The clinical procedures described and recommended in this publication are based on research and consultation with nursing, medical, pharmaceutical, and legal authorities. To the best of our knowledge, these procedures reflect currently accepted practice; nevertheless, they can't be considered absolute and universal recommendations. For individual application, all recommendations must be considered in light of the patient's clinical condition and, before the administration of new or infrequently used drugs, in light of the latest package-insert information. The authors and publisher disclaim responsibility for adverse effects resulting directly or indirectly from the suggested procedures, from undetected errors, or from the reader's misunderstanding of the text.

Preface

The number of clinically important drugs increases every year, as does the nurse's responsibility for drug therapy. No nurse can memorize all the drug information needed to provide safe and efficacious drug therapy. The *2012 Lippincott's Nursing Drug Guide* provides the drug information nurses need in a concise, ready-access format. This edition was completely updated and then it was reviewed by independent clinical reviewers, including pharmacists and nurses, to ensure that nurses will have the most up-to-date and accurate information possible.

This book presents nursing considerations related to drug therapy in the format of the nursing process, a framework for applying basic pharmacologic information to patient care. It is intended for the student nurse who is just learning how to apply pharmacologic data in the clinical situation, as well as for the busy practicing professional nurse who needs a quick, easy-to-use guide to the clinical use of drugs.

This book provides broad coverage of the drugs commonly encountered by nurses and of drugs whose use commonly involves significant nursing intervention. *Anatomy of a monograph*, found inside the front cover, explains how the information in each monograph can be used to implement the nursing process. Commonly used medical abbreviations are used throughout the book and are defined in the *Guide to abbreviations*, which follows this Preface.

The first two chapters of this book provide a concise review of the nursing process and its application to pharmacologic situations, including guidelines for avoiding medication errors and concise examples of how to use the drug guide to apply the nursing process and to make a patient teaching guide. Next is a review of selected drug classifications, which provides a convenient, complete summary of the drug information pertinent to drugs in each class.

Complete drug monographs

Drug information is presented in monograph form, with the monographs arranged alphabetically by generic name. Each page of the book contains guide words at the top, much like a dictionary, to facilitate easy access to any drug. The right-hand edge of the book contains letter guides, again to facilitate finding a drug as quickly as possible.

Each drug monograph is complete in itself—that is, it includes all of the clinically important information that a nurse needs to know to give the drug safely and effectively. Every monograph begins with the drug's generic (nonproprietary) name; any alternate names follow in parentheses; an alphabetical list of the most common brand names, including common brand names found only in Canada (noted by the designation CAN); the drug's pregnancy category classification, and its schedule if it is a controlled substance. The names of drugs that are described in Appendix U, *Less commonly used drugs*, appear alphabetically in the text and are cross referenced to the index.

Preventing medication errors is a critical component of patient care. Clinical practice has revealed that some drugs are especially dangerous when involved in a medication error. The monographs for these drugs are marked with the “dangerous drug” logo to alert the nurse to use exceptional care during administration. TALL man lettering, approved by the Food and Drug Administration (FDA) to help decrease medication errors and confusion, will appear with those drugs on the list.

Each monograph provides a commonly accepted pronunciation (after *USAN* and the *USP Dictionary of Drug Names, 2010*) to help the nurse feel more comfortable discussing the

drug with other members of the health care team. After the pronunciation, each monograph gives you these features:

- The clinically important drug classes of each drug are indicated to put the drug in appropriate context.
- The therapeutically useful actions of the drug are described, including, where known, the mechanism(s) by which these therapeutic effects are produced; no attempt is made to list *all* of the drug's known actions here.
- Clinical indications for the drug are listed, including important unlabeled indications not approved by the FDA, as well as orphan drug uses where appropriate. New indications for a drug are emphasized by the “New indication” logo.
- Contraindications to drug use and cautions that should be considered when using the drug are listed.
- The pharmacokinetic profile of the drug is given in table form to allow easy access to such information as half-life, peak levels, distribution, and so on, offering a quick reference on how the drug is handled by the body.
- Dosage information is listed next, including dosages for adults, pediatric patients, and geriatric patients, and dosages for indications when these differ. A listing of the available forms of each drug serves as a guide for prescribing or suggesting alternate routes of administration. Details of drug administration that must not be overlooked for the safe administration of the drug (eg, “Dilute before infusing” or “Infuse slowly over 30 min”) are included in the dosage section, but other aspects of drug administration (eg, directions for reconstituting a powder for injection) are presented under *Interventions* in the next section of the monograph. If there is a treatment for the overdose of this drug, that information is indicated in *Interventions*.
- The *IV Facts* section, with a prominent logo, gives concise, important information that is needed for drugs given IV—dilution, flow rate, compatibilities—making it unnecessary to have a separate IV handbook.
- Commonly encountered adverse effects are listed by body system, with the most commonly encountered adverse effects appearing in *italics* to make it easier to assess the patient for adverse effects and to teach the patient about what to expect. Potentially life-threatening adverse effects are in **bold** for easy access. Adverse effects that have been reported, but appear less commonly or rarely, are also listed to make the drug information as complete as possible.
- Clinically important interactions are listed separately for easy access: drug-drug, drug-food, drug-lab test, drug-alternative therapy—for interferences to consider when using the drug and any nursing action that is necessary because of this interaction.
- The “Dangerous drug” heading indicates those drugs proven more likely to be involved in serious patient reactions.
- Drugs that cannot be cut, crushed, or chewed have a “Do Not Crush” () logo to immediately alert you about this caution.
- A “Black box” warning logo highlights FDA warnings regarding safe use of the drug.
- The “Warning” logo highlights important facts and potential safety issues; warnings appear in antibiotic monographs for those antibiotics with a higher incidence of the development of multidrug-resistant organisms (MDRO); warnings appear in proton pump inhibitor monographs regarding the increased risk of *Clostridium difficile* infection.

Clinically focused nursing considerations

The remainder of each monograph is concerned with nursing considerations, which are presented in the format of the nursing process. The steps of the nursing process are given slightly different names by different authorities; this handbook includes: assessment (history and physical examination), interventions, and teaching points for each of the drugs presented.

“Clinical alert” provides important information about reported name confusions that have occurred with a given drug to help prevent potential medication errors.

- **Assessment:** Outlines the information that should be collected before administering the drug. This section is further divided into two subsections:
 - History:** Includes a list of those underlying conditions that constitute contraindications and cautions for use of the drug.
 - Physical:** Provides data, by organ system, that should be collected before beginning drug therapy, both to allow detection of conditions that are contraindications or cautions to the use of the drug and to provide baseline data for detecting adverse reactions to the drug and monitoring for therapeutic response.
- **Interventions:** Lists, in chronological order, those nursing activities that should be undertaken in the course of caring for a patient who is receiving the drug. This section includes interventions related to drug preparation and administration, the provision of comfort and safety measures, and drug levels to monitor, as appropriate.
- **Teaching points:** Includes specific information that is needed for teaching the patient who is receiving this drug. Proven “what to say” advice can be transferred directly to patient teaching printouts and used as a written reminder.

Evaluation

Evaluation is usually the last step of the nursing process. In all drug therapy, the patient should be evaluated for the desired effect of the drug as listed in the *Indications* section; the occurrence of adverse effects, as listed in the *Adverse effects* section; and learning following patient teaching, as described in the *Teaching points* section. These points are essential. In some cases, evaluation includes monitoring specific therapeutic serum drug levels; these cases are specifically mentioned in the *Interventions* section. The *Nursing process guidelines* chapter gives an example of how the drug monograph can be used to establish a nursing care plan, to develop a patient teaching printout, and to incorporate the nursing process into drug therapy.

Appendices

The appendices contain information that is useful to nursing practice but may not lend itself to the monograph format—alternative and complementary therapies; a guide to preventing miscommunication; a guide to patient teaching to prevent medication errors; important drug-related dietary guidelines for patient teaching; a list of drugs that interact with grapefruit juice; recommended routes of administration; new medication disposal guidelines; formulas for pediatric dosage calculations; schedules of controlled substances (for U.S. and Canadian drugs); pregnancy categories (for U.S. drugs); cardiovascular guidelines—including standards for lipid levels and blood pressure monitoring; normal laboratory values; Canadian drug information, including mini-monographs of drugs that are used in Canada but not in the United States; topical drugs and corticosteroids; ophthalmic drugs; laxatives; detailed combination drug references; information about hormonal contraceptives; commonly used biologicals; less commonly used drugs; and a quick guide for reputable Internet sites. A suggested bibliography follows the appendices.

Index

An extensive index provides a ready reference to drug information. The **generic** name of each drug is highlighted in bold. If the generic name of a drug is not known, the drug may be found quickly by using whatever name is known. *Brand names* are listed in italics, commonly used chemical names and any commonly used “jargon” name (such as IDU for idoxuridine) are in parentheses after the generic name. In addition, the index lists drugs by clinically important classes—pharmacologic and therapeutic. If you know a patient is taking an antianginal drug and don’t remember the name, reviewing the list of drugs under *Antianginals* may well help you recall the name. Chlorpromazine, for example, is listed by its generic name, by all of its brand names, and by classes as an antipsychotic (a therapeutic classification), as a phenothiazine (the pharmacologic class), and as a dopaminergic blocking drug (a classification by

postulated mechanism of action). The comprehensive index helps to avoid cross-referencing from within the text, which is time consuming and often confusing.

2012 Quick-access photoguide

The full-color photoguide located in the center of the book presents nearly 400 pills and capsules, representing the most commonly prescribed generic and brand drugs. Photos of certain brands were provided by the following companies: Forest Pharmaceuticals, Inc. (Campral); Novartis Pharmaceuticals (Enblex); Sepracor, Inc. (Lunesta); Teva Pharmaceuticals (Azilect); Bayer Healthcare Pharmaceuticals (Nexavar); and Pfizer (Sutent). Photos of the following drugs were provided by Jeff Sigler, © SFI Medical Publishing, Inc.: Aciphex, Actos, Aricept, Clozaril, Dexilant, Diovan HCT, Effient, Flomax, Lyrica, Nexium, Plavix, Pristiq, Seroquel, Topamax, TriCor, Valtrex, Vytorin, and Zyprexa.

What's new

The new features in the book include:

- More than 36 new drugs
- More than 1,200 updates
- TALL man lettering for drugs on the FDA-approved list
- More “Warning” logos that highlight potential complications, antibiotics associated with MDRO, and proton pump inhibitors associated with *Clostridium difficile* infection

Web site

Through the NursingDrugGuide.com Web site you will be able to access patient-teaching printouts for more than 200 of the most commonly prescribed drugs, which you can use to prepare your own study aids, develop nursing care plans, and customize patient and staff teaching tools. You'll also find tips for avoiding common drug errors, information on toxic drug-drug interactions, and many other patient safety resources. Pharmacology information, therapeutic guidelines, and tools such as a dosage calculator, pronunciation guide, and Spanish-English resources are also provided on the Web site.

Added benefit

With this guide comes access to free monthly drug updates available to you throughout the year via the NursingDrugGuide.com Web site. Get the most recent drug information available, including the latest FDA drug approvals and advances in clinical pharmacology. In addition, you will be able to access new continuing education tests via the Web site and earn contact hours.

This 17th edition incorporates many of the suggestions and requests that have been made by the users of earlier editions of this book. It is hoped that the overall organization and concise, straightforward presentation of the material in the *2012 Lippincott's Nursing Drug Guide* will make it a readily used and clinically useful reference for the nurse who needs easily accessible information to facilitate the provision of drug therapy within the framework of the nursing process. It is further hoped that the thoroughness of the additional sections of the book will make it an invaluable resource that will replace the need for several additional references.

Guide to abbreviations

ACE	angiotensin-converting enzyme	CDC	Centers for Disease Control and Prevention
ACT	activated clotting time	CML	chronic myelogenous leukemia
ACTH	adrenocorticotrophic hormone	CNS	central nervous system
ADH	antidiuretic hormone	COPD	chronic obstructive pulmonary disease
ADHD	attention-deficit hyperactivity disorder	CPK	creatine phosphokinase
ADLs	activities of daily living	CPR	cardiopulmonary resuscitation
AIDS	acquired immunodeficiency syndrome	CR	controlled release
ALL	acute lymphocytic leukemia	CrCl	creatinine clearance
ALT	alanine transaminase (formerly called SGPT)	CSF	cerebrospinal fluid
AML	acute myelogenous leukemia	CTZ	chemoreceptor trigger zone
ANA	anti-nuclear antibodies	CV	cardiovascular
ANC	absolute neutrophil count	CVP	central venous pressure
aPTT	activated partial thromboplastin time	CYP450	cytochrome P-450
ARB	angiotensin II receptor blocker	D ₅ W	dextrose 5% in water
ARC	AIDS-related complex	DEA	Drug Enforcement Administration
ASA	acetylsalicylic acid	DIC	disseminated intravascular coagulopathy
AST	aspartate transaminase (formerly called SGOT)	dL	deciliter (100 mL)
AV	atrioventricular	DNA	deoxyribonucleic acid
bid	twice a day (<i>bis in die</i>)	DR	delayed release
BP	blood pressure	DTP	diphtheria-tetanus-pertussis (vaccine)
BPH	benign prostatic hypertrophy	DVT	deep venous thrombosis
BSP	bromsulphalein	ECG	electrocardiogram
BUN	blood urea nitrogen	ECT	electroconvulsive therapy
C	centigrade, Celsius	ED	erectile dysfunction
CAD	coronary artery disease	EEG	electroencephalogram
cAMP	cyclic adenosine monophosphate	EENT	eye, ear, nose, and throat
CBC	complete blood count	ER	extended release
		EST	electroshock therapy

F	Fahrenheit	IPPB	intermittent (or inspiratory) positive pressure breathing
FDA	Food and Drug Administration	IUD	intrauterine device
5-FU	fluorouracil	IV	intravenous
5-HIAA	5-hydroxyindole acetic acid	JVP	jugular venous pressure
FSH	follicle-stimulating hormone	kg	kilogram
g	gram	L	liter
GABA	gamma-aminobutyric acid	lb	pound
GERD	gastroesophageal reflux disease	LDH	lactic dehydrogenase
GFR	glomerular filtration rate	LDL	low-density lipoproteins
GGTP	gamma-glutamyl transpeptidase	LFT	liver function test
GI	gastrointestinal	LH	luteinizing hormone
G6PD	glucose-6-phosphate dehydrogenase	LHRH	luteinizing hormone-releasing hormone
GU	genitourinary	m	meter
HCG	human chorionic gonadotropin	MAO	monoamine oxidase
Hct	hematocrit	MAOI	monoamine oxidase inhibitor
HDL	high-density lipoproteins	mcg	microgram
HF	heart failure	MDRO	multidrug-resistant organisms
Hg	mercury	mg	milligram
Hgb	hemoglobin	MI	myocardial infarction
Hib	<i>Haemophilus influenzae</i> type b	min	minute
HIV	human immunodeficiency virus	mL	milliliter
HMG-CoA	3-hydroxy-3-methylglutaryl coenzyme A	mo	month
HPA	hypothalamic–pituitary axis	MS	multiple sclerosis
hr	hour	ng	nanogram
HR	heart rate	NMS	neuroleptic malignant syndrome
HSV	herpes simplex virus	NPO	nothing by mouth (<i>nihil per os</i>)
IBS	irritable bowel syndrome	NSAID	nonsteroidal anti-inflammatory drug
IHSS	idiopathic hypertrophic subaortic stenosis	OCD	obsessive compulsive disorder
I & O	intake and output	OTC	over-the-counter
IM	intramuscular	P	pulse
INR	international normalized ratio	PABA	para-aminobenzoic acid
IOP	intraocular pressure	PAT	paroxysmal atrial tachycardia

PBI	protein-bound iodine	SIADH	syndrome of inappropriate anti-diuretic hormone secretion
PCWP	pulmonary capillary wedge pressure	SLE	systemic lupus erythematosus
PDA	patent ductus arteriosus	SMA-12	sequential multiple analysis-12
PE	pulmonary embolus	SR	sustained release
PFT	pulmonary function test	SSRI	selective serotonin reuptake inhibitor
PG	prostaglandin	STD	sexually transmitted disease
pH	hydrogen ion concentration	Subcut.	subcutaneous
PID	pelvic inflammatory disease	SWSD	shift-work sleep disorder
PMDD	premenstrual dysphoric disorder	T	temperature
PMS	premenstrual syndrome	T _{1/2}	half-life
PO	orally, by mouth (<i>per os</i>)	T ₃	triiodothyronine
PRN	when required (<i>pro re nata</i>)	T ₄	thyroxine (tetraiodothyronine)
PSA	prostate-specific antigen	TB	tuberculosis
PT	prothrombin time	TCA	tricyclic antidepressant
PTSD	post-traumatic stress disorder	TIA	transient ischemic attack
PTT	partial thromboplastin time	tid	three times a day (<i>ter in die</i>)
PVCs	premature ventricular contractions	URI	upper respiratory (tract) infection
qid	four times a day (<i>quarter in die</i>)	US	United States
R	respiratory rate	USP	United States Pharmacopeia
RAS	reticular-activating system	UTI	urinary tract infection
RBC	red blood cell	UV	ultraviolet
RDA	recommended dietary allowance	VLDL	very-low-density lipoproteins
RDS	respiratory distress syndrome	VMA	vanillylmandelic acid
REM	rapid eye movement	VRE	vancomycin-resistant enterococcus
RNA	ribonucleic acid	WBC	white blood cell
RSV	respiratory syncytial virus	WBCT	whole blood clotting time
SA	sinoatrial	wk	week
SBE	subacute bacterial endocarditis	yr	year
sec	seconds		

Author's acknowledgments

I would like to thank the many people who have had an impact on making this book possible. Students and practicing nurses, past and present, who have helped me learn how to make pharmacology clinically useful; the many users of past editions of the book who have taken the time to offer suggestions and provide valuable comments; Judy McCann, the Chief Nursing Officer at the Ambler office of Lippincott, Williams & Wilkins; Beverly Tscheschlog, my go-to person at the Ambler office; Joan Robinson, who has been so patient, supportive, and helpful; and Linda Ruhf and Karen Kirk, who continue to keep me up-to-date.

A special thanks to Kerrie Foley-Koch, Dr. Burgesser, Dr. Intile, Dr. Black, Dr. Wihlen and the amazing staff of MVA and VSES for your professionalism, compassion, and amazing support and for continuing to allow us to make good things occur; to Sue Ellen Tarantello for teaching us about courage, optimism, and hope; to Tim, Jyoti, Mark, Tracey, Cortney, Bryan, and Kathryn for their unwavering support; to Vikas, Nisha, Logan, Zara, Connor, and Jack for bringing the sunshine back into our lives and for teaching us all the real joy of learning and the wonders of the world; and to Hayley, Brodie, and Stanley, my harshest critics and most joyous supporters who keep everything in perspective.

Amy M. Karch, RN, MS

Nursing Process Guidelines

The delivery of medical care is in a constant state of change and sometimes in crisis. The population is aging, resulting in more chronic disease and more complex care issues. The population is transient, resulting in unstable support systems and fewer at-home care providers and helpers. At the same time, medicine is undergoing a technological and pharmacological boom. Patients are being discharged earlier from the acute-care facility or not being admitted at all for procedures that used to be done in the hospital with follow-up support and monitoring. Patients are becoming more responsible for their own care and for following complicated medical regimens at home.

Nursing is a unique and complex science and a nurturing and caring art. Traditionally, nurses minister to and soothe the sick; currently, nursing also requires using more technical and scientific skills. Nurses have had to assume increasing responsibilities involved not only with nurturing and caring, but also with assessing, diagnosing, and intervening with patients to treat, prevent, and educate to help people cope with various health states.

The nurse deals with the whole person—the physical, emotional, intellectual, and spiritual aspects—considering the ways that a person responds to disease and treatment, and the change in lifestyle that may be required by both. The nurse is the key health care provider in a position to assess the patient (physical, social, and emotional aspects), administer therapy and medications, teach the patient how best to cope with the therapy to ensure the most effectiveness, and evaluate the effectiveness of therapy. This role requires a broad base of knowledge in the basic sciences (anatomy, physiology, nutrition, chemistry, pharmacology), the social sciences (sociology, psychology), and education (learning approaches, evaluation).

Although all nursing theorists do not completely agree on the process that defines the

practice of nursing, most include certain key elements in the nursing process. These elements are the basic components of the decision-making or problem-solving process: assessment (gathering of information), diagnosis (defining that information to arrive at some conclusions), planning (developing a plan of care), intervention (eg, administration, education, comfort measures), and evaluation (determining the effects of the interventions that were performed). Using this process each time a situation arises ensures a method of coping with the overwhelming scientific and technical information. However, the unique emotional, social, and physical aspects that each patient brings to the situation can confound matters. Using the nursing process format in each instance of drug therapy will ensure that the patient receives the best, most efficient, scientifically based holistic care.

Assessment

The first step of the nursing process is the systematic, organized collection of data about the patient. Because the nurse is responsible for holistic care, these data must include information about physical, intellectual, emotional, social, and environmental factors. They will provide the nurse with information needed to plan discharge, plan educational programs, arrange for appropriate consultations, and monitor physical response to treatment or to disease. In actual clinical practice, this process never ends. The patient is not in a steady state but is dynamic, adjusting to physical, emotional, and environmental influences. Each nurse develops a unique approach to the organization of the assessment, an approach that is functional, useful, and appropriate in the clinical setting and that makes sense to that nurse and that clinical situation.

Drug therapy is a complex, integral, and important part of health care today, and the principles of drug therapy need to be incorporated

into every patient assessment plan. The particular information that is needed and that should be assessed will vary with each drug, but the concepts involved are similar and are based on the principles of drug therapy. Two important areas that need to be assessed are history and physical presentation.

History

Past experiences and past illnesses and surgeries impact the actual effect of a drug.

Chronic conditions: These may be contraindications to the use of a drug or may require that caution be used or that drug dosage be adjusted.

Drug use: Prescription drugs, over-the-counter (OTC) drugs, street drugs, alcohol, nicotine, and caffeine all may have an impact on the effect of a drug. Patients often neglect to mention OTC drugs, herbal and alternative therapy, vitamin and mineral supplements, and contraceptives, not considering them actual drugs, and should be asked specifically about use of OTC drugs, herbals, supplements, contraceptives, or any drug that might be taken on a long-term basis and not mentioned.

Allergies: Past exposure to a drug or other allergen can predict a future reaction or need to use certain drugs, food, or animal products cautiously.

Level of education: This information will help to provide a basis for patient education programs and level of explanation.

Level of understanding of disease and therapy: This information also will direct the development of educational information.

Social supports: Patients are being discharged earlier than ever before and often need assistance at home to provide care and institute and monitor drug therapy.

Financial supports: The financial impact of health care and the high cost of medications need to be considered when prescribing drugs. These factors may impact a patient's ability to follow through with drug therapy.

Pattern of health care: The way that a patient seeks health care will give the nurse valuable information to include in educational information. Does this patient routinely

seek physical examinations and follow-up care or wait for emergency situations?

Physical assessment

Weight: Weight is an important factor when determining if the recommended dosage of a drug is appropriate. The recommended dosage is based on the 150-lb adult male. Patients who are much lighter or much heavier will need a dosage adjustment.

Age: Patients at the extremes of the age spectrum—pediatric and geriatric—often require dosage adjustments based on the functional level of the liver and kidneys and the responsiveness of other organs.

Physical parameters related to the disease state or known drug effects:

Assessment of these factors before beginning drug therapy will give a baseline level with which future assessments can be compared to determine the effects of drug therapy. The specific parameters that need to be assessed will depend on the disease process being treated and on the expected therapeutic and adverse effects of the drug therapy. Because the nurse has the greatest direct and continual contact with the patient, the nurse has the best opportunity to detect the minute changes that will determine the course of drug therapy and therapeutic success or the need for discontinuation because of adverse or unacceptable responses.

The monographs in this book include the specific parameters that need to be assessed in relation to the particular drug being discussed (see the sample monograph in the preface). This assessment provides not only the baseline information needed before giving that drug, but the data needed to evaluate the effects of that drug on the patient. The information given in this area should supplement the overall nursing assessment of the patient, which will include social, intellectual, financial, environmental, and other physical data.

Nursing diagnosis

Once data have been collected, the nurse must organize and analyze that information to arrive at a nursing diagnosis. A nursing diagnosis is simply a statement of the patient's

status from a nursing perspective. This statement directs appropriate nursing interventions. A nursing diagnosis will show actual or potential alteration in patient function based on the assessment of the clinical situation. Because drug therapy is only a small part of the overall patient situation, the nursing diagnoses that are related to drug therapy must be incorporated into a total picture of the patient. In many cases the drug therapy will not present a new nursing diagnosis, but the desired effects and adverse effects related to each drug given should be considered in the identified nursing diagnoses for each patient. NANDA International (NANDA-I) produces a coded list of accepted nursing diagnoses that are updated periodically.

Interventions

The assessment and diagnosis of the patient's situation will direct specific nursing interventions. Four types of interventions are frequently involved in drug therapy: Drug administration, provision of comfort measures, monitoring the effects of drug therapy, and patient and family teaching.

Drug administration

Drug: Ensuring that the drug being administered is the correct dose of the correct drug at the correct time, and is being given to the correct patient, is standard nursing practice.

Storage: Some drugs require specific storage environments (eg, refrigeration, protection from light).

Route: Determining the best route of administration is often determined by the prescription of the drug. Nurses can often have an impact on modifying the prescribed route to determine the most efficient route and the most comfortable one for the patient based on his or her specific situation. When establishing the prescribed route, it is important to check the proper method of administering a drug by that route.

Dosage: Drug dosage may need to be calculated based on available drug form, patient body weight or surface area, or kidney function.

Preparation: Some drugs require specific preparation before administration. Oral drugs

may need to be shaken or crushed; parenteral drugs may need to be reconstituted or diluted with specific solutions; topical drugs may require specific handling before administration.

Timing: Actual administration of a drug may require coordination with the administration of other drugs, foods, or physical parameters. The nurse, as the caregiver most frequently involved in administering a drug, must be aware of and juggle all of these factors and educate the patient to do this on his or her own.

Documentation: Once the nurse has assessed the patient, made the appropriate nursing diagnoses, and delivered the correct drug by the correct route, in the correct dose, and at the correct time, that information needs to be recorded in accordance with the local requirements for documenting medication administration.

Each monograph in this book contains pertinent guidelines for storage, dosage, preparation, and administration of the drug being discussed.

Comfort measures

Nurses are in the unique position to help the patient cope with the effects of drug therapy.

Placebo effect: The anticipation that a drug will be helpful (placebo effect) has been proved to have tremendous impact on the actual success of drug therapy, so the nurse's attitude and support can be a critical part of drug therapy. A back rub, a kind word, and a positive approach may be as beneficial as the drug itself.

Side effects: These interventions can be directed at decreasing the impact of the anticipated side effects of the drug and promoting patient safety. Such interventions include environmental control (eg, temperature, lighting), safety measures (eg, avoiding driving, avoiding the sun, using side rails), physical comfort (eg, skin care, laxatives, frequent meals).

Lifestyle adjustment: Some drug effects will require that a patient change his or her lifestyle to cope effectively. Diuretic users may have to rearrange the day to be near toilet

facilities when the drug works. MAOI users have to adjust their diet to prevent serious drug effects.

Each monograph in this book will include a list of pertinent comfort measures appropriate to that particular drug.

Education

With patients becoming more responsible for their own care, it is essential that they have all of the information necessary to ensure safe and effective drug therapy at home. Many states now require that the patient be given written information. Key elements that need to be included in any drug education include the following:

- Name, dose, and action of drug: With many people seeing more than one health care provider, this information is important for ensuring safe and effective drug therapy.
- Timing of administration: Patients need to know specifically when to take the drug with regard to frequency, other drugs, and meals.
- Special storage and preparation instructions: Some drugs require particular handling that the patient will need to have spelled out.
- Specific OTC drugs, vitamin and mineral supplements, or alternative therapies to avoid: Many people do not consider these to be actual drugs and may inadvertently take them and cause unwanted or even dangerous drug interactions. Explaining problems will help the patient avoid these potential situations.
- Special comfort or safety measures that need to be considered: Alerting the patient to ways to cope with anticipated side effects will prevent a great deal of anxiety and noncompliance with drug therapy. The patient also may need to be alerted to the need to return for follow-up tests or evaluation.
- Safety measures: All patients need to be alerted to keep drugs out of the reach of children. They also need to be reminded to tell any health care provider whom they see that they are taking this drug. This can prevent drug-

drug interactions, polypharmacy, and misdiagnosing based on drug effects.

- Specific points about drug toxicity: Warning signs of drug toxicity that the patient should be aware of should be listed. He or she can be advised to notify the health care provider if any of these effects occur.
- Specific warnings about drug discontinuation: Some drugs with a small margin of safety and drugs with particular systemic effects cannot be stopped abruptly without dangerous effects. Patients taking these drugs need to be alerted to the problem and encouraged to call immediately if they cannot take their medication for any reason (eg, illness, financial).

Each drug monograph in this book lists specific teaching points that relate to that particular drug. An example of a compact, written drug card developed from the information in the monograph is shown on page 5.

Evaluation

Evaluation is part of the continual process of patient care that leads to changes in assessment, diagnosis, and intervention. The patient is continually evaluated for therapeutic response, the occurrence of drug side effects, and the occurrence of drug-drug, drug-food, drug-laboratory test, or drug-alternative therapy interactions.

The efficacy of the nursing interventions and the education program must be evaluated. In some situations, the nurse will evaluate the patient simply by reapplying the beginning steps of the nursing process and analyzing for change. In some cases of drug therapy, particular therapeutic drug levels need to be evaluated as well.

Monographs in this book list only specific evaluation criteria, such as therapeutic serum levels, as they apply to each drug. Regular evaluation of drug effects, side effects, and the efficacy of comfort measures and education

Patient Drug Sheet: Oral Linezolid

Patient's Name: Mr. Kors

Prescriber's Name: J. Smith, ANP

Phone Number: 555-555-5555

Instructions:

1. The name of your drug is *linezolid*; the brand name is *Zyvox*. This drug is an antibiotic that is being used to treat your *pneumonia*. This drug is very specific in its action and is only indicated for your particular infection. Take the full course of your drug. Do not share this drug with other people or save tablets for future use.
2. The dose of the drug that has been prescribed for you is: *600 mg (1 tablet)*.
3. The drug should be taken *once every 12 hours*. The best time for you to take this drug will be *8:00 in the morning and 8:00 in the evening*. Do not skip any doses. Do not take two doses at once if you forget a dose. If you miss a dose, take the dose as soon as you remember and then again in 12 hours.
4. The drug can be taken with food if GI upset is a problem. Avoid foods that are rich in tyramine (list is below) while you are taking this drug.
5. The following side effects may occur:
 - Nausea, vomiting, abdominal pain (taking the drug with food and eating frequent small meals may help).
 - Diarrhea (ensure ready access to bathroom facilities). Notify your health care provider if this becomes severe.
6. Do not take this drug with over-the-counter drugs or herbal remedies without first checking with your health care provider. Many of these agents can cause problems with your drug.
7. Tell any nurse, physician, or dentist who is taking care of you that you are on this drug.
8. Keep this and all medications out of the reach of children.

Notify your health care provider if any of the following occur:

Rash, severe GI problems, bloody or excessive diarrhea, weakness, tremors, increased bleeding or bruising, anxiety.

Foods high in tyramine to avoid: Aged cheeses, avocados, bananas, beer, bologna, caffeinated beverages, chocolate, liver, over-ripe fruit, pepperoni, pickled fish, red wine, salami, smoked fish, yeast, yogurt.

programs will not be specifically listed but can be deduced from information in the monograph regarding therapeutic effects and adverse effects. See *Nursing care plan: Patient*

receiving oral linezolid, page 6. *Anatomy of a monograph*, in the preface, provides additional guidelines for using each section of a monograph as it applies to the nursing process.

Nursing care plan: Patient receiving oral linezolid

Preventing Medication Errors

Growing numbers of patients—and drugs—bring increased risk of medication errors. Compounding this risk is the tremendous upsurge in the use of over-the-counter (OTC) drugs and herbal remedies. Physicians, pharmacists, and nurses serve as checkpoints for ensuring medication safety. A nurse is commonly the final check because nurses usually administer drugs and have responsibility for discharging patients to home to manage a potentially complicated drug regimen.

The monumental task of ensuring medication safety can be managed by consistently using the six rights of drug administration: right drug, right route, right dose, right time, right patient, and right documentation.

Right drug

- Always review a drug order before administering the drug.
- Do not assume that a computer system is always right and will protect the patient. Always double check.
- Make sure the drug name is correct. Ask for a brand name and a generic name. Because many drug names look and sound alike (note the Clinical Alerts throughout the monographs), the chance of reading the name incorrectly is greatly reduced if both generic and brand names are used.
- Avoid taking verbal or telephone orders whenever possible. If you must, have a second person listen in to verify and clarify the order.
- Abbreviations can be confusing between and even within health care facilities. Do not be afraid or embarrassed to ask the meaning of an abbreviation, even a common one. For instance, many people use *hs* to mean hour of sleep, others may read it as every hour. As much as possible, spell out abbreviations for clarification.
- Also, consider whether the drug makes sense for the patient's diagnosis. If you do not know or you have questions, look up the drug and ask the patient what it is being used for.

Right route

- Review the available forms of a drug to make sure the drug can be given according to the order.
- Check the routes available and the appropriateness of the route. Be familiar with the appropriate and safe technique for administration by the ordered route.
- Make sure the patient is able to take the drug by the route indicated. If you know that the patient has trouble swallowing, for example, you also know that a liquid form of the drug may be better than a tablet or capsule.
- Do not use abbreviations for routes because the danger of confusion is too great. For example, *SC* is often used to mean subcutaneous, but it has been misinterpreted to mean sublingual among other misinterpretations. Also, *IV* can be misinterpreted to mean *IU*, or international units.

Right dose

- Always place a 0 to the left of a decimal point, and never place a 0 to the right of a decimal point. For example, 0.5 is correct (not .5, which can be easily mistaken for 5) and 5 is correct (not 5.0, which can be easily mistaken for 50). If you see an ordered dose that starts with a decimal point, question it. And if a dose seems much too big, question that.
- Double-check drug calculations. If a dose has to be calculated for pediatric or other use, always have someone double-check the math, even if a computer did the calculations. This is especially important with drugs that have small margins of safety, such as digoxin and insulin.
- Check the measuring devices used for liquid drugs. Advise patients not to use kitchen teaspoons or tablespoons to measure drug doses.
- Do not cut tablets in half to get the correct dose without checking the warnings that come with the drug. Many drugs cannot be cut, crushed, or chewed because of the matrix systems that have been developed to prepare the drugs.

Right time

- Increased workloads, decreased nursing staffs, and constant interruptions can interfere with the delivery of medications at the right times. Even at home, patients are busy, have tight schedules, and may fail to follow a precise schedule. Ensure the timely delivery of the patient's drugs by scheduling dosage with other drugs, meals, or other consistent events to maintain the serum level.
- Teach patients the importance of timing critical drugs. Keep in mind that patients tend to take all of their daily drugs at once, in the morning, to reduce the risk of forgetting them. But with critical drugs, such as those with a small margin of safety, those that interact, and those that need meticulous spacing, you will need to stress the importance of accurate timing. As needed, make detailed medication schedules and prepare pill boxes.

Right patient

- Check the patient's identification even if you think you know who the patient is. Ask for the patient's full name, and check the patient's identification band if available.
- Review the patient's diagnosis, and verify that the drug matches the diagnosis. If a drug does not make sense for the patient's diagnosis, look it up and, if necessary, consult with the prescriber.
- Make sure all allergies have been checked before giving a drug. Serious adverse reactions can be avoided if allergies are known.
- Ask patients specifically about OTC drugs, vitamin and mineral supplements, herbal remedies, and routine drugs that they may not think to mention, such as oral contraceptives, thyroid hormones, and insulin. Serious overdoses, adverse reactions, and drug interactions can be avoided if this information is acquired early.
- Review the patient's drug regimen to prevent potential interactions between the drug you are about to give and drugs the patient already takes. If you are not sure about potential interactions, consult a drug reference.

The bottom line in avoiding medication errors is simple: "If in doubt, check it out." A strange abbreviation, a drug or dosage that is new to you, and a confusing name are all

examples that signal a need for follow-up. Look up the drug in your drug guide or call the prescriber or the pharmacy to double check. Never give a drug until you have satisfied yourself that it is the right drug, given by the right route, at the right dose, at the right time, and to the right patient.

Right documentation

Document according to facility policy. Include the drug name, dose, route, and time of administration. Note special circumstances, such as the patient having difficulty swallowing or the site of the injection.

Error reporting

In recent years, the incidence of medication errors has become a frequent media headline. As the population ages and more people are taking multiple medications—and as more drugs become available—the possibilities for medication errors seem to be increasing. Institutions have adopted policies for reporting errors, which protect patients and staff and identify the need for educational programs within the institution, but it is also important to submit information about errors to national programs. These national programs, coordinated by the US Pharmacopeia (USP), help to gather and disseminate information about errors, to prevent their recurrence at other sites and by other providers. These reports might prompt the issuing of prescriber warnings to alert health care providers about potential or actual medication errors and to prevent these same errors from recurring. The reporting of actual or potential errors results in alerts and publicity about sound-alike drug names, problems with abbreviations, the need for clear writing of dosages and times, incorrect calculations, and transcribing issues.

The strongest warning that the FDA can give about potential drug problems is called a black box warning. This warning may be part of the initial drug prescribing information, if a drug is found to have potentially serious adverse effects before approval, or the warning may be added as a result of postmarketing reports of adverse effects or serious errors involving the drug. The black box warning alerts the health care provider and patient about screening to

be done, adverse effects to watch for, and other drugs to avoid. The monographs in this book will highlight black box warnings to help bring attention to these reported effects and to help decrease medication errors and promote patient safety.

If you witness or participate in an actual or potential medication error, it is important to report that error to the national clearinghouse to ultimately help other professionals avoid similar errors. To help streamline the process of reporting and make it as easy as possible for professionals to participate, the USP maintains one central reporting center, from which it disseminates information to the FDA, drug manufacturers, and the Institute for Safe Medication Practices (ISMP). You can report an actual error or potential error by calling 1-800-23-ERROR, the USP Medication Errors Reporting Program. Their office will send you a mailer to fill out and return to them. Or, you can log on to www.usp.org to report an error online or to print out the form to mail or fax back to the USP. You may request to remain anonymous to all institutions to which the report is subsequently disseminated if you feel uncomfortable sharing this information. If you aren't sure about what you want to report, you may report errors to the USP through the ISMP Web site at www.ismp.org, which also offers a discussion forum on medication errors.

What kind of errors should be reported? Errors (or potential errors) such as administration of the wrong drug, strength, or dose of a drug; incorrect routes of administration; miscalculations; misuse of medical equipment; mistakes in prescribing or transcribing (misunderstanding of verbal orders); and errors resulting from sound-alike or look-alike names. In your report, you will be asked to include the following:

1. A description of the error or preventable adverse drug reaction. What went wrong?
2. Was this an actual medication accident (reached the patient) or are you express-

ing concern about a potential error or writing about an error that was discovered before it reached the patient?

3. Patient outcome. Did the patient suffer any adverse effects?
4. Type of practice site (eg, hospital, private office, retail pharmacy, drug company, long-term care facility)
5. Generic name (International Nonproprietary Name [INN] or official name) of all products involved
6. Brand name of all products involved
7. Dosage form, concentration or strength, and so forth
8. Where error was based on communication problem, is a sample of the order available? Are package label samples or pictures available if requested?
9. Your recommendations for error prevention.

You will also be asked to provide your name, title, facility address and e-mail, fax, or phone location if someone wants to contact you about details. You can remain anonymous and no one will contact your employer to discuss the report. The ISMP publishes case studies and publicizes warnings and alerts based on clinician reports of medication errors. Their efforts have helped to increase recognition of the many types of errors, such as those involving sound-alike names, look-alike names and packaging, instructions on equipment and delivery devices, and others.

To report an actual or potential medication error, call 1-800-23-ERROR or log on to www.usp.org.

For more information regarding warnings, error alerts, and case reports log on to www.ismp.org, www.fda.gov, or www.medwatch.gov.

Pharmacologic Classes

Alkylating Drugs

DANGEROUS DRUG

PREGNANCY CATEGORY D

Therapeutic actions

Alkylating drugs are cytotoxic. They alkylate cellular DNA, interfering with the replication of susceptible cells and causing cell death. Their action is most evident in rapidly dividing cells.

Indications

- Palliative treatment of chronic lymphocytic leukemia; malignant lymphomas, including lymphosarcoma, giant follicular lymphoma; brain tumors; Hodgkin's lymphoma; multiple myelomas; testicular cancers; pancreatic cancer; ovarian and breast cancers
- Used as part of multiple-drug regimens

Contraindications and cautions

- Contraindicated with hypersensitivity to the drugs, concurrent radiation therapy, hematopoietic depression, pregnancy, lactation.

Adverse effects

- **CNS:** *Tremors, muscular twitching, confusion*, agitation, ataxia, flaccid paresis, hallucinations, seizures
- **Dermatologic:** *Skin rash, urticaria, alopecia*, keratitis
- **GI:** Nausea, vomiting, anorexia, **hepatotoxicity**
- **GU:** Sterility
- **Hematologic:** *Bone marrow depression*, hyperuricemia
- **Respiratory:** Bronchopulmonary dysplasia, **pulmonary fibrosis**
- **Other:** *Cancer, acute leukemia*

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to drug, radiation therapy, hematopoietic depression, pregnancy, lactation

- **Physical:** T; weight; skin color, lesions; R, adventitious sounds; liver evaluation; CBC, differential, Hgb, uric acid, LFTs, renal function tests

Interventions

- ⊗ **Black box warning** Arrange for blood tests to evaluate hematopoietic function prior to and weekly during therapy; severe bone marrow suppression is possible.
- Restrict dosage within 4 wk after a full course of radiation therapy or chemotherapy because of risk of severe bone marrow depression.
- Ensure that patient is well hydrated before treatment.
- Arrange for frequent small meals and dietary consultation to maintain nutrition if GI upset occurs.
- Arrange for skin care for rashes.
- ⊗ **Black box warning** Suggest use of contraception; serious fetal abnormalities or death is possible.

Teaching points

- You may experience these side effects: Nausea, vomiting, loss of appetite (dividing dose may help; frequent small meals may help; maintain fluid intake and nutrition; drink at least 10–12 glasses of fluid each day); infertility (potentially irreversible and irregular menses to amenorrhea and aspermia; discuss feelings with your health care provider); these drugs can cause severe birth defects; use birth control methods while on these drugs.
- Report unusual bleeding or bruising; fever, chills, sore throat; cough, shortness of breath; yellowing of the skin or eyes; flank or stomach pain.

Representative drugs

altretamine
bendamustine
busulfan
carboplatin
carmustine
chlorambucil

cisplatin
 cyclophosphamide
 dacarbazine
 estramustine
 ifosfamide
 lomustine
 mechlorethamine
 melphalan
 oxaliplatin
 procarbazine
 streptozocin
 temozolomide
 thiotepea

Alpha₁-adrenergic Blockers

PREGNANCY CATEGORY C

Therapeutic actions

Alpha₁-adrenergic blockers selectively block postsynaptic alpha₁-adrenergic receptors, decreasing sympathetic tone on the vasculature, dilating arterioles and veins, and lowering both supine and standing BP; unlike conventional alpha-adrenergic blockers (phenolamine), they do not also block alpha₂ presynaptic receptors, so they do not cause reflex tachycardia. They also relax smooth muscle of bladder and prostate.

