamp chest tube and continue external suction. Acute respiratory distress syndrome, PE, MI, local reactions are common. Monitor patient closely.

telbivudine

Tyzeka

Drug class and indications

Nucleoside, antiviral

Treatment of chronic hepatitis B in adult patients with evidence of viral replication and either evidence of persistent elevations in serum aminotransferases (ALT or AST) or histologically active disease.

Dosages and special alerts

Adults older than 16 yr: 600 mg/day PO with or without food. Pediatric patients: Safety and efficacy not established. Patients with renal impairment: For creatinine clearance greater than 50 mL/min, no adjustment needed; for clearance of 30–49 mL/min, 600 mg PO every 48 hr; for clearance less than 30 mL/min, 600 mg PO every 72 hr; for end-stage renal disease, 600 mg PO every 96 hr. ☒ **Black box warning** Monitor patient for myopathy, severe hepatic failure with steatosis, exacerbation of hepatitis B with discontinuation of drug.

DANGEROUS DRUG

temozolomide

Temodar

Drug class and indications

Antineoplastic

Treatment of refractory astrocytoma in patients at first relapse with disease progression on a drug regimen including a nitrosourea and procarbazine; treatment of advanced metastatic melanoma.

Treatment of adult patients with newly diagnosed glioblastoma multiforme with radiation therapy and then as maintenance therapy.

Dosages and special alerts

Anaplastic astrocytoma: Dose is based on body surface area. Taken for 5 consecutive days for a 28-day treatment cycle. Adjusted dose is based on neutrophil and platelet counts. Monitor bone marrow function closely. Especially toxic in women and the elderly.

Glioblastoma: 75 mg/m²/day PO or IV for 42 days with focal radiation therapy, then 6 cycles: cycle 1—150 mg/m²/day PO or IV for 5 days, 23 days rest; cycles 2–6—200 mg/m²/day PO or IV for 5 days, 23 days rest.

DANGEROUS DRUG

temsirolimus

Torisel

Drug class and indications

Kinase inhibitor, antineoplastic

Treatment of advanced renal cell carcinoma.

Dosages and special alerts

30 min after giving prophylactic diphenhydramine 25–50 mg IV, give 25 mg IV infused over 30–60 min once per wk until disease progresses or unacceptable toxicity occurs. Monitor lung function, blood glucose level, bowel sounds, renal function. Assess patient for slowed healing. Do not give with vaccines. Do not give to pregnant women. Avoid giving with grapefruit juice, St. John's wort, numerous drugs.

teriparatide

Forteo

Drug class and indications

Parathyroid hormone, calcium regulator

Treatment of postmenopausal women with osteoporosis and high risk of fracture.

Treatment of men and women with osteoporosis associated with sustained systemic glucocorticoid therapy at high risk for fracture.

To increase bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture.

Dosages and special alerts

20 mcg/day subcutaneously in thigh or abdominal wall; use for more than 2 yr is not recommended. ☒ **Black box warning** Increased risk of osteosarcoma in rats; should not be used in patients with increased risk of osteosarcoma (Paget's disease, unexplained elevations in alkaline phosphatase level, open epiphyses, prior external beam or implant radiation therapy involving the skeleton). Not recommended for treatment of bone disease other than osteoporosis. May cause orthostatic hypotension; may increase risk of renal stones. Not for use by nursing mothers. Arthralgia, pain, and nausea are common.

tesamorelin

Egrifta

Drug class and indications

Growth hormone releasing factor analog

Reduction of excess abdominal fat in HIV-infected patients with lipodystrophy related to use of antiretrovirals

Dosages and special alerts

2 mg/day subcutaneously. Not for use in pregnancy or breast-feeding. Monitor patient for fluid retention, glucose intolerance, and injection-site reactions. Encourage patient to rotate injection sites.

thalidomide

Thalomid

Drug class and indications

Immune modulator

Treatment of erythema nodosum leprosum—painful inflammatory condition related to an immune reaction to dead bacteria following treatment of leprosy; newly diagnosed multiple myeloma; brain tumors; Crohn's disease; HIV-wasting syndrome; graft-host reaction in bone marrow transplant.

Dosages and special alerts

100–300 mg/day PO. Taken once daily with water at bedtime for at least 2 wk. Taper off in decrements of 50 mg every 2–4 wk. ☒ **Black box warning** Associated with severe birth

defects; women must have a pregnancy test and sign consent to use birth control to avoid pregnancy while on this drug (STEPS program).

tiludronate disodium

Skelid

Drug class and indications

Bisphosphonate

Treatment of Paget's disease in patients with alkaline phosphatase at least two times the upper limit of normal who are asymptomatic and at risk for future complications.

Dosages and special alerts

400 mg/day PO for 3 mo taken with 6–8 oz of plain water at least 2 hr before any other food or beverage. Monitor serum calcium closely; patient should increase intake of vitamin D and calcium; allow a 3-mo rest period if retreatment is needed.

tiopronin

Thiola

Drug class and indications

Thiol compound

Prevention of cystine kidney stone formation in patients with severe homozygous cystinuria with urine cystine levels exceeding 500 mg/day who are resistant to other therapy.

Dosages and special alerts

800 mg/day PO; increase to 1,000 mg/day in divided doses; take on an empty stomach. Monitor cystine levels at 1 mo and then every 3 mo. Patient should drink fluids liberally to 3 L/day.

TOLAZamide**Drug class and indications**

Antidiabetic, first-generation sulfonylurea

Adjunct to diet and exercise to control blood glucose in patients with type 2 diabetes.