Indications

- Treatment of hypertension (alone or with other drugs)
- Treatment of BPH (alfuzosin, doxazosin, terazosin, tamsulosin)
- Unlabeled uses: Symptomatic treatment of chronic abacterial prostatitis (terazosin)

Contraindications and cautions

- Contraindicated with hypersensitivity to any alpha₁-adrenergic blocker, lactation.
- Use cautiously with heart failure, renal failure, pregnancy.

Adverse effects

- **CNS:** *Dizziness, headache, drowsiness, lack of energy, weakness*, nervousness, vertigo, depression, paresthesias
- **CV:** *Palpitations*, sodium and water retention, increased plasma volume, edema, dys-

pnea, syncope, tachycardia, orthostatic hypotension

- **Dermatologic:** Rash, pruritus, lichen planus
- **EENT:** Blurred vision, reddened sclera, epistaxis, tinnitus, dry mouth, nasal congestion
- **GI:** *Nausea*, vomiting, diarrhea, constipation, abdominal discomfort or pain
- **GU:** Urinary frequency, incontinence, impotence
- **Other:** Diaphoresis

Interactions

★ **Drug-drug** • Severity and duration of hypotension following first dose of drug may be greater in patients receiving beta-adrenergic blockers (propranolol), verapamil • Risk of severe hypotension if combined with sildenafil, tadalafil, vardenafil

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any alpha₁-adrenergic blocker, heart failure, renal failure, lactation
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds, status of nasal mucous membranes; bowel sounds, normal output; voiding pattern, normal output; renal function tests, urinalysis

Interventions

- Administer, or have patient take, first dose at night to lessen likelihood of first-dose syncope believed to be caused by excessive orthostatic hypotension.
- Have patient lie down, and treat supportively if syncope occurs; condition is self-limiting.
- Monitor patient for orthostatic hypotension: most marked in the morning, accentuated by hot weather, alcohol, exercise.
- Monitor edema, weight in patients with incipient cardiac decompensation; arrange to add a thiazide diuretic to the drug regimen if sodium and fluid retention, signs of impending heart failure occur.
- Provide frequent small meals, frequent mouth care if GI effects occur.
- Establish safety precautions if CNS, hypotensive changes occur (side rails, accompany patient).

- Arrange for analgesic for patients experiencing headache.

Teaching points

- Take these drugs exactly as prescribed. Take the first dose at bedtime. Do not drive a car or operate machinery for 4 hours after the first dose.
- Avoid over-the-counter drugs (nose drops, cold remedies) while taking these drugs. If you feel you need one of these preparations, consult your health care provider.
- You may experience these side effects: Dizziness, weakness may occur when changing position, in the early morning, after exercise, in hot weather, and after consuming alcohol; tolerance may occur after taking these drugs for a while, but avoid driving or engaging in tasks that require alertness while experiencing these symptoms; change position slowly, and use caution in climbing stairs; lie down if dizziness persists; GI upset (frequent small meals may help); dry mouth (sucking on sugarless lozenges, ice chips may help); stuffy nose. Most of these effects will stop with continued therapy.
- Report frequent dizziness or faintness.

Representative drugs

alfuzosin
doxazosin
prazosin
silodosin
tamsulosin
terazosin

Aminoglycosides

PREGNANCY CATEGORY D

Therapeutic actions

Aminoglycosides are antibiotics that are bactericidal. They inhibit protein synthesis in susceptible strains of gram-negative bacteria, appear to disrupt the functional integrity of bacterial cell membrane, causing cell death. Oral aminoglycosides are very poorly absorbed and are used for the suppression of GI bacterial flora.

Indications

- Short-term treatment of serious infections caused by susceptible strains of *Pseudomonas* species, *Escherichia coli*, indole-positive *Proteus* species, *Providencia* species, *Klebsiella-Enterobacter-Serratia* species, *Acinetobacter* species
- Suspected gram-negative infections before results of susceptibility studies are known
- Initial treatment of staphylococcal infections when penicillin is contraindicated or when infection may be caused by mixed organisms
- Neonatal sepsis when other antibiotics cannot be used (used in combination with penicillin-type drug)
- Unlabeled uses: As part of a multidrug regimen for treatment of *Mycobacterium avium* complex (a common infection in AIDS patients) and orally for the treatment of intestinal amebiasis; adjunctive treatment of hepatic coma and for suppression of intestinal bacteria for surgery

Contraindications and cautions

- Contraindicated with allergy to any aminoglycosides, renal disease, hepatic disease, preexisting hearing loss, myasthenia gravis, parkinsonism, infant botulism, lactation.
- Use cautiously in elderly patients; patients with diminished hearing; patients with decreased renal function, dehydration, neuromuscular disorders, pregnancy.

Adverse effects

- **CNS:** *Ototoxicity*, confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, fever, numbness, tingling, tremor, paresthesias, muscle twitching, seizures, muscular weakness, neuromuscular blockade, apnea
- **CV:** Palpitations, hypotension, hypertension
- **GI:** Nausea, vomiting, anorexia, diarrhea, weight loss, stomatitis, increased salivation, splenomegaly
- **GU:** *Nephrotoxicity*
- **Hematologic:** Leukemoid reaction, agranulocytosis, granulocytosis, leukopenia, leukocytosis, thrombocytopenia, eosinophilia, pancytopenia, anemia, hemolytic anemia, increased or decreased reticulocyte count, electrolyte disturbances

- **Hepatic:** Hepatic toxicity, hepatomegaly
- **Hypersensitivity:** Purpura, rash, urticaria, exfoliative dermatitis, itching
- **Other:** *Superinfections, pain and irritation at IM injection sites*

Interactions

* **Drug-drug** • Increased ototoxic and nephrotoxic effects if taken with potent diuretics and similarly toxic drugs (cephalosporins) • Increased likelihood of neuromuscular blockade if given shortly after general anesthetics, depolarizing and nondepolarizing neuromuscular junction blockers

■ Nursing considerations

Assessment

- **History:** Allergy to any aminoglycosides, renal disease, hepatic disease, preexisting hearing loss, myasthenia gravis, parkinsonism, infant botulism, lactation, diminished hearing, decreased renal function, dehydration, neuromuscular disorders
- **Physical:** Arrange culture and sensitivity tests of infection prior to therapy; renal function tests before, during, and after therapy; eighth cranial nerve function, and state of hydration, during and after therapy; LFTs, CBC; skin color, lesions; orientation, affect; reflexes, bilateral grip strength; body weight; bowel sounds

Interventions

⊗ **Black box warning** Monitor patient carefully for severe renal toxicity and ototoxicity; discontinue drug or adjust dosage at first indication of either.

- Arrange for culture and sensitivity testing of infected area prior to treatment.
- Monitor duration of treatment: Usual duration is 7–10 days. If no clinical response within 3–5 days, stop therapy. Prolonged treatment leads to increased risk of toxicity. If drug is used longer than 10 days, monitor auditory and renal function daily.
- Give IM dosage by deep injection.
- Ensure that patient is well hydrated before and during therapy.
- Establish safety measures if CNS, vestibular nerve effects occur (use of side rails, assistance with ambulation).

- Provide frequent small meals if nausea, anorexia occur.
- Provide comfort measures and medication for superinfections.
- Monitor drug levels periodically if used for prolonged periods.

Teaching points

- Take full course of oral drugs; drink plenty of fluids.
- You may experience these side effects: Ringing in the ears, headache, dizziness (reversible; safety measures need to be taken if severe); nausea, vomiting, loss of appetite (frequent small meals, frequent mouth care may help).
- Report pain at injection site, severe headache, dizziness, loss of hearing, changes in urine pattern, difficulty breathing, rash or skin lesions.

Representative drugs

amikacin
gentamicin
kanamycin
neomycin
streptomycin
tobramycin

Angiotensin-converting Enzyme (ACE) Inhibitors

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Therapeutic actions

ACE inhibitors block ACE in the lungs from converting angiotensin I, activated when renin is released from the kidneys, to angiotensin II, a powerful vasoconstrictor. Blocking this conversion leads to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action.

Indications

- Treatment of hypertension (alone or with thiazide-type diuretics)
- Treatment of heart failure (used with diuretics and digitalis)
- Treatment of stable patients within 24 hr of acute MI to improve survival (lisinopril)
- Reduction in risk of MI, CVA, and death from CV causes (ramipril)
- Treatment of left ventricular dysfunction post-MI (captopril, trandolapril)
- Treatment of asymptomatic left ventricular dysfunction (enalapril)
- Treatment of diabetic nephropathy (captopril)
- Unlabeled uses: Renovascular hypertension, nondiabetic nephropathy, migraine prophylaxis, stroke prevention, heart failure, high risk of CAD, diabetes, chronic renal disease, scleroderma renal crisis

Contraindications and cautions

- Contraindicated with allergy to the drug, impaired renal function, heart failure, salt or volume depletion, lactation, pregnancy, history of angioedema, bilateral renal artery stenosis.

Adverse effects

- **CV:** Tachycardia, angina pectoris, **MI**, Raynaud's syndrome, heart failure, hypotension in salt- or volume-depleted patients
- **Dermatologic:** *Rash*, pruritus, alopecia, pemphigoid-like reaction, scalded mouth sensation, exfoliative dermatitis, photosensitivity
- **GI:** *Gastric irritation, apbthous ulcers*, peptic ulcers, dysgeusia, cholestatic jaundice, hepatocellular injury, anorexia, constipation
- **GU:** Proteinuria, renal insufficiency, renal failure, polyuria, oliguria, urinary frequency
- **Hematologic:** Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, **pancytopenia**, hyperkalemia
- **Other:** *Cough*, malaise, dry mouth, lymphadenopathy, angioedema

Interactions

- *** Drug-drug** • Increased risk of hypersensitivity reactions with allopurinol • Decreased antihypertensive effects with indomethacin

• *** Drug-food** • Decreased absorption of selected drugs if taken with food

• *** Drug-lab test** • False-positive test for urine acetone

Nursing considerations**Assessment**

- **History:** Allergy to ACE inhibitors, impaired renal function, heart failure, salt or volume depletion, pregnancy, lactation
- **Physical:** Skin color, lesions, turgor; T, P, BP, peripheral perfusion; mucous membranes; bowel sounds; liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential, potassium levels

Interventions

⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy; serious fetal effects can occur.

- Administer 1 hr before or 2 hr after meals; is affected by food in GI tract (captopril, moexipril).
- Alert surgeon and mark patient's chart that ACE inhibitor is being taken; angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.
- Monitor patient closely in situations that may lead to a fall in BP due to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.
- Arrange for reduced dosage in patients with impaired renal function.
- Arrange for bowel program if constipation occurs.
- Provide frequent small meals if GI upset is severe.
- Provide frequent mouth care and oral hygiene if mouth sores, alteration in taste occur.
- Caution patient to change position slowly if orthostatic changes occur.
- Provide skin care as needed.

Teaching points

- Take these drugs 1 hour before or 2 hours after meals; do not take with food (captopril, moexipril).

- Do not stop taking the medication without consulting your health care provider.
- Be careful with any conditions that may lead to a drop in blood pressure (such as diarrhea, sweating, vomiting, dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- Avoid over-the-counter drugs, especially cough, cold, allergy medications. If you need one of these, consult your health care provider.
- You may experience these side effects: GI upset, loss of appetite, change in taste perception (limited effects; if they persist or become a problem, consult your health care provider); mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, light-headedness (passes after a few days of therapy; if it occurs, change position slowly and limit activities requiring alertness and precision); cough.
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heartbeat, chest pains; swelling of the face, eyes, lips, tongue; difficulty breathing.

Representative drugs

benazepril
captopril
enalapril
enalaprilat
fosinopril
lisinopril
moexipril
perindopril
quinapril
ramipril
trandolapril

Angiotensin II Receptor Blockers (ARBs)

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Therapeutic actions

ARBs selectively block the binding of angiotensin II to specific tissue receptors found in

the vascular smooth muscle and adrenal gland. This action blocks the vasoconstriction effect of the renin-angiotensin system as well as the release of aldosterone leading to decreased BP; may block vessel remodeling that occurs in hypertension and contributes to the development of atherosclerosis.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- Nephropathy in type 2 diabetes (losartan, irbesartan)
- Treatment of heart failure in patients resistant to ACE inhibitors (valsartan)
- Reduction in the risk of CVA in patients with hypertension and left ventricular hypertrophy (losartan)

Contraindications and cautions

- Contraindicated with hypersensitivity to any ARB, pregnancy (use during the second or third trimester can cause injury or even death to the fetus), lactation.
- Use cautiously with renal impairment, hypovolemia.

Adverse effects

- **CNS:** Headache, dizziness, syncope, muscle weakness, *fatigue*, *depression*
- **CV:** Hypotension
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** Diarrhea, *abdominal pain*, nausea, constipation
- **Respiratory:** *URI symptoms*, cough, sinus disorders
- **Other:** Cancer in preclinical studies, UTIs

Interactions

★ **Drug-drug** • Decreased effectiveness if combined with phenobarbital • Risk of increased lithium levels

■ Nursing considerations Assessment

- **History:** Hypersensitivity to any ARB, pregnancy, lactation, renal impairment, hypovolemia
- **Physical:** Skin lesions, turgor; body T; reflexes, affect; BP; R, respiratory auscultation; renal function tests

Interventions

- Administer without regard to meals.
- ⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy; suggest the use of barrier contraception; fetal injury and deaths have been reported.
- Find an alternative method of feeding infant if ARBs are given to a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.
- Alert surgeon and mark on patient's chart that an ARB is being taken. The blockage of the renin-angiotensin system after surgery can produce problems. Hypotension may be reversed with volume expansion.
- If BP control does not reach desired levels, diuretics or other antihypertensives may be added to the drug regimen. Monitor patient's BP carefully.
- Monitor patient closely in situations that may cause a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea—excessive hypotension can occur.

Teaching points

- Take these drugs without regard to meals. Do not stop taking these drugs without consulting your health care provider.
- Use a barrier method of birth control while using these drugs; if you become pregnant or desire to become pregnant, consult with your physician.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); nausea, abdominal pain (proper nutrition is important; consult a dietitian to maintain nutrition); symptoms of upper respiratory tract or urinary tract infection, cough (do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy.

Representative drugs

candesartan
 eprosartan
 irbesartan
 losartan
 olmesartan

telmisartan
 valsartan

Antiarrhythmics

PREGNANCY CATEGORY C

Therapeutic actions

Antiarrhythmics act at specific sites to alter the action potential of cardiac cells and interfere with the electrical excitability of the heart. Most of these drugs may cause new or worsened arrhythmias (proarrhythmic effect) and must be used with caution and with continual cardiac monitoring and patient evaluation.

Indications

- Treatment of tachycardia when rapid but short-term control of ventricular rate is desirable (patients with atrial fibrillation, flutter, in perioperative or postoperative situations)
- Treatment of noncompensatory tachycardia when heart rate requires specific intervention
- Treatment of atrial arrhythmias

Contraindications and cautions

- There are no contraindications; reserve for emergency situations.
- Use cautiously during pregnancy or lactation.

Adverse effects

- **CNS:** *Light-headedness, speech disorder, midscapular pain, weakness, rigors, somnolence, confusion*
- **CV:** *Hypotension*, pallor, arrhythmias
- **GI:** *Taste perversion*
- **GU:** *Urine retention*
- **Local:** *Inflammation*, induration, edema, erythema, burning at the site of infusion
- **Other:** Fever, rhonchi, flushing

Interactions

- ★ **Drug-drug** • Increased risk of drug interactions with antiarrhythmic use; monitor patients

■ Nursing considerations

Assessment

- **History:** Cardiac disease, cerebrovascular disease
- **Physical:** P, BP, ECG; orientation, reflexes; R, adventitious sounds; urinary output

Interventions

- Ensure that more toxic drug is not used in chronic settings when transfer to another drug is anticipated.
- Monitor BP, heart rate, and rhythm closely.
- Provide comfort measures for pain, rigors, fever, flushing, if patient is awake.
- Provide supportive measures appropriate to condition being treated.
- Provide support and encouragement to deal with drug effects and discomfort of IV lines.
- Monitor drug levels for procainamide and amiodarone, as indicated.

Teaching points

- Reserved for emergency use. Incorporate information about these drugs into the overall teaching program for patient. Patients maintained on oral drugs will need specific teaching.

Representative drugs

Type IA

disopyramide
procainamide
quinidine

Type IB

lidocaine
mexiletine
phenytoin

Type IC

flecainide
moricizine
propafenone

Type II

acebutolol
esmolol
propranolol

Type III

amiodarone
dofetilide
ibutilide
sotalol

Type IV

diltiazem
verapamil

Other

adenosine
digoxin
dronedarone

Anticoagulants

DANGEROUS DRUG

PREGNANCY CATEGORY C

Therapeutic actions

Oral anticoagulants interfere with the hepatic synthesis of vitamin K–dependent clotting factors (factors II, prothrombin, VII, IX, and X), resulting in their eventual depletion and prolongation of clotting times; parenteral anticoagulants interfere with the conversion of prothrombin to thrombin, blocking the final step in clot formation but leaving the circulating levels of clotting factors unaffected.

Indications

- Treatment and prevention of pulmonary embolism and venous thrombosis and its extension
- Treatment of atrial fibrillation with embolization
- Prevention of DVT
- Prophylaxis of systemic embolization after acute MI
- Prevention of thrombi following specific surgical procedures and prolonged bedrest (low–molecular-weight heparins)
- Unlabeled uses: Prevention of recurrent TIAs and MI

Contraindications and cautions

- Contraindicated with allergy to the drug; SBE; hemorrhagic disorders; TB; hepatic diseases; GI ulcers; renal disease; indwelling catheters, spinal puncture; aneurysm; diabetes; visceral carcinoma; uncontrolled hypertension; severe trauma (including recent or contemplated CNS, eye surgery, recent placement of IUD); threatened abortion, menometrorrhagia; pregnancy (oral drugs cause fetal damage and death); or lactation (heparin if anticoagulation is required).

- Use cautiously with heart failure, diarrhea, fever, thyrotoxicosis; patients with dementia, psychosis, depression.

Adverse effects

- **Bleeding:** *Hemorrhage*; GI or urinary tract bleeding (hematuria, dark stools; paralytic ileus; intestinal obstruction from hemorrhage into GI tract); petechiae and purpura, bleeding from mucous membranes; hemorrhagic infarction, vasculitis, skin necrosis of female breast; adrenal hemorrhage and resultant adrenal insufficiency; compressive neuropathy secondary to hemorrhage near a nerve
- **Dermatologic:** *Alopecia, urticaria, dermatitis*
- **GI:** *Nausea*, vomiting, anorexia, abdominal cramping, diarrhea, retroperitoneal hematoma, hepatitis, jaundice, mouth ulcers
- **GU:** Priapism, nephropathy, red-orange urine
- **Hematologic:** Granulocytosis, leukopenia, eosinophilia
- **Other:** Fever, “purple toes” syndrome

Interactions

- * **Drug-drug** • Increased bleeding tendencies with salicylates, chloral hydrate, phenylbutazone, disulfiram, chloramphenicol, metronidazole, cimetidine, ranitidine, cotrimoxazole, sulfipyrazone, quinidine, thyroid drugs, glucagon, danazol, erythromycin, androgens, amiodarone, cefoxitin, ceftriaxone, meclizine, mefenamic acid, famotidine, nizatidine, nalidixic acid, fluoroquinolones • Possible decreased anticoagulation effect with barbiturates, rifampin, phenytoin, carbamazepine, vitamin K, vitamin E, cholestyramine • Altered effects of warfarin with methimazole, propylthiouracil • Increased activity and toxicity of phenytoin with oral anticoagulants
- * **Drug-alternative therapy** • Increased risk of bleeding with chamomile, garlic, ginger, ginkgo, ginseng therapy, turmeric, horse chestnut, green tea leaf, grape seed extract, feverfew, dong quai
- * **Drug-lab test** • Red-orange discoloration of alkaline urine may interfere with some lab tests

■ Nursing considerations

Assessment

- **History:** Allergy to the drug; SBE; hemorrhagic disorders; tuberculosis; hepatic diseases; GI ulcers; renal diseases; indwelling catheters, spinal puncture; aneurysm; diabetes; visceral carcinoma; uncontrolled hypertension; severe trauma; threatened abortion, menometrorrhagia; pregnancy; lactation; heart failure, diarrhea, fever; thyrotoxicosis; senile, psychotic, or depressed patients
- **Physical:** Skin lesions, color, T, orientation, reflexes, affect; P, BP, peripheral perfusion, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds, normal output; CBC, urinalysis, guaiac stools, PT, INR, LFTs, renal function tests, WBCT, aPTT

Interventions

- Monitor INR (warfarin) or aPTT (heparin) to adjust dosage.
- Do not change brand names once stabilized; bioavailability problems can occur.
- Evaluate patient for signs of blood loss (petechiae, bleeding gums, bruises, dark stools, dark urine).
- Establish safety measures to protect patient from injury.
- ⊗ **Black box warning** Do not give to patients receiving epidural/spinal anesthesia; risk of epidural/spinal hematoma with neurological impairment.
- Do not give patient IM injections. Monitor sites of invasive procedures; ensure prolonged compression of bleeding vessels.
- Double-check other drugs that are ordered for potential interaction: Dosage of both drugs may need to be adjusted.
- Use caution when discontinuing other medications; dosage of warfarin may need to be adjusted; carefully monitor PT and INR values.
- Keep vitamin K available in case of overdose of oral drugs; keep protamine sulfate available for parenteral drug.
- Arrange for frequent follow-up, including blood tests to evaluate drug effects.
- Evaluate for therapeutic effects: PT, 1.5–2.5 times the control value; INR, 2–3; aPTT, 1.5–2 times the control.

Teaching points

- Many factors may change your body's response to these drugs—fever, change of diet, change of environment, other medications. The dosage of the drug may have to be changed. Be sure to write down all changes prescribed.
- Do not change any medication that you are taking (adding or stopping another drug) without consulting your health care provider. Other drugs affect the way anticoagulants work; starting or stopping another drug can cause excessive bleeding or interfere with the desired effects of these drugs.
- Carry or wear a medical alert tag stating that you are using one of these drugs. This will alert medical personnel in an emergency that you are taking an anticoagulant.
- Avoid situations in which you could be easily injured—contact sports, shaving with a straight razor.
- Arrange periodic blood tests to check on the action of the drug. It is very important that you have these tests.
- Use contraceptive measures while taking these drugs; it is important that you do not become pregnant.
- You may experience these side effects: Stomach bloating, cramps (passes with time; if it becomes too uncomfortable, contact your health care provider); loss of hair, skin rash (this is a frustrating and upsetting effect; if it becomes a problem, discuss it with your health care provider); orange-red discoloration to the urine (this may be mistaken for blood; add vinegar to urine, the color should disappear).
- Report unusual bleeding (when brushing your teeth, excessive bleeding from injuries, excessive bruising), black or bloody stools, cloudy or dark urine, sore throat, fever, chills, severe headaches, dizziness, suspected pregnancy.

Representative drugs

Oral

warfarin sodium

Parenteral

argatroban
bivalirudin
desirudin
fondaparinux
heparin
lepirudin

Low-molecular-weight heparins

dalteparin
enoxaparin
tinzaparin

Antidiabetics

PREGNANCY CATEGORY C

PREGNANCY CATEGORY B (METFORMIN)

Therapeutic actions

Oral antidiabetics include several drug types. One type, called the sulfonylureas, stimulates insulin release from functioning beta cells in the pancreas and may either improve binding between insulin and insulin receptors or increase the number of insulin receptors. Second-generation sulfonylureas (glipizide and glyburide) are thought to be more potent than first-generation sulfonylureas. Other types include drugs that increase insulin receptor sensitivity (thiazolidinediones); drugs that delay or alter glucose absorption (acarbose, miglitol); and insulin, which is used for replacement therapy.

Indications

- Adjuncts to diet and exercise to lower blood glucose in patients with type 2 (non-insulin-dependent) diabetes mellitus
- Adjuncts to insulin therapy in the stabilization of certain cases of insulin-dependent maturity-onset diabetes, reducing the insulin requirement and decreasing the chance of hypoglycemic reactions
- Replacement therapy in type 1 (insulin-dependent) diabetes mellitus and when oral drugs cannot control glucose levels in type 2 diabetes

Contraindications and cautions

- Contraindicated with allergy to sulfonylureas; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is indicated); type 1 diabetes, serious hepatic impairment, serious renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; labor and delivery (if glipizide is used

during pregnancy, discontinue drug at least 1 mo before delivery); lactation, safety not established.

Adverse effects

- **CV:** Increased risk of CV mortality
- **Endocrine:** *Hypoglycemia*
- **GI:** *Anorexia, nausea, vomiting, epigastric discomfort, heartburn, diarrhea*
- **Hematologic:** Leukopenia, thrombocytopenia, anemia
- **Hypersensitivity:** *Allergic skin reactions, eczema, pruritus, erythema, urticaria, photosensitivity, fever, eosinophilia, jaundice*

Interactions

*** Drug-drug** • Increased risk of hypoglycemia with sulfonamides, chloramphenicol, salicylates • Decreased effectiveness of both sulfonylurea and diazoxide if taken concurrently • Increased risk of hyperglycemia with rifampin, thiazides • Risk of hypoglycemia and hyperglycemia with ethanol; “disulfiram reaction” has also been reported

*** Drug-alternative therapy** • Increased risk of hypoglycemia with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

■ Nursing considerations

Assessment

- **History:** Allergy to sulfonylureas; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is indicated); type 1 diabetes, serious hepatic impairment, serious renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease
- **Physical:** Skin color, lesions; T, orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, serum creatinine, LFTs, blood glucose, CBC

Interventions

- Administer in appropriate relationship to meals, based on drug.
- Monitor urine or serum glucose levels to determine effectiveness of drug and dosage.

- Arrange for transfer to insulin therapy during high stress (infections, surgery, trauma).
- Arrange for use of IV glucose if severe hypoglycemia occurs as a result of overdose.
- Arrange consultation with dietitian to establish weight loss program and dietary control as appropriate.
- Arrange thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.
- Provide skin care to prevent breakdown.
- Ensure access to bathroom facilities if diarrhea occurs.
- Establish safety precautions if CNS effects occur.

Teaching points

- Do not stop taking these drugs without consulting your health care provider.
- Monitor urine or blood for glucose and ketones.
- Learn to recognize symptoms of low blood sugar and have a source of glucose readily available.
- Do not use these drugs during pregnancy (except insulin).
- Avoid alcohol while on these drugs.
- Report fever, sore throat, unusual bleeding or bruising, skin rash, dark urine, light-colored stools, hypoglycemia, or hyperglycemic reactions.

Representative drugs

acarbose
chlorpropamide
exenatide
glimepiride
glipizide
glyburide
insulin
liraglutide
metformin
miglitol
nateglinide
pioglitazone
pramlintide
repaglinide
rosiglitazone
saxagliptin
sitagliptin

tolazamide
tolbutamide

Antifungals

PREGNANCY CATEGORY C

Therapeutic actions

Antifungals bind to or impair sterols of fungal cell membranes, allowing increased permeability and leakage of cellular components and causing the death of the fungal cell.

Indications

- Systemic fungal infections: Candidiasis, chronic mucocutaneous candidiasis, oral thrush, candiduria, blastomycosis, coccidioidomycosis, histoplasmosis, chromomycosis, paracoccidioidomycosis, dermatophytosis, ringworm infections of the skin
- Treatment of onychomycosis, pityriasis versicolor, vaginal candidiasis; topical treatment of tinea corporis and tinea cruris caused by *Trichophyton rubrum*, *Trichophyton mentagrophytes*, and *Epidermophyton floccosum*; treatment of tinea versicolor caused by *Malassezia furfur* (topical); and reduction of scaling due to dandruff (shampoo)

Contraindications and cautions

- Contraindicated with allergy to any antifungal, fungal meningitis, pregnancy, lactation.
- Use cautiously with hepatocellular failure (increased risk of hepatocellular necrosis).

Adverse effects

- **CNS:** Headache, dizziness, somnolence, photophobia
- **GI:** **Hepatotoxicity**, *nausea*, *vomiting*, abdominal pain
- **GU:** Impotence, oligospermia (with very high doses), **nephrotoxicity**
- **Hematologic:** Thrombocytopenia, leukopenia, hemolytic anemia
- **Hypersensitivity:** Urticaria to anaphylaxis
- **Local:** *Severe irritation*, *pruritus*, *stinging* with topical application

- **Other:** *Pruritus*, fever, chills, gynecomastia, electrolyte abnormalities (amphotericin B)

Interactions

- *** Drug-drug *** Decreased blood levels with rifampin • Increased blood levels of cyclosporine and risk of toxicity with antifungals
- Increased duration of adrenal suppression when methylprednisolone, corticosteroids are taken with antifungals

■ Nursing considerations

Assessment

- **History:** Allergy to antifungals, fungal meningitis, hepatocellular failure, pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes, affect; bowel sounds, liver evaluation, LFTs; CBC and differential; culture of area involved

Interventions

⊗ **Black box warning** Reserve systemic antifungals for patients with progressive and potentially fatal infections because of severe toxicity.

- Arrange for culture before beginning therapy; treatment should begin prior to lab results.
- Maintain epinephrine on standby in case of severe anaphylaxis after first dose.
- Administer oral drug with food to decrease GI upset.
- Administer until infection is eradicated: candidiasis, 1–2 wk; other systemic mycoses, 6 mo; chronic mucocutaneous candidiasis often requires maintenance therapy; tinea versicolor, 2 wk of topical application.
- Discontinue treatment and consult physician about diagnosis if no improvement within 2 wk of topical application.
- Discontinue topical applications if sensitivity or chemical reaction occurs.
- Administer shampoo as follows: Moisten hair and scalp thoroughly with water; apply sufficient shampoo to produce a lather; gently massage for 1 min; rinse hair with warm water; repeat, leaving on hair for 3 min.
- Provide hygiene measures to control sources of infection or reinfection.

- Provide frequent small meals if GI upset occurs.
- Provide comfort measures appropriate to site of fungal infection.
- Arrange hepatic function tests prior to therapy and at least monthly during treatment.
- Establish safety precautions if CNS effects occur (side rails, assistance with ambulation).

Teaching points

- Take the full course of therapy. Long-term use of the drug will be needed; beneficial effects may not be seen for several weeks. Take oral drugs with meals to decrease GI upset. Apply topical drugs to affected area and surrounding area. Shampoo—moisten hair and scalp thoroughly with water; apply to produce a lather; gently massage for 1 minute; rinse with warm water; repeat, leaving on for 3 minutes. Shampoo twice a week for 4 weeks with at least 3 days between shampooing.
- Use hygiene measures to prevent reinfection or spread of infection.
- You may experience these side effects: Nausea, vomiting, diarrhea (take drug with food); sedation, dizziness, confusion (avoid driving or performing tasks that require alertness); stinging, irritation (local application).
- Report skin rash, severe nausea, vomiting, diarrhea, fever, sore throat, unusual bleeding or bruising, yellowing of skin or eyes, dark urine or pale stools, severe irritation (local applications).

Representative drugs

posaconazole
sertaconazole
terbinafine
tolnaftate
voriconazole

Antihistamines

PREGNANCY CATEGORY B OR C

Therapeutic actions

Antihistamines competitively block the effects of histamine at peripheral H₁ receptor sites, have anticholinergic (atropine-like) and antipruritic effects.

Indications

- Relief of symptoms associated with perennial and seasonal allergic rhinitis, vasomotor rhinitis, allergic conjunctivitis, mild, uncomplicated urticaria and angioedema
- Amelioration of allergic reactions to blood or plasma
- Treatment of dermatographism
- Management of tremor in early parkinsonian syndrome and drug-induced extrapyramidal reactions
- Control of nausea, vomiting, and dizziness from motion sickness (buclizine, cyclizine, diphenhydramine, meclizine)
- Adjunctive therapy in anaphylactic reactions
- Unlabeled uses: Relief of lower respiratory conditions, such as histamine-induced bronchoconstriction in asthmatics and exercise- and hyperventilation-induced bronchospasm

Contraindications and cautions

- Contraindicated with allergy to antihistamines, pregnancy, or lactation.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction.

Adverse effects

- **CNS:** *Depression*, nightmares, sedation
- **CV:** Arrhythmia, increase in QTc intervals
- **Dermatologic:** Alopecia, angioedema, skin eruption and itching
- **GI:** *Dry mouth*, *GI upset*, anorexia, increased appetite, nausea, vomiting, diarrhea, constipation
- **GU:** Galactorrhea, menstrual disorders, dysuria, hesitancy
- **Respiratory:** *Bronchospasm*, *cough*, *thickening of secretions*
- **Other:** Musculoskeletal pain, mild to moderate transaminase elevations

Interactions

- *** Drug-drug** • Altered antihistamine metabolism with ketoconazole, troleandomycin
- Increased antihistaminic anticholinergic effects with MAOIs
- Additive CNS depressant effects with alcohol, CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergy to any antihistamines, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, pregnancy, lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; R, adventitious sounds; prostate palpation; serum transaminase levels

Interventions

- Administer with food if GI upset occurs.
- Provide mouth care, sugarless lozenges for dry mouth.
- Arrange for humidifier if thickening of secretions, nasal dryness become bothersome; encourage intake of fluids.
- Provide skin care for dermatologic effects.

Teaching points

- Avoid excessive dosage.
- Take with food if GI upset occurs.
- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); dry mouth (mouth care, sucking

sugarless lozenges may help); thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier); menstrual irregularities.

- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

 brompheniramine
 cetirizine
 chlorpheniramine
 clemastine
 cyclizine
 cyproheptadine
 desloratadine
 dexchlorpheniramine
 dimenhydrinate
 diphenhydramine
 fexofenadine
 hydroxyzine
 levocetirizine
 loratadine
 meclizine
 promethazine

Antimetabolites

DANGEROUS DRUG

PREGNANCY CATEGORY D

Therapeutic actions

Antimetabolites are antineoplastic drugs that inhibit DNA polymerase. They are cell-cycle-phase-specific to S phase (stage of DNA synthesis), causing cell death for cells in the S phase; they also block progression of cells from G₁ to S in the cell cycle.

Indications

- Induction and maintenance of remission in acute myelocytic leukemia (higher response rate in children than in adults), chronic lymphocytic leukemia
- Treatment of acute lymphocytic leukemia, chronic myelocytic leukemia and erythro-leukemia, meningeal leukemia, psoriasis and rheumatoid arthritis (methotrexate)

- Palliative treatment of GI adenocarcinoma, carcinoma of the colon, rectum, breast, stomach, pancreas
- Part of combination therapy for treatment of non-Hodgkin's lymphoma in children

Contraindications and cautions

- Contraindicated with allergy to the drug, pregnancy, lactation, premature infants.
- Use cautiously with hematopoietic depression secondary to radiation or chemotherapy; impaired liver function.

Adverse effects

- **CNS:** Neuritis, neural toxicity
- **Dermatologic:** Fever, rash, urticaria, freckling, skin ulceration, pruritus, conjunctivitis, alopecia
- **GI:** *Anorexia, nausea, vomiting, diarrhea, oral and anal inflammation or ulceration*; esophageal ulcerations, esophagitis, abdominal pain, *hepatic impairment* (jaundice), acute pancreatitis
- **GU:** Renal impairment, urine retention
- **Hematologic:** Bone marrow depression, hyperuricemia
- **Local:** Thrombophlebitis, cellulitis at injection site
- **Other:** *Fever, rash*

Interactions

* **Drug-drug** • Decreased therapeutic action of digoxin with cytarabine • Enhanced toxicity of 5-FU with leucovorin • Potentially fatal reactions if methotrexate is taken with various NSAIDs

■ Nursing considerations

Assessment

- **History:** Allergy to drug, hematopoietic depression, impaired hepatic function, lactation
- **Physical:** Weight; T; skin lesions, color; hair; orientation, reflexes; R, adventitious sounds; mucous membranes, liver evaluation, abdominal examination; CBC, differential; LFTs; renal function tests; urinalysis

Interventions

⊗ **Black box warning** Arrange for tests to evaluate hematopoietic status prior to and

during therapy; serious to fatal bone marrow suppression can occur.

- Arrange for discontinuation of drug therapy if platelet count is lower than 50,000/mm³ or polymorphonuclear granulocyte count is lower than 1,000/mm³; consult physician for dosage adjustment.
- Monitor injection site for signs of thrombophlebitis, inflammation.
- Provide mouth care for mouth sores.
- Provide frequent small meals and dietary consultation to maintain nutrition when GI effects are severe.
- Establish safety measures if dizziness, CNS effects occur.
- Arrange for patient to obtain a wig or some other suitable head covering if alopecia occurs; ensure that head is covered in extremes of temperature.
- Protect patient from exposure to infections.
- Provide skin care.
- Arrange for comfort measures if anal inflammation, headache, or other pain associated with cytarabine syndrome occurs.
- Arrange for treatment of fever if it occurs.

Teaching points

- Keep the prepared calendar of treatment days available for your reference.
- Use birth control; these drugs may cause birth defects or miscarriages.
- Arrange to have frequent, regular medical follow-up, including frequent blood tests.
- You may experience these side effects: Nausea, vomiting, loss of appetite (medication may be ordered; frequent small meals may help; it is important to maintain nutrition); malaise, weakness, lethargy (these are all effects of the drug; consult your health care provider and avoid driving or operating dangerous machinery); mouth sores (frequent mouth care will be needed); diarrhea; loss of hair (you may wish to obtain a wig or other suitable head covering; keep the head covered in extremes of temperature); anal inflammation (consult with your health care provider; comfort measures can be ordered).
- Report black, tarry stools; fever, chills; sore throat; unusual bleeding or bruising; shortness of breath; chest pain; difficulty swallowing.

Representative drugs

capecitabine
 cladribine
 clofarabine
 cytarabine
 floxuridine
 fludarabine
 5-FU (fluorouracil)
 gemcitabine
 hydroxyurea
 mercaptopurine
 methotrexate
 nelarabine
 pemetrexed
 pentostatin
 pralatrexate
 thioguanine

Antimigraine Drugs (Triptans)

PREGNANCY CATEGORY C

Therapeutic actions

Triptans bind to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients.

Indications

- Treatment of acute migraine attacks with or without aura
- Treatment of cluster headaches (sumatriptan injection)

Contraindications and cautions

- Contraindicated with allergy to any triptan, active coronary artery disease, uncontrolled hypertension, hemiplegic migraine, pregnancy.
- Use cautiously in the elderly; with lactation.

Adverse effects

- **CNS:** *Dizziness, vertigo, headache, anxiety, malaise or fatigue, weakness, myalgia*
- **CV:** *BP alterations, tightness or pressure in chest*
- **GI:** Abdominal discomfort, dysphagia
- **Local:** *Injection site discomfort*
- **Other:** *Tingling, warm or hot sensations, burning sensation, feeling of heaviness, pressure sensation, numbness, feeling of tightness, feeling strange, cold sensation*

Interactions

- *** Drug-drug** • Prolonged vasoactive reactions when taken concurrently with ergot-containing drugs, MAOIs, other triptans • Risk of increased blood levels and prolonged effects with hormonal contraceptives; monitor patient very closely if this combination must be used • Risk of serious serotonin syndrome if combined with SSRIs
- *** Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to any triptan, active coronary artery disease, uncontrolled hypertension, hemiplegic migraine, pregnancy, lactation
- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure.
- Administer as prescribed—by inhalation, injection, or orally.
- Establish safety measures if CNS, visual disturbances occur.
- Provide appropriate analgesics as needed for pains related to therapy.
- Monitor injection sites—pain and redness are common—for signs of infection or irritation.
- Control environment as appropriate to help relieve migraine (eg, lighting, temperature).
- Monitor BP of patients with possible coronary artery disease; discontinue triptan at any sign of angina, prolonged high BP.

Teaching points

- Learn to use the autoinjector; injection may be repeated in not less than 1 hour if relief is not obtained; do not administer more than two injections in 24 hours (if appropriate).
- These drugs should not be taken during pregnancy; if you suspect that you are pregnant, contact your health care provider and refrain from using the drug.
- Continue to do anything that usually helps you feel better during a migraine—control lighting, noise.

- Take these drugs at first sign of a migraine.
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or operating dangerous machinery while using these drugs); numbness, tingling, feelings of tightness or pressure.
- Report feelings of heat, flushing, tiredness, sickness, swelling of lips or eyelids.

Representative drugs

almotriptan
eletriptan
frovatriptan
naratriptan
rizatriptan
sumatriptan
zolmitriptan

Antivirals

PREGNANCY CATEGORY B or C

Therapeutic actions

Antiviral drugs inhibit viral DNA or RNA replication in the virus, preventing replication and leading to viral death.

Indications

- Initial and recurrent mucosal and cutaneous HSV-1 and HSV-2 infections in immunocompromised patients, encephalitis, herpes zoster
- HIV infections (part of combination therapy)
- Cytomegalovirus (CMV) retinitis in patients with AIDS
- Severe initial and recurrent genital herpes infections
- Treatment and prevention of influenza A respiratory tract illness
- Prevention of CMV infection in patients receiving kidney, heart, or pancreas transplant who are considered at high risk for CMV infection
- Treatment of initial HSV genital infections and limited mucocutaneous HSV infections in immunocompromised patients (ointment)

- Unlabeled uses: Treatment of herpes zoster, CMV and HSV infection following transplant, herpes simplex infections, infectious mononucleosis, varicella pneumonia, and varicella zoster in immunocompromised patients

Contraindications and cautions

- Contraindicated with allergy to drug, seizures, heart failure, renal disease, lactation.

Adverse effects

Systemic administration

- **CNS:** Headache, vertigo, depression, tremors, encephalopathic changes, fatigue
 - **Dermatologic:** *Inflammation or phlebitis at injection sites*, rash, hair loss, sweating
 - **GI:** *Nausea, vomiting*, diarrhea, anorexia, taste perversion
 - **GU:** Crystalluria with rapid IV administration, hematuria
 - **Metabolic:** Hyperglycemia, dyslipidemia
- ##### Topical administration
- **Skin:** *Transient burning at the site of application*

Interactions

- ★ **Drug-drug** • Increased drug effects with probenecid • Increased nephrotoxicity with other nephrotoxic drugs
- ★ **Drug-alternative therapy** • Decreased effectiveness if combined with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to drug, seizures, heart failure, renal disease, lactation
- **Physical:** Skin color, lesions; orientation; BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; BUN, creatinine clearance

Interventions

Systemic administration

- Ensure that the patient is well hydrated with IV or PO fluids.
- Provide support and encouragement to deal with disease.
- Provide frequent small meals if systemic therapy causes GI upset.
- Provide skin care, analgesics if needed for rash.

Topical administration

- Start treatment as soon as possible after onset of signs and symptoms.
- Wear a rubber glove or finger cot when applying drug.

Teaching points**Systemic administration**

- Complete the full course of oral therapy, and do not exceed the prescribed dose.
- These drugs are not a cure for your disease but they should make you feel better.
- Avoid sexual intercourse if lesions are visible.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea, headache, dizziness.
- Report difficulty urinating, skin rash, increased severity or frequency of recurrences.

Topical administration

- Wear rubber gloves or finger cots to apply the drug to prevent autoinoculation of other sites and transmission of the disease.
- These drugs do not cure the disease; applying the drug during symptom-free periods will not prevent recurrences.
- Avoid sexual intercourse while visible lesions are present.
- These drugs may cause burning, stinging, itching, rash; notify your health care provider if these are pronounced.

Barbiturates**PREGNANCY CATEGORY D****CONTROLLED SUBSTANCE C-II****Therapeutic actions**

Barbiturates act as sedatives, hypnotics, and antiepileptics. They are general CNS depressants. Barbiturates inhibit impulse conduction in the ascending reticular activating system, depress the cerebral cortex, alter cerebellar function, depress motor output, and can produce excitation, sedation, hypnosis, anesthesia, and deep coma; at anesthetic doses, they have anticonvulsant activity.

Indications

- Sedatives or hypnotics for short-term treatment of insomnia
- Preanesthetic medications
- Antiepileptics, in anesthetic doses, for emergency control of certain acute seizure episodes (eg, status epilepticus, eclampsia, meningitis, tetanus, toxic reactions to strychnine or local anesthetics)

Contraindications and cautions

- Contraindicated with hypersensitivity to barbiturates, manifest or latent porphyria, marked hepatic impairment, nephritis, severe respiratory distress, respiratory disease with dyspnea, obstruction, or cor pulmonale, previous addiction to sedative-hypnotic drugs, pregnancy (causes fetal damage, neonatal withdrawal syndrome), or lactation.
- Use cautiously with acute or chronic pain (paradoxical excitement or masking of important symptoms could result), seizure disorders (abrupt discontinuation of daily doses of drug can result in status epilepticus), fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, status asthmaticus, shock, uremia.

Adverse effects

- **CNS:** *Somnolence, agitation, confusion, hyperkinesia, ataxia, vertigo, CNS depression, nightmares, lethargy, residual sedation (hangover), paradoxical excitement, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, abnormal thinking*
- **CV:** *Bradycardia, hypotension, syncope*
- **GI:** *Nausea, vomiting, constipation, diarrhea, epigastric pain*
- **Hypersensitivity:** Skin rashes, angio-neurotic edema, serum sickness, morbilliform rash, urticaria; rarely, exfoliative dermatitis, **Stevens-Johnson syndrome**
- **Local:** *Pain, tissue necrosis at injection site, gangrene, arterial spasm with inadvertent intra-arterial injection; thrombophlebitis; permanent neurologic deficit if injected near a nerve*
- **Respiratory:** *Hypoventilation, apnea, respiratory depression, laryngospasm, bronchospasm, circulatory collapse*
- **Other:** Tolerance, psychological and physical dependence; **withdrawal syndrome**

Interactions

- **Drug-drug** • Increased CNS depression with alcohol • Increased nephrotoxicity with methoxyflurane • Decreased effects of the following drugs given with barbiturates: oral anticoagulants, corticosteroids, oral contraceptives and estrogens, beta-adrenergic blockers

(especially propranolol, metoprolol), theophylline, metronidazole, doxycycline, phenylbutazones, quinidine

Nursing considerations**Assessment**

- **History:** Hypersensitivity to barbiturates, manifest or latent porphyria; marked hepatic impairment; nephritis; severe respiratory distress; respiratory disease with dyspnea, obstruction, or cor pulmonale; previous addiction to sedative-hypnotic drugs; acute or chronic pain; seizure disorders; pregnancy; lactation; fever, hyperthyroidism; diabetes mellitus; severe anemia; pulmonary or cardiac disease; status asthmaticus; shock; uremia
- **Physical:** Weight; T; skin color, lesions, injection site; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, blood and urine glucose, BUN

Interventions

- Do not administer intra-arterially; may produce arteriospasm, thrombosis, gangrene.
- Administer IV doses slowly.
- Administer IM doses deep in a muscle mass.
- Do not use parenteral dosage forms if solution is discolored or contains a precipitate.
- Monitor injection sites carefully for irritation, extravasation (IV); solutions are alkaline and very irritating to the tissues.
- Monitor P, BP, R carefully during IV administration.
- Keep resuscitative facilities available in case of respiratory depression, hypersensitivity reaction.
- Provide frequent small meals, frequent mouth care if GI effects occur.
- Use safety precautions if CNS changes occur (use side rails, accompany patient).
- Provide skin care if dermatologic effects occur.
- Provide comfort measures, reassurance for patients receiving pentobarbital for tetanus, toxic seizures.
- Offer support and encouragement to patients receiving this drug for preanesthetic medication.

- Taper dosage gradually after repeated use, especially in patients with epilepsy.

Teaching points

When giving these drugs as preanesthetic, incorporate teaching about the drug into general teaching about the procedure. Include these points:

- This drug will make you drowsy and less anxious.
- Do not try to get up after you have received this drug (request assistance if you must sit up or move about for any reason).

Outpatients

- Take these drugs exactly as prescribed. These drugs are habit forming; the drug's effectiveness in facilitating sleep disappears after a short time. Do not take these drugs longer than 2 weeks (for insomnia), and do not increase the dosage without consulting your health care provider. If the drug appears to be ineffective, consult your health care provider.
- Avoid becoming pregnant while taking these drugs. The use of hormonal contraceptives while taking these drugs is not recommended as the contraceptives lose their effectiveness.
- You may experience these side effects: Drowsiness, dizziness, hangover, impaired thinking (these effects may become less pronounced after a few days; avoid driving a car or engaging in activities that require alertness); GI upset (taking the drug with food may help); dreams, nightmares, difficulty concentrating, fatigue, nervousness (these are effects of the drug that will go away when the drug is discontinued; consult your health care provider if these become bothersome).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, pregnancy.

Representative drugs

amobarbital
butobarbital
methohexital
pentobarbital
pentobarbital sodium
phenobarbital
primidone
secobarbital
thiopental

Benzodiazepines

PREGNANCY CATEGORY D OR X CONTROLLED SUBSTANCE C-IV

Therapeutic actions

Benzodiazepines are anxiolytics, antiepileptics, muscle relaxants, and sedative-hypnotics. Their exact mechanisms of action are not understood, but it is known that benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter.

Indications

- Management of anxiety disorders, short-term relief of symptoms of anxiety
- Short-term treatment of insomnia
- Alone or as adjunct in treatment of Lennox-Gastaut syndrome (petit mal variant), akinetic and myoclonic seizures
- May be useful in patients with absence (petit mal) seizures who have not responded to succinimides; up to 30% of patients show loss of effectiveness of drug within 3 mo of therapy (may respond to dosage adjustment)
- Unlabeled use: Treatment of panic attacks, treatment of IBS, acute alcohol withdrawal syndrome, chemotherapy-induced nausea and vomiting, psychogenic catatonic depression, PMS

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery ("floppy infant" syndrome reported), or lactation (infants become lethargic and lose weight).
- Use cautiously with impaired hepatic or renal function, debilitation.

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, anger, hostility, episodes of mania and hypomania, restlessness, confusion, crying, delirium,*

headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment

- **CV:** Bradycardia, tachycardia, CV collapse, hypertension and hypotension, palpitations, edema
- **Dermatologic:** Urticaria, pruritus, skin rash, dermatitis
- **EENT:** Visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **GI:** *Constipation, diarrhea, dry mouth*, salivation, *nausea*, anorexia, vomiting, difficulty in swallowing, gastric disorders, hepatic impairment, encopresis
- **GU:** Incontinence, urine retention, changes in libido, menstrual irregularities
- **Hematologic:** Elevations of blood enzymes—LDH, alkaline phosphatase, AST, ALT; blood dyscrasias—agranulocytosis, leukopenia
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia; *drug dependence with withdrawal syndrome when drug is discontinued; more common with abrupt discontinuation of higher dosage used for longer than 4 mo*

Interactions

★ **Drug-drug** • Increased CNS depression with alcohol • Increased effect with cimetidine, disulfiram, omeprazole, hormonal contraceptives • Decreased effect with theophylline

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy, lactation, impaired hepatic or renal function, debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination,

bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Keep addiction-prone patients under careful surveillance.
- Monitor liver function, blood counts in patients on long-term therapy.
- Ensure ready access to bathroom if GI effects occur; establish bowel program if constipation occurs.
- Provide frequent small meals, frequent mouth care if GI effects occur.
- Provide measures appropriate to care of urinary problems (protective clothing, bed changing).
- Establish safety precautions if CNS changes occur (eg, side rails, accompany patient).
- Taper dosage gradually after long-term therapy, especially in patients with epilepsy; arrange to substitute another antiepileptic.
- Monitor patient for therapeutic drug levels; levels vary with drug being used.
- Arrange for patient to wear medical alert identification indicating epilepsy and drug therapy.

Teaching points

- Take drug exactly as prescribed; do not stop taking these drugs (long-term therapy) without consulting your health care provider.
- Avoid alcohol, sleep-inducing drugs, or over-the-counter drugs.
- You may experience these side effects: Drowsiness, dizziness (may become less pronounced after a few days; avoid driving or engaging in other dangerous activities); GI upset (take drug with food); fatigue; depression; dreams; crying; nervousness; depression, emotional changes; bed wetting, urinary incontinence.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, difficulty voiding, palpitations, swelling in the extremities.

Representative drugs

 chlordiazepoxide
 clonazepam
 clorazepate
 diazepam

estazolam
 flurazepam
 lorazepam
 midazolam
 nitrazepam (CAN)
 oxazepam
 quazepam
 temazepam
 triazolam

Beta-adrenergic Blockers (β -blockers)

PREGNANCY CATEGORY C (MOST),
 D (ATENOLOL), B (ACEBUTOLOL,
 PINDOLOL, SOTALOL)

Therapeutic actions

Beta-adrenergic blockers are antianginals, antiarrhythmics, and antihypertensives. These drugs competitively block beta-adrenergic receptors in the heart and juxtaglomerular apparatus. They decrease the influence of the sympathetic nervous system on these tissues, the excitability of the heart, cardiac workload, oxygen consumption, and the release of renin; they lower BP. They have membrane-stabilizing (local anesthetic) effects that contribute to their antiarrhythmic action. They also act in the CNS to reduce sympathetic outflow and vasoconstrictor tone.

Indications

- Hypertension (alone or with other drugs, especially diuretics)
- Angina pectoris caused by coronary atherosclerosis
- Hypertrophic subaortic stenosis, to manage associated stress-induced angina, palpitations, and syncope; cardiac arrhythmias, especially supraventricular tachycardia, and ventricular tachycardias induced by digoxin or catecholamines; essential tremor, familial or hereditary
- Prevention of reinfarction in clinically stable patients when started 1–4 wk after MI
- Adjunctive therapy for pheochromocytoma after treatment with an alpha-adrenergic blocker, to manage tachycardia before or during surgery or if the pheochromocytoma is inoperable

- Prophylaxis for migraine headache (propranolol)
- Management of acute situational stress reaction (stage fright); essential tremor (propranolol)
- Unlabeled uses: Treatment of recurrent GI bleeding in cirrhotic patients, schizophrenia, tardive dyskinesia, acute panic symptoms, vaginal contraceptive, acute alcohol withdrawal

Contraindications and cautions

- Contraindicated with allergy to beta-adrenergic blockers, sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, bronchial asthma, bronchospasm, COPD, pregnancy (neonatal bradycardia, hypoglycemia, and apnea have occurred in infants whose mothers received propranolol; low birth weight occurs with chronic maternal use during pregnancy), or lactation.
- Use cautiously with hypoglycemia and diabetes, thyrotoxicosis, hepatic impairment.

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, laryngospasm, respiratory distress
- **CV:** *Bradycardia, heart failure, cardiac arrhythmias, sinoatrial or AV nodal block, tachycardia*, peripheral vascular insufficiency, claudication, **CVA**, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequency
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramps
- **Neurologic:** Dizziness, vertigo, tinnitus, *fatigue*, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **Respiratory:** Bronchospasm, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis

- **Other:** *Decreased exercise tolerance, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH*

Interactions

- *** Drug-drug** • Increased effects with verapamil, diltiazem • Decreased effects with indomethacin, ibuprofen, piroxicam, sulindac, barbiturates • Prolonged hypoglycemic effects of insulin with beta-adrenergic blockers • Peripheral ischemia possible if combined with ergot alkaloids • Initial hypertensive episode followed by bradycardia with epinephrine • Increased “first-dose response” to prazosin with beta-adrenergic blockers • Increased serum levels and toxic effects with lidocaine, cimetidine • Increased serum levels of beta-adrenergic blockers and phenothiazines, hydralazine if the two drugs are taken concurrently • Paradoxical hypertension when clonidine is given with beta-adrenergic blockers; increased rebound hypertension when clonidine is discontinued • Decreased serum levels and therapeutic effects if taken with methimazole, propylthiouracil • Decreased bronchodilator effects of theophyllines • Decreased antihypertensive effects with NSAIDs (eg, ibuprofen, indomethacin, piroxicam, sulindac), rifampin
- *** Drug-lab test** • Interference with glucose or insulin tolerance tests, glaucoma screening tests

■ Nursing considerations

Assessment

- **History:** Allergy to beta-adrenergic blockers, sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, bronchial asthma, bronchospasm, COPD, hypoglycemia and diabetes, thyrotoxicosis, hepatic impairment, pregnancy, lactation
- **Physical:** Weight, skin color, lesions, edema, T; reflexes, affect, vision, hearing, orientation; BP, P, ECG, peripheral perfusion; R, auscultation; bowel sounds, normal output, liver evaluation; bladder palpation; LFTs, thyroid function test, blood and urine glucose

Interventions

- Do not stop drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult with physician about withdrawing drug if patient is to undergo surgery (contraversial).
- Give oral drug with food to facilitate absorption.
- Provide side rails and assistance with walking if CNS, vision changes occur.
- Position patient to decrease effects of edema, respiratory obstruction.
- Space activities, and provide rest periods.
- Provide frequent small meals if GI effects occur.
- Provide comfort measures to help patient cope with eye, GI, joint, CNS, dermatologic effects.

Teaching points

- Take these drugs with meals. Do not stop taking these drugs abruptly; this can worsen the disorder being treated.
- If you have diabetes, the normal signs of hypoglycemia (tremor, tachycardia) may be blocked by these drugs; monitor your blood or urine glucose carefully; be sure to eat regular meals, and take your diabetic medication regularly.
- You may experience these side effects: Dizziness, drowsiness, light-headedness, blurred vision (avoid driving or performing hazardous tasks); nausea, loss of appetite (frequent small meals may help); nightmares, depression (notify your health care provider, who may be able to change your medication); sexual impotence (you may want to discuss this with your health care provider).
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

Representative drugs

acebutolol
atenolol
betaxolol
bisoprolol
carvedilol

esmolol
 labetalol
 levobunolol
 metipranolol
 metoprolol
 nadolol
 nebivolol
 penbutolol
 pindolol
 propranolol
 sotalol
 timolol

Bisphosphonates

PREGNANCY CATEGORY D
(PARENTERAL), C (ORAL)

Therapeutic actions

Bisphosphonates inhibit bone resorption, possibly by inhibiting osteoclast activity and promoting osteoclast cell apoptosis; this action leads to decreased release of calcium from bone and decreased serum calcium level.

Indications

- Treatment of Paget's disease of bone (oral)
- Treatment of osteoporosis (oral) (postmenopausal and in males)
- Treatment of heterotopic ossification (oral)
- Treatment of hypercalcemia of malignancy in patients inadequately managed by diet or oral hydration (parenteral)
- Treatment of hypercalcemia of malignancy, which persists after adequate hydration has been restored (parenteral)
- Prevention of new clinical fractures in patients with low-trauma hip fractures (parenteral)

Contraindications and cautions

- Contraindicated with allergy to bisphosphonates, hypocalcemia, pregnancy, lactation, severe renal impairment.
- Use cautiously in the presence of renal impairment, upper GI disease.

Adverse effects

- **CNS:** *Headache*, dizziness
- **CV:** Hypertension, chest pain

- **GI:** *Nausea, diarrhea*, altered taste, metallic taste, *abdominal pain*, anorexia, esophageal erosion
- **Hematologic:** Elevated BUN, serum creatinine, hypophosphatemia, hypokalemia, hypomagnesemia, hypocalcemia
- **Respiratory:** Dyspnea, coughing, pleural effusion
- **Skeletal:** *Increased or recurrent bone pain* (Paget's disease), focal osteomalacia, *arthralgia*
- **Other:** *Infections* (UTI, candidiasis), *fever*, progression of cancer

Interactions

- *** Drug-drug** • Increased risk of GI distress if taken with aspirin • Decreased absorption if oral form is taken with antacids, calcium, iron, multivalent cations; separate dosing by at least 30 min • Possible increased risk of hypocalcemia if parenteral form is given with aminoglycosides, loop diuretics; if this combination is used, monitor serum calcium levels closely
- *** Drug-food** • Significantly decreased absorption and serum levels if oral form is taken with any food; administer on an empty stomach, 30 min before meals

Nursing considerations

Assessment

- **History:** Allergy to bisphosphonates, renal failure, upper GI disease, lactation, pregnancy
- **Physical:** Muscle tone, bone pain, bowel sounds, urinalysis, serum calcium, renal function tests

Interventions

- Administer oral drug with a full glass of water, 30 min to 1 hr before meals or any other medication; make sure that patient stays upright for at least 30 min after administration.
- Make sure that patient is well hydrated before and during therapy with parenteral agents.
- Monitor serum calcium levels before, during, and after therapy.
- Ensure a 3-mo rest period after treatment for Paget's disease if retreatment is required; allow 7 days between treatments for hypercalcemia of malignancy.

- Ensure adequate vitamin D and calcium intake.
- Provide comfort measures if bone pain returns.

Teaching points

- Take these drugs with a full glass of water 30 to 60 minutes before meals or any other medication; stay upright for at least 30 minutes after taking these drugs.
- Periodic blood tests may be required to monitor your calcium levels.
- You may experience these side effects: Nausea, diarrhea, bone pain, headache (analgesics may help).
- Report twitching, muscle spasms, dark-colored urine, severe diarrhea, GI distress, epigastric pain.

Representative drugs

alendronate
etidronate
ibandronate
pamidronate
risedronate
tiludronate
zoledronic acid

Calcium Channel Blockers

PREGNANCY CATEGORY C

Therapeutic actions

Calcium channel blockers are antianginal and antihypertensive. They inhibit the movement of calcium ions across the membranes of cardiac and arterial muscle cells; this inhibition of transmembrane calcium flow results in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, depression of myocardial contractility, and dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac energy consumption, and increased delivery of oxygen to myocardial cells.

Indications

- Treatment of angina pectoris caused by coronary artery spasm (Prinzmetal's variant angina), chronic stable angina (effort-associated angina), hypertension, arrhythmias (supraventricular, those related to digoxin [verapamil]), subarachnoid hemorrhage (nimodipine)
- Orphan drug use in the treatment of interstitial cystitis, hypertensive emergencies, migraines, Raynaud's syndrome
- Unlabeled uses: Treatment of preterm labor, Raynaud's phenomenon, acute ischemic stroke, vascular headaches, hypertensive emergencies

Contraindications and cautions

- Contraindicated with heart block, allergy to calcium channel blockers, sick sinus syndrome, ventricular dysfunction, pregnancy.
- Use cautiously during lactation.

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue, nervousness, sleep disturbances, blurred vision*
- **CV:** *Peripheral edema, angina, hypotension, arrhythmias, bradycardia, AV block, asystole*
- **Dermatologic:** *Flushing, rash, dermatitis, pruritus, urticaria*
- **GI:** *Nausea, diarrhea, constipation, flatulence, cramps, hepatic injury*
- **Other:** *Nasal congestion, cough, fever, chills, shortness of breath, muscle cramps, joint stiffness, sexual difficulties*

Interactions

- **Drug-drug** • Increased effects with cimetidine, ranitidine • Increased toxicity of cyclosporine
- **Drug-food** • Increased serum levels when combined with grapefruit juice

■ Nursing considerations Assessment

- **History:** Allergy to calcium channel blockers, sick sinus syndrome, heart block, ventricular dysfunction; pregnancy; lactation
- **Physical:** Skin lesions, color, edema; orientation, reflexes; P, BP, baseline ECG,

peripheral perfusion, auscultation; R, adventitious sounds; liver evaluation, normal GI output; LFTs

Interventions

- Monitor patient carefully (BP, cardiac rhythm, and output) while drug is being titrated to therapeutic dose; the dosage may be increased more rapidly in hospitalized patients under close supervision.
- Ensure that patients do not chew or divide sustained-release tablets.
- Taper dosage of beta-adrenergic blockers before beginning calcium channel blocker therapy.
- Protect drug from light and moisture.
- Ensure ready access to bathroom.
- Provide comfort measures for skin rash, headache, nervousness.
- Establish safety precautions if CNS changes occur.
- Position patient to alleviate peripheral edema.
- Provide frequent small meals if GI upset occurs.

Teaching points

- Do not chew or divide sustained-release tablets. Swallow whole.
- Avoid grapefruit juice while taking this drug.
- You may experience these side effects: Nausea, vomiting (frequent small meals may help); dizziness, light-headedness, vertigo (avoid driving, operating hazardous machinery; avoid falling); muscle cramps, joint stiffness, sweating, sexual difficulties (should stop when the drug therapy is stopped; discuss with your health care provider if these become too uncomfortable).
- Report irregular heartbeat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

Representative drugs

amlodipine
 clevidipine
 diltiazem
 felodipine
 isradipine
 nicardipine
 nifedipine
 nimodipine

nisoldipine
 verapamil

Cephalosporins

PREGNANCY CATEGORY B

Therapeutic actions

Cephalosporins are antibiotics. They are bactericidal, inhibiting synthesis of bacterial cell wall, causing cell death in susceptible bacteria.

Indications

- Treatment of pharyngitis, tonsillitis caused by *Streptococcus pyogenes*; otitis media caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catarrhalis*, *S. pyogenes*; respiratory infections caused by *S. pneumoniae*, *Haemophilus parainfluenzae*, *Staphylococcus aureus*, *Escherichia coli*, *Klebsiella*, *H. influenzae*, *S. pyogenes*; UTIs caused by *E. coli*, *Klebsiella pneumoniae*; dermatologic infections caused by *S. aureus*, *S. pyogenes*, *E. coli*, *Klebsiella*, *Enterobacter*; uncomplicated and disseminated gonorrhea caused by *Neisseria gonorrhoea*; septicemia caused by *S. pneumoniae*, *S. aureus*, *E. coli*, *Klebsiella*, *H. influenzae*; meningitis caused by *S. pneumoniae*, *H. influenzae*, *S. aureus*, *Neisseria meningitidis*; bone and joint infections caused by *S. aureus*
- Perioperative prophylaxis

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins, renal failure, or lactation.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias, seizures
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, pseudomembranous colitis, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** Bone marrow depression; decreased WBC, platelets, Hct
- **Hypersensitivity:** Ranging from rash, fever to anaphylaxis; serum sickness reaction

- **Local:** *Pain*, abscess at injection site, *phlebitis*, inflammation at IV site
- **Other:** *Superinfections*, *disulfiram-like reaction with alcohol*

Interactions

* **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction may occur if alcohol is taken within 72 hr after cephalosporin administration

* **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Allergy to any cephalosporin, hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infected area and arrange for sensitivity tests before beginning drug therapy and during therapy if expected response is not seen.
- Administer oral drug with food to decrease GI upset and enhance absorption.
- Administer liquid drug to children who cannot swallow tablets; crushing the drug results in a bitter, unpleasant taste.
- Have vitamin K available in case hypoprothrombinemia occurs.
- Discontinue drug if hypersensitivity reaction occurs.
- Ensure ready access to bathroom and provide frequent small meals if GI complications occur.
- Arrange for treatment of superinfections.

Teaching points

Oral drug

- Take full course of therapy.
- These drugs are specific to an infection and should not be used to self-treat other problems.
- Swallow tablets whole; do not crush.
- Take the drug with food.

- Avoid drinking alcoholic beverages while taking and for 3 days after stopping this drug because severe reactions often occur (even with parenteral forms).
- You may experience these side effects: Stomach upset or diarrhea.
- Report severe diarrhea with blood, pus, or mucus; rash; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising; unusual itching or irritation, pain at injection site.

Representative drugs

First generation

cefadroxil
cefazolin
cephalexin

Second generation

cefaclor
cefotetan
cefoxitin
cefprozil
cefuroxime

Third generation

cefdinir
cefditoren
cefepime
cefixime
cefotaxime
cefpodoxime
ceftazidime
ceftibuten
ceftriaxone

Corticosteroids

PREGNANCY CATEGORY C

Therapeutic actions

Corticosteroids enter target cells and bind to cytoplasmic receptors, initiating many complex reactions that are responsible for anti-inflammatory, immunosuppressive (glucocorticoid), and salt-retaining (mineralocorticoid) actions. Some of these actions are considered undesirable, depending on the indication for which the drug is being used.

Indications

Systemic administration

- Replacement therapy in adrenal cortical insufficiency
- Treatment of hypercalcemia associated with cancer
- Short-term management of inflammatory and allergic disorders such as rheumatoid arthritis, collagen diseases (eg, SLE), dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders
- Management of hematologic disorders—thrombocytopenic purpura, erythroblastopenia
- Treatment of trichinosis with neurologic or myocardial involvement
- Treatment of ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas

Inhalation

- Treatment of asthma

Intra-articular or soft-tissue administration

- Treatment of arthritis, psoriatic plaques

Retention enema

- For ulcerative colitis, proctitis

Dermatologic preparations

- Relief of inflammatory and pruritic manifestations of dermatoses that are steroid-responsive

Anorectal cream, suppositories

- Relief of discomfort from hemorrhoids and perianal itching or irritation

Contraindications and cautions

- **Systemic administration:** Infections, especially tuberculosis, fungal infections, amebiasis, hepatitis B, vaccinia, or varicella, and antibiotic-resistant infections; kidney disease (predisposes to edema); liver disease, cirrhosis, hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; recent GI surgery; active or latent peptic ulcer; inflammatory bowel disease (drug may cause exacerbations or bowel perforation); hypertension, heart failure; thromboembolic tendencies, thrombophlebitis, osteoporosis, convulsive disorders, metastatic carcinoma, diabetes mellitus; lactation.
- **Retention enemas, intrarectal foam:** Systemic fungal infections; recent intestinal surgery; extensive fistulas.

- **Topical dermatologic administration:** Fungal, tubercular, herpes simplex skin infections; vaccinia, varicella; ear application when eardrum is perforated; lactation.

Adverse effects

Systemic administration

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis
- **CV:** *Hypotension, shock*, hypertension and CHF secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias secondary to electrolyte disturbances
- **Dermatologic:** *Thin, fragile skin; petechiae, ecchymoses*, purpura, striae, subcutaneous fat atrophy
- **Endocrine:** *Amenorrhea, irregular menses*, growth retardation, decreased carbohydrate tolerance and diabetes mellitus, cushingoid state (long-term therapy), hypothalamic-pituitary-adrenal (HPA) suppression systemic with therapy longer than 5 days
- **Eye:** Cataracts, glaucoma (long-term therapy), increased IOP
- **GI:** *Peptic or esophageal ulcer, pancreatitis*, abdominal distention, nausea, vomiting, increased appetite and weight gain (long-term therapy)
- **Hematologic:** *Sodium and fluid retention, hypokalemia*, hypocalcemia, increased blood sugar, increased serum cholesterol, decreased serum T₃ and T₄ levels
- **Hypersensitivity:** Anaphylactoid or hypersensitivity reactions
- **Musculoskeletal:** *Muscle weakness*, steroid myopathy and loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
- **Other:** *Immunosuppression, aggravation or masking of infections, impaired wound healing*

The following effects are related to specific routes of administration:

IM repository injections

Atrophy at injection site

Retention enema

Local pain, burning; rectal bleeding; systemic absorption and adverse effects (see above)

Inhalation

Cough, throat irritation, oral thrush

Intra-articular

Osteonecrosis, tendon rupture, infection

Intraspinal

Meningitis, adhesive arachnoiditis, conus medullaris syndrome

Intralesional therapy—head and neck

Blindness (rare)

Intrathecral administration

Arachnoiditis

Topical forms

Local burning, irritation, acneiform lesions, striae, skin atrophy

Systemic absorption can lead to HPA suppression (see above), growth retardation in children, and other systemic adverse effects. Children may be at special risk of systemic absorption because of their larger skin surface area-to-body weight ratio.

Interactions

• **Drug-drug** • Increased steroid blood levels if taken with hormonal contraceptives, troleandomycin • Decreased steroid blood levels if taken with phenytoin, phenobarbital, rifampin, cholestyramine • Decreased serum level of salicylates if taken with corticosteroids • Decreased effectiveness of anticholinesterases (ambenonium, edrophonium, neostigmine, pyridostigmine) if taken with corticosteroids

• **Drug-lab test** • False-negative nitroblue-tetrazolium test for bacterial infection (with systemic absorption) • Suppression of skin test reactions

■ Nursing considerations**Assessment**

• **History:** Infections, especially TB, fungal infections, amebiasis, hepatitis B, vaccinia, varicella, and antibiotic-resistant infections; kidney disease; liver disease, cirrhosis, hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; recent GI surgery; active or latent peptic ulcer; inflammatory bowel disease; hypertension, heart failure; thromboembolic tendencies, thrombophlebitis, osteoporosis, seizure disorders, metastatic carcinoma, diabetes mellitus; lactation

Retention enemas, intrarectal foam: Systemic fungal infections; recent intestinal surgery, extensive fistulas

Topical dermatologic administration: Fungal, tubercular, herpes simplex skin infections; vaccinia, varicella; ear application when eardrum is perforated

• **Physical:** *Systemic administration:* Body weight, T; reflexes, affect, bilateral grip strength, ophthalmologic examination; BP, P, auscultation, peripheral perfusion, discoloration, pain or prominence of superficial vessels; R, adventitious sounds, chest X-ray; upper GI X-ray (history or symptoms of peptic ulcer), liver palpation; CBC, serum electrolytes, 2-hr postprandial blood glucose, urinalysis, thyroid function tests, serum cholesterol

Topical, dermatologic preparations: Affected area, integrity of skin

Interventions**Systemic administration**

- Administer once a day before 9 AM to mimic normal peak diurnal corticosteroid levels and minimize HPA suppression.
- Space multiple doses evenly throughout the day.
- Do not give IM injections if patient has thrombocytopenia purpura.
- Rotate sites of IM repository injections to avoid local atrophy.
- Use minimal doses for shortest duration of time to minimize adverse effects.

⊗ **Black box warning** Arrange to taper doses when discontinuing high-dose or long-term therapy or when transferring from systemic to inhaled corticosteroids. Monitor for signs and symptoms of adrenal insufficiency.

- Arrange for increased dosage when patient is subject to unusual stress.
- Use alternate-day maintenance therapy with short-acting corticosteroids when possible.
- Do not give live-virus vaccines with immunosuppressive doses of glucocorticoids.
- Provide skin care if patient is bedridden.
- Provide frequent small meals to minimize GI distress.

- Provide antacids between meals to help avoid peptic ulcer.
- Arrange for bed rails, other safety precautions if CNS, musculoskeletal effects occur.
- Avoid exposing patient to infection.

Inhalation

- Teach patient the proper technique for using the delivery device prescribed.

Topical dermatologic administration

- Use caution with occlusive dressings, tight or plastic diapers over affected area; these can increase systemic absorption.
- Avoid prolonged use, especially near eyes, in genital and rectal areas, on face and in skin creases.
- Provide careful wound care if lesions are present.
- Provide measures to deal with pain, discomfort on administration.

Teaching points

Systemic administration

- Take these drugs exactly as prescribed. Do not stop taking these drugs without notifying your health care provider; drug dosage must be slowly tapered to avoid problems.
- Take with meals or snacks if GI upset occurs.
- Take single daily or alternate-day doses before 9 AM; mark a calendar or use other measure as a reminder of treatment days.
- Arrange for frequent follow-up visits to your health care provider so that your response to the drug may be determined and the dosage adjusted if necessary.
- Wear a medical identification tag (if you are on long-term therapy) so that any emergency medical personnel will know that you are taking one of these drugs.
- With dosage reductions, you may experience signs of adrenal insufficiency; report fatigue, muscle and joint pains, anorexia, nausea, vomiting, diarrhea, weight loss, weakness, dizziness, low blood sugar (if you monitor blood sugar).
- You may experience these side effects: Increase in appetite, weight gain (some of the weight gain may be from fluid retention, watching calories may help); heartburn, indigestion (eat frequent small meals; use antacids between meals); increased susceptibility to infection (avoid crowded areas during peak cold

or flu seasons and avoid contact with anyone with a known infection); poor wound healing (if you have an injury or wound, consult your health care provider); muscle weakness, fatigue (frequent rest periods may help).

- Report unusual weight gain, swelling of lower extremities, muscle weakness, black or tarry stools, vomiting of blood, epigastric burning, puffing of face, menstrual irregularities, fever, prolonged sore throat, cold or other infection, worsening of symptoms.

Inhalation

- Follow directions you have been given regarding proper use of the drug delivery device.
- Brush your teeth or rinse your mouth after each use.

Intra-articular, intralesional administration

- Do not overuse the injected joint even if the pain is gone. Follow directions you have been given for proper rest and exercise.

Topical dermatologic administration

- Apply sparingly and rub in lightly.
- Avoid eye contact.
- Report burning, irritation, or infection of the site, worsening of the condition.
- Avoid prolonged use.

Anorectal preparations

- Maintain normal bowel function by proper diet, adequate fluid intake, and regular exercise.
- Use stool softeners or bulk laxatives if needed.
- Notify your health care provider if symptoms do not improve in 7 days, or if bleeding, protrusion, or seepage occurs.

Representative drugs

alclometasone
 amcinonide
 beclomethasone
 betamethasone
 budesonide
 ciclesonide
 clobetasol
 clcortolone
 cortisone
 desonide
 desoximetasone
 dexamethasone
 diflorasone
 difluprednate

fludrocortisone
 flunisolide
 fluocinolone
 fluorocinonide
 fluoromethalone
 flurandrenolide
 fluticasone
 halcinonide
 halobetasol
 hydrocortisone
 methylprednisolone
 mometasone
 prednicarbate
 prednisolone
 prednisone
 rimexolone
 triamcinolone

Diuretics

PREGNANCY CATEGORY B OR C

Therapeutic actions

Diuretics are divided into several subgroups. Thiazide and thiazide-related diuretics inhibit reabsorption of sodium and chloride in the distal renal tubule, increasing the excretion of sodium, chloride, and water by the kidney. Loop diuretics inhibit the reabsorption of sodium and chloride in the loop of Henle and in the distal renal tubule; because of this added effect, loop diuretics are more potent. Potassium-sparing diuretics block the effect of aldosterone on the renal tubule, leading to a loss of sodium and water and the retention of potassium; their overall effect is much weaker. Osmotic diuretics pull fluid out of the tissues with a hypertonic effect. Overall effect of diuretics is a loss of water and electrolytes from the body.

Indications

- Adjunctive therapy in edema associated with heart failure, cirrhosis, corticosteroid and estrogen therapy, renal impairment
- Treatment of hypertension, alone or in combination with other antihypertensives
- Reduction of intracranial pressure before and during neurosurgery
- Reduction of intraocular pressure in acute episodes of glaucoma when other therapies are not successful
- Unlabeled uses: Treatment of diabetes insipidus, especially nephrogenic diabetes insipidus, reduction of incidence of osteoporosis in postmenopausal women

Contraindications and cautions

- Contraindicated with fluid or electrolyte imbalances, renal or hepatic disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, manic-depressive disorders, or lactation.

Adverse effects

- **CNS:** *Dizziness, vertigo*, paresthesias, weakness, headache, drowsiness, fatigue
- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain
- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation*, jaundice, hepatitis, pancreatitis
- **GU:** *Polyuria, nocturia, impotence*, loss of libido
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia, fluid and electrolyte imbalances
- **Other:** Muscle cramps and muscle spasms, fever, hives, gouty attacks, flushing, weight loss, rhinorrhea, electrolyte imbalance

Interactions

- **Drug-drug** • Increased thiazide effects and possible acute hyperglycemia with diazoxide • Decreased absorption with cholestyramine, colestipol • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Increased dosage of anti-diabetics may be needed • Risk of hyperkalemia if potassium-sparing diuretics are given with potassium preparations or ACE inhibitors • Increased risk of ototoxicity if loop diuretics are taken with aminoglycosides or cisplatin
- **Drug-lab test** • Monitor for decreased PBI levels without clinical signs of thyroid disturbances

■ Nursing considerations

Assessment

- **History:** Fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorders, lactation
- **Physical:** Orientation, reflexes, muscle strength; pulses, BP, orthostatic BP, perfusion, edema, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds; CBC, serum electrolytes, blood glucose; LFTs, renal function tests; serum uric acid, urinalysis

Interventions

- Administer with food or milk if GI upset occurs.
- Administer early in the day so increased urination will not disturb sleep.
- Ensure ready access to bathroom.
- Establish safety precautions if CNS effects, orthostatic hypotension occur.
- Measure and record regular body weights to monitor fluid changes.
- Provide mouth care and frequent small meals as needed.
- Monitor IV sites for any sign of extravasation.
- Monitor electrolytes frequently with parenteral use, periodically with chronic use.

Teaching points

- Take these drugs early in the day so sleep will not be disturbed by increased urination.
- Weigh yourself daily and record weights.
- Protect your skin from exposure to the sun or bright lights.
- If taking a potassium-sparing diuretic, avoid foods high in potassium and avoid using salt substitutes.
- Take prescribed potassium replacement, and eat foods high in potassium if taking a thiazide or loop diuretic.
- Increased urination will occur (stay close to bathroom facilities).
- Use caution if dizziness, drowsiness, or faintness occurs.
- Report rapid weight gain or loss, swelling in ankles or fingers, unusual bleeding or bruising, muscle cramps.

Representative drugs

Thiazide and related diuretics

chlorothiazide
chlorthalidone
hydrochlorothiazide
hydroflumethiazide
indapamide
methyclothiazide
metolazone

Loop diuretics

bumetanide
ethacrynic acid
furosemide
torsemide

Potassium-sparing diuretics

amiloride
spironolactone
triamterene

Osmotic diuretic

glycerin
isosorbide
mannitol
urea

Fluoroquinolones

PREGNANCY CATEGORY C

Therapeutic actions

Fluoroquinolones are antibacterial. They interfere with DNA replication in susceptible gram-negative bacteria, preventing cell reproduction and leading to death of bacteria.

Indications

- Treatment of infections caused by susceptible gram-negative bacteria, including *Escherichia coli*, *Proteus mirabilis*, *Klebsiella pneumoniae*, *Enterobacter cloacae*, *Proteus vulgaris*, *Providencia rettgeri*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Citrobacter freundii*, *Staphylococcus aureus*, *S. epidermidis*, group D streptococci, *Streptococcus pneumoniae*
- Unlabeled use: Treatment of patients with cystic fibrosis who have pulmonary exacerbations

Contraindications and cautions

- Contraindicated with allergy to any fluoroquinolone, pregnancy, or lactation.
- Use cautiously with renal impairment, seizures.

Adverse effects

- **CNS:** *Headache*, dizziness, insomnia, fatigue, somnolence, depression, blurred vision
- **GI:** *Nausea*, vomiting, dry mouth, *diarrhea*, abdominal pain
- **Hematologic:** Elevated BUN, AST, ALT, serum creatinine and alkaline phosphatase; decreased WBC, neutrophil count, Hct
- **Other:** Fever, rash, **photosensitivity**, QT-interval prolongation

Interactions

- * **Drug-drug** • Decreased therapeutic effect with iron salts, sucralfate • Decreased absorption with antacids • Increased serum levels and toxic effects of theophyllines with fluoroquinolones
- * **Drug-alternative therapy** • Increased photosensitivity reactions with St. John's wort

■ Nursing considerations**Assessment**

- **History:** Allergy to fluoroquinolones, renal impairment, seizures, lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; mucous membranes, bowel sounds; LFTs, renal function tests

Interventions

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy for 2 days after the signs and symptoms of infection have disappeared.
- Administer oral drug 1 hr before or 2 hr after meals with a glass of water.
- Ensure that patient is well hydrated during course of drug therapy.
- Administer antacids, if needed, at least 2 hr after dosing.
- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat culture and sensitivity.
- Ensure ready access to bathroom if diarrhea occurs.
- Arrange for appropriate bowel training program if constipation occurs.
- Provide frequent small meals if GI upset occurs.
- Arrange for monitoring of environment (noise, temperature) and analgesics, for headache.

- Establish safety precautions if CNS, visual changes occur.
- Encourage patient to complete full course of therapy.

Teaching points

- Take oral drugs on an empty stomach, 1 hour before or 2 hours after meals. If you need an antacid, do not take it within 2 hours of ciprofloxacin dose.
- Drink plenty of fluids.
- You may experience these side effects: Nausea, vomiting, abdominal pain (frequent small meals may help); diarrhea or constipation (consult your health care provider); drowsiness, blurring of vision, dizziness (observe caution if driving or using hazardous equipment).
- Report rash, visual changes, severe GI problems, weakness, tremors.

Representative drugs

ciprofloxacin
gemifloxacin
levofloxacin
moxifloxacin
norfloxacin
ofloxacin

Histamine₂ (H₂) Antagonists**PREGNANCY CATEGORY B****Therapeutic actions**

H₂ antagonists inhibit the action of histamine at the H₂ receptors of the stomach, inhibiting gastric acid secretion and reducing total pepsin output; the resultant decrease in acid allows healing of ulcerated areas.

Indications

- Short-term and maintenance treatment of active duodenal ulcer and benign gastric ulcer
- Treatment of pathologic hypersecretory conditions (Zollinger-Ellison syndrome) and erosive GERD

- Prophylaxis of stress-induced ulcers and acute upper GI bleed in critically ill patients
- Treatment of GERD, heartburn, acid indigestion, sour stomach

Contraindications and cautions

- Contraindicated with allergy to H₂ antagonists, impaired renal or hepatic function, or lactation.

Adverse effects

- **CNS:** Dizziness, somnolence, headache, confusion, hallucinations, peripheral neuropathy, symptoms of brain stem dysfunction (dysarthria, ataxia, diplopia)
- **CV:** Cardiac arrhythmias, arrest; hypotension (IV use)
- **GI:** *Diarrhea*
- **Hematologic:** Increases in plasma creatinine, serum transaminase
- **Other:** Impotence (reversible with drug withdrawal), gynecomastia (long-term treatment), rash, vasculitis, pain at IM injection site

Interactions

★ **Drug-drug** • Increased risk of decreased white blood cell counts with antimetabolites, alkylating agents, other drugs known to cause neutropenia • Increased serum levels and risk of toxicity of warfarin-type anticoagulants, phenytoin, beta-adrenergic blockers, alcohol, quinidine, lidocaine, theophylline, chloroquine, certain benzodiazepines (alprazolam, chlordiazepoxide, diazepam, flurazepam, triazolam), nifedipine, pentoxifylline, tricyclic antidepressants, procainamide, carbamazepine when taken with H₂ antagonists

■ Nursing considerations

Assessment

- **History:** Allergy to H₂ antagonists, impaired renal or hepatic function, lactation
- **Physical:** Skin lesions; orientation, affect; pulse, baseline ECG (continuous with IV use); liver evaluation, abdominal examination, normal output; CBC, LFTs, renal function tests

Interventions

- Administer drug with food and at bedtime.

- Decrease doses in renal and hepatic impairment.
- Administer IM dose undiluted, deep into large muscle group.
- Ensure ready access to bathroom.
- Provide comfort measures for skin rash, headache.
- Establish safety measures if CNS changes occur (side rails, accompany patient).
- Arrange for regular follow-up, including liver and renal function tests, to evaluate effects.