With insulin to control blood glucose levels and decrease the insulin dose in select patients with type 1 diabetes.

Dosages and special alerts

If fasting blood glucose is less than 200 mg/dL, 100 mg/day PO in the morning before breakfast. If fasting blood glucose is greater than 200 mg/dL, 250 mg/day PO. Do not exceed 1 g/day. Use caution with geriatric patients, who may be more sensitive to glucose-lowering effects. Adjust dosage based on patient response; switch to insulin in times of high stress. Be aware that patient may be at increased risk for CV events.

TOLBUTamide

Apo-Tolbutamide (CAN), Orinase, Orinase Diagnostic

Drug class and indications

Antidiabetic, first-generation sulfonylurea, diagnostic agent

Adjunct to diet and exercise to control blood glucose level in patients with type 2 diabetes.

With insulin to control blood glucose levels and decrease insulin dose in select patients with type 1 diabetes.

To aid in diagnosis of pancreatic islet cell adenoma

Dosages and special alerts

1–2 g/day PO in the morning before breakfast; maintenance dose of 0.25–3 g/day PO based on patient response. Do not exceed 3 g/day. As a diagnostic agent: 20 mL IV infused over 2–3 min. Use caution with geriatric patients, who may be more sensitive to glucose-lowering effects; switch to insulin in times of high stress. Be aware that patient may be at increased risk for CV events.

tolvaptan

Samsca

Drug class and indications

Selective vasopressin receptor antagonist

Treatment of clinically significant hypervolemic or euvolemic hyponatremia, including patients with heart failure, cirrhosis, and SIADH.

Dosages and special alerts

15 mg PO once daily; may increase after at least 24 hr, based on patient response, to a maximum of 60 mg/day. ☒ **Black box warning** Therapy should be initiated in a hospital setting, with close supervision of sodium and volume. Not for use when rapid correction of hyponatremia is needed. May cause fetal harm; do not give to nursing women. Dry mouth, constipation, increased blood glucose level, and polyuria are common.

DANGEROUS DRUG

topotecan hydrochloride

Hycamtin

Drug class and indications

Antineoplastic

Treatment of metastatic ovarian cancer after failure of traditional chemotherapy.

Treatment of small-cell lung cancer after failure of first-line treatment.

With cisplatin, for treatment of stage V recurrent or persistent carcinoma of the cervix when not amenable to surgery or radiation.

Dosages and special alerts

1.5 mg/m² IV over 30 min daily for 5 days, starting on day 1 of a 21-day course; minimum of 4 courses recommended (lung cancer, ovarian cancer).

0.75 mg/m² by IV infusion over 30 min on days 1, 2, 3 followed by cisplatin on day 1; repeat every 21 days (cervical cancer).

Provide analgesics. Suggest use of wig or head covering. Protect patient from exposure to infection. Barrier contraceptives should be urged.

☒ **Black box warning** Monitor bone marrow carefully.

DANGEROUS DRUG

tositumomab and iodine I-131 tositumomab

Bexxar

Drug class and indications

Antineoplastic, monoclonal antibody

Treatment of CD20-positive, follicular non-Hodgkin's lymphoma in patients whose disease is refractory to rituximab and who have relapsed following chemotherapy.

Dosages and special alerts

Two-step treatment: 450 mg tositumomab IV in 50 mL 0.9% sodium chloride over 60 min, 5 mCi I-131 with 35 mg tositumomab in 30 mL sodium chloride IV over 20 min; then repeat as a therapeutic step, adjusting I-131 based on patient response. Drug is pregnancy category X. **⊗ Black box warning** Risk of severe and prolonged cytopenia; hypersensitivity reactions including anaphylaxis have occurred.

tranexamic acid

Lysteda

Drug class and indications

Antifibrinolytic

Treatment of cyclic heavy menstrual bleeding.

Dosages and special alerts

1,300 mg PO tid for a maximum of 5 days during monthly menstruation. Reduce dosage with renal impairment. Increased risk of clots, stroke, and MI if combined with hormonal contraceptives, antihemophilic agents, or oral tretinoin. Visual changes or severe allergic reaction should lead to immediate discontinuation of drug. Cerebral infarct and cerebral edema have occurred. Most common adverse effects include pain, sinus and nasal symptoms, anemia, and fatigue.

trazodone hydrochloride

Apo-Trazodone (CAN),
NuTrazodone (CAN), Olepro **ORAC**

Drug class and indications

Antidepressant

Treatment of depression in inpatients and outpatients and for depressed patients with or without anxiety.

Dosages and special alerts

150 mg/day PO in divided doses; may be increased to maximum of 400 mg/day PO in divided doses. ER tablets (*Olepro*)—150 mg/day PO, up to a maximum 375 mg/day, once daily. For severe depression, maximum dosage 600 mg/day PO; adjust to a lower dosage as soon as possible. Geriatric patients should start at 75 mg/day PO in divided doses with close monitoring. **⊗ Black box warning** Limit quantities of drug in depressed and suicidal patients. Monitor patient for low BP. Discontinue drug if priapism occurs. Risk of suicidality is increased, especially in children, adolescents, and young adults.

trientine hydrochloride

Syprine

Drug class and indications

Chelate

Treatment of patients with Wilson's disease who are intolerant of penicillamine.

Dosages and special alerts

Adults: 750–1,250 mg/day PO in divided doses, maximum 2 g/day. Children: 500–750 mg/day PO; maximum, 1,500 mg/day. Interruption of therapy can lead to severe hypersensitivity reactions when drug is restarted. If iron supplements are taken, separate by at least 2 hr.

urofollitropin

Bravelle

Drug class and indications

Fertility drug

Sequentially with HCG to induce ovulation in patients who have previously received pituitary suppression.