Teaching points

- Take these drugs with food and at bedtime; therapy may continue for 4–6 weeks or longer.
- Take antacids exactly as prescribed; be careful of the time.
- Inform your health care provider about your cigarette smoking habits. Cigarette smoking decreases the effectiveness of these drugs.
- Have regular medical follow-up while on this drug to evaluate your response.
- Report sore throat, fever, unusual bruising or bleeding, tarry stools, confusion, hallucinations, dizziness, muscle or joint pain.

Representative drugs

cimetidine
famotidine
nizatidine
ranitidine

HMG-CoA Inhibitors

PREGNANCY CATEGORY X

Therapeutic actions

HMG-CoA inhibitors are antihyperlipidemic. They are a fungal metabolite that inhibits the enzyme that catalyzes the first step in the cholesterol synthesis pathway in humans, resulting in a decrease in serum cholesterol and serum LDLs (associated with increased risk of CAD); either an increase or no change in serum HDLs (associated with decreased risk of CAD); and a decrease in triglycerides.

Indications

- Adjunct to diet in the treatment of elevated total and LDL cholesterol in patients with primary hypercholesterolemia (types IIa and

IIb) whose response to dietary restriction of saturated fat and cholesterol and other non-pharmacologic measures has not been adequate

- Primary prevention of coronary events (lovastatin, pravastatin)
- Secondary prevention of CV events (fluvastatin, lovastatin, pravastatin, simvastatin)

Contraindications and cautions

- Contraindicated with allergy to HMG-CoA inhibitors, fungal byproducts, pregnancy, or lactation, concurrent gemfibrozil therapy.
- Use cautiously with impaired hepatic function, cataracts.

Adverse effects

- **CNS:** *Headache, blurred vision*, dizziness, insomnia, fatigue, muscle cramps, cataracts
- **GI:** *Flatulence, abdominal pain, cramps, constipation, nausea, vomiting*, heartburn
- **Hematologic:** Elevations of CPK, alkaline phosphatase, and transaminases
- **Musculoskeletal: Rhabdomyolysis with possible renal failure**

Interactions

- *** Drug-drug** • Monitor patients receiving HMG-CoA inhibitors for possible severe myopathy or rhabdomyolysis if taken with cyclosporine, erythromycin, gemfibrozil, niacin
- *** Drug-food** • Risk of increased serum levels if combined with grapefruit juice

■ Nursing considerations

Assessment

- **History:** Allergy to HMG-CoA inhibitors, fungal byproducts; impaired hepatic function; cataracts; pregnancy; lactation
- **Physical:** Orientation, affect, ophthalmologic examination; liver evaluation; lipid studies, LFTs

Interventions

- Administer drug at bedtime; highest rates of cholesterol synthesis are between midnight and 5 AM.
- Consult with dietitian about low-cholesterol diets.
- Arrange for diet and exercise consultation.

- Arrange for regular follow-up during long-term therapy.
- Provide comfort measures to deal with headache, muscle cramps, nausea.
- Arrange for periodic ophthalmologic examination to check for cataract development.
- Offer support and encouragement to deal with disease, diet, drug therapy, and follow-up.

Teaching points

- Take these drugs at bedtime.
- Institute appropriate diet changes.
- Use contraceptive measures to avoid pregnancy while using these drugs.
- Avoid grapefruit juice while taking these drugs.
- You may experience these side effects: Nausea (eat frequent small meals); headache, muscle and joint aches and pains (may lessen with time).
- Have periodic ophthalmic examinations while you are using these drugs.
- Report severe GI upset, changes in vision, unusual bleeding or bruising, dark urine or light-colored stools; muscle pain, weakness.

Representative drugs

atorvastatin
fluvastatin
lovastatin
pitavastatin
pravastatin
rosuvastatin
simvastatin

Macrolide Antibiotics

PREGNANCY CATEGORY B OR C

Therapeutic actions

Macrolides are antibiotics. They are bacteriostatic or bactericidal in susceptible bacteria; they bind to cell membranes and cause changes in protein function, leading to bacterial cell death.

Indications

- Treatment of acute infections caused by sensitive strains of *Streptococcus pneumoniae*,

Mycoplasma pneumoniae, *Listeria monocytogenes*, *Legionella pneumophila*; URIs, lower respiratory tract infections, skin and soft-tissue infections caused by group A beta-hemolytic streptococci when oral treatment is preferred to injectable benzathine penicillin; PID caused by *Neisseria gonorrhoeae* in patients allergic to penicillin; intestinal amebiasis caused by *Entamoeba histolytica*; infections in the newborn and in pregnancy that are caused by *Chlamydia trachomatis* and in adult chlamydial infections when tetracycline cannot be used; primary syphilis (*Treponema pallidum*) in penicillin-allergic patients; eliminating *Bordetella pertussis* organisms from the nasopharynx of infected individuals and as prophylaxis in exposed and susceptible individuals; superficial ocular infections caused by susceptible strains of microorganisms; prophylaxis of ophthalmia neonatorum caused by *N. gonorrhoeae* or *C. trachomatis*

- In conjunction with sulfonamides to treat URIs caused by *Haemophilus influenzae*
- Adjunct to antitoxin in infections caused by *Corynebacterium diphtheriae* and *Corynebacterium minutissimum*
- Prophylaxis against alpha-hemolytic streptococcal endocarditis before dental or other procedures in patients allergic to penicillin who have valvular heart disease and against infection in minor skin abrasions
- Unlabeled uses: Treatment of severe diarrhea associated with *Campylobacter* enteritis or enterocolitis; treatment of genital, inguinal, or anorectal lymphogranuloma venereum infection; treatment of *Haemophilus ducreyi* (chancroid); treatment of acne vulgaris and skin infections caused by sensitive microorganisms

Contraindications and cautions

- Contraindicated with allergy to any macrolide antibiotic.
- Use cautiously with hepatic impairment or lactation (secreted and may be concentrated in breast milk; may modify bowel flora of nursing infant and interfere with fever workups).

Adverse effects

- **CNS:** Reversible hearing loss, confusion, uncontrollable emotions, abnormal thinking
- **Dermatologic:** Edema, urticaria, dermatitis, angioneurotic edema
- **GI:** *Abdominal cramping, anorexia, diarrhea, vomiting*, pseudomembranous colitis, hepatotoxicity
- **Hypersensitivity:** Allergic reactions ranging from rash to **anaphylaxis**
- **Local:** *Irritation, burning, itching* at site of application
- **Other:** *Superinfections*

Interactions

- **Drug-drug** • Increased serum levels of digoxin • Increased effects of oral anticoagulants, theophyllines, carbamazepine • Increased therapeutic and toxic effects of corticosteroids • Increased levels of cyclosporine and risk of renal toxicity • Increased irritant effects with peeling, desquamating, or abrasive agents used with dermatologic preparations
- **Drug-lab test** • Interferes with fluorometric determination of urinary catecholamines • Decreased urinary estriol levels caused by inhibition of hydrolysis of steroids in the gut

■ Nursing considerations

Assessment

- **History:** Allergy to macrolides, hepatic impairment, lactation, viral, fungal, mycobacterial infections of the eye (ophthalmologic)
- **Physical:** Site of infection, skin color, lesions; orientation, affect, hearing tests; R, adventitious sounds; GI output, bowel sounds, liver evaluation; culture and sensitivity tests of infection, urinalysis, LFTs

Interventions

- Culture site of infection before therapy.
- Administer oral erythromycin base or stearate on an empty stomach, 1 hr before or 2–3 hr after meals, with a full glass of water (oral erythromycin estolate, ethylsuccinate, and certain enteric-coated tablets; see manufacturer's instructions; may be given without regard to meals).

• Administer drug around the clock to maximize therapeutic effect; scheduling may have to be adjusted to minimize sleep disruption.

⊗ **Black box warning** Monitor liver function in patients on prolonged therapy; serious toxicity can occur.

- Institute hygiene measures and treatment if superinfections occur.
- If GI upset occurs with oral therapy, some preparations (see previous) may be given with meals, or it may be possible to substitute one of these preparations.
- Provide frequent small meals if GI problems occur.
- Establish safety measures (accompany patient, side rails) if CNS changes occur.
- Give patient support and encouragement to continue with therapy.
- Wash affected area, rinse well, and dry before topical application.

Teaching points

- Take oral drugs on an empty stomach, 1 hour before or 2–3 hours after meals, with a full glass of water, or, as appropriate, drug may be taken without regard to meals. These drugs should be taken around the clock; schedule to minimize sleep disruption. It is important that you finish the *full course* of the drug therapy.
- Wash and rinse area and pat it dry before applying topical solutions; use fingertips or an applicator; wash hands thoroughly after application.
- You may experience these side effects: Stomach cramping, discomfort (taking the drug with meals, if appropriate, may alleviate this problem); uncontrollable emotions, crying, laughing, abnormal thinking (will end when the drug is stopped).
- Report severe or watery diarrhea, severe nausea or vomiting, dark urine, yellowing of the skin or eyes, loss of hearing, skin rash or itching.

Representative drugs

azithromycin
clarithromycin
erythromycin

Nitrates

PREGNANCY CATEGORY C

Therapeutic actions

Nitrates are antianginals. They relax vascular smooth muscle with a resultant decrease in venous return and decrease in arterial blood pressure, which reduces left ventricular workload and decreases myocardial oxygen consumption, relieving the pain of angina.

Indications

- Treatment of acute angina (sublingual, translingual, inhalant preparations)
- Prophylaxis of angina (oral sustained-release, sublingual, topical, transdermal, translingual, transmucosal preparations)
- Treatment of angina unresponsive to recommended doses of organic nitrates or beta-blockers (IV preparations)
- Management of perioperative hypertension, heart failure associated with acute MI (IV preparations)
- Produce controlled hypotension during surgery (IV preparations)
- Unlabeled uses: Reduction of cardiac workload in acute MI and in heart failure (sublingual, topical); diffuse esophageal spasm without reflux

Contraindications and cautions

- Contraindicated with allergy to nitrates, angle-closure glaucoma, severe anemia, early MI, head trauma, cerebral hemorrhage, cardiomyopathy, concomitant use with phosphodiesterase type 5 (PDE5) inhibitors, pregnancy, or lactation.
- Use cautiously with hepatic or renal disease, hypotension or hypovolemia, increased intracranial pressure, constrictive pericarditis, pericardial tamponade, low ventricular filling pressure or low pulmonary capillary wedge pressure (PCWP).

Adverse effects

- **CNS:** *Headache*, apprehension, restlessness, weakness, vertigo, dizziness, faintness

- **CV:** Tachycardia, retrosternal discomfort, palpitations, **hypotension**, syncope, collapse, orthostatic hypotension, angina
- **Dermatologic:** Rash, exfoliative dermatitis, cutaneous vasodilation with flushing, pallor, perspiration, cold sweat, contact dermatitis (transdermal preparations), topical allergic reactions (topical nitroglycerin ointment)
- **GI:** Nausea, vomiting, incontinence of urine and feces, abdominal pain
- **Local:** Local burning sensation at the point of dissolution (sublingual)
- **Other:** Ethanol intoxication with high dose IV use (alcohol in diluent)

Interactions

★ **Drug-drug** • Increased risk of hypertension and decreased antianginal effect with ergot alkaloids • Decreased pharmacologic effects of heparin • Risk of orthostatic hypotension with calcium channel-blockers • Profound hypotension with PDE5 inhibitors

★ **Drug-lab test** • False report of decreased serum cholesterol if done by the Zlatkis-Zak color reaction

■ Nursing considerations

Assessment

- **History:** Allergy to nitrates, severe anemia, early MI, head trauma, cerebral hemorrhage, hypertrophic cardiomyopathy, hepatic or renal disease, hypotension or hypovolemia, increased intracranial pressure, constrictive pericarditis, pericardial tamponade, low ventricular filling pressure or low PCWP, pregnancy, lactation
- **Physical:** Skin color, T, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; R, adventitious sounds; liver evaluation, normal output; LFTs (IV); renal function tests (IV); CBC, Hgb

Interventions

- Administer sublingual preparations under the tongue or in the buccal pouch. Encourage the patient not to swallow. Ask patient if the tablet “fizzles” or burns. Check the expiration date on the bottle; store at room temperature, protected from light. Discard unused drug 6 mo after bottle is opened (conventional tablets); stabilized tablets (*Nitrostat*) are less subject to loss of potency.

- Administer sustained-release preparations with water; tell the patient not to chew the tablets or capsules; do not crush these preparations.
- Administer topical ointment by applying it over a 6" × 6" area in a thin, uniform layer using the applicator. Cover area with plastic wrap held in place by adhesive tape. Rotate sites of application to decrease the chance of inflammation and sensitization; close tube tightly when finished.
- Administer transdermal systems to skin site free of hair and not subject to much movement. Shave areas that have a lot of hair. Do not apply to distal extremities. Change sites slightly to decrease the chance of local irritation and sensitization. Remove transdermal system before attempting defibrillation or cardioversion. Remove old system before applying new system.
- Administer transmucosal tablets by placing them between the lip and gum above the incisors or between the cheek and gum. Encourage patient not to swallow and not to chew the tablet.
- Administer the translingual spray directly onto the oral mucosa; preparation is not to be inhaled.
- Withdraw drug gradually; 4–6 wk recommended period for the transdermal preparations.
- Establish safety measures if CNS effects, hypotension occur.
- Keep environment cool, dim, and quiet.
- Provide periodic rest periods for patient.
- Provide comfort measures and arrange for analgesics if headache occurs.
- Maintain life support equipment on standby if overdose occurs or cardiac condition worsens.
- Provide support and encouragement to deal with disease, therapy, and needed lifestyle changes.

Teaching points

- Place sublingual tablets under your tongue or in your cheek; do not chew or swallow the tablet; the tablet should burn or “fizzle” under the tongue. Take nitroglycerin before chest pain begins, when you anticipate that your activities or situation may precipitate an attack. Do not buy large quantities; these

drugs do not store well. Keep these drugs in a dark, dry place, in a dark-colored glass bottle with a tight lid; do not combine with other drugs. You may repeat your dose every 5 minutes for a total of three tablets; if the pain is still not relieved, go to an emergency room.

- Do not chew or crush the timed-release preparations; take on an empty stomach.
- Spread a thin layer of topical ointment on the skin using the applicator. Do not rub or massage the area. Cover with plastic wrap held in place with adhesive tape. Wash your hands after application. Keep the tube tightly closed. Rotate the sites frequently to prevent local irritation.
- To use transdermal systems, you may need to shave an area for application. Apply to a slightly different area each day. Use care if changing brands; each system has a different concentration. Remove the old system before applying a new one.
- Place transmucosal tablets between the lip and gum or between the gum and cheek. Do not chew; try not to swallow.
- Spray translingual spray directly onto oral mucous membranes; do not inhale. Use 5–10 minutes before activities that you anticipate will precipitate an attack.
- Take these drugs exactly as directed; do not exceed recommended dosage.
- Do not take erectile dysfunction drugs while you are using a nitrate.
- You may experience these side effects: Dizziness, light-headedness (this may pass as you adjust to the drug; change positions slowly); headache (lying down in a cool environment and resting may help; over-the-counter preparations may not help); flushing of the neck or face (this usually passes as the drug's effects pass).
- Report blurred vision, persistent or severe headache, skin rash, more frequent or more severe angina attacks, fainting.

Representative drugs

isosorbide dinitrate
isosorbide mononitrate
nitroglycerin

Nondepolarizing Neuromuscular Junction Blockers (NMJ Blockers)

DANGEROUS DRUG

PREGNANCY CATEGORY C

Therapeutic actions

NMJ blockers interfere with neuromuscular transmission and cause flaccid paralysis by blocking acetylcholine receptors at the skeletal neuromuscular junction.

Indications

- Adjuncts to general anesthetics to facilitate endotracheal intubation and relax skeletal muscle; to relax skeletal muscle to facilitate mechanical ventilation

Contraindications and cautions

- Contraindicated with hypersensitivity to NMJ blockers and the bromide ion.
- Use cautiously with myasthenia gravis; pregnancy (teratogenic in preclinical studies; may be used in cesarean section, but reversal may be difficult if patient has received magnesium sulfate to manage preeclampsia); renal or hepatic disease, respiratory depression, altered fluid or electrolyte balance; patients in whom an increase in heart rate may be dangerous.

Adverse effects

- **CV:** *Increased heart rate*
- **Hypersensitivity:** Hypersensitivity reactions, especially rash
- **Musculoskeletal:** Profound and prolonged muscle paralysis
- **Respiratory:** *Depressed respiration, apnea, bronchospasm*

Interactions

★ **Drug-drug** • Increased intensity and duration of neuromuscular block with some anesthetics (isoflurane, enflurane, halothane, diethyl ether), some parenteral antibiotics (aminoglycosides, clindamycin, lincomycin, bacitracin, polymyxin B), ketamine, quinine, quinidine, trimethaphan, calcium channel-blocking drugs (eg, verapamil), Mg²⁺ salts,

and in hypokalemia (from K^+ -depleting diuretics) • Decreased intensity of neuromuscular block with acetylcholine, cholinesterase inhibitors, K^+ salts, theophyllines, phenytoins, azathioprine, mercaptopurine, carbamazepine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to NMJ blockers and the bromide ion, myasthenia gravis, pregnancy, renal or hepatic disease, respiratory depression, altered fluid or electrolyte balance
- **Physical:** Weight, T, skin condition, hydration, reflexes, bilateral grip strength, pulse, BP, R and adventitious sounds, LFTs, renal function tests, serum electrolytes

Interventions

⊗ **Black box warning** Drug should be given only by trained personnel (anesthesiologists); intubation will be necessary.

- Arrange to have facilities on standby to maintain airway and provide mechanical ventilation.
- Provide neostigmine, pyridostigmine, or edrophonium (cholinesterase inhibitors) on standby to overcome excessive neuromuscular block.
- Provide atropine or glycopyrrolate on standby to prevent parasympathomimetic effects of cholinesterase inhibitors.
- Provide a peripheral nerve stimulator on standby to assess degree of neuromuscular block, as needed.
- Change patient's position frequently, and provide skin care to prevent decubitus ulcer formation when drug is used for other than brief periods.
- Monitor conscious patient for pain or distress that he may not be able to communicate.
- Reassure conscious patients frequently.

Teaching points

- Teaching points about what these drugs do and how the patient will feel should be incorporated into the overall teaching program about the procedure.

Representative drugs

atracurium
cisatracurium
pancuronium

rocuronium
vecuronium

Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

PREGNANCY CATEGORY B OR C
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Therapeutic actions

NSAIDs have anti-inflammatory, analgesic, and antipyretic activities largely related to inhibition of prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Relief of signs and symptoms of rheumatoid arthritis, osteoarthritis, and juvenile arthritis
- Relief of mild to moderate pain
- Treatment of primary dysmenorrhea
- Fever reduction
- Reduction of number of adenomatous colorectal polyps in adults with familial adenomatous polyposis

Contraindications and cautions

- Contraindicated with allergy to salicylates or other NSAIDs (more common in patients with rhinitis, asthma, chronic urticaria, nasal polyps); CV dysfunction, hypertension; peptic ulceration, GI bleeding; pregnancy or lactation.
- Use cautiously with impaired hepatic function, impaired renal function, heart failure.

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, tinnitus, ophthalmologic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses, neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocy-

openia, agranulocytosis, granulocytopenia, aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia

- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis
- **Other:** Peripheral edema, anaphylactoid reactions to **anaphylactic shock**

Interactions

• **Drug-drug** • Increased toxic effects of lithium with NSAIDs • Decreased diuretic effect with loop diuretics: bumetanide, furosemide, ethacrynic acid • Potential decrease in antihypertensive effect of beta-adrenergic blockers

■ Nursing considerations

Assessment

- **History:** Allergy to salicylates or other NSAIDs; CV dysfunction, hypertension; peptic ulceration, GI bleeding; impaired hepatic function; impaired renal function; pregnancy; lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, ophthalmologic evaluation, audiometric evaluation, peripheral sensation; P, BP, edema; R, adventitious sounds; liver evaluation, bowel sounds; CBC, clotting times, urinalysis, LFTs, renal function tests, serum electrolytes, stool guaiac

Interventions

- ⊗ **Black box warning** Monitor patient for CV events, GI bleed; risk may be increased.
- Administer drug with food or after meals if GI upset occurs.
- Establish safety measures if CNS, visual disturbances occur.
- Arrange for periodic ophthalmologic examination during long-term therapy.
- Arrange for discontinuation of drug if eye changes, symptoms of hepatic impairment, renal impairment occur.
- Institute emergency procedures if overdose occurs (gastric lavage, induction of emesis, supportive therapy).
- Provide comfort measures to reduce pain and to reduce inflammation.
- Provide frequent small meals if GI upset is severe.

Teaching points

- Use these drugs only as suggested. Do not exceed the prescribed dosage. Take these drugs with food or after meals if GI upset occurs.
- Avoid over-the-counter drugs while taking these drugs. Many of these drugs contain similar medications; serious overdosage can occur. If you feel you need one of these preparations, consult your health care provider.
- Avoid alcohol while taking these drugs.
- You may experience these side effects: Nausea, GI upset, dyspepsia (take with food); diarrhea or constipation; drowsiness, dizziness, vertigo, insomnia (use caution when driving or operating dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black or tarry stools.

tolmetin

Opioids

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Therapeutic actions

Opioids act as agonists at specific opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating

these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to severe acute and chronic pain
- Preoperative medication to sedate and allay apprehension, facilitate induction of anesthesia, and reduce anesthetic dosage
- Analgesic adjunct during anesthesia
- Intraspinal use with microinfusion devices for the relief of intractable pain
- Unlabeled use: Relief of dyspnea associated with acute left ventricular failure and pulmonary edema

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning until toxins are eliminated, during labor or delivery of a premature infant (may cross immature blood-brain barrier more readily), after biliary tract surgery or following surgical anastomosis, pregnancy, or labor (can cause respiratory depression of neonate; may prolong labor).
- Use cautiously with head injury and increased intracranial pressure; acute asthma, COPD, cor pulmonale, preexisting respiratory depression, hypoxia, hypercapnia (may decrease respiratory drive and increase airway resistance); lactation (may be safer to wait 4–6 hr after administration to nurse the baby); acute abdominal conditions; CV disease, supraventricular tachycardias; myxedema; seizure disorders; acute alcoholism, delirium tremens; cerebral arteriosclerosis; ulcerative colitis; fever; kyphoscoliosis; Addison's disease; prostatic hypertrophy, urethral stricture; recent GI or GU surgery; toxic psychosis; renal or hepatic impairment.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation*, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex

- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, *bradycardia*, arrhythmia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope
- **Dermatologic:** Pruritus, urticaria, laryngospasm, bronchospasm, edema
- **GI:** *Nausea, vomiting*, dry mouth, anorexia, *constipation*, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis
- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Tissue irritation and induration (subcutaneous injection)
- **Major hazards:** **Respiratory depression, apnea, circulatory depression, respiratory arrest, shock, cardiac arrest**
- **Other:** *Sweating*, physical tolerance and dependence, psychological dependence

Interactions

- **Drug-drug** • Increased likelihood of respiratory depression, hypotension, profound sedation, or coma in patients receiving barbiturate general anesthetics
- **Drug-lab test** • Elevated biliary tract pressure (an effect of opioids) may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to opioids; diarrhea caused by poisoning; labor or delivery of a premature infant; biliary tract surgery or surgical anastomosis; head injury and increased intracranial pressure; acute asthma, COPD, cor pulmonale, preexisting respiratory depression, hypoxia, hypercapnia; acute abdominal conditions; CV disease, supraventricular tachycardias; myxedema; seizure disorders; acute alcoholism, delirium tremens; cerebral arteriosclerosis; ulcerative colitis; fever; kyphoscoliosis; Addison's disease; prostatic hypertrophy; urethral stricture; recent GI or GU surgery; toxic psychosis; renal or hepatic impairment; pregnancy; lactation

- **Physical:** T; skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect; P; auscultation, BP, orthostatic BP, perfusion; R, adventitious sounds; bowel sounds, normal output; urinary frequency, voiding pattern, normal output; ECG; EEG; LFTs, thyroid and renal function tests

Interventions

- Caution patient not to chew or crush controlled-release preparations.
- Dilute and administer IV slowly to minimize likelihood of adverse effects.
- Direct patient to lie down during IV administration.
- Keep opioid antagonist and equipment for assisted or controlled respiration readily available during IV administration.
- Use caution when injecting IM or subcutaneously into chilled areas or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.
- Monitor injection sites for irritation, extravasation.
- Instruct postoperative patients in pulmonary toilet; drug suppresses cough reflex.
- Monitor bowel function and arrange for anthraquinone laxatives for severe constipation.
- Institute safety precautions (use side rails, assist with walking) if CNS, vision effects occur.
- Provide frequent small meals if GI upset occurs.
- Control environment if sweating, visual difficulties occur.
- Provide back rubs, positioning, and other nondrug measures to alleviate pain.
- Reassure patient about addiction liability; most patients who receive opioids for medical reasons do not develop dependence syndromes.

Teaching points

When these drugs are used as a preoperative medication, teach the patient about the drug when explaining the procedure.

- Take these drugs exactly as prescribed. Avoid alcohol, antihistamines, sedatives, tranquilizers, and over-the-counter drugs.

- Do not take any leftover medication for other disorders, and do not let anyone else take your prescription.
- You may experience these side effects: Nausea, loss of appetite (take the drug with food and lie quietly); constipation (notify your health care provider if this is severe; a laxative may help); dizziness, sedation, drowsiness, impaired visual acuity (avoid driving or performing other tasks requiring alertness, visual acuity).
- Report severe nausea, vomiting, constipation, shortness of breath or difficulty breathing, skin rash.

Representative drugs

alfentanil

butorphanol
codeine
fentanyl
hydrocodone
hydromorphone
levorphanol
meperidine
methadone
morphine sulfate
nalbuphine
opium
oxycodone
oxymorphone
pentazocine
propoxyphene
sufentanil
tramadol

Penicillins

PREGNANCY CATEGORY B

Therapeutic actions

Penicillins are antibiotics. They are bactericidal, inhibiting the synthesis of cell wall of sensitive organisms, causing cell death in susceptible organisms.

Indications

- Treatment of moderate to severe infections caused by sensitive organisms: streptococci, pneumococci, staphylococci, *Neisseria*

gonorrhoeae, *Treponema pallidum*, meningococci, *Actinomyces israelii*, *Clostridium perfringens*, *Clostridium tetani*, *Leptotrichia buccalis* (Vincent's disease), *Spirillum minus* or *Streptobacillus moniliformis*, *Listeria monocytogenes*, *Pasteurella multocida*, *Erysipelothrix insidiosa*, *Escherichia coli*, *Enterobacter aerogenes*, *Alcaligenes faecalis*, *Salmonella*, *Sbigella*, *Proteus mirabilis*, *Corynebacterium diphtheriae*, *Bacillus anthracis*

- Treatment of syphilis, gonococcal infections
- Unlabeled use: Treatment of Lyme disease

Contraindications and cautions

- Contraindicated with allergy to penicillins, cephalosporins, other allergens.
- Use cautiously with renal disease, pregnancy, lactation (may cause diarrhea or candidiasis in the infant).

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth*, furry tongue, black “hairy” tongue, *nausea, vomiting, diarrhea*, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, nonspecific hepatitis
- **GU:** Nephritis-oliguria, proteinuria, hematuria, casts, azotemia, pyuria
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time
- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis*, thrombosis at injection site, Jarisch-Herxheimer reaction when used to treat syphilis
- **Other:** *Superinfections*, sodium overload, leading to heart failure

Interactions

- *** Drug-drug** • Decreased effectiveness with tetracyclines • Inactivation of parenteral aminoglycosides (amikacin, gentamicin, kanamycin, neomycin, streptomycin, tobramycin) if mixed in the same solution • Risk of increased serum levels if combined with aspirin, indomethacin, diuretics, sulfonamides
- *** Drug-lab test** • False-positive Coombs' test (IV)

■ Nursing considerations

Assessment

- **History:** Allergy to penicillins, cephalosporins, other allergens, renal disease, lactation
- **Physical:** Culture infected area; skin rashes, lesions; R, adventitious sounds; bowel sounds, normal output; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis; skin test with benzylpenicilloypolylysine if hypersensitivity reactions have occurred

Interventions

- Culture infected area before beginning treatment; reculture area if response is not as expected.
- Use the smallest dose possible for IM injection to avoid pain and discomfort.
- Arrange to continue treatment for 48–72 hr after the patient becomes asymptomatic.
- Monitor serum electrolytes and cardiac status if penicillin G is given by IV infusion. Na or K preparations have been associated with severe electrolyte imbalances.
- Check IV site carefully for signs of thrombosis or local drug reaction.
- Do not give IM injections repeatedly in the same site; atrophy can occur. Monitor injection sites.
- Explain the reason for parenteral routes of administration; offer support and encouragement to deal with therapy.
- Provide frequent small meals if GI upset occurs.
- Arrange for comfort and treatment measures for superinfections.
- Provide for frequent mouth care if GI effects occur.
- Ensure that bathroom facilities are readily available if diarrhea occurs.
- Keep epinephrine, IV fluids, vasopressors, bronchodilators, oxygen, and emergency equipment readily available in case of serious hypersensitivity reaction.
- Arrange for the use of corticosteroids, antihistamines for skin reactions.

Teaching points

- You may experience these side effects: Upset stomach, nausea, vomiting (eat frequent small meals); sore mouth (provide frequent mouth care); diarrhea; pain or discomfort

at the injection site (report if very uncomfortable).

- Report unusual bleeding, sore throat, rash, hives, fever, severe diarrhea, difficulty breathing.

Representative drugs

amoxicillin
ampicillin
oxacillin
penicillin G benzathine
penicillin G potassium
penicillin G procaine
penicillin V
piperacillin

Phenothiazines

PREGNANCY CATEGORY C

Therapeutic actions

Mechanism of action of phenothiazines is not fully understood. Antipsychotic drugs block postsynaptic dopamine receptors in the brain, but this may not be necessary and sufficient for antipsychotic activity; depresses the RAS, including the parts of the brain involved with wakefulness and emesis; anticholinergic, antihistaminic (H₁), and alpha-adrenergic blocking activity also may contribute to some of its therapeutic (and adverse) actions.

Indications

- Management of manifestations of psychotic disorders
- Control of severe nausea and vomiting, intractable hiccups

Contraindications and cautions

- Contraindicated with coma or severe CNS depression, bone marrow depression, blood dyscrasia, circulatory collapse, subcortical brain damage, Parkinson's disease, liver damage, cerebral arteriosclerosis, coronary disease, severe hypotension or hypertension, prolonged QTc interval.
- Use cautiously with respiratory disorders ("silent pneumonia" may develop); glauco-

ma, prostatic hypertrophy; epilepsy or history of epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat or phosphorous insecticides; pregnancy; lactation; children younger than 12 yr, especially those with chickenpox, CNS infections (children are especially susceptible to dystonias that may confound the diagnosis of Reye's syndrome).

Adverse effects

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, flushed facies, sweating, constipation, paralytic ileus, urine retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition, male impotence
- **CNS:** *Drowsiness*, insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, extrapyramidal syndromes—*pseudoparkinsonism*; *dystonias*; *akathisia*, tardive dyskinesias, potentially irreversible (no known treatment) **neuroleptic malignant syndrome**
- **CV:** Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, cardiac arrest, heart failure, cardiomegaly, **refractory arrhythmias**, pulmonary edema, prolonged QTc interval
- **EENT:** Glaucoma, *photophobia*, *blurred vision*, miosis, mydriasis, deposits in the cornea and lens (opacities), pigmentary retinopathy
- **Endocrine:** Lactation, breast engorgement in females, galactorrhea; syndrome of inappropriate ADH secretion; amenorrhea, menstrual irregularities; gynecomastia in males; changes in libido; hyperglycemia or hypoglycemia; glycosuria; hyponatremia; pituitary tumor with hyperprolactinemia; inhibition of ovulation, infertility, pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, progestins
- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia; aplastic anemia; hemolytic anemia; thrombocytopenic or non-thrombocytopenic purpura; pancytopenia

- **Hypersensitivity:** Jaundice, urticaria, angioneurotic edema, laryngeal edema, photosensitivity, eczema, asthma, anaphylactoid reactions, exfoliative dermatitis
- **Respiratory:** Bronchospasm, laryngospasm, dyspnea; suppression of cough reflex and potential for aspiration (**sudden death related to asphyxia** or cardiac arrest has been reported)
- **Other:** *Urine discolored pink to red-brown*

Interactions

• **Drug-drug** • Additive CNS depression with alcohol • Additive anticholinergic effects and possibly decreased antipsychotic efficacy with anticholinergic drugs • Increased likelihood of seizures with metrizamide (contrast agent used in myelography) • Increased chance of severe neuromuscular excitation and hypotension if given to patients receiving barbiturate anesthetics (methohexital, phenobarbital, thiopental) • Increased risk of cardiac arrhythmias and serious adverse effects if combined with drugs that prolong the QTc interval

• **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used) • Increase in protein-bound iodine, not attributable to an increase in thyroxine

■ Nursing considerations

Assessment

- **History:** Coma or severe CNS depression; bone marrow depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; respiratory disorders; glaucoma, prostatic hypertrophy; epilepsy or history of epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or myelography scheduled within 48 hr; exposure to heat or phosphorous insecticides; pregnancy; children younger than 12 yr, especially those with chickenpox, CNS infections
- **Physical:** Weight, T; reflexes, orientation, IOP, P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output, liver evaluation; urinary output, prostate

size; CBC, urinalysis, thyroid, LFTs, renal function tests, ECG analysis

Interventions

- Obtain baseline ECG with QTc interval noted.
- Dilute oral concentrate *only* with water, saline, 7-Up, homogenized milk, carbonated orange drink, and pineapple, apricot, prune, orange, V-8, tomato, or grapefruit juices; use 60 mL of diluent for each 16 mg (5 mL) of concentrate.
- Do *not* mix with beverages that contain caffeine (coffee, cola), tannins (tea), or pectinates (apple juice); physical incompatibility may result.
- Give IM injections only to seated or recumbent patients, and observe for adverse effects for a brief period afterward.
- Monitor pulse and BP continuously during IV administration.
- Do not change long-term therapy dosage more often than weekly; it takes 4–7 days to achieve steady-state plasma levels of drug.
- Avoid skin contact with oral solution; contact dermatitis has occurred.
- Arrange for discontinuation of drug if serum creatinine, BUN become abnormal or if WBC count is depressed.
- Monitor bowel function, arrange therapy for severe constipation; adynamic ileus with fatal complications has occurred.
- Monitor elderly patients for dehydration and institute remedial measures promptly; sedation and decreased sensation of thirst related to CNS effects of drug can lead to severe dehydration.
- Consult physician regarding warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about reducing dosage, using anticholinergic antiparkinsonians (controversial) if extrapyramidal effects occur.
- Provide safety measures (side rails, assist) if sedation, ataxia, vertigo, orthostatic hypotension, vision changes occur.
- Provide positioning to relieve discomfort of dystonias.
- Provide reassurance to deal with extrapyramidal effect, sexual dysfunction.

Teaching points

- Take these drugs exactly as prescribed. The full effect may require 6 weeks–6 months of therapy.
- Avoid skin contact with drug solutions.
- Avoid driving or engaging in activities requiring alertness if CNS, vision changes occur.
- Avoid prolonged exposure to sun or use a sunscreen or covering garments.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine (pink or reddish brown urine is to be expected), pale stools, yellowing of the skin or eyes.

Representative drugs

chlormpromazine
fluphenazine
perphenazine
prochlorperazine
thioridazine

Phosphodiesterase Type 5 Inhibitors

PREGNANCY CATEGORY B**Therapeutic actions**

Selectively inhibits cGMP-specific phosphodiesterase type 5. The mechanism of penile erection involves the release of nitric oxide into the corpus cavernosum of the penis during sexual stimulation. Nitrous oxide activates cGMP, which causes smooth muscle relaxation allowing the flow of blood into the corpus cavernosum. Phosphodiesterase type 5 inhibitors prevent the breakdown of cGMP by phosphodiesterase, leading to increased cGMP levels and prolonged smooth muscle relaxation promoting the flow of blood into the corpus cavernosum.

Indications

- Treatment of erectile dysfunction in the presence of sexual stimulation

- Treatment of pulmonary arterial hypertension

Contraindications and cautions

- Contraindicated with allergy to any component of the drugs, for women or children; concurrent use of nitrates or alpha blockers.
- Use cautiously with hepatic or renal impairment; with anatomical deformation of the penis; with known cardiac disease (effects of sexual activity need to be evaluated); congenital prolonged QT interval; unstable angina; hypotension (systolic lower than 90); uncontrolled hypertension (higher than 170/110); severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders.

Adverse effects

- **CNS:** *Headache*, abnormal vision, changes in color vision, fatigue, hearing loss
- **CV:** *Flushing*, angina, chest pain, hypertension, hypotension, **MI**, palpitation, orthostatic hypotension, tachycardia
- **GI:** *Dyspepsia*, diarrhea, abdominal pain, dry mouth, esophagitis, gastritis, GERD, nausea, abnormal LFT
- **GU:** Abnormal erection, spontaneous erection, priapism
- **Respiratory:** Rhinitis, sinusitis, dyspnea, epistaxis, pharyngitis, nasal congestion
- **Other:** Flulike symptoms, edema, pain, rash, sweating, myalgia

Interactions

- **Drug-drug** • Possible severe hypotension and serious cardiac events if combined with nitrates, alpha blockers; this combination is contraindicated • Possible increased levels and effects if taken with ketoconazole, itraconazole, erythromycin; monitor patient and reduce dosage as needed • Increased serum levels if combined with indinavir, ritonavir; if these drugs are being used, limit dosage • Reduced levels and effectiveness if combined with rifampin • Risk for increased cardiac effects, decreased BP, flushing if combined with alcohol; warn patient of this possibility if alcohol is used
- **Drug-food** • Possible increased levels if taken with grapefruit juice

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the tablet, concurrent use of nitrates or alpha blockers; unstable angina; hypotension; uncontrolled hypertension; severe hepatic impairment; end-stage renal disease with dialysis; hereditary degenerative retinal disorders; anatomical deformation of the penis, cardiac disease, congenital prolonged QT interval
- **Physical:** Orientation, affect; skin color, lesions; R, adventitious sounds; P, BP, ECG, LFTs, renal function tests

Interventions

- Assure diagnosis of erectile dysfunction and determine underlying causes and other appropriate treatment.
- Advise patient that drug does not work in the absence of sexual stimulation. Limit use to once per day.
- Remind patient that drug does not protect against STDs and that appropriate measures should be taken.

⊗ **Black box warning** Advise patient to never take this drug with nitrates or alpha blockers; serious and even fatal complications can occur.

- Warn patient of the risk of lowered BP and dizziness if taken with alcohol.

Teaching points

- Take these drugs before anticipated sexual activity; the drug will stay in your body for up to 4 hours (sildenafil, vardenafil), or up to 36 hours (tadalafil). The drug will have no effect in the absence of sexual stimulation.
- These drugs will not protect you from sexually transmitted diseases; use appropriate precautions.
- Do not take these drugs if you are taking any nitrates or alpha blockers or other drugs for treating erectile dysfunction; serious side effects and even death can occur.
- Many drugs may interact with these drugs; consult your health care provider before taking any drug, including over-the-counter drugs and herbal therapies; dosage adjustments may be needed.

- Know that combining these drugs with alcohol could cause dizziness, loss of blood pressure, increased flushing.
- You may experience these side effects: Headache, dizziness, upset stomach, runny nose, muscle pains; these side effects should go away within a couple of hours. If side effects persist, consult your health care provider.
- Report difficult or painful urination, vision changes, hearing loss, fainting, erection that persists for longer than 4 hours (if this occurs, seek medical assistance as soon as possible).

Representative drugs

sildenafil
tadalafil
vardenafil

Selective Serotonin Reuptake Inhibitors (SSRIs)

PREGNANCY CATEGORY C

Therapeutic actions

The SSRIs act as antidepressants by inhibiting CNS neuronal uptake of serotonin and blocking uptake of serotonin with little effect on norepinephrine; they are also thought to antagonize muscarinic, histaminergic, and α_1 -adrenergic receptors. The increase in serotonin levels at neuroreceptors is thought to act as a stimulant, counteracting depression and increasing motivation.

Indications

- Treatment of depression; most effective in patients with major depressive disorder
- Treatment of OCD, PTSD, social anxiety, generalized anxiety disorder, panic disorder, PMDD
- Unlabeled uses: Treatment of bulimia

Contraindications and cautions

- Contraindicated with hypersensitivity to any SSRI; pregnancy.
- Use cautiously with impaired hepatic or renal function, diabetes mellitus, lactation.

Adverse effects

- **CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, light-headedness*, agitation, sedation, abnormal gait, seizures
- **CV:** Hot flashes, palpitations
- **Dermatologic:** *Sweating, rash, pruritus*, acne, alopecia, contact dermatitis
- **GI:** *Nausea, vomiting, diarrhea, dry mouth, anorexia, dyspepsia, constipation, taste changes*, flatulence, gastroenteritis, dysphagia, gingivitis
- **GU:** *Painful menstruation, sexual dysfunction*, frequency, cystitis, impotence, urgency, vaginitis
- **Respiratory:** *URIs, pharyngitis*, cough, dyspnea, bronchitis, rhinitis
- **Other:** *Weight loss, asthenia, fever*

Interactions

★ **Drug-drug** • Increased therapeutic and toxic effects of TCAs with SSRIs • Decreased therapeutic effects with cyproheptadine • Risk for severe to fatal hypertensive crisis with MAOIs; avoid this combination

★ **Drug-alternative therapy** • Increased risk of severe reaction with St. John's wort

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to any SSRI; impaired hepatic or renal function; diabetes mellitus; lactation; pregnancy
- **Physical:** Weight; T; skin rash, lesions; reflexes, affect; bowel sounds, liver evaluation; P, peripheral perfusion; urinary output; LFTs, renal function tests, CBC

Interventions

- Arrange for lower dose or less frequent administration in elderly patients and patients with hepatic or renal impairment.
- Establish suicide precautions for severely depressed patients. Dispense only a small number of capsules at a time to these patients.

⊗ **Black box warning** Monitor children, adolescents, and young adults for suicidal thoughts and behavior, especially when changing dosage.

- Administer drug in the morning. If dose of more than 20 mg/day is needed, administer in divided doses.
- Monitor patient response for up to 4 wk before increasing dose because of lack of therapeutic effect. It frequently takes several weeks to see the desired effect.
- Provide frequent small meals if GI upset or anorexia occurs. Monitor weight loss; a nutritional consultation may be needed.
- Provide sugarless lozenges, frequent mouth care if dry mouth is a problem.
- Ensure ready access to bathroom facilities if diarrhea occurs. Establish bowel program if constipation is a problem.
- Establish safety precautions (use side rails, appropriate lighting; accompany patient) if CNS effects occur.
- Provide appropriate comfort measures if CNS effects, insomnia, rash, sweating occur.
- Encourage patient to maintain therapy for treatment of underlying cause of depression.

Teaching points

- It may take up to 4 weeks to get a full antidepressant effect from these drugs. These drugs should be taken in the morning (or in divided doses if necessary).
- Do not take these drugs during pregnancy. If you think that you are pregnant or you wish to become pregnant, consult your health care provider.
- You may experience these side effects: Dizziness, drowsiness, nervousness, insomnia (avoid driving or performing hazardous tasks); nausea, vomiting, weight loss (frequent small meals may help; monitor your weight loss—if it becomes marked, consult your health care provider); sexual dysfunction (drug effect); flulike symptoms (if severe, consult your health care provider for appropriate treatment); photosensitivity (avoid exposure to sunlight).
- Report rash, mania, seizures, severe weight loss.

Representative drugs

citalopram
desvenlafaxine
escitalopram
fluoxetine

fluvoxamine
 paroxetine
 sertraline
 venlafaxine

Sulfonamides

PREGNANCY CATEGORY C

PREGNANCY CATEGORY D (AT TERM)

Therapeutic actions

Sulfonamides are antibiotics. They are bacteriostatic; competitively antagonize para-aminobenzoic acid, an essential component of folic acid synthesis, in susceptible gram-negative and gram-positive bacteria, causing cell death.

Indications

- Treatment of ulcerative colitis, otitis media, inclusion conjunctivitis, meningitis, nocardiosis, toxoplasmosis, trachoma, UTIs
- Management of rheumatoid arthritis, colлагенous colitis, Crohn's disease

Contraindications and cautions

- Contraindicated with allergy to sulfonamides, sulfonyleureas, thiazides; pregnancy (teratogenic in preclinical studies; at term, may bump fetal bilirubin from plasma protein binding sites and cause kernicterus); or lactation (risk of kernicterus, diarrhea, rash).
- Use cautiously with impaired renal or hepatic function, G6PD deficiency, porphyria.

Adverse effects

- **CNS:** Headache, peripheral neuropathy, mental depression, seizures, ataxia, hallucinations, tinnitus, vertigo, insomnia, hearing loss, drowsiness, transient lesions of posterior spinal column, transverse myelitis
- **Dermatologic:** Photosensitivity, cyanosis, petechiae, alopecia
- **GI:** Nausea, emesis, abdominal pains, diarrhea, bloody diarrhea, anorexia, pancreatitis, stomatitis, impaired folic acid absorption, hepatitis, hepatocellular necrosis
- **GU:** Crystalluria, hematuria, proteinuria, nephrotic syndrome, toxic nephrosis with

oliguria and anuria, oligospermia, infertility

- **Hematologic: Agranulocytosis, aplastic anemia,** thrombocytopenia, leukopenia, hemolytic anemia, hypoprothrombinemia, methemoglobinemia, megaloblastic anemia
- **Hypersensitivity: Stevens-Johnson syndrome,** generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, **exfoliative dermatitis, anaphylactoid reactions,** periorbital edema, conjunctival and scleral redness, photosensitization, arthralgia, allergic myocarditis, transient pulmonary changes with eosinophilia, decreased pulmonary function
- **Other:** Drug fever, chills, periarteritis nodosum

Interactions

- **Drug-drug** • Increased risk of hypoglycemia when tolbutamide, tolazamide, glyburide, glipizide, chlorpropamide are taken concurrently • Increased risk of folate deficiency if taking sulfonamides; monitor patients receiving folic acid carefully for signs of folate deficiency
- **Drug-lab test** • Possible false-positive urinary glucose tests using Benedict's method

■ Nursing considerations

Assessment

- **History:** Allergy to sulfonamides, sulfonyleureas, thiazides; pregnancy; lactation; impaired renal or hepatic function; G6PD deficiency; porphyria
- **Physical:** T; skin color, lesions; culture of infected site; orientation, reflexes, affect, peripheral sensation; R, adventitious sounds; mucous membranes, bowel sounds, liver evaluation; LFTs, renal function tests, CBC and differential, urinalysis

Interventions

- Arrange for culture and sensitivity tests of infected area prior to therapy; repeat cultures if response is not as expected.
- Administer drug after meals or with food to prevent GI upset. Administer the drug around the clock.
- Ensure adequate fluid intake.

- Discontinue drug immediately if hypersensitivity reaction occurs.
- Establish safety precautions if CNS effects occur (side rails, assistance, environmental control).
- Protect patient from exposure to light (use sunscreen, protective clothing) if photosensitivity occurs.
- Provide frequent small meals if GI upset occurs.
- Provide mouth care for stomatitis.
- Offer support and encouragement to deal with side effects of drug therapy, including changes in sexual function.

Teaching points

- Complete the full course of therapy.
- Take these drugs with food or meals to decrease GI upset.
- Drink eight glasses of water per day.
- These drugs are specific to the disease being treated; do not use to self-treat any other infection.
- You may experience these side effects: Sensitivity to sunlight (use sunscreens; wear protective clothing); dizziness, drowsiness, difficulty walking, loss of sensation (avoid driving or performing tasks that require alertness); nausea, vomiting, diarrhea (ensure ready access to bathroom); loss of fertility; yellow-orange urine.
- Report blood in the urine, rash, ringing in the ears, difficulty breathing, fever, sore throat, chills.

Representative drugs

balsalazide
 sulfadiazine
 sulfamethoxazole (always used in combination with trimethoprim)
 sulfasalazine
 sulfisoxazole

Tetracyclines

PREGNANCY CATEGORY D

Therapeutic actions

Tetracyclines are antibiotics. They are bacteriostatic; inhibit protein synthesis of susceptible bacteria, preventing cell replication.

Indications

- Treatment of infections caused by rickettsiae; *Mycoplasma pneumoniae*; agents of psittacosis, ornithosis, lymphogranuloma venereum, and granuloma inguinale; *Borrelia recurrentis*, *Haemophilus ducreyi*, *Pasteurella pestis*, *Pasteurella tularensis*, *Bartonella bacilliformis*, *Bacteroides*, *Vibrio comma*, *Vibrio fetus*, *Brucella*, *Escherichia coli*, *Escherichia aerogenes*, *Shigella*, *Acinetobacter calcoaceticus*, *Haemophilus influenzae*, *Staphylococcus aureus*, *Diplococcus pneumoniae*, *Klebsiella*; when penicillin is contraindicated, infections caused by *Neisseria gonorrhoeae*, *Listeria monocytogenes*, *Treponema pallidum*, *Treponema pertenue*, *Clostridium*, *Bacillus anthracis*, *Actinomyces*, *Fusobacterium fusiforme*, *Neisseria meningitidis*
- Adjunct to amebicides in acute intestinal amebiasis
- Treatment of malaria
- Treatment of anthrax
- Treatment of acne
- Treatment of complicated urethral, endocervical, or rectal infections in adults caused by *Chlamydia trachomatis*
- Treatment of superficial ocular infections caused by susceptible strains of microorganisms
- Prophylaxis of ophthalmia neonatorum caused by *N. gonorrhoeae* or *C. trachomatis*
- Unlabeled uses: Lyme disease, carditis, facial nerve paralysis, arthritis, early syphilis, chlamydial infection, PID, epididymitis, prophylaxis after sexual assault

Contraindications and cautions

- Contraindicated with allergy to any tetracyclines, allergy to tartrazine (in 250-mg tetracycline capsules marketed under brand name *Sumycin*, pregnancy (toxic to fetus), lactation (causes damage to the teeth of infants).
- Use cautiously with hepatic or renal impairment; ocular viral, mycobacterial, or fungal infections.

Adverse effects

- **Dermatologic:** *Phototoxic reactions, rash, exfoliative dermatitis*

- **GI:** *Discoloring and inadequate calcification of primary teeth of fetus if used by pregnant women, discoloring and inadequate calcification of permanent teeth if used during period of dental development, fatty liver, hepatic failure, anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, esophageal ulcers*
- **Hematologic:** Hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia, leukocytosis, leukopenia
- **Hypersensitivity:** Reactions from urticaria to **anaphylaxis**, including intracranial hypertension
- **Local:** *Transient irritation, stinging, itching, angioneurotic edema, urticaria, dermatitis, superinfections with ophthalmic or dermatologic use*
- **Other:** *Superinfections, local irritation at parenteral injection sites*

Interactions

• **Drug-drug** • Decreased absorption with calcium salts, magnesium salts, zinc salts, aluminum salts, bismuth salts, iron, urine alkalizers, food, dairy products, charcoal • Increased digoxin toxicity • Increased nephrotoxicity if taken with methoxyflurane • Decreased effectiveness of hormonal contraceptives (rare) with a risk of breakthrough bleeding or pregnancy • Decreased activity of penicillins

■ Nursing considerations

Assessment

- **History:** Allergy to any of the tetracyclines; allergy to tartrazine; hepatic or renal impairment, pregnancy, lactation; ocular viral, mycobacterial, or fungal infections
- **Physical:** Site of infection, skin color, lesions; R, adventitious sounds; bowel sounds, output, liver evaluation; urinalysis, BUN, LFTs, renal function tests

Interventions

- Administer oral medication on an empty stomach, 1 hr before or 2–3 hr after meals. Do not give with antacids. If antacids must be used, give them 3 hr after the dose of tetracycline.
- Culture infected area prior to drug therapy.
- Do not use outdated drugs; degraded drug is highly nephrotoxic and should not be used.

- Do not give oral drug with meals, antacids, or food.
- Provide frequent hygiene measures if superinfections occur.
- Protect patient from sunlight and bright lights if photosensitivity occurs.
- Arrange for regular renal function tests if long-term therapy is used.
- Use topical preparations of this drug only when clearly indicated. Sensitization from the topical use of this drug may preclude its later use in serious infections. Topical preparations containing antibiotics that are not ordinarily given systemically are preferable.

Teaching points

Systemic administration

- Take these drugs throughout the day for best results. These drugs should be taken on an empty stomach, 1 hour before or 2–3 hours after meals, with a full glass of water. Do not take these drugs with food, dairy products, iron preparations, or antacids.
- Take the full course of therapy prescribed; if any drug is left, discard it immediately. Never take an outdated product.
- Pregnancy may occur when taking tetracycline with hormonal contraceptives. To be sure of avoiding pregnancy, use an additional type of contraceptive while using this drug.
- Report severe cramps, watery diarrhea, rash or itching, difficulty breathing, dark urine or light-colored stools, yellowing of the skin or eyes.

Eye drop administration

- To give eye drops: Lie down or tilt your head backward and look at the ceiling. Drop suspension drug inside your lower eyelid while looking up. Close your eye, and apply gentle pressure to the inner corner of the eye for 1 minute.
- Apply ointment inside the lower eyelid; close your eyes, and roll your eyeball in all directions.
- These drugs may cause temporary blurring of vision or stinging after application.
- Notify your health care provider if stinging or itching becomes severe.
- Take the full course of therapy prescribed; discard any leftover medication.
- Apply dermatologic solution until skin is wet. Avoid eyes, nose, and mouth.

Topical administration

- You may experience transient stinging or burning; this will subside quickly; skin in the treated area may become yellow; this will wash off.
- Use cosmetics as you usually do.
- Wash area before applying (unless contraindicated); this drug may stain clothing.
- You may experience these side effects: Stomach upset, nausea; superinfections in the mouth, vagina (frequent washing may help; if it becomes severe, medication may help); sensitivity of the skin to sunlight (use protective clothing and sunscreen).
- Report worsening of condition, rash, irritation.

Representative drugs

demeclocycline
doxycycline
minocycline
tetracycline

Tricyclic Antidepressants (TCAs)

PREGNANCY CATEGORY C OR D
(AMITRIPTYLINE, IMIPRAMINE,
NORTRIPTYLINE)

Therapeutic actions

Mechanism of action is unknown. The TCAs are structurally related to the phenothiazine antipsychotic drugs (eg, chlorpromazine), but in contrast to them, TCAs inhibit the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; the relation of these effects to clinical efficacy is unknown.

Indications

- Relief of symptoms of major depressive disorders
- Treatment of OCDs
- Unlabeled use: Treatment of obstructive sleep apnea, panic disorder, eating disorders, PMS, migraine, ADHD, insomnia associated with depression

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr, pregnancy (limb reduction abnormalities reported), or lactation.
- Use cautiously with EST; preexisting CV disorders (severe coronary heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urine retention, ureteral or urethral spasm; seizure disorders (lower seizure threshold); hyperthyroidism (predisposes to CVS toxicity, including cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients; schizophrenic or paranoid may exhibit a worsening of psychosis; manic-depressive disorder may shift to hypomanic or manic phase; elective surgery (discontinue as long as possible before surgery).

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects* (dry mouth, blurred vision, disturbance of accommodation for near vision, mydriasis, increased IOP), *confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, *seizures*, speech blockage, dysarthria, tinnitus, altered EEG
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, MI, arrhythmias, heart block, precipitation of heart failure, CVA
- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia,

peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black “hairy” tongue

- **GU:** Urine retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity, and galactorrhea; change in libido; impotence
- **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia; purpura; thrombocytopenia; leukopenia
- **Hypersensitivity:** Skin rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, face and tongue), drug fever
- **Withdrawal:** Symptoms with abrupt discontinuation of prolonged therapy; nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight change; sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug-drug** ● Increased TCA levels and pharmacologic effects with cimetidine, fluoxetine, ranitidine ● Altered response, including arrhythmias and hypertension, with sympathomimetics ● Risk of severe hypertension with clonidine ● Hyperpyretic crises, severe seizures, hypertensive episodes, and death with MAOIs ● Decreased hypotensive activity of guanethidine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; pregnancy; lactation; preexisting disorders; angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric, manic-depressive disorder; elective surgery
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

- Ensure that depressed and potentially suicidal patients have limited access to drug.
- Reduce dosage if minor side effects develop; discontinue drug if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.
- Ensure ready access to bathroom if GI effects occur; establish bowel program for constipation.
- Provide frequent small meals, frequent mouth care if GI effects occur; provide sugarless lozenges for dry mouth.
- Establish safety precautions if CNS changes occur (side rails, assist walking).

Teaching points

- Take these drugs exactly as prescribed; do not stop taking these drugs abruptly or without consulting your health care provider.
- Avoid alcohol, sleep-inducing drugs, over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments if unavoidable.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; safety measures may be needed if severe; avoid driving or performing tasks requiring alertness); nausea, vomiting, loss of appetite, dry mouth (frequent small meals, mouth care, and sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty in urination, excessive sedation.

Representative drugs

amitriptyline
amoxapine
clomipramine
desipramine
doxepin
imipramine
nortriptyline
protriptyline
trimipramine

abacavir sulfate*(ab bak' ab veer)*

Ziagen

PREGNANCY CATEGORY C

Drug class

Antiviral

Nucleoside reverse transcriptase inhibitor

Therapeutic actions

Nucleoside reverse transcriptase inhibitor; obstructs RNA and DNA synthesis and inhibits viral reproduction. Used in combination with other anti-HIV drugs to reduce the viral load as low as possible and decrease the chance of further viral mutation. Thought to cross the blood–brain barrier and be effective in the treatment of HIV-related dementia. There are no long-term studies on the effectiveness of this drug.

Indications

- Treatment of HIV-1 infection in combination with other antiretrovirals

Contraindications and cautions

- Contraindicated with life-threatening allergy or hypersensitivity to any component, moderate to severe hepatic impairment, lactation.
- Use cautiously with mild hepatic impairment, lactic acidosis, pregnancy.

Available forms

Tablets—300 mg; oral solution—20 mg/mL

Dosages**Adults**

300 mg PO bid or 600 mg PO once daily.

Adults with mild hepatic impairment

200 mg PO bid (solution).

Pediatric patients 3 mo–16 yr

8 mg/kg PO bid; do not exceed 300 mg/dose.

Pediatric patients younger than 3 mo

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr**Distribution:** Crosses placenta; may enter breast milk**Excretion:** Urine, feces**Adverse effects**

- **CNS:** *Headache, weakness, malaise, fatigue, insomnia, dizziness, anxiety, depression*
- **Dermatologic:** *Rash*
- **GI:** *Diarrhea, nausea, anorexia, vomiting, dyspepsia, liver enzyme elevations, liver enlargement, risk of severe to fatal hepatomegaly*
- **Other:** **Severe hypersensitivity reactions** (fever, malaise, nausea, vomiting, rash), **severe to fatal lactic acidosis**, fat redistribution, increased lipid levels

Interactions

- **Drug–drug** • Risk of severe toxic effects if combined with alcohol

Nursing considerations Assessment

- **History:** Life-threatening allergy to any component, impaired hepatic or renal function, lactic acidosis, pregnancy, lactation
- **Physical:** T; affect, reflexes, peripheral sensation; R, adventitious sounds; bowel sounds, liver evaluation; LFTs, renal function tests

Interventions

- Administer with meals or a light snack if GI upset occurs.
- **⊗ Black box warning** Monitor patient for signs of potentially fatal hypersensitivity reaction; give patient hypersensitivity reaction warning card provided by manufacturer. Advise patient to stop drug at first sign of reaction. Do not try the drug again if the patient has a hypersensitivity reaction.

⊗ **Black box warning** Monitor patient for lactic acidosis and severe hepatomegaly; increased risk with other antivirals.

⊗ **Black box warning** Patients with HLA-B*5701 allele are at high risk for hypersensitivity reactions. Screening for HLA-B*5701 allele is recommended.

- Administer the drug concurrently with other anti-HIV drugs.
- Recommend the use of barrier contraceptives while on this drug.

Teaching points

- Take drug exactly as prescribed; take missed doses as soon as possible and return to normal schedule; do not double skipped doses; take with meals or a light snack if GI upset occurs.
- This drug is not a cure for AIDS or AIDS-related complex; opportunistic infections may occur and regular medical follow-up is needed.
- Long-term effects of this drug are unknown.
- Treatment does not reduce the risk of transmission of HIV by sexual contact or blood contamination; use precautions.
- Do not drink alcohol while taking this drug.
- Use barrier contraceptives; hormonal contraceptives may not be effective.
- This drug has been connected with severe hypersensitivity reactions, which usually occur early in the use of the drug. Keep your hypersensitivity list readily available, and stop the drug if any of these effects occur.
- You may experience these side effects: Nausea, loss of appetite, diarrhea (eat frequent small meals; medication is available to control the diarrhea); dizziness, loss of feeling (take appropriate precautions).
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty breathing, rash, fever.

▷ abatacept

See Appendix U, *Less commonly used drugs*.

▷ abciximab (ab six' ab mab)

ReoPro

PREGNANCY CATEGORY C

Drug class

Antiplatelet

Glycoprotein IIb/IIIa inhibitor

Therapeutic actions

Interferes with platelet membrane function by inhibiting fibrinogen binding and platelet–platelet interactions; inhibits platelet aggregation and prolongs bleeding time; effect is irreversible for life of the platelet.

Indications

- Adjunct to percutaneous coronary intervention (PCI) for the prevention of cardiac ischemic complications in patients undergoing PCI and with unstable angina not responding to conventional therapy when PCI is planned within 24 hr; intended to be used with heparin and aspirin therapy
- Unlabeled uses: Early treatment of acute MI or acute ischemic stroke

Contraindications and cautions

- Contraindicated with allergy to abciximab; neutropenia; thrombocytopenia (fewer than 100,000 cells/mcL); hemostatic disorders; bleeding ulcer; intracranial bleeding; major trauma; vasculitis; recent major surgery; aneurysm; use of IV dextran (before or during PCI); pregnancy; severe, uncontrolled hypertension; active internal bleeding; recent (within 6 wk) GI or GU bleeding; history of stroke within 2 yr; administration of oral anticoagulants within 7 days (unless PT is 1.2 times control or less).
- Use cautiously during lactation and with concurrent use of anticoagulants, thrombolytics, or antiplatelet drugs.

Available forms

Injection—2 mg/mL

Dosages

Efficacy of abciximab has only been studied in combination with heparin and aspirin.

Adults

- *Adjunct to PCI*: 0.25 mg/kg by IV bolus 10–60 min prior to procedure, followed by continuous infusion of 0.125 mcg/kg/min (maximum dose 10 mcg/min) for 12 hr.
- *Unstable angina not responding to conventional medical therapy when PCI is planned within 24 hr*: 0.25 mg/kg by IV bolus over at least 1 min; then 10 mcg/min by IV infusion for 18–24 hr, concluding 1 hr after PCI.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	30 min

Metabolism: Cellular; $T_{1/2}$: less than 10 min, then 30 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: Withdraw the necessary amount through a 0.2- or 0.22-micron filter for bolus injection. Prepare infusion by withdrawing necessary amount through filter into syringe; inject into 250 mL 0.9% sterile saline or 5% dextrose. Do not use any solution that contains visibly opaque particles; discard solution after 12 hr. Do not shake; refrigerate solution.

Infusion (as adjunct to PCI): 10–60 min before procedure give bolus of 0.25 mg/kg over at least 1 min; give continuous infusion at rate of 0.125 mcg/kg/min (to a maximum dose of 10 mcg/min) for 12 hr.

Incompatibilities: Do not mix in solution with any other medication; give through a separate IV line.

Adverse effects

- **CNS:** Dizziness, confusion, anxiety
- **CV:** Bradycardia, *hypotension*, arrhythmias, edema
- **GI:** *Nausea, vomiting*
- **Hematologic:** **Thrombocytopenia, bleeding**
- **Local:** *Pain, edema*

- **Respiratory:** Pneumonia, pleural effusion

Interactions

* **Drug-drug** • Risk of increased bleeding if combined with anticoagulants, antiplatelets, or thrombolytics; monitor patient accordingly.

■ Nursing considerations**Assessment**

- **History:** Allergy to abciximab, neutropenia, thrombocytopenia, hemostatic disorders, bleeding ulcer, intracranial bleeding, severe liver disease, lactation, renal disorders, pregnancy, recent trauma or surgery
- **Physical:** Skin color, lesions; orientation; bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Monitor CBC count before use and frequently while initiating therapy.
- Monitor patient for signs and symptoms of bleeding.
- Arrange for concomitant aspirin and heparin therapy.
- Establish safety precautions to prevent injury and bleeding (such as using electric razor, not playing contact sports).
- Provide increased precautions against bleeding during invasive procedures—bleeding will be prolonged.
- Mark chart of any patient receiving abciximab to alert medical personnel to potential for increased bleeding in surgery or dental surgery.

Teaching points

- It may take longer than normal to stop bleeding while on this drug; avoid playing contact sports, use electrical razors, and take other precautions. Apply pressure for extended periods to bleeding sites.
- You may experience these side effects: Upset stomach, nausea.
- Report fever, chills, sore throat, rash, bruising, bleeding, dark stools or urine.

acamprosate calcium

(a kam *pro'* sate)

Campral

PREGNANCY CATEGORY C

Drug classes

Antialcoholic drug
GABA analogue

Therapeutic actions

Exact mechanism of action not understood; acts with glutamate and GABA neurotransmitter systems in the CNS to restore balance between neuronal excitation and inhibition that may be altered by chronic alcohol exposure.

Indications

- Maintenance of abstinence from alcohol in patients with alcohol dependence who are abstinent at treatment initiation as part of a comprehensive management program that includes psychosocial support

Contraindications and cautions

- Contraindicated with allergy to any component of the drug or severe renal impairment (creatinine clearance 30 mL/min or less).
- Use cautiously with pregnancy, lactation, moderate renal impairment, history of depression and suicidal thoughts.

Available forms

DR tablets—333 mg

Dosages

Adults

666 mg (two 333-mg tablets) PO tid; may be taken with meals to aid compliance. Dosage should begin as soon as possible after period of alcohol withdrawal when the patient has achieved abstinence, and should be maintained if patient relapses. Should be part of a comprehensive psychosocial treatment program.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Moderate impairment (creatinine clearance 30–50 mL/min): 333 mg PO tid; severe renal

impairment (creatinine clearance 30 mL/min or less): do not use acamprosate.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3–8 hr

Metabolism: Not metabolized; $T_{1/2}$: 20–30 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Anxiety, depression, dizziness, impaired judgment, insomnia, paresthesia, asthenia, insomnia, **suicidal thoughts**
- **GI:** Anorexia, *diarrhea*, dry mouth, flatulence, nausea
- **Respiratory:** Bronchitis, cough, dyspnea, pharyngitis, rhinitis
- **Skin:** Increased sweating, pruritus
- **Other:** Back pain, flulike symptoms, impotence, muscle aches and pains, weight gain

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the drug, renal impairment, pregnancy, lactation, history of depression and suicidal thoughts, alcohol intake
- **Physical:** Skin, lesions; orientation, reflexes, affect; abdominal examination

Interventions

- Ensure that patient is abstaining from alcohol intake when treatment is initiated.
- Ensure that patient is participating in a comprehensive program, including psychological and social support, to manage abstinence from alcohol.
- Give drug three times a day with meals—timing may be helpful in aiding compliance to the regimen when the patient is managing the drug regimen at home. However, drug may be given without regard to meals.
- Instruct patient to continue to take the drug even if a relapse to alcohol consumption occurs; encourage patient to notify health care provider if a relapse occurs.
- Encourage use of barrier contraceptives during treatment with this drug; fetal abnormalities are possible.

Teaching points

- This drug is given as part of a comprehensive program to support your abstinence from alcohol; it is important that you continue that program while taking this drug.
- Take this drug three times a day; taking the drug with meals may be a helpful reminder.
- If you forget a dose, take it as soon as you remember and return to your usual regimen. Do not make up doses and do not take more than three doses in 24 hours.
- Continue to take the drug even if you relapse and drink alcohol. Notify your health care provider to discuss the renewed drinking.
- You may experience impaired judgment, impaired thinking, or impaired motor skills. You should not drive or operate hazardous machinery or sign important documents or make important decisions until you are certain that *Campral* has not affected your ability to engage in these activities safely.
- You should not take this drug during pregnancy; if you suspect that you are pregnant, or wish to become pregnant, consult your health care provider.
- You should find another method of feeding the baby if you are nursing; it is not known if this drug crosses into breast milk.
- You may experience these side effects: Flatulence, diarrhea, abdominal discomfort; depression thoughts of suicide (if this occurs, consult with your health care provider); muscle or joint aches and pains (consult your health care provider, an analgesic may be helpful).
- Report depression or thoughts of suicide, numbness or tingling, fever, severe diarrhea.

acarbose

(a *kar'* boz)

Prandase (CAN), Precose

PREGNANCY CATEGORY B

Drug class

Alpha-glucosidase inhibitor
Antidiabetic

Therapeutic actions

Alpha-glucosidase inhibitor obtained from the fermentation process of a microorganism; delays the digestion of ingested carbohydrates, leading to a smaller increase in blood glucose following meals and a decrease in glycosylated Hgb; does not enhance insulin secretion, so its effects are additive to those of the sulfonylureas in controlling blood glucose.

Indications

- Monotherapy or adjunct to diet to lower blood glucose in those patients with type 2 diabetes mellitus whose hyperglycemia cannot be managed by diet alone
- Combination therapy with a sulfonylurea, metformin, or insulin to enhance glycemic control in patients who do not receive adequate control with diet and either drug alone

Contraindications and cautions

- Contraindicated with hypersensitivity to drug; diabetic ketoacidosis; cirrhosis; inflammatory bowel disease; conditions that deteriorate with increased gas in the bowel; type 1 diabetes; existence of or predisposition to intestinal obstruction; colonic ulceration.
- Use cautiously with renal impairment, pregnancy, lactation.

Available forms

Tablets—25, 50, 100 mg

Dosages

Adults

- *Monotherapy*: Initially, 25 mg PO tid with first bite of each meal. May start with 25 mg/day and gradually increase to tid if GI side effects are a problem. Increase as needed every 4–8 wk as indicated by 1-hr postprandial glucose levels or glycosylated Hgb level and tolerance. For patient 60 kg or less, maximum dosage 50 mg tid; for patient more than 60 kg, maximum dosage 100 mg tid.
- *Combination with sulfonylurea or insulin*: Blood glucose may be much lower; monitor closely and adjust dosages of each drug accordingly.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Intestinal; $T_{1/2}$: 2 hr

Distribution: Very little

Excretion: Feces, urine

Adverse effects

- **Endocrine:** *Hypoglycemia*
- **GI:** *Abdominal pain, flatulence, diarrhea, anorexia, nausea, vomiting*

Interactions

★ **Drug-drug** • Possible decrease in digoxin levels if combined; monitor patients closely if this combination is used • Decreased effects of acarbose if taken with digestive enzymes or charcoal; avoid these combinations • Increased risk of hypoglycemia when given with other antidiabetic drugs

★ **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to drug; diabetic ketoacidosis; cirrhosis; inflammatory bowel disease; existence of or predisposition to intestinal obstruction; type 1 diabetes; conditions that would deteriorate with increased gas in bowel; renal impairment; pregnancy; lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, blood glucose, CBC

Interventions

- Give drug tid with the first bite of each meal.
- Monitor serum glucose levels frequently to determine drug effectiveness and dosage; monitor LFTs every 3 mo for 1 year, then periodically. Oral glucose should be given if hypoglycemia occurs; sucrose absorption will be inhibited.
- Inform patient of likelihood of abdominal pain and flatulence.
- Consult with dietitian to establish weight loss program and dietary control.

- Arrange for thorough diabetic teaching program, including disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.

Teaching points

- Do not discontinue this drug without consulting health care provider.
- Take drug three times a day with first bite of each meal.
- Monitor blood for glucose and ketones as prescribed.
- Continue diet and exercise program established for control of diabetes.
- You may experience these side effects: Abdominal pain, flatulence, bloating.
- Report fever, sore throat, unusual bleeding or bruising, severe abdominal pain.

▽ acebutolol hydrochloride

(a se *byoo'* toe lolé)

Apo-Acebutolol (CAN), Gen-Acebutolol (CAN), Rhotral (CAN), Sactal

PREGNANCY CATEGORY B

Drug classes

Antiarrhythmic
Antihypertensive
Beta₁-selective adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney); decreases excitability of the heart, cardiac output and oxygen consumption, and release of renin from the kidney; and lowers BP.

Indications

- Hypertension, alone or with other antihypertensive drugs, especially diuretics
- Management of ventricular premature beats
- **NEW INDICATION:** Unlabeled uses: Ventricular tachycardia, thyrotoxicosis, essential tremor

Contraindications and cautions

- Contraindicated with bradycardia (HR lower than 45 beats per min), second- or third-degree heart block (PR interval greater than 0.24 sec), cardiogenic shock, heart failure, asthma, COPD, lactation.
- Use cautiously with diabetes or thyrotoxicosis, hepatic impairment, renal failure, pregnancy, bronchospastic disease, peripheral vascular disease, anesthesia, major surgery.

Available forms

Capsules—200, 400 mg

Dosages**Adults**

- **Hypertension:** Initially 400 mg/day in one or two doses PO; usual maintenance dosage range is 200 mg/day, up to 1,200 mg/day given in two divided doses.
- **Ventricular arrhythmias:** 200 mg bid PO; increase dosage gradually until optimum response is achieved (usually at 600–1,200 mg/day); discontinue gradually over 2 wk.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Because bioavailability doubles, lower doses may be required; maintain at 800 mg/day or less.

Patients with impaired renal or hepatic function

Reduce daily dose by 50% when creatinine clearance is less than 50 mL/min; reduce by 75% when creatinine clearance is less than 25 mL/min; use caution with hepatic impairment.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	3–4 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, *laryngospasm*, *respiratory distress*
- **CNS:** Dizziness, vertigo, tinnitus, *fatigue*, emotional depression, paresthesias, sleep disturbances, vision changes, hallucinations, disorientation, memory loss, slurred speech (because acebutolol is less lipid soluble than propranolol, it is less likely to penetrate the blood–brain barrier and cause CNS effects)
- **CV:** *Bradycardia*, *heart failure*, *cardiac arrhythmias*, *sinoatrial or AV nodal block*, *tachycardia*, peripheral vascular insufficiency, claudication, CVA, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain*, *flatulence*, *constipation*, *diarrhea*, *nausea*, *vomiting*, anorexia
- **GU:** *Impotence*, *decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory:** **Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis
- **Other:** *Decreased exercise tolerance*, *development of antinuclear antibodies*, hypoglycemia or hypoglycemia, elevated serum transaminase

Interactions

- **Drug–drug** • Increased effects of both drugs if combined with calcium channel blockers • Increased risk of orthostatic hypotension with beta blockers, alpha blockers, prazosin • Possible increased BP-lowering effects with aspirin, bismuth subsalicylate, magnesium salicylate • Decreased antihypertensive effects with NSAIDs, clonidine • Possible increased hypoglycemic effect of insulin

* **Drug-lab test** • Possible false results with glucose or insulin tolerance tests (oral)

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, asthma, COPD, pregnancy, lactation, diabetes, or thyrotoxicosis
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- Give with meals if needed.
- Do not discontinue drug abruptly after long-term therapy. Taper drug gradually over 2 wk with monitoring (abrupt withdrawal may cause serious beta-adrenergic rebound effects).
- ⊗ **Warning** Monitor apical pulse; do not administer if P is less than 50.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).
- Provide comfort measures for coping with drug effects.
- Provide safety precautions if CNS effects occur.

Teaching points

- Take drug with meals.
- Do not stop taking unless so instructed by your health care provider; drug must be slowly withdrawn.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Dizziness, lightheadedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▷ acetaminophen (N-acetyl-p-aminophenol)

(a seet a *min'* a fen)

Suppositories: Acephen

Oral: Aminofen, Anacin

Aspirin Free, APAP,

Apo-Acetaminophen (CAN), Atasol

(CAN), Cetafen, Feverall,

Genapap, Genebs, Mapap Arthritis

Pain **OND**, Masophen, Q-Pap,

Silapap, Tylenol, Valorin

PREGNANCY CATEGORY B

Drug classes

Analgesic (nonopioid)

Antipyretic

Therapeutic actions

Antipyretic: Reduces fever by acting directly on the hypothalamic heat-regulating center to cause vasodilation and sweating, which helps dissipate heat.

Analgesic: Site and mechanism of action unclear.

Indications

- Temporary reduction of fever; temporary relief of minor aches and pains caused by common cold and influenza, headache, sore throat, toothache (patients ages 2 yr and older), backache, menstrual cramps, minor arthritis pain, and muscle aches (patients older than 12 yr)
- Unlabeled use: Prophylaxis in children and patients at risk for seizures who are receiving DTP vaccination to reduce incidence of fever and pain

Contraindications and cautions

- Contraindicated with allergy to acetaminophen.
- Use cautiously with impaired hepatic function, chronic alcoholism, pregnancy, lactation.

Available forms

Suppositories—80, 120, 325, 650 mg; chewable tablets—80 mg; tablets—325, 500 mg; ER tablets **OND**—650 mg; disintegrating

tablets—80, 160 mg; rapid-release tablets—500 mg; capsules—500 mg; elixir—160 mg/5 mL; liquid—160 mg/5 mL, 166.6 mg/5 mL, 500 mg/5 mL; solution—100 mg/mL, 160 mg/5 mL.

Dosages

Adults and children older than 12 yr PO or rectal suppositories

By suppository, 325–650 mg every 4–6 hr. PO, or 1,300 mg ER tablets every 8 hr. Do not exceed 3,900 mg/day.

Pediatric patients

Doses may be repeated 4–5 times/day; do not exceed five doses in 24 hr or 10 mg/kg.

PO

Age	Dosage (mg)
0–3 mo	40
4–11 mo	80
12–23 mo	120
2–3 yr	160
4–5 yr	240
6–8 yr	320
9–10 yr	400
11 yr	480

Rectal suppositories

Age	Dosage
3–11 mo	80 mg every 6 hr
12–36 mo	80 mg every 4 hr
3–6 yr	120 mg every 4–6 hr
6–12 yr	325 mg every 4–6 hr

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	0.5–2 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 1–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache
- **CV:** Chest pain, dyspnea, **myocardial damage** when doses of 5–8 g/day are ingested daily for several weeks or when doses of 4 g/day are ingested for 1 yr
- **GI:** **Hepatic toxicity and failure**, jaundice

- **GU:** Acute renal failure, renal tubular necrosis
- **Hematologic:** Methemoglobinemia—cyanosis; hemolytic anemia—hematuria, anuria; neutropenia, leukopenia, pancytopenia, thrombocytopenia, hypoglycemia
- **Hypersensitivity:** Rash, fever

Interactions

- **Drug-drug** • Increased toxicity with long-term, excessive ethanol ingestion • Increased hypoprothrombinemic effect of oral anticoagulants • Increased risk of hepatotoxicity and possible decreased therapeutic effects with barbiturates, carbamazepine, hydantoin, rifampin, sulfapyrazone • Possible delayed or decreased effectiveness with anticholinergics • Possible reduced absorption of acetaminophen with activated charcoal • Possible decreased effectiveness of zidovudine
- **Drug-lab test** • Interference with *Chemstrip G*, *Dextrostix*, and *Visidex II* home blood glucose measurement systems; effects vary

Nursing considerations Assessment

- **History:** Allergy to acetaminophen, impaired hepatic function, chronic alcoholism, pregnancy, lactation
- **Physical:** Skin color, lesions; T; liver evaluation; CBC, LFTs, renal function tests

Interventions

- Do not exceed the recommended dosage.
- Consult physician if needed for children less than 3 yr; if needed for longer than 10 days; if continued fever, severe or recurrent pain occurs (possible serious illness).
- Reduce dosage with hepatic impairment.
- Avoid using multiple preparations containing acetaminophen. Carefully check all OTC products.
- Give drug with food if GI upset occurs.
- Discontinue drug if hypersensitivity reactions occur.
- Treatment of overdose: Monitor serum levels regularly, *N*-acetylcysteine should be available as a specific antidote; basic life support measures may be necessary.

Teaching points

- Do not exceed recommended dose; do not take for longer than 10 days unless directed by prescriber.
- Chew the chewable tablets before swallowing; dissolve dispersible tablets in mouth before swallowing; shake liquid forms well before using; do not cut, crush, or chew extended-relief forms.
- Take the drug only for complaints indicated; it is not an anti-inflammatory agent.
- Avoid the use of other over-the-counter or prescription preparations containing acetaminophen. Serious overdose can occur. If you need an over-the-counter preparation, consult your health care provider.
- Report rash, unusual bleeding or bruising, yellowing of skin or eyes, changes in voiding patterns.

acetaZOLAMIDE

(*ab set a zole' ab mide*)

Apo-Acetazolamide (CAN),
Diamox Sequels

PREGNANCY CATEGORY C

Drug classes

Antiepileptic
Antiglaucoma drug
Carbonic anhydrase inhibitor
Diuretic
Sulfonamide (nonbacteriostatic)

Therapeutic actions

Inhibits the enzyme carbonic anhydrase. This action decreases aqueous humor formation in the eye, IOP, and hydrogen ion secretion by renal tubule cells, and increases sodium, potassium, bicarbonate, and water excretion by the kidney, causing a diuretic effect. In epilepsy, carbonic anhydrase inhibition seems to retard abnormal, excessive discharge from CNS neurons.

Indications

- Adjunctive treatment of chronic open-angle glaucoma, secondary glaucoma
- Preoperative use in acute angle-closure glaucoma when delay of surgery is desired to lower IOP

- Edema caused by heart failure, drug-induced edema
- Centrencephalic epilepsy (absence, unlocalized seizures)
- Prophylaxis and treatment of acute mountain sickness
- **NEW INDICATION:** Unlabeled uses: Malignant glaucoma, migraine prevention, familial periodic paralysis, cystine or uric acid renal calculi prevention

Contraindications and cautions

- Contraindicated with allergy to acetazolamide, antibacterial sulfonamides, or thiazides; chronic noncongestive angle-closure glaucoma; cirrhosis.
- Use cautiously with fluid or electrolyte imbalance (specifically decreased Na⁺, decreased K⁺, hyperchloremic acidosis), renal disease, hepatic disease (risk of hepatic coma if acetazolamide is given), adrenocortical insufficiency, respiratory acidosis, COPD, lactation.

Available forms

Tablets—125, 250 mg; ER capsules—500 mg; powder for injection—500 mg/vial

Dosages

Adults

- *Open-angle glaucoma:* 250 mg–1 g/day PO, usually in divided doses or ER capsules—1 capsule bid (morning and evening). Do not exceed 1 g/day.
- *Acute congestive angle-closure glaucoma:* 500 mg PO bid (ER capsules) or 250 mg PO q4h
- *Secondary glaucoma and preoperatively:* 250 mg every 4 hr or 250 mg bid PO, or 500 mg followed by 125–250 mg every 4 hr. May be given IV for rapid relief of increased IOP—500 mg IV, then 125–250 mg PO every 4 hr.
- *Diuresis in heart failure:* 250–375 mg (5 mg/kg) daily in the morning. Most effective if given on alternate days or for 2 days alternating with a day of rest.
- *Drug-induced edema:* 250–375 mg once every day or for 1 or 2 days alternating with a day of rest.

- **Epilepsy:** 8–30 mg/kg/day in divided doses. When given in combination with other antiepileptics, starting dose is 250 mg daily. SR preparation is not recommended for this use. Range of dosing: 375–1,000 mg/day.
- **Acute altitude sickness:** 500 mg–1 g/day PO in divided doses of tablets or ER capsules. For rapid ascent, the 1-g dose is recommended. When possible, begin dosing 24–48 hr before ascent and continue for 48 hr or longer as needed while at high altitude.

Pediatric patients 12 yr and older

- **Acute mountain sickness:** 500–1,000 mg/day PO in divided doses.

Pediatric patients 11 yr and younger

- Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	4 hr	6–12 hr
SR	2 hr	3–6 hr	18–24 hr
IV	1–2 min	15–18 min	4–5 hr

Metabolism: $T_{1/2}$: 5–6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Reconstitute 500-mg vial with 5 mL of sterile water for injection; stable for 3 days if refrigerated, but use within 12 hr is recommended.

Infusion: Give over 1 min for single injection, over 4–8 hr in solution.

Incompatibilities: Do not mix with diltiazem or in multivitamin infusion.

Adverse effects

- **CNS:** Weakness, fatigue, nervousness, sedation, drowsiness, dizziness, depression, tremor, ataxia, headache, paresthesias, seizures, flaccid paralysis, transient myopia
- **Dermatologic:** Urticaria, pruritus, photosensitivity, rash, erythema multiforme (Stevens-Johnson syndrome)
- **GI:** Anorexia, nausea, vomiting, constipation, melena, hepatic insufficiency
- **GU:** Hematuria, glycosuria, *urinary frequency*, renal colic, renal calculi, crystaluria, polyuria

- **Hematologic:** Bone marrow depression
- **Other:** Weight loss, fever, acidosis

Interactions

- **Drug-drug** • Decreased renal excretion of quinidine, amphetamine, procainamide, TCAs
- Increased excretion of salicylates, lithium
- Increased risk of salicylate toxicity due to metabolic acidosis with acetazolamide
- **Drug-lab test** • False-positive results of tests for urinary protein

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Diamox* (acetazolamide) and *Trimox* (ampicillin); use caution.

Assessment

- **History:** Allergy to acetazolamide, anti-bacterial sulfonamides, or thiazides; chronic noncongestive angle-closure glaucoma; fluid or electrolyte imbalance; renal or hepatic disease; adrenocortical insufficiency; respiratory acidosis; COPD; lactation
- **Physical:** Skin color, lesions; edema, weight, orientation, reflexes, muscle strength, IOP; R, pattern, adventitious sounds; liver evaluation, bowel sounds, urinary output patterns; CBC, serum electrolytes, LFTs, renal function tests, urinalysis

Interventions

- Administer by direct IV if parenteral use is necessary; IM use is painful.
- Give with food or milk if GI upset occurs.
- Use caution if giving with other drugs with excretion inhibited by urine alkalization.
- Make oral liquid form by crushing tablets and suspending in cherry, chocolate, raspberry, or other sweet syrup, or one tablet may be submerged in 10 mL of hot water with 1 mL of honey or syrup; do not use alcohol or glycerin as a vehicle.
- Establish safety precautions if CNS effects occur; protect patient from sun or bright lights if photophobia occurs.
- Obtain regular weight to monitor fluid changes.

- Monitor serum electrolytes and acid–base balance during course of drug therapy.