Stimulation of multiple follicle development in ovulatory patients.

Dosages and special alerts

Patients who have received gonadotropin-releasing hormone agonist or antagonist suppression: 150 units daily subcutaneously or IM for the first 5 days of treatment. Subsequent dosing should be adjusted according to individual patient response, should not be

made more frequently than once every 2 days, and should not exceed more than 75–150 units per adjustment. The maximum daily dose is 450 units; treatment beyond 12 days is not recommended. If patient response is appropriate, give HCG 5,000 to 10,000 units 1 day following the last dose of *Bravelle*. Monitor patient for ovarian overstimulation; warn patient of risk of multiple births.

ustekinumab

Stelara

Drug class and indications

Monoclonal antibody

Treatment of mild to moderate plaque psoriasis in adults who are candidates for phototherapy or systemic therapy.

Dosages and special alerts

100 kg or less: 45 mg subcutaneously, followed by 45 mg in 4 wk and then every 12 wk; more than 100 kg: 90 mg subcutaneously, followed by 90 mg in 4 wk and then every 12 wk. Risk of serious infections and malignancy. Do not use during active infection; if infection occurs, stop treatment. Most common adverse effects are headache, fatigue, and URI symptoms.

velaglucerase alfa

VPRIV

Drug class and indications

Lysosomal enzyme

Long-term replacement therapy for children and adults with type 1 Gaucher disease.

Dosages and special alerts

60 units/kg as a 60-min IV infusion every other wk. Most common reactions are infusion-related; monitor patient closely during administration. Patient may also experience headache, joint pain, dizziness, abdominal pain, fatigue.

verteporfin

Visudyne

Drug class and indications

Ophthalmic drug

Treatment of age-related macular degeneration, pathologic myopia, ocular histoplasmosis.

Dosages and special alerts

6 mg/m² diluted in D₅W to total 30 mL IV into a free-flowing IV over 10 min at 3 mL/min using an inline filter and syringe pump. Laser light therapy should begin within 15 min of starting IV; may be repeated in 3 mo if needed. Protect patient from exposure to bright light for at least 5 days after treatment. Avoid use with hepatic impairment or sensitivity to eggs.

vigabatrin

Sabril

Drug class and indications

Antiepileptic, GABAase inhibitor

Monotherapy for children 1 mo–2 yr with infantile spasms.

Adjunctive therapy for adults with complex partial seizures not controlled by other therapy.

Dosages and special alerts

Children 1 mo–2 yr: 50 mg/kg/day PO bid oral solution to a maximum of 150 mg/kg/day PO bid. Adults: 500 mg PO bid to a maximum of 1.5 g PO bid with other antiepileptics.

⊗ **Black box warning** Risk of vision loss; limit dosage and duration of therapy and monitor patient's vision. Stop drug if vision changes occur. Risk of suicidal ideation; monitor patient accordingly. Causes anemia, somnolence, peripheral neuropathy, weight gain, edema. Taper dosage when discontinuing.

DANGEROUS DRUG

vorinostat

Zolinza

Drug class and indications

Histone deacetylase inhibitor, antineoplastic

Treatment of cutaneous manifestations in patients with cutaneous T-cell lymphoma who have progressive, persistent or recurrent disease on or following two systemic therapies.

Dosages and special alerts

400 mg PO once daily with food; continue until there is evidence of progression of disease or unacceptable toxicity. ☒ **Black box warning** Monitor patient for increased bleeding, excessive nausea and vomiting, thromboembolic events. Encourage 2 L/day of fluid intake to prevent dehydration.

ziconotide

Prialt

Drug class and indications

N-type calcium channel blocker, analgesic

Management of severe chronic pain in patients who need intrathecal therapy and are intolerant or unresponsive to traditional therapy.

Dosages and special alerts

Initially 2.4 mcg/day by continuous intrathecal pump; may be titrated to a maximum 19.2 mcg/day (0.8 mcg/hr). Monitor for development of meningitis, psychotic behaviors, and neurological impairment.

ALDOSTERONE RECEPTOR BLOCKER
 eplerenone: 453
Aldurazyme (laronidase): 1406
alefacept: 1382
alemtuzumab: 1382
alendronate sodium: 85, C3
Alertec (CAN) (modafinil): 822
Alesse (levonorgestrel, estradiol): 1344
Aleve (naproxen): 845
alfalfa: 1250
Alferon N (interferon alfa-n3): 1405
Alfuria (influenza virus vaccine): 1362
alfuzosin hydrochloride: 86, C3
alglucosidase alfa: 1383
Alimta (pemetrexed): 1415
Alinia (nitazoxanide): 1411
aliskiren: 88
alitretinoin: 1281
Alka-Seltzer (aspirin): 148
Alka-Seltzer Plus Cold & Cough Medicine (combo): 1332
Alka-Seltzer Plus Flu Medicine (combo): 1332
Alkeran (melphalan): 754
ALKYLATING AGENTS (see also page 10)
 altretamine: 1383
 bendamustine: 175
 busulfan: 208
 carboplatin: 229
 carmustine: 233
 chlorambucil: 266
 cisplatin: 291
 cyclophosphamide: 329

ALKYLATING AGENTS (*continued*)

dacarbazine: 337
 ifosfamide: 625
 lomustine: 721
 mechlorethamine: 745
 melphalan: 754
 streptozocin: 1422
 thiotepea: 1147

Allegra (fexofenadine): 521, C13

Allegra-D (fexofenadine, pseudoephedrine):
 1332

Allegra-D 24 Hour (fexofenadine,
 pseudoephedrine): 1332

Allegra ODT (fexofenadine): 521

Aller-Chlor (chlorpheniramine): 274

Allerdryl (CAN) (diphenhydramine): 396

Allerest Maximum Strength (pseu-
 doephedrine, chlorpheniramine): 1332

Allergy (chlorpheniramine): 274

Allergy Relief (chlorpheniramine): 274

AllerMax Caplets (diphenhydramine): 396

Allfen (guaifenesin): 592

Alli (orlistat): 900

allopurinol: 89

allspice: 1250

almotriptan malate: 91

Alocril (nedocromil): 1297

aloe leaves: 1250

Alomide (Iodoxamide): 1296

Aloprim (allopurinol): 89

Alora (estradiol transdermal): 473

alosetron hydrochloride: 92

Aloxi (palonosetron): 927

Alphagan P (brimonidine): 1293

ALPHA-GLUCOSIDASE INHIBITOR

acarbose: 68

miglitol: 809

Alphanate (antihemophilic factor): 135

AlphaNine SD (factor IX concentrates): 502

alpha₁-proteinase inhibitor: 1383

alpha₁-proteinase inhibitor (human):
 1383

alprazolam: 94, C4

Alprazolam Extended Relief (alprazolam): 94

Alprazolam Intensol (alprazolam): 94

alprostadil: 96

Alrex (loteprednol): 1296

Altabax (retapamulin): 1283

Altace (ramipril): 1034

Altarussin (guaifenesin): 592

alteplase, recombinant: 98

AlternaGEL (aluminum): 100

Alt-Desipramine (CAN) (desipramine): 355

Alternative and complementary

therapies (Appendix A): 1250–1259

Atoprev (lovastatin): 731

altretamine: 1383

aluminum acetate (Burow's solution): 1290

aluminum hydroxide gel: 100

Alvesco (ciclesonide): 1286

alvimopan: 1384

ALZHEIMER'S DISEASE DRUGS

donepezil: 407

galantamine: 567

memantine: 755

rivastigmine: 1054

tacrine: 1111

amantadine hydrochloride: 101

Amaryl (glimepiride): 578

ambenonium chloride: 103

Ambien (zolpidem): 1245, C31

Ambien CR (zolpidem): 1245

AmBisome (amphotericin B): 125

ambrisentan: 1384

AMEBICIDES

chloroquine: 272

iodoquinol: 651

metronidazole: 799

Amerge (naratriptan): 847

A-Methapred (methylprednisolone): 791

amethopterin (methotrexate): 777

Amevive (alefacept): 1382

Amicar (aminocaproic acid): 110

amifostine: 1384

Amigesic (salsalate): 1064

amikacin sulfate: 105

Amikin (amikacin): 105

amiloride hydrochloride: 107

Aminess 5.2 % (amino acids): 108

AMINO ACID

L-tryptophan (CAN): 1279

amino acids: 108

aminocaproic acid: 110

Aminofen (acetaminophen): 71

AMINOGLYCOSIDES (see also page 12)

amikacin: 105
 gentamicin: 576
 kanamycin: 669
 neomycin: 855
 streptomycin: 1422
 tobramycin: 1167

aminolevulinic acid hydrochloride: 1384

aminophylline: 111

4-AMINOQUINOLONES

chloroquine: 272

5-aminosalicylic acid (mesalamine): 765

Aminosyn (amino acids): 108

amiodarone hydrochloride: 115

Amitiza (lubiprostone): 1298, C19

amitriptyline hydrochloride: 117

amlexanox: 1291

amlodipine besylate: 119, C4

AMMONIA REDUCTION AGENTS

lactulose: 679

sodium phenylacetate/sodium benzoate:
 1421

ammonium chloride: 120

Ammonul (sodium phenylacetate/sodium benzoate): 1421

Amnesteem (isotretinoin): 663

amoxapine: 121

amoxicillin trihydrate: 124

Amoxil (amoxicillin): 124

Amphadase (hyaluronidase): 1402

AMPHETAMINES

dextroamphetamine: 374

lisdexamfetamine: 714

Amphojel (aluminum): 100

Amphotec (amphotericin B): 125

amphotericin B: 125

amphotericin B desoxycholate: 125

amphotericin B, lipid-based: 125

ampicillin: 128

ampicillin sodium: 128

Amprya (dalfampridine): 1393

Amrix (cyclobenzaprine): 328

AMYLINOMIMETIC

pramlintide: 984

AMYOTROPHIC LATERAL SCLEROSIS**DRUG**

riluzole: 1419

ANABOLIC STEROIDS

oxandrolone: 905

oxymetholone: 916

Anacin (aspirin, caffeine): 1333

Anacin Aspirin Free (acetaminophen): 71,
 1333

Anadrol- 50 (oxymetholone): 916

Anafranil (clomipramine): 304

anagrelide hydrochloride: 130

anakinra: 131

ANALEPTICS

caffeine: 213

doxapram: 412

ANALGESICS, NONOPIOID

acetaminophen: 71

aspirin: 148

celecoxib: 260

choline magnesium trisalicylate:
 1391

clonidine: 308

diclofenac: 381

diflunisal: 385

etodolac: 494

fenoprofen: 514

flurbiprofen: 543

ibuprofen: 620

ketoprofen: 672

ketorolac: 674

mefenamic acid: 750

nabumetone: 836

naproxen: 845

oxaprozin: 907

pregabalin: 995

salsalate: 1064

tramadol: 1180

ziconotide: 1248

ANALGESICS, OPIOID AGONISTS

codeine: 317

hydromorphone: 610

Anaprox (naproxen): 845

Anaprox DS (naproxen): 845

Anaspaz (hyoscyamine): 616

anastrozole: 133, C4

Anatomy of a monograph:

front cover

Ancobon (flucytosine): 529

Androcur (cyproterone) (CAN): 1278

Androderm (testosterone): 1135

AndroGel 1 % (testosterone): 1135

ANDROGEN HORMONE

INHIBITORS

dutasteride: 428

finasteride: 523

ANDROGEN RECEPTOR

ANTAGONIST

cyproterone (CAN): 1278

ANDROGEN

testosterone: 1135

androstenedione: 1250

Anestacon (lidocaine): 705

Anexate (CAN) (flumazenil): 532

Anexsia (hydrocodone, acetaminophen):

1303, 1333

angelica: 1250

Angeliq (drospirenone, estradiol): 1327, 1333,

Angiomax (bivalirudin): 1387

ANGIOTENSIN-CONVERTING ENZYME

(ACE) INHIBITORS (see also

page 13)

benazepril: 174

captopril: 224

enalapril: 439

fosinopril: 556

lisinopril: 716

moexipril: 824

perindopril: 950

quinapril: 1025

ramipril: 1034

trandolapril: 1182

ANGIOTENSIN II RECEPTOR BLOCK-

ERS (ARBs) (see also page 15)

anise: 1250

ANOREXIANT

dextroamphetamine: 374

Ansaid (flurbiprofen): 543

Antabuse (disulfiram): 399

ANTACIDS

aluminum: 100

calcium salts: 216

magaldrate: 734

magnesium salts: 735

sodium bicarbonate: 1085

Antagon (ganirelix acetate):

1401

Antara (fenofibrate): 511

ANTARTHRITICS

abatacept: 1381

adalimumab: 1381

anakinra: 131

etanercept: 485

leflunomide: 686

ANTERIOR PITUITARY HORMONE

corticotropin: 324

ANTHELMINTICS

ivermectin: 1405

mebendazole: 744

praziquantel: 1417

pyrantel: 1017

anthralin: 1284

ANTIALCOHOLIC DRUGS

acamprosate: 67

disulfiram: 399

ANTIALLERGIC DRUG

cromolyn: 1392

ANTIANDROGENS

bicalutamide: 1387

flutamide: 544

ANTIANGIOTENSIN

lenalidomide: 1407

ANTIANGINALS

amlodipine: 119

atenolol: 153

diltiazem: 391

dipyridamole: 1396

isosorbide dinitrate: 662

isosorbide mononitrate: 662

nadolol: 838

nicardipine: 861

nifedipine: 866

nitroglycerin: 870

propranolol: 1009

ranolazine: 1037

verapamil: 1221

ANTIARRHYTHMICS (see also page 16)

acebutolol: 69
 adenosine: 1382
 amiodarone: 115
 disopyramide: 398
 dofetilide: 405
 dronedarone: 423
 esmolol: 468
 flecainide: 526
 ibutilide: 622
 lidocaine: 705
 mexiletine: 801
 propafenone: 1007
 propranolol: 1009
 quinidine: 1026
 sotalol: 1095
 verapamil: 1221

ANTIARTHRITIC

golimumab: 588

ANTIASTHMATICS

albuterol: 83
 cromolyn: 1392
 ephedrine: 448
 epinephrine: 450
 formoterol: 551
 isoproterenol: 660
 levalbuterol: 692
 metaproterenol: 767
 montelukast: 825
 omalizumab: 1412
 salmeterol: 1062
 terbutaline: 1133
 zafirlukast: 1234
 zileuton: 1239

ANTIBACTERIALS

benzalkonium: 1284
 fosfomicin: 555
 methenamine: 773
 metronidazole: 799
 nitrofurantoin: 869
 trimethoprim: 1200

ANTIBIOTICS (see also Aminoglycosides, Cephalosporins, Fluoroquinolones, Lincosamides, Macrolide Antibiotics, Penicillins, Sulfonamides, and Tetracyclines)

aztreonam: 166

ANTIBIOTICS (continued)

bacitracin: 168
 capreomycin: 223
 chloramphenicol: 268
 cycloserine: 331
 ertapenem: 461
 meropenem: 764
 metronidazole: 799
 polymyxin B: 974
 rifabutin: 1418
 rifampin: 1044
 rifaximin: 1047
 vancomycin: 1215

ANTIBIOTICS, ANTINEOPLASTIC

bleomycin: 189
 dactinomycin: 339
 DAUNOrubirin: 1393
 decitabine: 1394
 doxorubicin: 417
 epirubicin: 1397
 idarubicin: 623
 mitomycin: 819
 pentostatin: 1415

ANTIBIOTICS, TOPICAL

ciprofloxacin, dexamethasone: 1282
 mupirocin: 1283,

ANTICATALECTIC

sodium oxybate: 1089

ANTICHOLINERGICS

atropine: 160
 cyclizine: 327
 dicyclomine: 383
 dimenhydrinate: 392
 glycopyrrolate: 586
 hyoscyamine: 616
 ipratropium: 652
 meclizine: 746
 methscopolamine: 782
 propantheline: 1417
 scopolamine: 1070
 tiotropium: 1161

ANTICHOREA DRUG

tetrabenazine: 1137

ANTICOAGULANTS (see also page 17)

argatroban: 1385
 bivalirudin: 1387
 dalteparin: 341

ANTICOAGULANTS (*continued*)