Teaching points

- Take drug with meals if GI upset occurs.
- Arrange to have intraocular pressure checked periodically.
- Weigh yourself on a regular basis, at the same time of the day and in the same clothing. Record weight on calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness, fatigue (do not engage in hazardous activities like driving a car); sensitivity to sunlight (use sunglasses; wear protective clothing or use a sunscreen when outdoors); GI upset (taking the drug with meals, eat frequent small meals).
- Report weight change of more than 3 pounds in 1 day, unusual bleeding or bruising, sore throat, dizziness, trembling, numbness, fatigue, muscle weakness or cramps, flank or loin pain, rash.

acetylcysteine (N-acetylcysteine)

(a se teel sis' tay een)

Acetadote, Mucomyst

PREGNANCY CATEGORY B

Drug classes

Antidote
Mucolytic

Therapeutic actions

Mucolytic activity: Splits links in the mucoproteins contained in respiratory mucus secretions, decreasing the viscosity of the mucus.

Antidote to acetaminophen hepatotoxicity: Protects liver cells by maintaining cell function and detoxifying acetaminophen metabolites.

Indications

- Mucolytic adjuvant therapy for abnormal, viscid, or inspissated mucus secretions in acute and chronic bronchopulmonary disease (emphysema with bronchitis, asthmatic

bronchitis, tuberculosis, pneumonia, primary bronchiectasis, lung amyloidosis), in pulmonary complications of cystic fibrosis, and in tracheostomy care; pulmonary complications associated with surgery, anesthesia, posttraumatic chest conditions; diagnostic bronchial studies (oral solution only)

- To prevent or lessen hepatic injury that may occur after ingestion of a potentially hepatotoxic dose of acetaminophen; treatment must start as soon as possible; most effective if administered within 8–10 hr of ingestion, but can be given within 24 hr after ingestion; IV use approved for this indication
- Unlabeled uses: As ophthalmic solution to treat keratoconjunctivitis sicca (dry eye); as an enema to treat bowel obstruction due to meconium ileus or its equivalent; prevention of radiocontrast-induced nephrotoxicity

Contraindications and cautions

Mucolytic use

- Contraindicated with hypersensitivity to acetylcysteine; use caution and discontinue immediately if bronchospasm occurs.

Antidotal use

- No contraindications; use caution with esophageal varices, peptic ulcer.

Available forms

Solution—10%, 20%; injection—200 mg/mL

Dosages

Adult and pediatric patients

Mucolytic use

- *Nebulization with face mask, mouthpiece, tracheostomy:* 3–5 mL of the 20% solution or 6–10 mL of the 10% solution tid or qid.
- *Nebulization with tent, croupette:* Very large volumes are required, occasionally up to 300 mL, during a treatment period. The dose is the volume or solution that will maintain a very heavy mist in the tent or croupette for the desired period. Administration for intermittent or continuous prolonged periods, including overnight, may be desirable.

Instillation

- *Direct or by tracheostomy:* 1–2 mL of a 10%–20% solution every 1–4 hr; may be introduced into a particular segment of the bronchopulmonary tree by way of a plastic catheter (inserted under local anesthesia and with

direct visualization). Instill 2–5 mL of the 20% solution by a syringe connected to the catheter.

- **Percutaneous intratracheal catheter:** 1–2 mL of the 20% solution or 2–4 mL of the 10% solution every 1–4 hr by a syringe connected to the catheter.
- **Diagnostic bronchogram:** Before the procedure, give two to three administrations of 1–2 mL of the 20% solution or 2–4 mL of the 10% solution by nebulization or intratracheal instillation.

Antidotal use

- **For acetaminophen overdose, oral:** Administer acetylcysteine immediately if 8 hr or less have elapsed since acetaminophen ingestion, using the following protocol:
 - If activated charcoal has been administered by lavage, charcoal may adsorb acetylcysteine and reduce its effectiveness.
 - Draw blood for acetaminophen plasma assay and for baseline AST, ALT, bilirubin, PT, creatinine, BUN, blood sugar, and electrolytes; if acetaminophen assay cannot be obtained or dose is clearly in the toxic range, give full course of acetylcysteine therapy; monitor hepatic and renal function, fluid and electrolyte balance.
 - Administer acetylcysteine PO 140 mg/kg loading dose.
 - See manufacturer's directions for preparation of oral dose using 10% or 20% solution and cola or other soft drink as diluent.
 - Administer 17 maintenance doses of 70 mg/kg every 4 hr, starting 4 hr after loading dose; administer full course of doses unless acetaminophen assay shows nontoxic level.
 - If patient vomits loading or maintenance dose within 1 hr of administration, repeat that dose; if patient is persistently unable to retain oral dosing, may administer by duodenal intubation.
- **IV:** Dilute in 5% dextrose. Loading dose—150 mg/kg in 200 mL given IV over 60 min; then first maintenance dose 50 mg/kg in 500 mL IV over 4 hr followed by a second maintenance dose 100 mg/kg in 1,000 mL given IV over 16 hr. Total IV dose is 300 mg/kg over 21 hr.
 - Children less than 40 kg and patients who need fluid restriction should receive lowest infusion volume possible. See prescribing information for details.
 - Repeat blood chemistry assays as described above daily if acetaminophen plasma level is in toxic range.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1–2 hr	Not known
Instillation, Inhalation	1 min	5–10 min	2–3 hr
IV	Immediate	5 min	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 5.6–6.25 hr

Excretion: Urine (30%)

IV FACTS

Preparation: Dilute in 5% dextrose only. Solution may change from colorless to pink or purple when the stopper is punctured. Reconstituted solution is stable 24 hr at room temperature. Discard any unused portion of the vial. Solution is preservative-free.

Infusion: Infuse loading dose over 15 min, first maintenance dose over 4 hr, second maintenance dose over 16 hr.

Incompatibilities: Do not mix with other drugs. Avoid solution contact with rubber and metals, particularly iron, copper, nickel.

Adverse effects

Mucolytic use

- **GI:** Nausea, stomatitis
- **Hypersensitivity:** Urticaria
- **Respiratory:** Bronchospasm, especially in patients with asthma
- **Other:** Rhinorrhea

Antidotal use

- **Dermatologic:** Rash
- **GI:** Nausea, vomiting, other GI symptoms
- **Other:** Anaphylactoid reactions

Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between **Mucomyst** (acetylcysteine) and **Mucinex** (guaifenesin); use caution.

Assessment

- **History:** Mucolytic use: Hypersensitivity to acetylcysteine, asthma. Antidotal use: Esophageal varices, peptic ulcer
- **Physical:** Weight, T, skin color, lesions; BP, P, R, adventitious sounds, bowel sounds, liver palpation

Interventions

Mucolytic use

- Dilute the 20% acetylcysteine solution with either normal saline or sterile water for injection; use the 10% solution undiluted. Refrigerate unused, undiluted solution, and use within 96 hr. Drug solution in the opened bottle may change color, but this does not alter safety or efficacy.
- Administer the following drugs separately, because they are incompatible with acetylcysteine solutions: Tetracyclines, erythromycin lactobionate, amphotericin B, iodized oil chymotrypsin, trypsin, hydrogen peroxide.
- Use water to remove residual drug solution on the patient's face after administration by face mask.
- Inform patient that nebulization may produce an initial disagreeable odor, but the odor will soon disappear.
- Monitor nebulizer for buildup of drug from evaporation; dilute with sterile water for injection to prevent concentrate from impeding nebulization and drug delivery.
- Establish routine for pulmonary toilet; have suction equipment on standby.

Antidotal use

- Dilute the 20% acetylcysteine solution with cola drinks or other soft drinks to a final concentration of 5%; if administered by gastric tube or Miller-Abbott tube, water may be used as diluent. Dilution minimizes the risk of vomiting.
- Prepare fresh solutions, and use within 1 hr; undiluted solution in opened vials may be kept for 96 hr.
- Treat fluid and electrolyte imbalance, hypoglycemia.
- Give vitamin K₁ if prothrombin ratio exceeds 1.5; give fresh-frozen plasma if prothrombin ratio exceeds 3.
- Do not administer diuretics.
- Monitor timing of IV doses.
- Follow acetaminophen assays carefully to determine appropriate dosage.

Teaching points

- You may experience these side effects: Increased productive cough, nausea, GI upset.
- Report difficulty breathing or nausea.

acitretin

See Appendix U, *Less commonly used drugs*.

acyclovir (acycloguanosine)

(ay sye' kloe ver)

Apo-Acyclovir (CAN), Gen-Acyclovir (CAN), ratio-Acyclovir (CAN), Zovirax

PREGNANCY CATEGORY B

Drug classes

Antiviral
Purine nucleoside analogue

Therapeutic actions

Antiviral activity; inhibits viral DNA replication.

Indications

- Initial and recurrent mucosal and cutaneous HSV-1 and HSV-2 and varicella zoster infections in immunocompromised patients
- Severe initial and recurrent genital herpes infections in immunocompromised patients
- Herpes simplex encephalitis
- Treatment of neonatal HSV infections
- Acute treatment of herpes zoster (shingles) and chickenpox (varicella)
- Ointment: Initial herpes genital infections; limited mucocutaneous HSV infections in immunocompromised patients
- Cream: Recurrent herpes labialis (cold sores) in patients 12 yr or older
- Unlabeled uses: Cytomegalovirus and HSV infection following transplant, ocular and other herpes simplex infections, varicella pneumonia, disseminated primary eczema herpeticum

Contraindications and cautions

- Contraindicated with allergy to acyclovir, renal disease, lactation.
- Use cautiously with pregnancy.

Available forms

Tablets—400, 800 mg; capsules—200 mg; suspension—200 mg/5 mL; powder for injection—500 mg/vial, 1,000 mg/vial;

injection—50 mg/mL; ointment—50 mg/g;
cream—50 mg/g

Dosages

Adults

Parenteral

- *Herpes genitalis*: 5 mg/kg IV infused over 1 hr every 8 hr for 5 days.
- *Herpes encephalitis*: 10 mg/kg IV infused over 1 hr every 8 hr for 10 days.
- *Herpes simplex, immunocompromised patients*: 5 mg/kg IV infused over 1 hr every 8 hr for 7 days.
- *Varicella zoster, immunocompromised patients*: 10 mg/kg IV infused over 1 hr every 8 hr for 7 days.

Oral

- *Initial genital herpes*: 200 mg every 4 hr five times daily (1,000 mg/day) for 10 days.
- *Long-term suppressive therapy*: 400 mg bid for up to 12 mo.
- *Recurrent therapy*: 200 mg every 4 hr five times daily for 5 days.
- *Acute herpes zoster*: 800 mg every 4 hr five times daily while awake for 7–10 days.
- *Chickenpox*: 800 mg qid for 5 days.

Pediatric patients

Parenteral

- *HSV infections in patients younger than 12 yr*: 10 mg/kg infused IV over 1 hr every 8 hr for 7 days.
- *Varicella zoster infection in patients younger than 12 yr*: 20 mg/kg IV over 1 hr every 8 hr for 7 days.
- *Shingles, HSV encephalitis in patients 3 mo to 12 yr*: 20 mg/kg IV over 1 hr every 8 hr for 10 days.
- *Neonatal HSV*: 10 mg/kg infused over 1 hr every 8 hr for 10 days.

Oral

Younger than 2 yr: Safety not established.
2 yr or older and 40 kg or less: 20 mg/kg per dose qid (80 mg/kg/day) for 5 days.
More than 40 kg: Use adult dosage.
12 yr or older: Use adult dosage.

Geriatric patients or patients with renal impairment

Oral

For creatinine clearance less than 10 mL/min, 200 mg every 12 hr. If on hemodialysis, an

additional dose should be given after each dialysis session.

IV

CrCl (mL/min)	Dosage (IV)
More than 50	5 mg/kg every 8 hr
25–50	5 mg/kg every 12 hr
10–25	5 mg/kg daily
0–10	2.5 mg/kg daily

Topical

Ointment (all ages): Apply sufficient quantity to cover all lesions 6 times/day (every 3 hr) for 7 days; 1.25-cm (0.5-in) ribbon of ointment covers 2.5 cm² (4 in²) surface area.

Cream (12 yr and older): Apply enough to cover all lesions 5 times/day for 4 days.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1.5–2 hr	Not known
IV	Immediate	1 hr	8 hr
Topical	Absorption is minimal		

Metabolism: T_{1/2}: 2.5–5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unchanged in urine

IV FACTS

Preparation: Reconstitute 500 mg vial in 10 mL sterile water for injection; do not use bacteriostatic water for injection containing benzyl alcohol, 1,000 mg vial in 20 mL; concentration will be 50 mg/mL. Do not dilute drug with bacteriostatic water containing parabens. Use reconstituted solution within 12 hr; dilute IV solution to concentration of 7 mg/mL or less. Do not use biologic or colloidal fluids such as blood products or protein solutions. Warm drug to room temperature to dissolve precipitates formed during refrigeration.

Infusion: Administer by slow IV infusion of parenteral solutions; avoid bolus or rapid injection. Infuse over at least 1 hr to avoid renal damage.

Incompatibilities: Do not mix with diltiazem, dobutamine, dopamine, fludarabine, foscarnet, idarubicin, meperidine, morphine, ondansetron, piperacillin, sargramostim, vinorelbine.

Adverse effects

Systemic administration

- **CNS:** Headache, vertigo, depression, tremors, encephalopathic changes
- **Dermatologic:** *Inflammation or phlebitis at injection sites*, rash, hair loss
- **GI:** *Nausea, vomiting*, diarrhea, anorexia
- **GU:** Crystalluria with rapid IV administration, hematuria, increased BUN.

Topical administration

- **Dermatologic:** Transient burning at site of application

Interactions

Systemic administration

★ **Drug-drug** • Increased effects with probenecid • Increased nephrotoxicity with other nephrotoxic drugs • Extreme drowsiness with zidovudine

■ **Nursing considerations**

Assessment

- **History:** Allergy to acyclovir, renal disease, lactation, pregnancy
- **Physical:** Skin color, lesions; orientation; BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; BUN, creatinine clearance

Interventions

Systemic administration

- Ensure that the patient is well hydrated.

Topical administration

- Start treatment as soon as possible after onset of signs and symptoms.
- Wear a rubber glove or finger cot when applying drug.

Teaching points

Systemic administration

- Complete the full course of oral therapy, and do not exceed the prescribed dose.
- Oral acyclovir is not a cure for your disease but should make you feel better.
- Avoid sexual intercourse while visible lesions are present.
- You may experience these side effects: Nausea, vomiting, loss of appetite, diarrhea; headache, dizziness.
- Report difficulty urinating, rash, increased severity or frequency of recurrences.

Topical administration

- Wear rubber gloves or finger cots when applying the drug to prevent autoinoculation of other sites and transmission to others.
- This drug does not cure the disease; application during symptom-free periods will not prevent recurrences.
- Avoid sexual intercourse while visible lesions are present.
- This drug may cause burning, stinging, itching, rash; notify your health care provider if these are pronounced.

▷ **adalimumab**

See Appendix U, *Less commonly used drugs*.

▷ **adefovir dipivoxil**

(*ab def' o veer dye pib vocks' ill*)

Hepsera

PREGNANCY CATEGORY C

Drug class

Antiviral
Reverse transcriptase inhibitor

Therapeutic actions

Antiviral activity; nucleotide analogue of adenosine that inhibits hepatitis B virus reverse transcriptase and causes DNA chain termination and blocked viral replication.

Indications

- Treatment of chronic hepatitis B in adults and children 12 yr and older with evidence of active viral replication and either evidence of persistent elevations in ALT or AST or histologically active disease

Contraindications and cautions

- Contraindicated with allergy to adefovir or any components of the product, lactation.
- Use cautiously with pregnancy, renal impairment, signs of lactic acidosis, risk factors for severe liver disease, the elderly.

Available forms

Tablets—10 mg

Dosages**Adults and children 12 yr and older**

10 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

For creatinine clearance 30–49 mL/min, 10 mg every 48 hr; for creatinine clearance 10–29 mL/min, 10 mg every 72 hr. For hemodialysis patients, 10 mg every 7 days following dialysis. Drug not recommended for creatinine clearance less than 10 mL/min if patient is not on dialysis.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.6–4 hr

Metabolism: Hepatic; $T_{1/2}$: 7.5 hr**Distribution:** May cross placenta; may enter breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** Headache, *asthenia*
- **GI:** Nausea, diarrhea, abdominal pain, flatulence, dyspepsia, **severe hepatomegaly with steatosis, sometimes fatal; exacerbation of hepatitis if therapy is discontinued, elevated liver enzymes**
- **GU:** **Nephrotoxicity**, hematuria, glycosuria
- **Metabolic:** **Lactic acidosis, sometimes severe**, elevated creatine kinase, elevated amylase levels
- **Other:** HIV resistance if used to treat patients with unrecognized HIV infection

Interactions

*** Drug-drug** • Increased risk of nephrotoxicity if combined with other drugs that cause nephrotoxicity; if this combination is used, monitor renal function closely and evaluate risks versus benefits of continuing the combination

■ Nursing considerations**Assessment**

- **History:** Allergy to adefovir or any component of the drug, renal or hepatic impairment, lactic acidosis, pregnancy, lactation
- **Physical:** T; orientation, reflexes; abdominal examination, LFTs, renal function tests

Interventions

- Ensure that HIV antibody testing has been done before initiating therapy to reduce risk of emergence of HIV resistance.

⊗ **Black box warning** Caution patient not to run out of this drug; patients who stop taking it may develop worsened or severe hepatitis.

⊗ **Black box warning** Monitor patients regularly to evaluate renal function and liver enzymes; severe nephrotoxicity and hepatotoxicity can occur.

⊗ **Black box warning** Withdraw drug and monitor patient if patient develops signs of lactic acidosis or hepatotoxicity, including hepatomegaly and steatosis.

⊗ **Black box warning** HIV resistance may occur in unrecognized or untreated HIV infection; test patients for HIV infection before beginning therapy.

- Encourage women of childbearing age to use barrier contraceptives while on this drug as the effects of the drug on the fetus are not known.
- Advise women who are lactating to find another method of feeding the baby.
- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others; advise the use of barrier contraceptives.

Teaching points

- Take this drug once a day.
- Take the full course of therapy as prescribed; if you miss a dose, take it as soon as you remember and then take the next dose at the usual time the next day. Do not double any doses.
- You will be asked to have an HIV antibody test if your HIV status is not known; some people with HIV who are treated with this drug develop resistant strains of HIV.
- This drug does not cure chronic hepatitis B infection; long-term effects are not yet known;

continue to take precautions as the risk of transmission is not reduced by this drug.

- Do not stop taking this drug; you may experience very serious or worsening hepatitis B if the drug is stopped after you have been taking it. Consult your health care provider if your prescription is getting low and make sure that you do not skip any doses.
- You may experience these side effects: Nausea, diarrhea, abdominal pain, headache; try to maintain nutrition and fluid intake as much as possible—eat frequent small meals.
- Report severe weakness, muscle pain, trouble breathing, dizziness, cold feelings in your arms or legs, palpitations.

▷ adenosine

See Appendix U, *Less commonly used drugs*.

▷ agalsidase beta

See Appendix U, *Less commonly used drugs*.

▷ albumin, human (normal serum albumin) (*al byoo' min*)

5%: Albuminar-5, Albutein 5%,
Normal Serum Albumin 5%
Solution, Plasbumin-5
20%: Plasbumin-20
25%: Albuminar-25, Albutein 25%,
Normal Serum Albumin 25%
Solution, Plasbumin-25

PREGNANCY CATEGORY C

Drug classes

Blood product
Plasma protein

Therapeutic actions

Normal blood protein; maintains plasma osmotic pressure and is important in maintaining normal blood volume.

Indications

- Emergency treatment of shock due to burns, trauma, surgery, and infections (20% or 25%); 5% for use in nonemergency cases

- Burns: Albumin 5% used to prevent hemoconcentration and water and protein losses in conjunction with adequate infusions of crystalloid. 20% or 25% used beyond 24 hr.
- Hypoproteinemia in nephrotic syndrome, hepatic cirrhosis, toxemia of pregnancy, postoperative patients, tuberculous patients, premature infants
- Adult respiratory distress syndrome: Albumin 20% or 25% with a diuretic may be helpful
- Cardiopulmonary bypass: Preoperative blood dilution with 20% or 25% albumin. 5% may be used as adjunct therapy.
- Acute liver failure (20% or 25%)
- Sequestration of protein-rich fluids
- Erythrocyte resuspension: Albumin 20% or 25% may be added to the isotonic suspension of washed red cells immediately before transfusion
- Acute nephrosis: Albumin 20% or 25% and loop diuretic may help to control edema repeated daily for 7–10 days
- Renal dialysis: Albumin 20% or 25% may be useful in treatment of shock and hypotension. 5% solution may be used as adjunct in hemodialysis.
- Hyperbilirubinemia and erythroblastosis fetalis: Adjunct in exchange transfusions
- Neonatal hemolytic disease: 20–25% solution

Contraindications and cautions

- Contraindicated with allergy to albumin; severe anemia, cardiac failure, normal or increased intravascular volume, current use of cardiopulmonary bypass.
- Use cautiously with hepatic or renal failure.

Available forms

Injection—5%, 20%, 25%

Dosages

Administer by IV infusion only; contains 130–160 mEq sodium/L.

Adults

- *Hypovolemic shock*: 5% albumin: Initial dose of 500 mL is given as rapidly as possible; additional 500 mL may be given in 15–30 min. Base therapy on clinical response if more than 1,000 mL is required; consider the need for whole blood. In patients with low blood volume, administer at rate of

1–2 mL/min. 20% or 25% albumin: Base therapy on clinical response. Administer as rapidly as tolerated; 1 mL/min may be given to patients with low blood volume.

- **Erythrocyte resuspension:** 25 g of albumin per liter of erythrocytes, add to isotonic suspension of washed RBCs before transfusion.
- **Hypoproteinemia:** 5% albumin may be given for acute replacement of protein; if patient has edema, use 20% or 25% albumin 50–75 g/day. Do not exceed 2 mL/min. Adjust the rate of infusion based on patient response.
- **Burns:** 20% or 25% albumin can be helpful in maintaining colloid osmotic pressure; goal is to maintain plasma albumin concentration at 2.5 ± 0.5 g/100 mL with a plasma oncotic pressure of 20 mm Hg.
- **Hepatic cirrhosis:** 25% may be effective in temporary restoration of plasma protein levels.
- **Nephrosis:** Initial dose of 100 mL of 25% albumin may be repeated daily for 7–10 days, with a loop diuretic; effects are not sustained because of the underlying problem.

Pediatric patients

- Usual rate of administration is 1/4 to 1/2 adult rate, or dosage may be calculated on basis of 0.6–1 g/kg.
- **Hypoproteinemia:** 25 g/day of 20% or 25% albumin.
- **Hyperbilirubinemia and erythroblastosis fetalis:** 1 g/kg 1 hr before transfusion.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	End of infusion

Metabolism: Tissue; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Swab stopper top with antiseptic immediately before removing seal and entering the vial. Use a 16-gauge needle or dispensing pin with vials 20 mL or larger. Inspect for particulate matter and discoloration. Store at room temperature; do not freeze. Do not di-

lute 5% albumin; 25% albumin may be undiluted or diluted in normal saline; if sodium restriction is required, may dilute 25% albumin with D₅W.

Infusion: Give by IV infusion slowly enough to prevent rapid plasma volume expansion 1–2 mL/min for adults, 0.25–1 mL/min for children. Give in combination with or through the same administration set as solutions of saline or carbohydrates.

Incompatibilities: Do not use with solutions containing alcohol or protein hydrolysates—precipitates may form.

Adverse effects

- **CV:** Hypotension, heart failure, pulmonary edema after rapid infusion
- **Hypersensitivity:** Fever, chills, *changes in blood pressure*, flushing, nausea, vomiting, changes in respiration, rashes

Nursing considerations

Assessment

- **History:** Allergy to albumin, severe anemia, heart failure, current use of cardiopulmonary bypass, hepatic failure, renal failure
- **Physical:** Skin color, lesions; T, P, BP, peripheral perfusion; R, adventitious sounds; LFTs, renal function tests, Hct, serum electrolytes

Interventions

- Give to all blood groups or types.
- Consider using whole blood; infusion provides only symptomatic relief of hypoproteinemia.
- Monitor BP; discontinue infusion if hypotension occurs.
- Stop infusion if headache, flushing, fever, changes in BP occur; treat reaction with antihistamines. If a plasma protein is still needed, try material from a different lot number.
- Monitor patient's clinical response, and adjust infusion rate accordingly.

Teaching points

- Report headache, nausea, vomiting, difficulty breathing, back pain.

albuterol sulfate (*al byoo' ter ole*)

AccuNeb, ProAir HFA,
Proventil HFA, Ventolin
Diskus (CAN), Ventolin HFA,
Ventolin Oral Liquid (CAN),
VoSpire ER DMC

PREGNANCY CATEGORY C

Drug classes

Antiasthmatic

Beta₂-selective adrenergic agonist

Bronchodilator

Sympathomimetic

Therapeutic actions

In low doses, acts relatively selectively at beta₂-adrenergic receptors to cause bronchodilation and vasodilation; at higher doses, beta₂ selectivity is lost, and the drug acts at beta₂ receptors to cause typical sympathomimetic cardiac effects.

Indications

- Relief and prevention of bronchospasm in patients with reversible obstructive airway disease or COPD
- Inhalation: Treatment of acute attacks of bronchospasm
- Prevention of exercise-induced bronchospasm
- Unlabeled use: Adjunct in treating moderate to severe hyperkalemia in dialysis patients; seems to lower potassium concentrations when inhaled by patients on hemodialysis

Contraindications and cautions

- Contraindicated with hypersensitivity to albuterol; tachyarrhythmias, tachycardia caused by digitalis intoxication; general anesthesia with halogenated hydrocarbons or cyclopropane (these sensitize the myocardium to catecholamines); unstable vasomotor system disorders; hypertension; coronary insufficiency, CAD; history of CVA; COPD patients with degenerative heart disease.
- Use cautiously with diabetes mellitus (large IV doses can aggravate diabetes and ketoacidosis); hyperthyroidism; history of seizure disorders; psychoneurotic individu-

als; labor and delivery (oral use has delayed second stage of labor; parenteral use of beta₂-adrenergic agonists can accelerate fetal heart beat and cause hypoglycemia, hypokalemia, pulmonary edema in the mother and hypoglycemia in the neonate); lactation; the elderly (more sensitive to CNS effects).

Available forms

Tablets—2, 4 mg; ER tablets DMC—4, 8 mg; syrup—2 mg/5 mL; aerosol—90 mcg/actuation; solution for inhalation—0.021%, 0.042%, 0.083%, 0.5%.

Dosages

Adults

Oral

Initially, 2 or 4 mg (1–2 tsp syrup) tid–qid PO; may cautiously increase dosage if necessary to 4 or 8 mg qid, not to exceed 32 mg/day. ER tablets, 4–8 mg q 12 hr.

Inhalation

Each actuation of aerosol dispenser delivers 90 mcg albuterol; 2 inhalations every 4–6 hr; some patients may require only 1 inhalation every 4 hr; more frequent administration or larger number of inhalations not recommended.

- *Prevention of exercise-induced bronchospasm:* 2 inhalations 15 min prior to exercise.

Solution for inhalation

2.5 mg tid to qid by nebulization.

Pediatric patients

Oral, tablets

6–12 yr: 2 mg tid–qid. May be increased if needed, but do not exceed 24 mg/day. ER tablets, 4 mg q 12 hr.

12 yr and older: Use adult dosage.

Oral, syrup

Younger than 2 yr: Safety and efficacy not established.

2–6 yr: Initially 0.1 mg/kg tid, not to exceed 2 mg (1 tsp) tid; if necessary, cautiously increase stepwise to 0.2 mg/kg tid. Do not exceed 4 mg (2 tsp) tid.

6–14 yr: 2 mg (1 tsp) tid–qid; if necessary, cautiously increase dosage. Do not exceed 24 mg/day in divided doses.

Older than 14 yr: Use adult dosage.

Inhalation Solution

2–12 yr: For child 10–15 kg, use 1.25 mg bid or tid by nebulization; for child more than 15 kg, use 2.5 mg bid or tid by nebulization.

12 yr and older: Use adult dosage.

AccuNeb for patients 2–12 yr: Usual starting dose, 1.25 mg or 0.63 mg tid or qid as needed by nebulization over 5–15 min. More frequent administration is not recommended.

Geriatric patients or patients sensitive to beta-adrenergic stimulation

Restrict initial dose to 2 mg tid or qid; individualize dosage thereafter to as much as 8 mg tid–qid. Patients older than 60 yr are more likely to develop adverse effects.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	2–2.5 hr	4–8 hr
Inhalation	5 min	1.5–2 hr	3–8 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Restlessness, apprehension, anxiety, fear, CNS stimulation*, hyperkinesia, insomnia, tremor, drowsiness, irritability, weakness, vertigo, headache
- **CV:** *Cardiac arrhythmias*, tachycardia, palpitations, PVCs (rare), anginal pain
- **Dermatologic:** *Sweating, pallor, flushing*
- **GI:** *Nausea*, vomiting, heartburn, unusual or bad taste in mouth
- **GU:** Increased incidence of leiomyomas of uterus when given in higher than human doses in preclinical studies
- **Respiratory:** Respiratory difficulties, pulmonary edema, coughing, **bronchospasm**; paradoxical airway resistance with repeated, excessive use of inhalation preparations

Interactions

- **Drug-drug** • Increased sympathomimetic effects with other sympathomimetic drugs
- Increased risk of toxicity, especially cardiac, when used with theophylline, aminophylline
- Decreased bronchodilating effects with beta-adrenergic blockers (eg, propranolol)
- Decreased effectiveness of insulin, oral hypoglycemic drugs
- Decreased serum levels and therapeutic effects of digoxin
- Increased risk of QT-interval prolongation when combined with other drugs that prolong QT interval

■ Nursing considerations Assessment

- **History:** Hypersensitivity to albuterol; tachyarrhythmias, tachycardia caused by digitalis intoxication; general anesthesia with halogenated hydrocarbons or cyclopropane; unstable vasomotor system disorders; hypertension; coronary insufficiency, CAD; history of CVA; COPD patients who have developed degenerative heart disease; diabetes mellitus; hyperthyroidism; history of seizure disorders; psychoneurotic individuals; lactation
- **Physical:** Weight; skin color, T, turgor; orientation, reflexes, affect; P, BP; R, adventitious sounds; blood and urine glucose, serum electrolytes, thyroid function tests, ECG

Interventions

- Use minimal doses for minimal periods; drug tolerance can occur with prolonged use.
- Maintain a beta-adrenergic blocker (cardioselective beta-blocker, such as atenolol, should be used with respiratory distress) on standby in case cardiac arrhythmias occur.
- Prepare solution for inhalation by diluting 0.5 mL 0.5% solution with 2.5 mL normal saline; deliver over 5–15 min by nebulization.
- Do not exceed recommended dosage; administer pressurized inhalation drug forms during second half of inspiration, because the airways are open wider and the aerosol distribution is more extensive.

Teaching points

- Do not exceed recommended dosage; adverse effects or loss of effectiveness may result. Read the instructions that come with respiratory inhalant.
- Do not cut, crush, or chew ER tablets; swallow them whole.
- You may experience these side effects: Dizziness, drowsiness, fatigue, headache (use caution if driving or performing tasks that require alertness); nausea, vomiting, change in taste (eat frequent small meals); rapid heart rate, anxiety, sweating, flushing, insomnia.
- Report chest pain, dizziness, insomnia, weakness, tremors or irregular heart beat, difficulty breathing, productive cough, failure to respond to usual dosage.

(ab len' dro nate)

Co-Alendronate (CAN), Fosamax, Novo-Alendronate (CAN), PMS-Alendronate (CAN), ratio-Alendronate (CAN)

PREGNANCY CATEGORY C

Drug classes

Bisphosphonate
Calcium regulator

Therapeutic actions

Slows normal and abnormal bone resorption without inhibiting bone formation and mineralization.

Indications

- Treatment and prevention of osteoporosis in postmenopausal women
- Treatment of men with osteoporosis
- Treatment of glucocorticoid-induced osteoporosis
- Treatment of Paget's disease of bone in patients with alkaline phosphatase at least two times upper limit of normal, those who are symptomatic, those at risk for future complications
- Unlabeled uses: Osteoporosis with spinal cord injury, vitamin D intoxication

Contraindications and cautions

- Contraindicated with allergy to bisphosphonates, hypocalcemia, esophageal abnormalities, inability to stay upright for at least 30 min, and in those at risk for aspiration (oral solution).
- Use cautiously with renal impairment, upper GI disease, pregnancy, lactation.

Available forms

Tablets—5, 10, 35, 40, 70 mg; oral solution—70 mg

Dosages

Adults

- *Postmenopausal osteoporosis*: 10 mg/day PO in AM with full glass of water, at least 30 min before the first beverage, food, or medication of the day, or 70 mg PO once a week or one bottle of 70 mg oral solution once a week. Avoid lying down for 30 min after taking drug.
- *Men with osteoporosis*: 10 mg/day PO or 70 mg tablet or one bottle 70 mg oral solution once a week.
- *Prevention of osteoporosis*: 5 mg/day PO or 35 mg PO once a week.
- *Paget's disease*: 40 mg/day PO in AM with full glass of water, at least 30 min before the first beverage, food, or medication of the day for 6 mo; may retreat after 6-mo treatment-free period.
- *Glucocorticoid-induced osteoporosis*: 5 mg/day PO with calcium and vitamin D (for men and women); 10 mg/day PO for postmenopausal women not on estrogen.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Dosage adjustment not necessary for creatinine clearance 35–60 mL/min; not recommended if creatinine clearance less than 35 mL/min.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	Days

Metabolism: Not metabolized; $T_{1/2}$: More than 10 yr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **GI:** *Nausea, diarrhea, GI irritation, pain, esophageal erosion*
- **Skeletal:** *Increased or recurrent bone pain, focal osteomalacia*

Interactions

* **Drug-drug** • Increased risk of GI distress with aspirin • Decreased absorption if taken with antacids, calcium, iron, multivalent cations; separate dosing by at least 30 min • Increased risk of toxicity if combined with ranitidine; if this combination is used, alendronate dosage may need to be reduced

* **Drug-food** • Significantly decreased absorption and serum levels if taken with food; separate dosing from food and beverage by at least 30 min

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between *Fosamax* (alendronate) and *Flomax* (tamsulosin); use caution.

Assessment

- **History:** Allergy to bisphosphonates, renal failure, upper GI disease, lactation, pregnancy
- **Physical:** Muscle tone, bone pain; bowel sounds; urinalysis, serum calcium

Interventions

⊗ **Warning** Give in AM with full glass of water at least 30 min before the first beverage, food, or medication of the day. Patient must stay upright for 30 min to decrease risk of potentially serious esophageal erosion.

- Monitor serum calcium levels before, during, and after therapy.
- Ensure 6-mo rest period after treatment for Paget's disease if retreatment is required.
- Ensure adequate vitamin D and calcium intake.
- Provide comfort measures if bone pain returns.

Teaching points

- Take drug in the morning with a full glass of plain water (not mineral water), at least 30 minutes before any beverage, food, or medication, and stay upright for 30 minutes and until after the first food of the day; mark calendar for once-weekly dosing.
- You may experience these side effects: Nausea, diarrhea; bone pain, headache (analgesic may help).
- Report twitching, muscle spasms, dark-colored urine, severe diarrhea, difficulty swallowing.

▽ **alfuzosin hydrochloride**
(*al foo zow' sin*)

Uroxatral **OND**

PREGNANCY CATEGORY B

Drug classes

Alpha adrenergic blocker
BPH drug

Therapeutic actions

Blocks the smooth muscle alpha-1 adrenergic receptors in the prostate, prostatic capsule, prostatic urethra, and bladder neck, leading to the relaxation of the bladder and prostate and improving the flow of urine and improvement in symptoms in patients with BPH.

Indications

- Treatment of the signs and symptoms of BPH

Contraindications and cautions

- Contraindicated with allergy to any component of the product; hepatic insufficiency, pregnancy, lactation.
- Use cautiously with hypotension, renal insufficiency, prolonged QTc interval, CAD.

Available forms

ER tablets —10 mg

Dosages

Adults

10 mg/day PO after the same meal each day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	8 hr

Metabolism: Hepatic; $T_{1/2}$: 10 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, headache
- **CV:** Orthostatic hypotension, syncope, tachycardia, chest pain
- **GI:** Abdominal pain, dyspepsia, constipation, nausea
- **GU:** Impotence, priapism
- **Respiratory:** Cough, bronchitis, sinusitis, pharyngitis, URI
- **Other:** Fatigue, pain

Interactions

★ **Drug-drug** • Increased serum levels and risk of adverse effects of alfuzosin if combined with CYP3A4 inhibitors, ketoconazole, itraconazole, ritonavir; use of these combinations is contraindicated • Increased risk of orthostatic hypotension and syncope if combined with antihypertensive medications; monitor patient closely and adjust antihypertensive dosage accordingly • Increased risk of adverse effects if combined with other adrenergic blockers; monitor patients closely and adjust dosages

as needed • Risk of serious adverse effects if combined with protease inhibitors; this combination is contraindicated

■ Nursing considerations

Assessment

- **History:** Allergy to alfuzosin, hepatic or renal impairment, CAD, prolonged QTc interval, pregnancy, lactation
- **Physical:** Body weight; skin color; lesions; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; PSA level; voiding pattern, normal output, urinalysis

Interventions

- Ensure that patient does not have prostatic cancer before beginning treatment; check for normal PSA levels.
- Administer once a day, after the same meal each day.
- Ensure that patient does not crush, chew, or cut tablet. Tablet should be swallowed whole.
- Store tablets in a dry place, protected from light.

⊗ **Warning** Monitor patient carefully for orthostatic hypotension; chance of orthostatic hypotension, dizziness, and syncope are greatest with the first dose. Establish safety precautions as appropriate.

Teaching points

- Take this drug exactly as prescribed, once a day. Do not chew, crush, or cut tablets; tablets must be swallowed whole. Use care when beginning therapy; dizziness and syncope are most likely at the beginning of therapy. Change position slowly to avoid increased dizziness. Take the drug after the same meal each day. Do not take the drug on an empty stomach.
- You may experience these side effects: Dizziness, weakness (these are more likely to occur when you change position, in the early morning, after exercise, in hot weather, and when you have consumed alcohol; some tolerance may occur after you have taken the drug for a while. Avoid driving a car or engaging in tasks that require alertness while you are experiencing these symptoms; remember to change position slowly, use caution when climbing stairs, lie down for a while if dizziness persists); GI upset (eat frequent small meals); impotence (you may

wish to discuss this with your health care provider); fatigue.

- Report frequent dizziness or fainting, worsening of symptoms, chest pain.

▷ **alglucosidase alfa**

See Appendix U, *Less commonly used drugs*.

▷ **aliskiren**

(*ab liss kye' ren*)

Tekturna

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug class

Antihypertensive
Renin inhibitor

Therapeutic actions

Directly inhibits renin, which decreases plasma renin activity and inhibits conversion of angiotensinogen to angiotensin I. Inhibition of the renin-angiotensin-aldosterone system leads to decreased blood pressure, decreased aldosterone release, and decreased sodium resorption.

Indications

- Treatment of hypertension, alone or with other antihypertensives

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug, second or third trimester of pregnancy, lactation.
- Use cautiously with history of impaired renal function, hyperkalemia.

Available forms

Tablets—150, 300 mg

Dosages

Adults

150 mg/day PO. May be increased to 300 mg/day PO if needed to control blood pressure.

Pediatric patients

Safety and efficacy not established.

Patients with severe renal impairment

No dosage adjustment needed with mild to moderate renal dysfunction; caution should be used with severe dysfunction because clinical experience is limited.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 24 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, fatigue, headache, seizures
- **CV:** Edema, hypotension
- **GI:** Diarrhea, abdominal pain, dyspepsia, GERD
- **Respiratory:** Cough, URI, **angioedema with respiratory symptoms**
- **Other:** Back pain

Interactions

★ **Drug-drug** • Risk of decreased effectiveness of furosemide if combined with aliskiren; monitor patient closely • Risk of increased serum levels and effects of aliskiren if combined with atorvastatin, ketoconazole; monitor patient closely • Risk of increased uric acid levels if combined with thiazides; monitor patient • Risk of hyperkalemia if combined with ACE inhibitors, other drugs that alter potassium levels; monitor potassium level periodically • Decreased serum aliskiren level if combined with irbesartan; monitor blood pressure carefully.

■ Nursing considerations

⊗ **Black box warning** Use during second and third trimesters of pregnancy can cause fetal injury or death; if pregnancy occurs, discontinue drug as soon as possible.

Assessment

- **History:** Hypersensitivity to any component of the drug, second or third trimester of pregnancy, lactation, history of impaired renal function, hyperkalemia

- **Physical:** Orientation, affect; BP; R, lung sounds; abdominal examination; renal function tests, electrolytes

Interventions

- Ensure that patient is not pregnant before starting drug; suggest use of contraceptive measures.
- Monitor serum potassium level periodically.
- Monitor patients also receiving furosemide for possible loss of diuretic effects.
- Continue other antihypertensive drugs as needed to control blood pressure.

Teaching points

- Take this drug once a day, at about the same time each day. If you miss a dose, take it as soon as you remember; then resume your usual schedule the next day. Do not make up missed doses. Do not take more than one dose each day.
- Store this drug at room temperature in a dry place (not in the bathroom or near the kitchen sink). Do not share this drug with any other people; keep it out of the reach of children.
- You may also be taking other drugs to control your blood pressure; check with your health care provider, and follow your drug regimen as directed.
- This drug should not be taken during pregnancy; use of contraceptive measures is advised. If you wish to become pregnant, discuss this with your health care provider. If you become pregnant while taking *Tektur-na*, stop the drug and consult with your health care provider about a different treatment for your hypertension.
- It is not known how this drug could affect a nursing baby. Because of the potential for serious adverse effects on the baby, another method of feeding should be used while you are taking this drug.
- Your health care provider will monitor your blood pressure regularly while you are taking this drug.
- You may experience low blood pressure if you are also taking diuretics, if you become dehydrated, or if you have dialysis treatments. If you feel faint or dizzy, lie down and call your health care provider right away.

- Report difficulty breathing; swelling of the face, lips, or tongue; dizziness or lightheadedness; pregnancy.

▶ allopurinol (*al ob pure' i nole*)

Aloprim, Apo-Allopurinol (CAN),
Zyloprim

PREGNANCY CATEGORY C

Drug class

Antigout drug
Purine analogue

Therapeutic actions

Inhibits the enzyme responsible for the conversion of purines to uric acid, thus reducing the production of uric acid with a decrease in serum and sometimes in urinary uric acid levels, relieving the signs and symptoms of gout.

Indications

- Management of the signs and symptoms of primary and secondary gout
- Management of patients with leukemia, lymphoma, and malignancies who are undergoing chemotherapy expected to result in elevations of serum and urinary uric acid
- Management of patients with recurrent calcium oxalate calculi whose daily uric acid excretion exceeds 800 mg/day (males) or 750 mg/day (females)
- Orphan drug use: Treatment of Chagas' disease; cutaneous and visceral leishmaniasis
- Unlabeled uses: Amelioration of granulocyte suppression with 5-FU; as a mouthwash to prevent 5-FU-induced stomatitis

Contraindications and cautions

- Contraindicated with allergy to allopurinol, blood dyscrasias.
- Use cautiously with liver disease, renal failure, lactation, pregnancy.