- desirudin: 1395
- enoxaparin: 443
- fondaparinux: 549
- heparin: 599
- lepirudin: 1407
- protein C concentrate: 1418
- tinzaparin: 1160
- warfarin: 1231

ANTICONVULSANTS(see **Antiepileptics**)**ANTIDEPRESSANTS**

- amitriptyline: 117
- bupropion: 204
- citalopram: 293
- desipramine: 355
- desvenlafaxine: 360
- duloxetine: 426
- escitalopram: 466
- fluoxetine: 537
- fluvoxamine: 547
- maprotiline: 740
- mirtazapine: 816
- nefazodone: 1410
- paroxetine: 932
- phenelzine: 953
- selegiline: 1074
- sertraline: 1076
- tranylcypromine: 1183
- trazodone: 1426
- venlafaxine: 1220

ANTIDIABETICS (see also page 19)

- acarbose: 68
- chlorpropamide: 1391
- exenatide: 499
- glimepiride: 578
- glipizide: 580
- glyburide: 583
- insulin: 640
- liraglutide: 713
- metformin: 769
- migliitol: 809
- nateglinide: 850
- pioglitazone: 969
- pramlintide: 984
- repaglinide: 1040
- rosiglitazone: 1058

ANTIDIABETICS (*continued*)

- saxagliptin: 1069
- sitagliptin: 1084
- tolazamide: 1424
- tolbutamide: 1425

ANTIDIARRHEALS

- bismuth subsalicylate: 187
- loperamide: 722
- octreotide: 885
- opium: 898
- rifaximin: 1047

ANTIDOTES

- acetylcysteine: 75
- atropine: 160
- charcoal: 264
- deferoxamine: 1394
- digoxin immune fab: 389
- dimercaprol: 1395
- edetate calcium disodium: 431
- edrophonium: 433
- flumazenil: 532
- fomepizole: 1400
- hydroxocobalamin: 1403
- mesna: 1408
- methylene blue: 786
- neostigmine: 856
- pralidoxime: 981
- pyridostigmine: 1019
- succimer: 1101

ANTIEMETICS

- aprepitant: 137
- chlorpromazine: 276
- cyclizine: 327
- dolasetron: 406
- doxylamine and pyridoxine (CAN): 1278
- dronabinol: 421
- fosaprepitant: 137
- granisetron: 591
- hydroxyzine: 614
- meclizine: 746
- metoclopramide: 793
- nabilone: 835
- ondansetron: 896
- palonosetron: 927
- prochlorperazine: 1000
- promethazine: 1005
- trimethobenzamide: 1199

ANTIEPILEPTICS

acetazolamide: 73
 carbamazepine: 226
 clonazepam: 306
 clorazepate: 311
 diazepam: 377
 ethosuximide: 489
 ethotoin: 491
 fosphenytoin: 558
 gabapentin: 566
 lacosamide: 677
 lamotrigine: 682
 levetiracetam: 694
 magnesium sulfate: 737
 methsuximide: 1409
 nitrazepam (CAN): 1279
 oxcarbazepine: 909
 pentobarbital: 948
 phenobarbital: 956
 phenytoin: 963
 pregabalin: 995
 primidone: 997
 rufinamide: 1420
 secobarbital: 1073
 tiagabine: 1152
 topiramate: 1175
 valproic acid: 1211
 vigabatrin: 1427
 zonisamide: 1247

ANTIESTROGENS

anastrozole: 133
 letrozole: 688
 tamoxifen: 1116

ANTIFIBRINOLYTIC

tranexamic acid: 1426

ANTIPLATULENT

simethicone: 1081

ANTIFUNGALS

(see also page 21)

amphotericin B: 125
 anidulafungin: 134
 fluconazole: 527
 flucytosine: 529
 itraconazole: 667
 ketoconazole: 670
 micafungin: 802
 miconazole: 804

ANTIFUNGALS (*continued*)

nystatin: 884
 voriconazole: 1229

ANTIFUNGALS, TOPICAL

butenafine: 1283
 butoconazole: 1283
 ciclopirox: 1283
 clotrimazole: 313, 1283
 econazole: 1283
 gentian violet: 1283
 ketoconazole: 670, 1283
 naftifine: 1283
 oxiconazole: 1284
 sertaconazole: 1284
 terbinafine: 1132, 1284
 tolnaftate: 1284

ANTI GLAUCOMA DRUGS

acetazolamide: 73
 betaxolol: 184
 brimonidine: 1293
 brinzolamide: 1293
 latanoprost: 1295
 timolol: 1156, 1297

ANTIGONADOTROPIC DRUG

cetorelix: 1390

ANTIGOUT DRUGS

allopurinol: 89
 colchicine: 319
 febuxostat: 508
 probenecid: 998

antihemophilic factor: 135

antihemophilic factor, recombinant:
 1384

ANTHEMOPHILICS

antihemophilic factor: 135
 antihemophilic factor, recombinant: 1384
 coagulation factor VIIa: 1392
 factor IX concentrates: 502

ANTIHISTAMINES (see also page 22)

azelastine: 1284, 1293
 brompheniramine: 197
 cetirizine: 263
 chlorpheniramine: 274
 clemastine: 297
 cyclizine: 327
 cyproheptadine: 334
 desloratadine: 357

ANTIHISTAMINES (*continued*)

dexchlorpheniramine: 366
 dimenhydrinate: 392
 diphenhydramine: 396
 fexofenadine: 521
 hydroxyzine: 614
 levocetirizine: 696
 loratadine: 726
 meclizine: 746
 promethazine: 1005

ANTI-HIV DRUGS

atazanavir: 151
 emtricitabine: 438
 enfuvirtide: 442

ANTHYPERLIPIDEMICS

atorvastatin: 157
 cholestyramine: 281
 colessevelam: 321
 colestipol: 322
 fenofibrate: 511
 fenofibric acid: 512
 fluvastatin: 545
 gemfibrozil: 573
 lovastatin: 731
 niacin: 859
 pitavastatin: 972
 pravastatin: 988
 rosuvastatin: 1060
 simvastatin: 1082

ANTHYPERTENSIVES

acebutolol: 69
 aliskiren: 88
 ambrisentan: 1384
 amlodipine: 119
 atenolol: 153
 benazepril: 174
 betaxolol: 184
 bisoprolol: 188
 bosentan: 191
 candesartan: 220
 captopril: 224
 carteolol: 235
 carvedilol: 237
 clevidipine: 298
 clonidine: 308
 diazoxide: 379
 diltiazem: 391

ANTHYPERTENSIVES (*continued*)

doxazosin: 413
 enalapril: 439
 eplerenone: 453
 eprosartan: 457
 felodipine: 510
 fosinopril: 556
 guanabenz: 593
 guanfacine: 594
 hydralazine: 602
 irbesartan: 653
 isradipine: 665
 labetalol: 676
 losartan: 729
 methyldopa: 784
 metoprolol: 797
 minoxidil: 814
 moexipril: 824
 nadolol: 838
 nebivolol: 851
 nicardipine: 861
 nifedipine: 866
 nisoldipine: 867
 nitroprusside: 873
 olmesartan: 891
 penbutolol: 936
 perindopril: 950
 pindolol: 968
 prazosin: 989
 propranolol: 1009
 quinapril: 1025
 ramipril: 1034
 telmisartan: 1124
 terazosin: 1130
 timolol: 1156
 trandolapril: 1182
 trestipinil: 1187
 valsartan: 1213
 verapamil: 1221

ANTHYPOTENSIVE

midodrine: 1410

ANTI-INFECTIVE

benzalkonium: 1284

ANTI-INFLAMMATORIES

aspirin: 148
 diclofenac: 381, 1294
 flurbiprofen: 543

ANTI-INFLAMMATORIES (*continued*)

mesalamine: 765
 olsalazine: 1412
 rilonacept: 1419
 salsalate: 1064
 sulfasalazine: 1106

ANTILITHIC

cellulose: 1389

ANTIMALARIALS

chloroquine: 272
 quinine: 1418

ANTIMANIC DRUG

lithium: 718

ANTIMETABOLITES (*see also page 23*)

capecitabine: 221
 cladribine: 294
 clofarabine: 1391
 cytarabine: 335
 floxuridine: 1399
 fludarabine: 530
 fluorouracil: 535
 gemcitabine: 571
 mercaptopurine: 762
 methotrexate: 777
 pemetrexed: 1415
 pentostatin: 1415
 rasburicase: 1418
 thioguanine: 1146

ANTIMIGRAINE DRUGS (*see also page 25*)

almotriptan: 91
 dihydroergotamine: 1395
 eletriptan: 436
 ergotamine: 1397
 frovatriptan: 561
 naratriptan: 847
 rizatriptan: 1056
 sumatriptan: 1109
 topiramate: 1175
 zolmitriptan: 1244

ANTI-MOTION-SICKNESS DRUGS

cyclizine: 327
 dimenhydrinate: 392
 diphenhydramine: 396
 meclizine: 746
 promethazine: 1005
 scopolamine: 1070

ANTIMUSCARINICS

atropine: 160
 darifenacin: 349
 dicyclomine: 383
 fesoterodine: 519

 imatinib: 628
 interferon alfa-2b: 643
 interferon alfa-n3: 1405
 irinotecan: 655
 ixabepilone: 1406
 lapatinib: 1406
 leuprolide: 691
 lomustine: 721
 mechlorethamine: 745
 medroxyprogesterone: 748
 megestrol: 751
 melphalan: 754
 mercaptopurine: 762
 methotrexate: 777
 mitomycin: 819
 mitotane: 1410
 mitoxantrone: 821
 nelarabine: 1411
 nilotinib: 1411
 ofatumumab: 1412
 oxaliplatin: 1412
 paclitaxel: 922
 panitumumab: 1413
 pegaspargase: 1414

ANTINEOPLASTICS (*continued*)

pemetrexed: 1415
 pentostatin: 1415
 porfimer: 1417
 pralatrexate: 1417
 procarbazine: 1417
 rituximab: 1419
 romidepsin: 1419
 sorafenib: 1422
 streptozocin: 1422
 sunitinib: 1422
 temozolomide: 1423
 temsirolimus: 1423
 thioguanine: 1146
 thiotepa: 1147
 tolvaptan: 1425
 topotecan: 1425
 toremifene: 1177
 tositumomab: 1425
 trastuzumab: 1185
 tretinoin: 1189
 triptorelin: 1203
 vinblastine: 1223
 vincristine: 1225
 vinorelbine: 1227
 vorinostat: 1427

ANTIPARKINSONIANS

amantadine: 101
 apomorphine: 1385
 atropine: 160
 benzotropine: 178
 bromocriptine: 195
 diphenhydramine: 396
 entacapone: 445
 levodopa: 697
 pramipexole: 983
 rasagiline: 1038
 ropinirole: 1057
 selegiline: 1074
 tolcapone: 1171
 trihexyphenidyl: 1197