Available forms

Tablets—100, 300 mg; powder for injection—500 mg

Dosages**Adults**

- *Gout and hyperuricemia*: 100–800 mg/day PO in divided doses, depending on the severity of the disease (200–300 mg/day is usual dose). *Maintenance*: Establish dose that maintains serum uric acid levels within normal limits.
- *Hyperuricosuria*: 200–300 mg/day PO; adjust dose based on 24-hr urinary urate levels.
- *Prevention of acute gouty attacks*: 100 mg/day PO; increase the dose by 100 mg at weekly intervals until uric acid levels are 6 mg/dL or less.
- *Prevention of uric acid nephropathy in certain malignancies*: 600–800 mg/day PO for 2–3 days with a high fluid intake; maintenance dose should then be established as above.
- *Recurrent calcium oxalate stones*: 200–300 mg/day PO; adjust dose based on 24-hr urinary urate determinations.
- *Parenteral*: 200–400 mg/m²/day IV to maximum of 600 mg/day as continuous infusion or at 6-, 8-, 12-hr intervals.

Pediatric patients

- *Secondary hyperuricemia associated with various malignancies*:
6–10 yr: 300 mg/day PO.
Younger than 6 yr: 150 mg/day; adjust dosage after 48 hr of treatment based on serum uric acid levels.
- *Parenteral*: 200 mg/m²/day IV as continuous infusion or at 6-, 8-, 12-hr intervals.

Geriatric patients or patients with renal impairment

For geriatric patients or for patients with creatinine clearance 10–20 mL/min, 200 mg/day; for creatinine clearance less than 10 mL/min, 100 mg/day; for creatinine clearance less than 3 mL/min, extend intervals between doses based on patient's serum uric acid levels.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–2 hr
IV	10–15 min	30 min

Metabolism: Hepatic; T_{1/2}: 1–1.5 hr, then 23–24 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve contents of each vial with 25 ml of sterile water for injection. Further dilute with NSS or D₅W to final concentration of 6 mg/ml or less. Administer within 10 hr of reconstitution.

Infusion: Administer as a continuous infusion or infused every 6, 8, or 12 hr with rate dependent on volume used.

Incompatibilities: Incompatible with many other drugs and solutions containing sodium bicarbonate. Do not mix with any other drug in same solution.

Adverse effects

- **CNS:** *Headache, drowsiness*, peripheral neuropathy, neuritis, paresthesias
- **Dermatologic:** *Rashes—maculopapular, scaly or exfoliative—sometimes fatal*
- **GI:** *Nausea, vomiting, diarrhea*, abdominal pain, gastritis, hepatomegaly, hyperbilirubinemia, cholestatic jaundice
- **GU:** Exacerbation of gout and renal calculi, renal failure
- **Hematologic:** Anemia, leukopenia, agranulocytosis, thrombocytopenia, aplastic anemia, bone marrow depression

Interactions

• **Drug-drug** • Increased risk of hypersensitivity reaction with ACE inhibitors • Increased toxicity with thiazide diuretics • Increased risk of rash with ampicillin or amoxicillin • Increased risk of bone marrow suppression with cyclophosphamide, other cytotoxic agents • Increased half-life of oral anticoagulants • Increased serum levels of theophylline • Increased risk of toxic effects with thiopurines, 6-MP (azathioprine dose and dose of 6-MP should be reduced to one-third to one-fourth the usual dose)

Nursing considerations Assessment

- **History:** Allergy to allopurinol, blood dyscrasias, liver disease, renal failure, lactation

- **Physical:** Skin lesions, color; orientation, reflexes; liver evaluation, normal urinary output; normal output; CBC, LFTs, renal function tests, urinalysis

Interventions

- Administer drug following meals.
- Encourage patient to drink 2.5–3 L/day to decrease the risk of renal stone development.
- Check urine alkalinity—urates crystallize in acid urine; sodium bicarbonate or potassium citrate may be ordered to alkalinize urine.
- ⊗ **Warning** Discontinue drug at first sign of skin rash; severe to fatal skin reactions have occurred.
- Arrange for regular medical follow-up and blood tests.

Teaching points

- Take the drug after meals.
- Avoid over-the-counter medications. Many of these preparations contain vitamin C or other agents that might increase the likelihood of kidney stone formation. If you need an over-the-counter preparation, check with your health care provider.
- You may experience these side effects: Exacerbation of gouty attack or renal stones (drink 2.5–3 liters of fluids per day while on this drug); nausea, vomiting, loss of appetite (take after meals or eat frequent small meals); drowsiness (use caution while driving or performing hazardous tasks).
- Report rash; unusual bleeding or bruising; fever, chills; gout attack; numbness or tingling; flank pain, skin rash.

almotriptan malate
(al mob *trip'* tan mah' layt)

Axert

PREGNANCY CATEGORY C

Drug classes

Antimigraine
Serotonin selective agonist
Triptan

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients.

Indications

- Treatment of acute migraines with or without aura

Contraindications and cautions

- Contraindicated with allergy to almotriptan, active coronary artery disease, Prinzmetal's angina, peripheral or cerebrovascular syndromes, uncontrolled hypertension, use of an ergot compound or other triptan within 24 hours, pregnancy.
- Use cautiously with hepatic or renal impairment, risk factors for CAD, lactation.

Available forms

Tablets—6.25, 12.5 mg

Dosages

Adults

6.25–12.5 mg PO as a single dose at first sign of migraine; if headache returns, may be repeated after 2 hr; do not use more than 2 doses/24 hr.

Pediatric patients

12–17 yr: 6.25–12.5 mg PO; may be repeated after 2 hr. Maximum daily dosage, 25 mg. Safety and efficacy not established for patients younger than 12 yr.

Patients with hepatic or renal impairment

Starting dose—6.25 mg; do not exceed 12.5 mg/24 hr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–3 hr

Metabolism: Hepatic; T_{1/2}: 3–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness*, headache, anxiety, malaise or fatigue, weakness, myalgia, somnolence
- **CV:** *BP alterations, tightness or pressure in chest, arrhythmias*

- **GI:** *Nausea, dry mouth*, abdominal discomfort, dysphagia
- **Other:** Tingling; cold, warm, or hot sensations; burning sensation; feeling of heaviness; pressure sensation; numbness; feeling of tightness; feeling strange

Interactions

★ **Drug-drug** • Prolonged vasoactive reactions when taken concurrently with ergot-containing drugs, other triptans • Risk of severe effects if taken with or within 2 wk of discontinuation of an MAOI • Increased effects and possible toxicity if taken with ketoconazole and other antifungals, nefazodone, macrolide antibiotics, antivirals; monitor patient closely if this combination is used • Risk of serotonin syndrome when combined with SSRIs, other antidepressants; monitor patient carefully if combination cannot be avoided

■ Nursing considerations

Assessment

- **History:** Allergy to almotriptan, active coronary artery disease, Prinzmetal's angina, pregnancy, lactation, peripheral vascular syndromes, uncontrolled hypertension, use of an ergot compound or other triptan within 24 hr, risk factors for CAD
- **Physical:** Skin color and lesions; orientation, reflexes, peripheral sensation; P, BP; LFTs, renal function tests

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure.
- ⊗ **Warning** Ensure that the patient has not taken an ergot-containing compound or other triptan within 24 hr; risk of potentially serious vasospastic events.
- Do not administer more than 2 doses in a 24-hr period.
- Establish safety measures if CNS, visual disturbances occur.
- Control environment as appropriate to help relieve migraine (lighting, temperature, noise).
- Monitor BP of patients with possible coronary artery disease; discontinue at any sign of angina, prolonged high BP, and so forth.

Teaching points

- Take drug exactly as prescribed, at the onset of headache or aura. Do not take this drug to prevent a migraine; it is only used to treat migraines that are occurring. If the headache persists after you take this drug, you may repeat the dose after 2 hours have passed.
- Do not take more than 2 doses in a 24-hour period. Do not take any other migraine medication while you are taking this drug. If the headache is not relieved, call your health care provider.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, contact your health care provider and refrain from using drug.
- Continue to do anything that usually helps you feel better during a migraine (such as controlling lighting and reducing noise).
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or the use of dangerous machinery while on this drug), numbness, tingling, feelings of tightness or pressure.
- Report feeling hot, tired, or sick; flushing; swelling of lips or eyelids.

▼ alosetron hydrochloride

(*ab loss' e tron*)

Lotronex

PREGNANCY CATEGORY B

Drug classes

5-HT₃ (serotonin) antagonist
IBS drug

Therapeutic actions

Blocks 5-HT₃ (serotonin) receptors in the enteric nervous system of the GI tract; interacting with these receptors blocks visceral sensitivity, increases colonic transit time, decreases GI motility, may also decrease the perception of abdominal pain and discomfort.

Indications

- Treatment of severe diarrhea-predominant IBS in women who have chronic IBS (longer than 6 mo), have no anatomic or biochemical abnormalities of the GI tract, and who have failed to respond to conventional therapy

Contraindications and cautions

- Contraindicated with hypersensitivity to the drug, history of chronic or severe constipation or sequelae from constipation; history of intestinal obstruction, stricture, toxic megacolon, GI perforation or adhesions; history of ischemic colitis, impaired intestinal circulation, thrombophlebitis, or hypercoagulable state; history of or current Crohn's disease, ulcerative colitis, diverticulitis; inability to understand or comply with the Physician–Patient Agreement.
- Use cautiously with pregnancy, lactation, elderly patients, hepatic impairment.

Available forms

Tablets—0.5, 1 mg

Dosages

Adults

0.5 mg PO bid for 4 wk; may be continued if drug is tolerated and symptoms of IBS are under adequate control. Dose may be increased up to 1 mg bid PO after 4 wk if well tolerated and needed.

Pediatric patients

Safety and efficacy not established for patients younger than 18 yr.

Geriatric patients or patients with hepatic impairment

These patients may be at increased risk for complications from constipation; monitor very closely.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5 hr

Distribution: Crosses placenta; enters into breast milk

Excretion: Bile, urine, feces

Adverse effects

- **CNS:** Anxiety, tremors, dreams, headache

- **Dermatologic:** Sweating, urticaria
- **GI:** Abdominal pain, nausea, *constipation*, **ischemic colitis**
- **Other:** Malaise, fatigue, pain

Interactions

★ **Drug-drug** • Increased risk of constipation if taken with other drugs that cause decreased GI motility; if this combination cannot be avoided, monitor patient very carefully and discontinue drug at first sign of constipation or ischemic colitis • Contraindicated for use with fluvoxamine • Avoid use with fluoroquinolones, cimetidine because of risk of adverse effects • Risk of increased alose tron serum levels if combined with clarithromycin, itraconazole, ketoconazole, protease inhibitors, telithromycin, voriconazole; use caution

Nursing considerations

Assessment

- **History:** Hypersensitivity to the drug, history of chronic or severe constipation or sequelae from constipation; history of intestinal obstruction, stricture, toxic megacolon, GI perforation or adhesions; history of ischemic colitis, impaired intestinal circulation, thrombophlebitis, or hypercoagulable state; history of Crohn's disease, ulcerative colitis, diverticulitis; inability to understand or comply with the Physician–Patient Agreement, pregnancy, lactation, elderly patients, hepatic impairment
- **Physical:** Skin lesions; T; reflexes, affect; urinary output, abdominal examination; bowel patterns

Interventions

⊗ **Black box warning** Ensure that the patient has read and understands the Physician–Patient Agreement, which outlines the risks associated with the use of the drug, including risk for ischemic colitis, and warning signs to report. Drug is only indicated for women with severe diarrhea-dominant IBS who have failed to respond to conventional therapy.

⊗ **Black box warning** Discontinue drug immediately if patient develops constipation or signs and symptoms of ischemic colitis. Do not restart drug if ischemic colitis has occurred.

- Ensure that the Physician–Patient Agreement is in the patient’s permanent record.
- Administer drug without regard to food.
- Arrange for further evaluation of patient after 4 wk of therapy to determine effectiveness of drug; discontinue drug if symptoms are not controlled at 1 mg bid.
- Encourage the use of barrier contraceptives to prevent pregnancy while patient is using this drug.
- Maintain supportive treatment as appropriate for underlying problem.
- Provide additional comfort measures to alleviate discomfort from GI effects, headache.
- Monitor patient for any signs of constipation; discontinue drug at first sign of constipation or ischemic colitis and alert the prescribing physician.

Teaching points

- Read and sign the Physician–Patient Agreement, which outlines the risks and benefits of therapy with this drug.
- Arrange to have regular medical follow-up while you are on this drug.
- Use barrier contraceptives while on this drug; serious adverse effects could occur during pregnancy; if you become or wish to become pregnant, consult your health care provider.
- Maintain all of the usual activities and restrictions that apply to your condition. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Headache (consult your health care provider if these become bothersome, medications may be available to help); nausea, vomiting (proper nutrition is important, consult a dietician to maintain nutrition).
- Report constipation, signs of ischemic colitis—worsening abdominal pain, bloody diarrhea, blood in the stool; continuation of IBS symptoms without relief.

alpha₁-proteinase inhibitor

See Appendix U, *Less commonly used drugs*.

alprazolam (*al'prab'zoe lam*)

Alprazolam Extended Relief **ONC**, Alprazolam Intensol, Apo-Alpraz (CAN), Apo-Alpraz TS (CAN), Gen-Alprazolam (CAN), Niravam, Novo-Alprazol (CAN), Xanax, Xanax TS (CAN), Xanax XR **ONC**

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Anxiolytic
Benzodiazepine

Therapeutic actions

Exact mechanisms of action not understood; main sites of action may be the limbic system and reticular formation; increases the effects of GABA, an inhibitory neurotransmitter; anxiety blocking effects occur at doses well below those necessary to cause sedation, ataxia.

Indications

- Management of anxiety disorders, short-term relief of symptoms of anxiety; anxiety associated with depression
- Treatment of panic attacks with or without agoraphobia (*Niravam, Xanax, Xanax XR*)

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (crosses the placenta; risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery (“floppy infant” syndrome), lactation (secreted in breast milk; infants become lethargic and lose weight).
- Use cautiously with impaired liver or renal function, debilitation.

Available forms

Tablets—0.25, 0.5, 1, 2 mg; ER tablets **ONC**—0.5, 1, 2, 3 mg; oral solution—1 mg/mL; rapidly disintegrating tablets—0.25, 0.5, 1, 2 mg

Dosages

Individualize dosage; increase dosage gradually to avoid adverse effects; decrease dosage gradually (no more than 0.5 mg q 3 days) when discontinuing drug.

Adults

- **Anxiety disorders:** Initially, 0.25–0.5 mg PO tid; adjust to maximum daily dose of 4 mg/day in divided doses at intervals of 3–4 days or extended-release form once per day in the AM once dosage is established (immediate release, intensol solution).
- **Panic disorder:** Initially, 0.5 mg PO tid; increase dose at 3- to 4-day intervals in increments of no more than 1 mg/day; ranges of 1–10 mg/day have been needed. ER tablets—Initially, 0.5–1 mg/day; dosage range, 3–6 mg/day.

Geriatric patients or patients with advanced hepatic or debilitating disease

Initially, 0.25 mg bid–tid PO; gradually increase if needed and tolerated; ER tablets—0.5 mg PO once each day; gradually increase if needed and tolerated.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1–2 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 6.3–26.9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, anger, hostility*; episodes of mania and hypomania, *restlessness, confusion, crying, delirium, headache*, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; *mild paradoxical excitatory reactions during first 2 wk of treatment*
- **CV:** Bradycardia, tachycardia, CV collapse, hypertension, hypotension, palpitations, edema

- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **EENT:** Visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **GI:** *Constipation, diarrhea, dry mouth, salivation, nausea*, anorexia, vomiting, difficulty in swallowing, gastric disorders, hepatic impairment
- **GU:** Incontinence, changes in libido, urine retention, menstrual irregularities
- **Hematologic:** Elevations of blood enzymes—LDH, alkaline phosphatase, AST, ALT; blood dyscrasias—agranulocytosis, leukopenia
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia. *Drug dependence with withdrawal syndrome when drug is discontinued; more common with abrupt discontinuation of higher dosage used for longer than 4 mo*

Interactions

- **Drug-drug** • Increased CNS depression with alcohol, other CNS depressants, propoxyphene • Increased effect with cimetidine, disulfiram, omeprazole, isoniazid, hormonal contraceptives, valproic acid • Decreased effect with carbamazepine, rifampin, theophylline • Possible increased risk of digitalis toxicity with digoxin • Decreased antiparkinson effectiveness of levodopa with benzodiazepines • Contraindicated with ketoconazole, itraconazole; serious toxicity can occur
- **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination
- **Drug-alternative therapy** • Risk of coma if combined with kava therapy • Additive sedative effects with valerian root

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred among *Xanax* (alprazolam), *Celexa* (citalopram), and *Cerebyx* (fosphenytoin), and between alprazolam and lorazepam; use caution.

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication with depression of vital signs; labor and delivery; lactation; impaired liver or renal function; debilitation; pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Arrange to taper dosage gradually after long-term therapy, especially in epileptic patients.
- Do not administer with grapefruit juice or within 48 hr of grapefruit juice.
- Taper drug slowly, decrease by no more than 0.5 mg every 3 days.

Teaching points

- Take this drug exactly as prescribed; take extended-release form once a day in the morning; do not cut, crush, or chew extended-release tablets. Place the rapidly disintegrating tablet on top of your tongue, where it will disintegrate and can be swallowed with saliva.
- Do not drink grapefruit juice while on this drug.
- Do not stop taking drug (in long-term therapy) without consulting health care provider; drug should not be stopped suddenly.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs.
- You may experience these side effects: Drowsiness, dizziness (these effects will be less pronounced after a few days, avoid driving a car or engaging in other dangerous activities if these occur); GI upset (take drug with food); fatigue; depression; dreams; crying; nervousness.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, difficulty voiding, palpitations, swelling in the extremities.

▼ alprostadil

(*al'pross'ta dil*)

IV: Prostin VR Pediatric

Intracavernous: Caverject, Caverject Impulse, Edex, Muse

PREGNANCY CATEGORY

(NOT APPLICABLE)

Drug class

Prostaglandin

Therapeutic actions

Relaxes vascular smooth muscle; the smooth muscle of the ductus arteriosus is especially sensitive to this action and will relax and stay open; this is beneficial in infants who have congenital defects that restrict pulmonary or systemic blood flow and who depend on a patent ductus arteriosus for adequate blood oxygenation and lower body perfusion. Treatment of erectile dysfunction due to neurogenic, vasculogenic, psychogenic, or mixed etiology.

Indications

- Palliative therapy to temporarily maintain the patency of the ductus arteriosus until corrective or palliative surgery can be performed in neonates with congenital heart defects who depend on a patent ductus (eg, pulmonary atresia or stenosis, tetralogy of Fallot, coarctation of the aorta), men for whom sexual activity is unadvisable
- Treatment of erectile dysfunction (intracavernous injection)
- Unlabeled use: Peripheral vascular disease, Raynaud's disease, critical limb ischemia, peripheral angiography

Contraindications and cautions

- Contraindicated with respiratory distress syndrome (IV), conditions that might predispose to priapism, deformation of the penis, penile implants (intracavernous injection), known hypersensitivity, urethral strictures, severe hypospadias and curvature, acute or chronic urethritis, tendency for thromboembolism (urogenital).

- Use cautiously with patients with bleeding tendencies (drug inhibits platelet aggregation), hypotension, dizziness.

Available forms

Powder for injection—5, 10, 20, 40 mcg/mL; 10, 20 mcg/0.5 mL; injection (IV)—10, 20 mcg/mL; 40 mcg/2 mL (penile); 500 mcg/mL; pellets—125, 250, 500, 1,000 mcg

Dosages

Adults

Intracavernous injection

0.2–140 mcg by intracavernous injection using 0.5-in 27–30 gauge needle; may be repeated up to three times weekly with at least 24 hr between doses. Self-injection over 6-month period has been successful. Reduce dose if erection lasts more than 1 hr.

Urogenital

Initially, 125–250 mcg; maximum dosage, 2 systems per 24 hr.

Pellet

125, 250, 500, or 1,000 mcg based on patient response. Maximum dosage, two systems in 24 hr administered intraurethraly.

Pediatric patients

Preferred administration is through a continuous IV infusion into a large vein; may be administered through an umbilical artery catheter placed at the ductal opening. Begin infusion with 0.05–0.1 mcg/kg/min. After an increase in partial pressure of oxygen (pO_2) or in systemic BP and blood pH is achieved, reduce infusion to the lowest possible dosage that maintains the response (often achieved by reducing dosage from 0.1–0.05 to 0.025–0.01 mcg/kg/min). Up to 0.4 mcg/kg/min may be used for maintenance if required; higher dosage rates are not more effective.

Pharmacokinetics

Route	Onset	Peak
IV	5–25 min	End of infusion
Intracavernous	10 min	30–60 min
Pellet	5–10 min	30–60 min

Metabolism: Lungs, local metabolism in GU tract; $T_{1/2}$: 5–10 min

Excretion: Urine

IV FACTS

Preparation: Prepare solution by diluting 500 mcg alprostadil with sodium chloride injection or dextrose injection; dilute to volumes required for pump delivery system. Discard and prepare fresh infusion solutions every 24 hr; refrigerate drug ampules.

Infusion:

Add 500 mg Alprostadil to	Approximate Concentration of Resulting Solution	Infusion Rate (mL/kg/min)
250 mL	2 mcg/mL	0.05
100 mL	5 mcg/mL	0.02
50 mL	10 mcg/mL	0.01
25 mL	20 mcg/mL	0.005

Adverse effects

- **CNS:** *Seizures*, cerebral bleeding, hypothermia, jitteriness, lethargy, stiffness
- **CV:** *Bradycardia, flushing, tachycardia, hypotension, cardiac arrest*, heart block
- **GI:** Diarrhea, gastric outlet obstruction (neonates)
- **GU (with intracavernous injection):** Penile pain, rash, **fibrosis**, erection, priapism, urethral burning or bleeding
- **Hematologic:** Inhibited platelet aggregation, bleeding, anemia, DIC, hypokalemia
- **Respiratory:** *Apnea*, respiratory distress
- **Other:** Cortical proliferation of the long bones (with prolonged use, regresses after treatment is stopped), sepsis

Nursing considerations

CLINICAL ALERT!

Confusion has been reported with *Prostin VR Pediatric* (alprostadil), *Prostin F₂* (dinoprost—available outside US), *Prostin E₂* (dinoprostone), *Prostin 15M* (carboprost in Europe); use extreme caution.

Assessment

- **History:** Respiratory distress, bleeding tendencies
- **Physical:** T; cyanosis; skeletal development, reflexes, state of agitation, arterial pressure (using auscultation or Doppler), P, auscultation, peripheral perfusion; R, adventitious sounds, bleeding times, arterial blood gases, blood pH

Interventions

IV

- Constantly monitor arterial pressure; decrease infusion rate immediately if any fall in arterial pressure occurs.
- Regularly monitor arterial blood gases to determine efficacy of alprostadil (pO₂ in infants with restricted pulmonary flow; pH and systemic BP in infants with restricted systemic flow).

⊗ **Black box warning** Apnea occurs in 10%–12% of neonates treated with alprostadil, particularly those weighing less than 2 kg. Monitor respiratory status continuously, have ventilatory assistance readily available, and move the neonate often during the first hour of infusion.

Intracavernous

- Reconstitute vial with 1 mL diluent. 1 mL of solution will contain 5.4–41.1 mcg of alprostadil.
- Use solution immediately after reconstitution; do not store or freeze.
- Inject along the dorsal-lateral aspect of the proximal third of the penis using sterile technique.

Intraurethral

- Teach patient proper technique for intraurethral insertion.
- Store foil packets for pellets in the refrigerator and do not open them until ready to use.

Teaching points

IV

- Teaching about this drug should be incorporated into a total teaching program for the parents of the infant with a cyanotic congenital heart defect; specifics about the drug that they will need to know include:
- Your infant will be continually monitored and have frequent blood tests to follow the effects of the drug.
- The infant may look better, breathe easier, become fussy, and so forth, but the drug treatment is only a temporary solution, and the baby will require corrective surgery.

Intracavernous

- Learn and repeat self-injection technique. Plan for the first injection in the physician's office under supervision. Do not self-inject

more than three times per week; wait at least 24 hours between injections.

- Return for regular medical follow-up and evaluation.
- You may experience these side effects: Penile pain, swelling, rash.
- Report prolonged erection, swelling, or severe pain.

Intraurethral

- If you are prescribed the pellet form for intraurethral insertion, you will need to learn proper administration technique.
- Store foil packets for pellets in the refrigerator and do not open them until ready to use.
- Do not use more than two systems in a 24-hour period.

DANGEROUS DRUG

⚠ **alteplase,
recombinant
(recombinant tissue-
type plasminogen
activator, rt-PA)**

(*al ti plaze'*)

Activase, Cathflo Activase

PREGNANCY CATEGORY C

Drug class

Thrombolytic enzyme
Tissue plasminogen activator (TPA)

Therapeutic actions

Human tissue enzyme produced by recombinant DNA techniques; converts plasminogen to the enzyme plasmin (fibrinolysin), which degrades fibrin clots; lyses thrombi and emboli; is most active at the site of the clot and causes little systemic fibrinolysis.

Indications

- Treatment of coronary artery thrombosis associated with acute MI; improvement of ventricular function following MI; reduction of the incidence of heart failure and mortality associated with MI (*Activase*)
- Treatment of acute, massive pulmonary embolism in adults (*Activase*)
- Treatment of acute ischemic stroke (*Activase*)

- Restoration of function to central venous access devices occluded as assessed by the ability to withdraw blood (*Cathflo Activase*)
- Unlabeled use: Treatment of unstable angina, frostbite, pleural effusion

Contraindications and cautions

- Contraindicated with allergy to TPA; active internal bleeding; recent (within 2 mo) CVA; intracranial or intraspinal surgery or neoplasm; recent major surgery, obstetric delivery, organ biopsy, or rupture of a noncompressible blood vessel; recent serious GI bleed; recent serious trauma, including CPR; SBE; hemostatic defects; cerebrovascular disease; early-onset, insulin-dependent diabetes; septic thrombosis; severe uncontrolled hypertension; subarachnoid hemorrhage; concurrent use of anticoagulants; low platelet count; administration of heparin within 48 hr.
- Use cautiously with hepatic disease in elderly (more than 75 yr—risk of bleeding may be increased), pregnancy, lactation.

Available forms

Powder for injection—50, 100 mg; single use powder for injection (*Cathflo Activase*)—2 mg

Dosages

Careful patient assessment and evaluation are needed to determine the appropriate dose of this drug. Because experience is limited with this drug, careful monitoring is essential.

Adults

- **Acute MI:** For patients weighing more than 67 kg, 100 mg as a 15-mg IV bolus followed by 50 mg infused over 30 min. Then 35 mg over the next 60 min. For patients weighing 67 kg or less, 15-mg IV bolus followed by 0.75 mg/kg infused over 30 min (not to exceed 50 mg). Then 0.5 mg/kg over the next 60 min (not to exceed 35 mg). For a 3-hr infusion, 60 mg in first hr (6–10 mg as a bolus); 20 mg over second hr; 20 mg over third hr. Patients weighing less than 65 kg should receive 1.25 mg/kg over 3 hr.

⊗ **Warning** Do not use a total dose of 150 mg because of the increased risk of intracranial bleeding.

- **Pulmonary embolism:** 100 mg administered by IV infusion over 2 hr, followed immediately by heparin therapy.

- **Acute ischemic CVA:** 0.9 mg/kg (not to exceed 90 mg total dose) infused over 60 min with 10% given as an IV bolus over the first 1 min.
- **Restoration of function of central venous access devices (*Cathflo Activase*):** 2 mg in 2 mL of sterile water for injection from single-use vial injected into device; may repeat after 2 hr if necessary for patient weighing 30 kg (66 lb) or more.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	5–10 min	2.5–3 hr

Metabolism: Hepatic; $T_{1/2}$: 26 min

Distribution: Crosses placenta

Excretion: Liver

IV FACTS

Preparation: Do not use if vacuum is not present; add volume of the sterile water for injection provided with vial using a large bore needle and directing stream into the cake; slight foaming may occur but will dissipate after standing undisturbed for several min; reconstitute immediately before use. Do not shake. Refrigerate reconstituted solution and use within 8 hr. Do not use bacteriostatic water for injection. Reconstituted solution should be colorless or pale yellow and transparent; contains 1 mg/mL with a pH of 7.3.

Infusion: Administer as reconstituted or further dilute with an equal volume of 0.9% sodium chloride injection or 5% dextrose injection to yield 0.5 mg/mL; stable for up to 8 hr in these solutions. Avoid excessive agitation; mix by gentle swirling or slow inversion. Discard unused solution.

Incompatibilities: Do not add other medications to infusion solution; use 0.9% sodium chloride injection or 5% dextrose injection and no other solutions.

Y-site compatibility: Lidocaine.

Y-site incompatibilities: Dobutamine, dopamine, heparin, nitroglycerin.

Adverse effects

- **CV:** Cardiac arrhythmias with coronary reperfusion, hypotension
- **Hematologic:** Bleeding—particularly at venous or arterial access sites, GI bleeding, intracranial hemorrhage
- **Other:** Urticaria, nausea, vomiting, fever

Interactions

* **Drug-drug** • Increased risk of hemorrhage if used with heparin or oral anticoagulants, aspirin, dipyridamole

■ Nursing considerations**CLINICAL ALERT!**

Confusion has been reported between alteplase and *Altace* (ramipril); use caution.

Assessment

- **History:** Allergy to TPA; active internal bleeding; recent (within 2 mo) obstetric delivery, organ biopsy, or rupture of a non-compressible blood vessel; recent serious GI bleed; recent serious trauma, including CPR; SBE; hemostatic defects; cerebrovascular disease; type 1 diabetes; septic thrombosis; severe uncontrolled hypertension; liver disease
- **Physical:** Skin color, T, lesions; orientation, reflexes; P, BP, peripheral perfusion, baseline ECG; R, adventitious sounds; liver evaluation, Hct, platelet count, thrombin time, aPTT, PT

Interventions

- Discontinue heparin and alteplase if serious bleeding occurs.
- Monitor coagulation studies; PT or aPTT should be less than two times control.
- Apply pressure or pressure dressings to control superficial bleeding (at invaded or disturbed areas).
- Avoid arterial invasive procedures.
- Type and cross-match blood in case serious blood loss occurs and whole-blood transfusions are required.
- Institute treatment within 6 hr of onset of symptoms for evolving MI, within 3 hr of onset of CVA.

Teaching points

- This drug can only be given IV. You will be closely monitored during drug treatment.
- Report difficulty breathing, dizziness, disorientation, headache, numbness, tingling.

altrexamine

See Appendix U, *Less commonly used drugs*.

aluminum hydroxide gel

(a *loo' mi num*)

AlternaGEL, Amphojel, Dialume

PREGNANCY CATEGORY C

Drug class

Antacid

Therapeutic actions

Neutralizes or reduces gastric acidity, resulting in an increase in the pH of the stomach and duodenal bulb and inhibiting the proteolytic activity of pepsin, which protects the lining of the stomach and duodenum; binds with phosphate ions in the intestine to form insoluble aluminum–phosphate complexes, lowering phosphate in hyperphosphatemia and chronic renal failure; may cause hypophosphatemia in other states.

Indications

- Symptomatic relief of upset stomach associated with hyperacidity
- Hyperacidity associated with uncomplicated peptic ulcer, gastritis, peptic esophagitis, gastric hyperacidity, hiatal hernia
- Unlabeled uses: Prophylaxis of GI bleeding, stress ulcer; reduction of phosphate absorption in hyperphosphatemia in patients with chronic renal failure; suspected GERD laryngitis (adults)

Contraindications and cautions

- Contraindicated with allergy to aluminum products, gastric outlet destruction, hypophosphatemia, lactation.
- Use cautiously with pregnancy, renal impairment, hyperphosphatemia, constipation.

Available forms

Tablets—600 mg; capsules—500 mg; suspension—320 mg/5 mL, 450 mg/5 mL, 675 mg/5 mL; liquid—600 mg/5 mL

Dosages

Adults

Tablets and capsules: 500–1,500 mg 3–6 times/day PO between meals and at bedtime. Liquid: 5–10 mL between meals, at bedtime, or as directed.

Pediatric patients

- **General guidelines:** 5–15 mL PO every 3–6 hr or 1–3 hr after meals and at bedtime.
- **Hyperphosphatemia:** 50–150 mg/kg every 24 hr PO in divided doses every 4–6 hr; adjust dosage to normal serum phosphorus.
- **Prophylaxis of GI bleeding in critically ill infants:** 2–5 mL/dose every 1–2 hr PO.
- **Prophylaxis of GI bleeding in critically ill children:** 5–15 mL/dose every 1–2 hr PO.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic

Distribution: Long-term use, small amounts may be absorbed systemically and cross the placenta and enter breast milk

Excretion: Feces

Adverse effects

- **GI:** *Constipation*; intestinal obstruction; decreased absorption of fluoride; accumulation of aluminum in serum, bone, and CNS; rebound hyperacidity
- **Musculoskeletal:** Osteomalacia and chronic phosphate deficiency with bone pain, malaise, muscular weakness

Interactions

• **Drug-drug** • Do not administer other oral drugs within 1–2 hr of antacid; change in gastric pH may interfere with absorption of oral drugs • Decreased pharmacologic effect of corticosteroids, diflunisal, digoxin, fluoroquinolones, iron, isoniazid, penicillamine, phenothiazines, ranitidine, tetracyclines • Increased pharmacologic effect of benzodiazepines

■ Nursing considerations

Assessment

- **History:** Allergy to aluminum products; gastric outlet obstruction; hypertension, heart failure; hypophosphatemia; lactation

- **Physical:** Bone strength, muscle strength; P, auscultation, BP, peripheral edema; abdominal examination, bowel sounds; serum phosphorous, serum fluoride; bone X-ray is appropriate

Interventions

- Give hourly for first 2 wk when used for acute peptic ulcer; during the healing stage, give 1–3 hr after meals and at bedtime.
- ⊗ **Warning** Do not administer oral drugs within 1–2 hr of antacid administration.
- Have patient chew tablets thoroughly; follow with a glass of water.
- Monitor serum phosphorus levels periodically during long-term therapy.

Teaching points

- Take this drug between meals and at bedtime; ulcer patients need to strictly follow prescribed dosage pattern. If tablets are being used, chew thoroughly before swallowing, and follow with a glass of water.
- Do not take maximum dosage of antacids for longer than 2 weeks except under medical supervision.
- Do not take this drug with any other oral medications; absorption of those medications can be inhibited. Take other oral medications at least 1–2 hours after aluminum salt. Consult with your health care provider before using other drugs.
- Constipation may occur.
- Report constipation; bone pain, muscle weakness; coffee ground vomitus, black tarry stools; no relief from symptoms being treated.

▷ alvimopan

See Appendix U, *Less commonly used drugs*.

▷ amantadine hydrochloride (a man' ta deen)

Endantadine (CAN), Gen-Amantadine (CAN), Symmetrel

PREGNANCY CATEGORY C

Drug classes

Antiviral
Antiparkinsonian

Therapeutic actions

May inhibit penetration of influenza A virus into the host cell; may increase dopamine release in the nigrostriatal pathway of patients with Parkinson's disease, relieving their symptoms.

Indications

- Prevention and treatment of influenza A virus respiratory infection, especially in high-risk patients
- Adjunct to late vaccination against influenza A virus, to provide interim coverage; supplement to vaccination in immunodeficient patients; prophylaxis when vaccination is contraindicated
- Treatment of Parkinson's disease and drug-induced extrapyramidal reactions

Contraindications and cautions

- Contraindicated with allergy to drug product, psychoses, lactation.
- Use cautiously with renal or hepatic disease, seizures, heart failure, pregnancy, eczema-toid rash.

Available forms

Tablets—100 mg; capsules—100 mg; syrup—50 mg/5 mL

Dosages**Adults**

- *Influenza A virus prophylaxis*: 200 mg/day PO or 100 mg bid PO for 10 days after exposure, for the duration of known influenza A in the community if vaccination is impossible and exposure is repeated. If used in conjunction with influenza vaccine, administer for 2–4 wk after vaccine has been given.
- *Uncomplicated influenza A virus treatment*: Same dose as above; start treatment as soon after exposure as possible, continuing for 24–48 hr after symptoms are gone.
- *Parkinsonism treatment*: 100 mg bid (up to 400 mg/day) PO when used alone; reduce in patients receiving other antiparkinsonian drugs.

- *Drug-induced extrapyramidal reactions*: 100 mg bid PO, up to 300 mg/day in divided doses has been used.

Patients with seizure disorders

100 mg/day.

Patients with renal disease

For patients on hemodialysis, 200 mg PO every 7 days. For patients with reduced creatinine clearance, use dosage as outlined below:

CrCl (mL/min)	Dosage
Less than 15	200 mg PO every 7 days
15–29	200 mg PO first day, then 100 mg on alternate days
30–50	200 mg PO first day, then 100 mg/day

Pediatric patients

Not recommended for children younger than 1 yr.

- *Influenza A virus prophylaxis*:
1–9 yr: 4.4–8.8 mg/kg/day PO in one or two divided doses, not to exceed 150 mg/day.
9–12 yr: 100 mg PO bid.
- *Influenza A virus treatment*: As above; start as soon after exposure as possible, continuing for 24–48 hr after symptoms are gone.

Geriatric patients

- *Influenza A prophylaxis treatment*: For patients older than 65 yr with no recognized renal disease, 100 mg once daily PO.
- *Parkinsonism*: 100 mg/day for patients with serious associated medical illnesses or who are using other parkinsonism drugs. May increase to 100 mg bid if necessary after 1 wk or longer.

Pharmacokinetics

Route	Onset	Peak
Oral	36–48 hr	1.5–8 hr

Metabolism: $T_{1/2}$: 10–25 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unchanged in the urine

Adverse effects

- **CNS**: *Light-headedness, dizziness, insomnia*, confusion, irritability, ataxia, psychosis, depression, hallucinations, headache, somnolence, suicidal ideation
- **CV**: HF, orthostatic hypotension, dyspnea

- **GI:** *Nausea*, anorexia, constipation, dry mouth, diarrhea
- **GU:** Urinary retention, fatigue

Interactions

• *** Drug-drug** • Increased atropine-like side effects with anticholinergic drugs • Increased amantadine effects with hydrochlorothiazide, triamterene • Increased risk of QT-interval prolongation if combined with other drugs that prolong QT interval

■ **Nursing considerations**

Assessment

- **History:** Allergy to drug product, seizures, hepatic disease, eczematoid rash, psychoses, HF, renal disease, lactation
- **Physical:** Orientation, vision, speech, reflexes; BP, orthostatic BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; BUN, creatinine clearance

Interventions

- Do not discontinue abruptly when treating parkinsonism syndrome; parkinsonian crisis may occur.
- Be aware that the smallest amount possible should be prescribed; deaths have been reported from overdose.

Teaching points

- Mark your calendar if you are on alternating dosage schedules; it is very important to take the full course of the drug.
- You may experience these side effects: Drowsiness, blurred vision (use caution when driving or using dangerous equipment); dizziness, light-headedness (avoid sudden position changes); irritability or mood changes (common effect; if severe, drug may be changed).
- Report swelling of the fingers or ankles; shortness of breath; difficulty urinating, walking; tremors, slurred speech; thoughts of suicide.

 **ambenonium chloride**

(*am be noe' nee um*)

Mytelase

PREGNANCY CATEGORY C

Drug classes

Antimyasthenic
Cholinesterase inhibitor
Parasympathomimetic (indirectly acting)

Therapeutic actions

Increases the concentration of acetylcholine at the sites of cholinergic transmission (parasympathetic neurons and skeletal muscles) and prolongs and exaggerates the effects of acetylcholine by inhibiting the enzyme acetylcholinesterase; this causes parasympathomimetic effects and facilitates transmission at the skeletal neuromuscular junction. Also has direct stimulating effects on skeletal muscle and has a longer duration of effect and fewer side effects than other agents.

Indications

- Symptomatic control of myasthenia gravis

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinesterases, intestinal or urogenital tract obstruction, peritonitis, lactation, concurrent use of atropine.
- Use cautiously with asthma, peptic ulcer, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, pregnancy.

Available forms

Tablets—10 mg

Dosages

Adults

5–25 mg PO tid–qid (5–75 mg per dose has been used). Start dosage with 5 mg, and gradually increase to determine optimum dosage based on optimal muscle strength and no GI disturbances; increase dose every 1–2 days. Dosage above 200 mg/day requires close supervision to avoid overdose.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Oral	20–30 min	3–8 hr

Metabolism: T_{1/2}: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

Adverse effects

Parasympathomimetic effects

- **CNS:** Seizures, dysarthria, dysphonia, drowsiness, dizziness, headache, loss of consciousness
- **CV:** *Bradycardia, cardiac arrhythmias*, AV block and nodal rhythm, **cardiac arrest**, decreased cardiac output, leading to hypotension, syncope
- **Dermatologic:** Diaphoresis, flushing
- **EENT:** *Lacrimation, miosis*, spasm of accommodation, diplopia, conjunctival hyperemia
- **GI:** *Salivation, dysphagia, nausea, vomiting, increased peristalsis, abdominal cramps*, flatulence, diarrhea
- **GU:** *Urinary frequency and incontinence*, urinary urgency
- **Respiratory:** *Increased pharyngeal and tracheobronchial secretions*, **laryngospasm, bronchospasm**, bronchiolar constriction, dyspnea

Skeletal muscle effects

- **Peripheral:** Skeletal muscle weakness, fasciculations, muscle cramps, arthralgia
- **Respiratory:** Respiratory muscle paralysis, **central respiratory paralysis**

Interactions

★ **Drug-drug** • Decreased neuromuscular blockade of succinylcholine • Decreased effects of ambenonium and possible muscular depression with corticosteroids • Risk of severe toxicity with atropine; combination is contraindicated • Risk of toxicity if given with other anticholinesterases, antiarrhythmics, local and general anesthetics

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to anticholinesterases, intestinal or urogenital tract obstruction, peritonitis, asthma, peptic ulcer, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, lactation

- **Physical:** Skin color, texture, lesions; reflexes, bilateral grip strength; P, auscultation, BP; R, adventitious sounds; salivation, bowel sounds, normal output; frequency, voiding pattern, normal urinary output; EEG, thyroid function tests

Interventions

- Overdose can cause muscle weakness (cholinergic crisis) that is difficult to differentiate from myasthenic weakness (use of edrophonium for differential diagnosis is recommended). The administration of atropine may mask the parasympathetic effects of anticholinesterase overdose and further confound the diagnosis.

⊗ **Warning** Keep atropine sulfate readily available as an antidote and antagonist in case of cholinergic crisis or hypersensitivity reaction.

- Use edrophonium (2 mg IV given 1 hr after last ambenonium dose) to evaluate adequacy of dose. Transient increase in strength occurring in 30 sec and lasting 3–5 min indicates inadequate dose; adequate maintenance dose will reflect no change, or transient decrease in strength will occur.
- Monitor patient response carefully if increasing dosage.
- Discontinue drug and consult physician if excessive salivation, emesis, frequent urination, or diarrhea occurs.
- Arrange for decreased dosage of drug if excessive sweating, nausea, or GI upset occurs.

Teaching points

- Take this drug exactly as prescribed; does not need to be taken at night. You and your home caregiver need to know about the effects of the drug, the signs and symptoms of myasthenia gravis, the fact that muscle weakness may be related to drug overdose and to exacerbation of the disease, and that it is important to report muscle weakness promptly to your health care provider so that proper evaluation can be made.
- You may experience these side effects: Blurred vision, difficulty with far vision, difficulty with dark adaptation (use caution while driving, especially at night, or performing hazardous tasks in reduced light); increased urinary frequency, abdominal cramps (if these

become a problem, notify your health care provider); sweating (avoid hot or excessively humid environments).