ANTIPEPTIC ULCER DRUG

sucralfate: 1102

ANTIPLATELETS

abciximab: 65
 anagrelide: 130
 aspirin: 148

ANTIPLATELETS (*continued*)

cilostazol: 284
 clopidogrel: 310
 dipyridamole: 1396
 eptifibatide: 458
 prasugrel: 986
 ticlopidine: 1153
 tirofiban: 1165

ANTIPROTOZOALS

atovaquone: 159
 metronidazole: 799
 nitazoxanide: 1411
 pentamidine: 943
 tinidazole: 1158

ANTIPSORIATICS

acitretin: 1381

ANTIPSORIATICS, TOPICAL

anthralin: 1284
 calcipotriene: 1284

ANTIPSYCHOTICS

chlorpromazine: 276
 clozapine: 315
 flupentixol (CAN): 1279
 fluphenazine: 539
 haloperidol: 596
 loxapine: 732
 olanzapine: 889
 pimozide: 1416
 prochlorperazine: 1000
 quetiapine: 1023
 risperidone: 1051
 thiothixene: 1149

ANTIPSYCHOTICS, ATYPICAL

aripiprazole: 141
 asenapine: 144
 iloperidone: 627
 lurasidone: 1408
 paliperidone: 924
 ziprasidone: 1241

ANTIPYRETICS

acetaminophen: 71
 aspirin: 148
 choline magnesium trisalicylate:
 1391
 diclofenac: 381
 diflunisal: 385
 etodolac: 494

ANTIPYRETICS (*continued*)

oxaprozin: 907
 salsalate: 1064
 sulindac: 1108

ANTIRETROVIRAL

indinavir: 636

ANTIRHEUMATICS

aspirin: 148
 auranofin: 1386
 gold sodium thiomalate:
 1401
 golimumab: 588
 methotrexate: 777
 penicillamine: 1415
 salsalate: 1064
 tocilizumab: 1169

ANTISEBORRHEICS

chloroxine: 1284
 selenium: 1284

ANTISECRETORY DRUGS

dexlansoprazole: 367
 esomeprazole: 469
 lansoprazole: 684
 omeprazole: 894
 pantoprazole: 931
 rabeprazole: 1028

ANTI-SEPSIS AGENT

drotrecogin: 425

ANTISEPTICS

benzalkonium: 1284
 chlorhexidine: 1285
 hexachlorophene: 1285
 iodine: 1285
 povidone iodine: 1285
 sodium hypochlorite: 1285
 thimerosal: 1285

ANTISPASMODICS

dicyclomine: 383
 glycopyrrolate: 586
 hyoscyamine: 616
 methscopolamine: 782
 propantheline: 1417
 scopolamine: 1070
 tizanidine: 1166

antithrombin, recombinant:

1385

antithrombin III: 1385

ANTITHROMBOTICS

dalteparin: 341
 enoxaparin: 443
 fondaparinux: 549

anti-thymocyte globulin: 1379

ANTITHYROID DRUGS

methimazole: 774
 propylthiouracil: 1011

ANTITUBERCULOTICS

capreomycin: 223
 cycloserine: 331
 ethambutol: 487
 ethionamide: 488
 isoniazid: 658
 pyrazinamide: 1018
 rifampin: 1044
 rifapentine: 1045
 streptomycin: 1422

ANTITUSSIVES

benzonatate: 177
 codeine: 317
 dextromethorphan: 375

antivenin (crotalidae) polyvalent: 1379

Antivenin (Latrodectus mactans) (Black

Widow spider species antivenin): 1380

antivenin (micrurus fulvius): 1379

Antivert (meclizine): 746

ANTIVIRALS (see also page 26)

abacavir: 64
 acyclovir: 77, 1285
 adefovir: 79
 amantadine: 101
 atazanavir: 151
 cidofovir: 1391
 darunavir: 1393
 delavirdine: 351
 didanosine: 384
 docosanol: 1285
 efavirenz: 435
 emtricitabine: 438
 entecavir: 446
 etravirine: 497
 famciclovir: 504
 fosamprenavir: 553
 ganciclovir: 568, 1295
 imiquimod: 1285
 indinavir: 636

ANTIVIRALS (continued)

kunecatechins: 1286
 lamivudine: 680
 lopinavir: 723
 maraviroc: 742
 nelfinavir: 853
 nevirapine: 858
 oseltamivir: 902
 palivizumab: 926
 penciclovir: 1286
 raltegravir: 1031
 ribavirin: 1042
 rimantadine: 1048
 ritonavir: 1053
 saquinavir: 1065
 stavudine: 1099
 telbivudine: 1423
 tenofovir: 1129
 tipranavir: 1162
 trifluridine: 1297
 valacyclovir: 1207
 valganciclovir: 1209
 zanamivir: 1237
 zidovudine: 1238

Antizol (fomepizole): 1400

Antrizine (meclizine): 746

Antrocol (atropine, phenobarbital): 1333

Anusol-HC (hydrocortisone): 1288

ANXIOLYTICS

alprazolam: 94
 amoxapine: 121
 buspirone: 206
 chlordiazepoxide: 269
 chlorpromazine: 276
 clorazepate: 311
 diazepam: 377
 doxepin: 415
 hydroxyzine: 614
 lorazepam: 727
 meprobamate: 761
 oxazepam: 908
 prochlorperazine: 1000
 venlafaxine: 1220

Anzemet (dolasetron): 406

APAP (acetaminophen): 71

Aphbasol (amlexanox): 1291

Apidra (insulin glulisine): 640