- Report muscle weakness, nausea, vomiting, diarrhea, severe abdominal pain, excessive sweating, excessive salivation, frequent urination, urinary urgency, irregular heartbeat, difficulty breathing.

▷ ambrisentan

See Appendix U, *Less commonly used drugs*.

▷ amifostine

See Appendix U, *Less commonly used drugs*.

▷ amikacin sulfate

(am i kay' sin)

Amikin

PREGNANCY CATEGORY D

Drug class

Aminoglycoside

Therapeutic actions

Bactericidal: Inhibits protein synthesis in susceptible strains of gram-negative bacteria, and the functional integrity of bacterial cell membrane appears to be disrupted, causing cell death.

Indications

- Short-term treatment of serious infections caused by susceptible strains of *Pseudomonas* species, *Escherichia coli*, indole-positive and indole-negative *Proteus* species, *Providencia* species, *Klebsiella*, *Enterobacter*, and *Serratia* species, *Acinetobacter* species
- Suspected gram-negative infections before results of susceptibility studies are known (effective in infections caused by gentamicin- or tobramycin-resistant strains of gram-negative organisms)
- Initial treatment of staphylococcal infections when penicillin is contraindicated or infection may be caused by mixed organisms
- Treatment of serious infections such as bacterial septicemia (including neonatal sepsis);

infections of the respiratory tract, bones, joints, CNS, skin and soft tissues; intra-abdominal infections; postoperative infections; recurrent and complicated UTIs

- Unlabeled uses: Intrathecal or intraventricular administration at 8 mg/24 hr; part of a multidrug regimen for treatment of *Mycobacterium avium* complex, a common infection in AIDS patients; aerosolized for the treatment of pneumonia or cystic fibrosis

Contraindications and cautions

- Contraindicated with allergy to any aminoglycosides, renal or hepatic disease, preexisting hearing loss, myasthenia gravis, parkinsonism, infant botulism, lactation.
- Use cautiously with elderly patients, any patient with diminished hearing, decreased renal function, dehydration, neuromuscular disorders, pregnancy.

Available forms

Injection—50 mg/mL, 250 mg/mL

Dosages

Adults and pediatric patients

15 mg/kg/day IM or IV divided into two to three equal doses at equal intervals, not to exceed 1.5 g/day. Usual course of treatment is 7–10 days. Uncomplicated infections should respond in 24–48 hr. If no clinical response is seen in 3–5 days, reevaluate therapy.

- *UTIs*: 250 mg bid IM or IV; treatment is usually required for 7–10 days. If treatment is required for longer, carefully monitor serum levels and renal and neurologic function.

Neonatal patients

Loading dose of 10 mg/kg IM or IV; then 7.5 mg/kg every 12 hr.

Geriatric patients or patients with renal failure

Reduce dosage, and carefully monitor serum drug levels and renal function tests throughout treatment; regulate dosage based on these values. If creatinine clearance is not available and patient condition is stable, calculate a dosage interval in hours for the normal dose by multiplying patient's serum creatinine by 9. Dosage guide if creatinine clearance is known: Maintenance dose every 12 hr = observed creatinine clearance ÷ normal creatinine

clearance \times calculated loading dose (mg). For patients on dialysis, approximately one-half of the normal dose can be administered after hemodialysis. Before peritoneal dialysis, 7.5 mg/kg is given, then drug is instilled in peritoneal dialysis at the desired concentration.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	30–90 min
IM	Varies	45–120 min

Metabolism: $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Prepare IV solution by adding the contents of a 500-mg vial to 100 or 200 mL of sterile diluent. Do not physically mix with other drugs. Administer amikacin separately. Prepared solution is stable in concentrations of 0.25 and 5 mg/mL for 24 hr at room temperature.

Infusion: Administer to adults or pediatric patients over 30–60 min; infuse to infants over 1–2 hr.

Compatibilities: Amikacin is stable in 5% dextrose injection; 5% dextrose and 0.2%, 0.45%, or 0.9% sodium chloride injection; lactated Ringer's injection; *Normosol M* in 5% dextrose injection; *Normosol R* in 5% dextrose injection; *Plasma-Lyte 56* or 148 injection in D₅W.

Y-site compatibilities: May be given with enalaprilat, furosemide, magnesium sulfate, morphine, ondansetron.

Y-site incompatibility: Do not give with hetastarch.

Adverse effects

- **CNS:** *Ototoxicity*, confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, fever, numbness, tingling, tremor, paresthesias, muscle twitching, seizures, muscular weakness, neuromuscular blockade, apnea
- **CV:** Palpitations, hypotension, hypertension
- **GI:** *Nausea, vomiting, anorexia, diarrhea*, weight loss, stomatitis, increased salivation, splenomegaly

• GU: Nephrotoxicity

• **Hematologic:** Leukemoid reaction, agranulocytosis, granulocytosis, leukopenia, leukocytosis, thrombocytopenia, eosinophilia, pancytopenia, anemia, hemolytic anemia, increased or decreased reticulocyte count, electrolyte disturbances

• **Hepatic:** Hepatic toxicity; hepatomegaly

• **Hypersensitivity:** Purpura, rash, urticaria, exfoliative dermatitis, itching

• **Other:** *Superinfections, pain and irritation at IM injection sites*

Interactions

• **Drug-drug** • Increased ototoxic and nephrotoxic effects with potent diuretics and other similarly toxic drugs (eg, cephalosporins) • Risk of inactivation if mixed parenterally with penicillins • Increased likelihood of neuromuscular blockade if given shortly after general anesthetics, depolarizing and nondepolarizing neuromuscular junction blockers

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between amikacin and anakinra; use caution.

Assessment

- **History:** Allergy to any aminoglycosides, renal or hepatic disease, preexisting hearing loss, myasthenia gravis, parkinsonism, infant botulism, lactation, diminished hearing, decreased renal function, dehydration, neuromuscular disorders
- **Physical:** Arrange culture and sensitivity tests on infection prior to therapy; eighth cranial nerve function and state of hydration prior to, during, and after therapy; LFTs, renal function tests, CBC, skin color and lesions, orientation and affect, reflexes, bilateral grip strength, weight, bowel sounds

Interventions

⊗ **Black box warning** Monitor patient for nephrotoxicity, ototoxicity with baseline and periodic renal function and neurological examinations; risk for serious toxicity.

- Arrange for culture and sensitivity testing of infected area before treatment.

⊗ **Warning** Monitor duration of treatment: Usually 7–10 days. If clinical response does not occur within 3–5 days, stop therapy. Prolonged treatment leads to increased risk of toxicity. If drug is used longer than 10 days, monitor auditory and renal function daily.

- Give IM dosage by deep injection.
- Ensure that patient is well hydrated before and during therapy.

Teaching points

- This drug is only available for IM or IV use.
- You may experience these side effects: Ringing in the ears, headache, dizziness (reversible; safety measures may need to be taken if severe); nausea, vomiting, loss of appetite (eat frequent small meals, frequent mouth care may help).
- Report pain at injection site, severe headache, dizziness, loss of hearing, changes in urine pattern, difficulty breathing, rash or skin lesions.

amiloride hydrochloride (a mill' ob ride)

Midamor

PREGNANCY CATEGORY B

Drug class

Potassium-sparing diuretic

Therapeutic actions

Inhibits sodium reabsorption in the renal distal tubule, causing loss of sodium and water and retention of potassium.

Indications

- Adjunctive therapy with thiazide or loop diuretics in heart failure and in hypertension to treat hypokalemia or to prevent hypokalemia in patients who would be at high risk if hypokalemia occurred (digitalized patients, patients with cardiac arrhythmias)
- Unlabeled uses: Inhalation in the treatment of cystic fibrosis; reduction of lithium-induced polyuria without increasing lithium levels

Contraindications and cautions

- Contraindicated with allergy to amiloride, hyperkalemia, severe renal disease, diabetic nephropathy, potassium-rich diet.
- Use cautiously with renal or hepatic disease, diabetes mellitus, metabolic or respiratory acidosis, lactation, pregnancy.

Available forms

Tablets—5 mg

Dosages

Adults

- **Adjunctive therapy:** Add 5 mg/day PO to usual antihypertensive or dosage of kaliuretic diuretic; if necessary, increase dose to 10 mg/day or to 15–20 mg/day with careful monitoring of electrolytes.
- **Single-drug therapy:** Start with 5 mg/day PO; if necessary, increase to 10 mg/day or to 15–20 mg/day with careful monitoring of electrolytes.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2 hr	6–10 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 6–9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Headache, dizziness, drowsiness, fatigue, paresthesias, tremors, confusion, encephalopathy
- **GI:** Nausea, anorexia, vomiting, diarrhea, dry mouth, constipation, jaundice, gas pain, GI bleeding
- **GU:** Polyuria, dysuria, impotence, decreased libido
- **Musculoskeletal:** Weakness, fatigue, muscle cramps and muscle spasms, joint pain
- **Respiratory:** Cough, dyspnea
- **Other:** Rash, pruritus, itching, alopecia, hyperkalemia

Interactions

- **Drug-drug** • Increased hyperkalemia with triamterene, spironolactone, potassium

supplements, diets rich in potassium, ACE inhibitors • Reduced effectiveness of digoxin with amiloride

■ Nursing considerations

Assessment

- **History:** Allergy to amiloride, hyperkalemia, renal or liver disease, diabetes mellitus, metabolic or respiratory acidosis, lactation
- **Physical:** Skin color, lesions, edema; orientation, reflexes, muscle strength; pulses, baseline ECG, BP; R, pattern, adventitious sounds; liver evaluation, bowel sounds, urinary output patterns; CBC, serum electrolytes, blood sugar, LFTs, renal function tests, urinalysis

Interventions

⊗ **Black box warning** Monitor patient for hyperkalemia (serum potassium level greater than 5.5 mEq/L).

- Administer with food or milk to prevent GI upset.
- Administer early in the day so increased urination does not disturb sleep.
- Measure and record weight regularly to monitor mobilization of edema fluid.
- Avoid foods and salt substitutes high in potassium. See Appendix D for listing of high-potassium foods.
- Provide frequent mouth care and sugarless lozenges to suck.
- Arrange for regular evaluation of serum electrolytes.

Teaching points

- Take single dose early in the day so increased urination will not disturb sleep.
- Take the drug with food or meals to prevent GI upset.
- Avoid foods that are high in potassium and any flavoring that contains potassium (such as a salt substitute).
- Weigh yourself on a regular basis at the same time and in the same clothing, and record the weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes, hazardous activities like driving, and the use of

alcohol which may intensify these problems); decrease in sexual function; increased thirst (sucking on sugarless lozenges may help; frequent mouth care also may help); avoid foods that are rich in potassium (eg, fruits, *Sanka*).

- Report loss or gain of more than 3 pounds in 1 day; swelling in your ankles or fingers; dizziness, trembling, numbness, fatigue; muscle weakness or cramps.

▽ amino acids

(a mee' noe)

Aminess 5.2%, Aminosyn, BranchAmin, FreAmine, HepatAmine, Novamine, Primene (CAN), ProcalAmine, RenAmin, Travasol, TrophAmine

PREGNANCY CATEGORY C

Drug classes

Caloric agent
Protein substrate

Therapeutic actions

Essential and nonessential amino acids provided in various combinations to supply calories and proteins and provide a protein-building and a protein-sparing effect for the body (a positive nitrogen balance).

Indications

- Provide nutrition to patients who are in a negative nitrogen balance when GI tract cannot absorb protein; when protein needs exceed the ability to absorb protein (with burns, trauma, infections); when bowel rest is needed; when tube feeding cannot supply adequate nutrition; when health can be improved or restored by replacing lost amino acids
- Treatment of hepatic encephalopathy in patients with cirrhosis or hepatitis (*HepatAmine*)
- Nutritional support of uremic patients when oral nutrition is not feasible or is impractical or insufficient

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the solution; severe electrolyte or acid–base imbalance; inborn errors in amino acid metabolism; decreased circulating blood volume; severe renal or hepatic disease; hyperammonemia; bleeding abnormalities.
- Use cautiously with hepatic or renal impairment, diabetes mellitus, heart failure, hypertension, decreased circulating blood volume.

Available forms

Many forms available for IV injections.

Dosages

Dosage must be individualized with careful observation of cardiac status and BUN and evaluation of metabolic needs. Recommended protein dietary allowances are 0.9 g/kg/day for healthy adults, 1.4–2.2 g/kg/day in healthy infants and children. Requirements increase with trauma or in those who are malnourished.

- **Hepatic encephalopathy:** 80–120 g amino acid/day; 500 mL *HepatAmine* with 500 mL 50% dextrose and electrolyte solution over 8–12 hr per day.

Adults

1–1.5 g/kg/day amino acid injection IV into a peripheral vein; 250–500 mL/day amino acid injection IV mixed with appropriate dextrose, vitamins, and electrolytes as part of a total parenteral nutrition (TPN) solution.

Pediatric patients

2–4 g/kg/day amino acid IV mixed with dextrose as appropriate.

Pharmacokinetics

Route	Onset
IV	Immediate

Metabolism: Part of normal anabolic processes

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Strict aseptic technique is required in mixing solution; use of a laminar flow hood in the pharmacy is recommended.

A 0.22-micron filter should be used to block any particulate matter and bacteria. Use mixed solution immediately. If not used within 1 hr, refrigerate solution. Mixed solutions must be used within 24 hr. Use strict aseptic technique when changing bottles, catheter tubing, and so forth. Replace all IV apparatus every 24 hr. Change dressing every 24 hr to assess insertion site.

Infusion: Use a volumetric infusion pump. Infuse only if solution is absolutely clear and without particulate matter. Infuse slowly. If infusion falls behind, do not try to speed up infusion rate; serious overload could occur. Infusion rates of 20–30 mL/hr up to a maximum of 60–100 mL/hr have been used.

Incompatibilities: Do not mix with amphotericin B, ampicillin, carbenicillin, cephradine, gentamicin, metronidazole, tetracycline, ticarcillin.

Adverse effects

- **CNS:** *Headache, dizziness*, mental confusion, loss of consciousness
- **CV:** Hypertension, heart failure, **pulmonary edema**, tachycardia, *generalized flushing*
- **Endocrine:** Hypoglycemia, hyperglycemia, fatty acid deficiency, azotemia, hyperammonemia
- **GI:** *Nausea, vomiting*, abdominal pain, liver impairment, fatty liver
- **Hypersensitivity:** Fever, chills, rash, papular eruptions
- **Local:** *Pain, infection*, phlebitis, venous thrombosis, tissue sloughing at injection site

Interactions

★ **Drug–drug** • Reduced protein-sparing effects of amino acids if taken with tetracyclines

Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the solution; severe electrolyte or acid–base imbalance; inborn errors in amino acid metabolism; decreased circulating blood volume; hepatic or renal disease; hyperammonemia; bleeding abnormalities; diabetes mellitus; heart failure; hypertension
- **Physical:** T, weight, height; orientation, reflexes; P, BP, edema; R, lung auscultation;

abdominal examination; urinary output; CBC, platelet count, PT, electrolytes, BUN, blood glucose, uric acid, bilirubin, creatinine, plasma proteins, LFTs, renal function tests; urine glucose, osmolarity

Interventions

- Assess nutritional status before and frequently during treatment; weigh patient daily to monitor fluid load and nutritional status.
- Monitor vital signs often during infusion; monitor I&O continually during treatment.
- Observe infusion site at least daily for infection, phlebitis; change dressing using strict aseptic technique at least every 24 hr.
- Arrange to give D₅W or D₁₀W for injection by a peripheral line to avoid hypoglycemia rebound if TPN infusion needs to be stopped.
- Monitor urine glucose, acetone, and specific gravity every 6 hr during initial infusion period, at least bid when the infusion has stabilized; stop solution at any sign of renal failure.
- Monitor patient for vascular overload or hepatic impairment; decrease rate of infusion or discontinue.

Teaching points

- This drug can be given only through an intravenous or central line.
- This drug helps you to build new proteins and regain strength and healing power.
- You may experience these side effects: Headache, dizziness (medication may be ordered to help); nausea, vomiting; pain at infusion site.
- Report fever, chills, severe pain at infusion site, changes in color of urine or stool, severe headache, rash.

aminocaproic acid

(a mee noe ka **proe'** ik)

Amicar

PREGNANCY CATEGORY C

Drug class

Systemic hemostatic drug

Therapeutic actions

Inhibits fibrinolysis by inhibiting plasminogen activator substances and by antiplasmin activity; this action prevents the breakdown of clots.

Indications

- Treatment of excessive bleeding resulting from systemic hyperfibrinolysis and urinary fibrinolysis
- Unlabeled uses: Prevention of recurrence of subarachnoid hemorrhage; management of amegakaryocytic thrombocytopenia; to decrease the need for platelet administration; to abort and treat attacks of hereditary angioneurotic edema; to reduce postoperative bleeding complications in cardiac and orthopedic procedures

Contraindications and cautions

- Contraindicated with allergy to aminocaproic acid, active intravascular clotting, cardiac disease, renal impairment, hematuria of upper urinary tract origin, hepatic impairment, lactation.
- Use cautiously with hyperfibrinolysis, pregnancy.

Available forms

Tablets—500, 1,000 mg; injection—250 mg/mL; oral solution—250 mg/mL

Dosages

Adults

- *Treatment of excessive bleeding:* Initial dose of 5 g PO or IV followed by 1–1.25 g every hr to produce and sustain plasma levels of 0.13 mg/mL; do not administer more than 30 g/day.
- *Acute bleeding:* 4–5 g IV in 250 mL of diluent during the first hour of infusion; then continuous infusion of 1 g/hr in 50 mL of diluent. Continue for 8 hr or until bleeding stops.
- *Prevention of recurrence of subarachnoid hemorrhage:* 36 g/day in six divided doses, PO or IV.
- *Amegakaryocytic thrombocytopenia:* 2–24 g/day for 3 days to 13 mo.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	2 hr	Not known
IV	Immediate	Minutes	2–3 hr

Metabolism: $T_{1/2}$: 2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Dilute in compatible IV fluid. Rapid IV infusion undiluted is not recommended. Dilute 4 mL (1 g) of solution with 50 mL of diluent. For acute bleed, dilute 4–5 g in 250 mL diluent and give over 1 hr; then a continuous infusion of 1 g/hr given in 50 mL diluent. Store at room temperature.

Infusion: Infuse at 4–5 g the first hour of treatment, then 1 g/hr by continuous infusion; administer slowly to avoid hypotension, bradycardia, arrhythmias. Continue infusion for 8 hr or until bleeding is controlled. Undiluted, rapid injection is not recommended.

Compatibilities: Compatible with sterile water for injection, normal saline, 5% dextrose, Ringer's solution.

Adverse effects

- **CNS:** *Dizziness, tinnitus, headache*, delirium, hallucinations, psychotic reactions, weakness, conjunctival suffusion, nasal stuffiness
- **CV:** Hypotension, cardiac myopathy, bradycardia
- **GI:** *Nausea, cramps, diarrhea*, vomiting
- **GU:** Intrarenal obstruction, renal failure, *fertility problems*
- **Hematologic:** *Elevated serum CPK*, aldolase, AST, elevated serum potassium
- **Musculoskeletal:** *Malaise*, myopathy, symptomatic weakness, fatigue
- **Respiratory:** Dyspnea, **pulmonary embolism**
- **Other:** Rash, thrombophlebitis

Interactions

- * **Drug-drug** • Risk of hypercoagulable state with hormonal contraceptives, estrogens
- * **Drug-lab test** • Elevation of serum K⁺ levels, especially with impaired renal function

Nursing considerations

Assessment

- **History:** Allergy to aminocaproic acid, DIC, cardiac disease, renal impairment; hematuria of upper urinary tract origin, hepatic impairment, lactation, hyperfibrinolysis
- **Physical:** Skin color, lesions; muscular strength; orientation, reflexes, affect; BP, P, baseline ECG, peripheral perfusion; liver evaluation, bowel sounds, output; clotting studies, CPK, urinalysis, LFTs, renal function tests

Interventions

- Patient on oral therapy may need up to 10 tablets the first hour of treatment and tablets around the clock during treatment.
- Orient patient and offer support if hallucinations, delirium, or psychoses occur.
- Monitor patient for signs of clotting.

Teaching points

- You may experience these side effects: Dizziness, weakness, headache, hallucinations (avoid driving or the use of dangerous machinery; take special precautions to avoid injury); nausea, diarrhea, cramps (eat frequent small meals); infertility problems (menstrual irregularities, dry ejaculation—should go away when the drug is stopped); weakness, malaise (plan activities, take rest periods as needed).
- Report severe headache, restlessness, muscle pain and weakness, blood in the urine.

aminolevulinic acid hydrochloride

See Appendix U, *Less commonly used drugs*.

aminophylline (theophylline ethylenediamine) (am in off' i lin)

PREGNANCY CATEGORY C

Drug classes

Bronchodilator
Xanthine

Therapeutic actions

Relaxes bronchial smooth muscle, causing bronchodilation and increasing vital capacity, which has been impaired by bronchospasm and air trapping; in higher concentrations, it also inhibits the release of slow-reacting substance of anaphylaxis (SRS-A) and histamine and suppresses the response of airways to stimuli.

Indications

- Symptomatic relief or prevention of bronchial asthma and reversible bronchospasm associated with chronic bronchitis and emphysema
- As adjunct to inhaled beta₂ selective adrenergic agonists and systemic corticosteroids for the treatment of acute exacerbations of the symptoms and reversible airflow obstruction associated with asthma and other obstructive lung diseases
- Unlabeled uses: Respiratory stimulant in Cheyne-Stokes respiration; treatment of apnea and bradycardia in premature babies

Contraindications and cautions

- Contraindicated with hypersensitivity to any xanthine or to ethylenediamine, peptic ulcer, active gastritis.
- Use cautiously with cardiac arrhythmias, acute myocardial injury, heart failure, cor pulmonale, severe hypertension, severe hypoxemia, renal or hepatic disease, hyperthyroidism, alcoholism, labor, lactation, pregnancy.

Available forms

Tablets—100, 200 mg; injection—25 mg/mL

Dosages

Individualize dosage. Because of poor distribution of drug in body fat, dosing should be calculated based on ideal body weight. Base dosage adjustments on clinical response. Monitor serum theophylline levels and maintain a therapeutic range of 10–20 mcg/mL. Aminophylline is approximately 79% anhydrous theophylline by weight. To convert a theophylline dose to aminophylline, divide the theophylline dose by 0.8.

Adults

Oral

- *Acute symptoms requiring rapid theophyllinization in patients not receiving theophylline:* Initially, 300 mg PO in divided doses every 6–8 hr; after 3 days increase to 400 mg/day PO in divided doses every 6–8 hr; after 3 more days, if tolerated, 600 mg/day PO in divided doses every 6–8 hr. Dosage should then be adjusted based on the serum theophylline concentration.

Peak theophylline level

Peak theophylline level	Adjustment
< 9.9 mcg/mL	Increase dose 25% if symptoms are uncontrolled and dose is tolerated; recheck levels in 3 days.
10–14.9 mcg/mL	Maintain dose and recheck at 6-mo–12-mo intervals if symptoms are controlled and dose is tolerated.
15–19.9 mcg/mL	Consider a 10% decrease in dose if current dose is tolerated to increase safety window.
20–24.9 mcg/mL	Decrease dose by 25% even if no adverse events have been reported; recheck levels in 3 days.
25–30 mcg/mL	Skip next dose and then decrease dose by 25% even if no adverse events have been reported; recheck levels in 3 days.
> 30 mcg/mL	If symptomatic for overdose, treat accordingly. Decrease dose by 50% and recheck levels in 3 days.

Pediatric patients

Children are very sensitive to CNS stimulation of theophylline; use caution in younger children unable to report minor side effects. Not recommended for children younger than 6 mo. Safety and efficacy not established for children younger than 1 yr.

Oral

Acute bronchodilation: 5 mg/kg will produce an average peak theophylline level of 5–15 mcg/mL in patients who have not received any theophylline in the previous 24 hr.

Age and weight	Starting dose	After 3 days	After 3 more days
Children 1–15 yr weighing less than 45 kg	12–14 mg/kg/day in divided doses every 4–6 hr, maximum 300 mg/day	16 mg/kg/day in divided doses every 4–6 hr, maximum 400 mg/day	20 mg/kg/day in divided doses every 4–6 hr, maximum 600 mg/day
Children 16 yr and older weighing more than 45 kg (adult dose)	300 mg/day in divided doses every 6–8 hr	400 mg/day in divided doses every 6–8 hr	600 mg/day in divided doses every 6–8 hr

Patients with impaired renal function

Do not exceed 16 mg/kg/day up to a maximum 400 mg/day.

Adult and pediatric patients

IV

Loading dose is 5.7 mg/kg (aminophylline) calculated on ideal body weight. Administer over 30 min. This should produce a peak serum level of 6–16 mcg/mL. Determine serum levels 30 min after administering dose. If patient has had theophylline within 24 hr, monitor levels before administering loading dose and adjust dosage accordingly.

Initial theophylline infusion rates after loading dose to target 10 mcg/mL serum level. (Divide theophylline dose by 0.8 to arrive at aminophylline dose.)

Age	Initial infusion rate
Neonates 24 days or younger	1 mg/kg every 12 hr
Neonates older than 24 days	1.5 mg/kg every 12 hr
Infants 6–52 wk	$\text{mg/kg/hr} = 0.008 \times \text{age in weeks} + 0.21$
Children 1–9 yr	0.8 mg/kg/hr
Children 9–12 yr and adolescent smokers	0.7 mg/kg/hr
Nonsmoking adolescents 12–16 yr	0.5 mg/kg/hr; do not exceed 900 mg theophylline/day
Healthy, nonsmoking adults	0.4 mg/kg/hr; do not exceed 900 mg theophylline/day

Age	Initial infusion rate
Adults older than 60 yr	0.3 mg/kg/hr; do not exceed 400 mg theophylline/day
Adults with cardiac decompensation, cor pulmonale, hepatic impairment, sepsis with multiorgan failure, shock	0.2 mg/kg/hr; do not exceed 400 mg theophylline/day; do not exceed 17 mg/hr

Infusion dosage should be adjusted based on serum theophylline levels as noted under oral dosing.

Compatibilities: Aminophylline is compatible with most IV solutions, but do not mix in solution with other drugs, including vitamins.

Y-site incompatibilities: Dobutamine, hydralazine, ondansetron.

Adverse effects

- **Serum theophylline levels less than 20 mcg/mL:** Adverse effects uncommon
- **Serum theophylline levels more than 20–25 mcg/mL:** Nausea, vomiting, diarrhea, headache, insomnia, irritability (75% of patients)
- **Serum theophylline levels more than 30–35 mcg/mL:** Hyperglycemia, hypotension, cardiac arrhythmias, **seizures**, tachycardia (more than 10 mcg/mL in premature newborns), **brain damage**
- **CNS:** Irritability (especially in children); restlessness, dizziness, muscle twitching, seizures, severe depression, stammering speech; abnormal behavior characterized by withdrawal, mutism, and unresponsiveness alternating with hyperactive periods
- **CV:** Palpitations, sinus tachycardia, ventricular tachycardia, life-threatening ventricular arrhythmias, circulatory failure
- **GI:** Loss of appetite, hematemesis, epigastric pain, gastroesophageal reflux during sleep, increased AST
- **GU:** Proteinuria, increased excretion of renal tubular cells and RBCs; diuresis (dehydration), urinary retention in men with prostate enlargement
- **Respiratory:** Tachypnea, respiratory arrest
- **Other:** Fever, flushing, hyperglycemia, SIADH, rash

Interactions

*** Drug-drug** • Increased effects with acyclovir, allopurinol, cimetidine, erythromycin, troleandomycin, clindamycin, lincomycin, methotrexate, diltiazem, disulfiram, enoxacin, fluvoxamine, interferon alfa-2a, mexiletine, pentoxifylline, ticlopidine, verapamil, zileuton, influenza virus vaccine, fluoroquinolones, hormonal contraceptives • Possibly increased effects with thiabendazole, allopurinol • Increased cardiac toxicity with halothane; increased likelihood of seizures when given with ketamine; increased likelihood of adverse GI effects when given with tetracyclines • Increased or decreased effects with furosemide, levothyroxine, liothyronine, liotrix, thyroglobulin, thyroid hormones • Decreased effects in patients who are cigarette smokers (1–2 packs per day); theophylline dosage may need to be increased 50–100% • Decreased effects with phenobarbital, carbamazepine, isoproterenol, rifamycins • Increased effects, toxicity of sympathomimetics (especially ephedrine) with theophylline preparations • Decreased effects of phenytoin and theophylline preparations when given concomitantly • Decreased effects of lithium carbonate, nondepolarizing neuromuscular blockers given with theophylline preparations • Mutually antagonistic effects of beta-blockers and theophylline preparations

*** Drug-food** • Elimination is increased by a low-carbohydrate, high-protein diet and by charcoal-broiled beef • Elimination is decreased by a high-carbohydrate, low-protein diet • Food may alter bioavailability and absorption of timed-release theophylline preparations, causing toxicity; these forms should be taken on an empty stomach

*** Drug-lab test** • Interference with spectrophotometric determinations of serum theophylline levels by furosemide, phenylbutazone, probenecid, theobromine; coffee, tea, cola beverages, chocolate, acetaminophen cause falsely high values • Alteration in assays of uric acid, urinary catecholamines, plasma free fatty acids by theophylline preparations

■ Nursing considerations

Assessment

• History: Hypersensitivity to any xanthine or to ethylenediamine, peptic ulcer, active

gastritis, cardiac arrhythmias, acute myocardial injury, heart failure, cor pulmonale, severe hypertension, severe hypoxemia, renal or hepatic disease, hyperthyroidism, alcoholism, labor, lactation

• Physical: Bowel sounds, normal output; P, auscultation, BP, perfusion, ECG; R, adventitious sounds; frequency of urination, voiding, normal output pattern, urinalysis, LFTs, renal function tests; liver palpation; thyroid function tests; skin color, texture, lesions; reflexes, bilateral grip strength, affect, EEG

Interventions

- Administer to pregnant patients only when clearly needed—neonatal tachycardia, jitteriness, and withdrawal apnea observed when mothers received xanthines up until delivery.
- Give tablets, liquid dosage forms with food if GI effects occur.
- Maintain adequate hydration.
- Monitor results of serum theophylline levels carefully, and arrange for reduced dosage if serum levels exceed therapeutic range of 10–20 mcg/mL.
- Take serum samples to determine peak theophylline concentration drawn 15–30 min after an IV loading dose.
- Monitor for clinical signs of adverse effects, particularly if serum theophylline levels are not available.
- Ensure that diazepam and/or phenobarbital is readily available to treat seizures.

Teaching points

- Take this drug exactly as prescribed.
- It may be necessary to take this drug around-the-clock for adequate control of asthma attacks.
- Avoid excessive intake of coffee, tea, cocoa, cola beverages, and chocolate.
- Smoking cigarettes or other tobacco products impacts the drug's effectiveness. Try not to smoke. Notify your health care provider if smoking habits change while taking this drug.
- Frequent blood tests may be necessary to monitor the effect of this drug and to ensure safe and effective dosage; keep all appointments for blood tests and other monitoring.

- You may experience these side effects: Nausea, loss of appetite (taking this drug with food may help if taking the immediate-release or liquid dosage forms); difficulty sleeping, depression, emotional lability (reversible).
- Report nausea, vomiting, severe GI pain, restlessness, seizures, irregular heartbeat.

DANGEROUS DRUG

amiodarone hydrochloride

(a mee o' da rone)

Apo-Amiodarone (CAN), Cordarone, Gen-Amiodarone (CAN), Nexterone, Novo-Amiodarone (CAN), Pacerone, PMS-Amiodarone (CAN), ratio-Amiodarone (CAN)

PREGNANCY CATEGORY D

Drug classes

Adrenergic blocker (not used as sympatholytic drug)

Antiarrhythmic

Therapeutic actions

Type III antiarrhythmic: Acts directly on cardiac cell membrane; prolongs repolarization and refractory period; increases ventricular fibrillation threshold; acts on peripheral smooth muscle to decrease peripheral resistance.

Indications

- Only for treatment of the following documented life-threatening recurrent ventricular arrhythmias that do not respond to documented adequate doses of other antiarrhythmics or when alternative agents are not tolerated: Recurrent ventricular fibrillation, recurrent hemodynamically unstable ventricular tachycardia. Serious and even fatal toxicity has been reported with this drug; use alternative agents first; very closely monitor patient receiving this drug
- Unlabeled uses: Treatment of refractory sustained or paroxysmal atrial fibrillation and paroxysmal supraventricular tachycardia; postoperative conversion of atrial fibrillation, atrial flutter

Contraindications and cautions

- Contraindicated with hypersensitivity to amiodarone; sinus node dysfunction, heart block, cardiogenic shock, severe bradycardia; hypokalemia; lactation; sensitivity to iodine.
- Use cautiously with thyroid dysfunction, pregnancy.

Available forms

Tablets—100, 200, 400 mg; injection—50 mg/mL

Dosages

Careful patient assessment and evaluation with continual monitoring of cardiac response are necessary for titrating the dosage. Therapy should begin in the hospital with continual monitoring and emergency equipment on standby. The following is a guide to usual dosage.

Adults

Oral

Loading dose, 800–1,600 mg/day PO in divided doses for doses of 1,000 mg or more or with GI intolerance, for 1–3 wk; reduce dose to 600–800 mg/day in divided doses for 1 mo; if rhythm is stable, reduce dose to 400 mg/day in one to two divided doses for maintenance dose. Adjust to the lowest possible dose to limit side effects.

IV

1,000 mg IV over 24 hr—150 mg loading dose over 10 min, followed by 360 mg over 6 hr at rate of 1 mg/min, then 540 mg at 0.5 mg/min over the next 18 hr. After the first 24 hr, a maintenance infusion of 0.5 mg/min (720 mg/24 hr) or less can be cautiously continued for 2–3 wk. Switch to oral form as soon as possible.

Converting from IV to PO

IV dose of 720 mg/day at 0.5 mg/min: Convert to PO dose based on duration of IV therapy. Less than 1 wk—initial oral dose 800–1,600 mg; 1–3 wk—initial oral dose 600–800 mg; more than 3 wk—initial oral dose 400 mg.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2–3 days	3–7 hr	6–8 hr
IV	Immediate	20 min	Infusion

Metabolism: Hepatic; $T_{1/2}$: 10 days, then 40–55 days

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces

IV FACTS

Preparation: Do not use PVC container if infusion is to exceed 2 hr; use glass or polyolefin instead. Dilute 150 mg in 100 mL D₅W for rapid loading dose (1.5 mg/mL). Dilute 900 mg in 500 mL D₅W for slow infusions (1.8 mg/mL). Store at room temperature and use within 24 hr.

Infusion: Infuse loading dose over 10 min. Immediately follow with slow infusion of 1 mg/min or 33.3 mL/hr. Maintenance infusion of 0.5 mg/min or 16.6 mL/hr can be continued up to 96 hr. Use of an infusion pump is advised.

Incompatibilities: Do not mix with aminophylline, cefazolin, heparin, sodium bicarbonate; do not mix in solution with other drugs.

Adverse effects

- **CNS:** *Malaise, fatigue, dizziness, tremors, ataxia, paresthesias, lack of coordination*
- **CV: Cardiac arrhythmias**, heart failure, **cardiac arrest**, *hypotension*
- **EENT:** *Corneal microdeposits* (photophobia, dry eyes, halos, blurred vision); ophthalmic abnormalities including permanent blindness
- **Endocrine:** *Hypothyroidism or hyperthyroidism*
- **GI:** *Nausea, vomiting, anorexia, constipation, abnormal LFT, hepatotoxicity*
- **Respiratory: Pulmonary toxicity**—pneumonitis, infiltrates (shortness of breath, cough, rales, wheezes)
- **Other:** *Photosensitivity, angioedema*

Interactions

* **Drug-drug** • Increased digitalis toxicity with digoxin • Increased risk of rhabdomyolysis if combined with simvastatin; limit sim-

vastatin to less than 20 mg/dose • Increased quinidine toxicity with quinidine • Increased procainamide toxicity with procainamide • Increased flecainide toxicity with amiodarone • Increased risk of arrhythmias with azole antifungals, fluoroquinolones, macrolide antibiotics, ranolazine, trazodone, cisapride, thioridazine, vardenafil, ziprasidone • Increased phenytoin toxicity with phenytoin, ethotoin • Increased bleeding tendencies with warfarin • Potential sinus arrest and heart block with beta-blockers, calcium channel blockers

* **Drug-lab test** • Increased T_4 levels, increased serum reverse T_3 levels

* **Drug-food** • Increased risk of toxicity if oral form combined with grapefruit juice; avoid this combination

Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred with amrinone (name has now been changed to inamrinone, but confusion may still occur); use caution.

Assessment

- **History:** Hypersensitivity to amiodarone, sinus node dysfunction, heart block, severe bradycardia, hypokalemia, lactation, thyroid dysfunction, pregnancy
- **Physical:** Skin color, lesions; reflexes, gait, eye examination; P, BP, auscultation, continuous ECG monitoring; R, adventitious sounds, baseline chest X-ray; liver evaluation; LFTs, serum electrolytes, T_4 , and T_3

Interventions

⊗ **Black box warning** Reserve use for life-threatening arrhythmias; serious toxicity, including arrhythmias, pulmonary toxicity can occur.

- Monitor cardiac rhythm continuously.
- Monitor for an extended period when dosage adjustments are made.

⊗ **Warning** Monitor for safe and effective serum levels (0.5–2.5 mcg/mL).

⊗ **Warning** Doses of digoxin, quinidine, procainamide, phenytoin, and warfarin may need to be reduced one-third to one-half when amiodarone is started.

- Give drug with meals to decrease GI problems.
- Arrange for ophthalmologic examinations; reevaluate at any sign of optic neuropathy.
- Arrange for periodic chest X-ray to evaluate pulmonary status (every 3–6 mo).
- Arrange for regular periodic blood tests for liver enzymes, thyroid hormone levels.

Teaching points

- Drug dosage will be changed in relation to response of arrhythmias; you will need to be hospitalized during initiation of drug therapy; you will be closely monitored when dosage is changed.
- Avoid grapefruit juice while on this drug.
- Have regular medical follow-up, monitoring of cardiac rhythm, chest X-ray, eye examination, blood tests.
- You should avoid pregnancy while taking this drug. If you are nursing a baby, you should use another method of feeding the baby.
- You may experience these side effects: Changes in vision (halos, dry eyes, sensitivity to light; wear sunglasses, monitor light exposure); nausea, vomiting, loss of appetite (take with meals; eat frequent small meals); sensitivity to the sun (use a sunscreen or protective clothing when outdoors); constipation (a laxative may be ordered); tremors, twitching, dizziness, loss of coordination (do not drive, operate dangerous machinery, or undertake tasks that require coordination until drug effects stabilize and your body adjusts to it).
- Report unusual bleeding or bruising; fever, chills; intolerance to heat or cold; shortness of breath, difficulty breathing, cough; swelling of ankles or fingers; palpitations; difficulty with vision.

amitriptyline hydrochloride

(a mee *trip'* ti leen)

Apo-Amitriptyline (CAN)

PREGNANCY CATEGORY D

Drug class

Antidepressant
TCA; tertiary amine

Therapeutic actions

Mechanism of action unknown; TCAs inhibit the reuptake of the neurotransmitters norepinephrine and serotonin, leading to an increase in their effects; anticholinergic at CNS and peripheral receptors; sedative.

Indications

- Relief of symptoms of depression (endogenous most responsive); sedative effects may help when depression is associated with anxiety and sleep disturbance
- Unlabeled uses: Control of chronic pain (eg, intractable pain of cancer, central pain syndromes, peripheral neuropathies, postherpetic neuralgia, tic douloureux); prevention of onset of cluster and migraine headaches; treatment of pathologic weeping and laughing secondary to forebrain disease (due to MS); insomnia; fibromyalgia

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation.
- Use cautiously with electroshock therapy; preexisting CV disorders (severe heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis with TCA therapy); patients with bipolar disorder; elective surgery (discontinue as long as possible before surgery).

Available forms

Tablets—10, 25, 50, 75, 100, 150 mg

Dosages

Adults

- *Depression, hospitalized patients:* Initially, 100 mg/day PO in divided doses; gradually increase to 200–300 mg/day as required.
- *Depression, outpatients:* Initially, 75 mg/day PO, in divided doses; may increase to 150 mg/day. Increases should be made in late afternoon or at bedtime. Total daily dosage may be administered at bedtime. Initiate single

daily dose therapy with 50–100 mg at bedtime; increase by 25–50 mg as necessary to a total of 150 mg/day. Maintenance dose, 40–100 mg/day, which may be given as a single bedtime dose. After satisfactory response, reduce to lowest effective dosage. Continue therapy for 3 mo or longer to lessen possibility of relapse.

• **Chronic pain:** 75–150 mg/day PO.

Pediatric patients 12 yr and older

10 mg tid PO and then 20 mg at bedtime.

Pediatric patients younger than 12 yr

Not recommended.

Geriatric patients

10 mg tid PO and then 20 mg at bedtime.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	2–4 wk

Metabolism: Hepatic; $T_{1/2}$: 10–50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Disturbed concentration, sedation and anticholinergic (atropine-like) effects, confusion* (especially in elderly), hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, seizures, speech blockage, dysarthria, tinnitus, altered EEG
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure, CVA
- **Endocrine:** Elevated or depressed blood sugar, elevated prolactin levels, inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia,

peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis, jaundice (rare), elevated transaminase, altered alkaline phosphatase

- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; increased or decreased libido; impotence
- **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia, purpura, thrombocytopenia, leukopenia
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, face, tongue), drug fever
- **Withdrawal:** Symptoms on abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight change; sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine • Increased TCA levels with methylphenidate, phenothiazines, hormonal contraceptives, disulfiram
- Hyperpyretic crises, severe seizures, hypertensive episodes and deaths with MAOIs, furazolidone
- Increased antidepressant response and cardiac arrhythmias with thyroid medication
- Increased or decreased effects with estrogens • Delirium with disulfiram • Sympathetic hyperactivity, sinus tachycardia, hypertension, agitation with levodopa
- Increased biotransformation of TCAs in patients who smoke cigarettes
- Increased sympathomimetic (especially beta-adrenergic) effects of direct-acting sympathomimetic drugs (norepinephrine, epinephrine)
- Increased anticholinergic effects of anticholinergics (including anticholinergic antiparkinsonians)
- Increased response (especially CNS depression) to barbiturates
- Decreased antihypertensive effect of clonidine, other antihypertensives
- Decreased effects of indirect-acting sympathomimetic drugs (ephedrine)
- Increased risk of QT-interval prolongation if combined with other drugs that prolong QT interval

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients; manic-depressive patients; elective surgery
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

⊗ **Black box warning** Children, adolescents, and young adults have increased risk of suicidality; monitor patient carefully.

- Restrict drug access for depressed and potentially suicidal patients.
- Administer major portion of dose at bedtime if drowsiness, severe anticholinergic effects occur (note that the elderly may not tolerate single-daily-dose therapy).
- Reduce dosage if minor side effects develop; discontinue if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.
- Be aware that drug's sedative effects may be apparent before the antidepressant effect is seen.

Teaching points

- Take drug exactly as prescribed; do not stop abruptly or without consulting your health care provider.
- Drug's sedative effects may be apparent before the antidepressant effect is seen.
- Avoid using alcohol, other sleep-inducing drugs, over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use sunscreen or protective garments.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; if severe, avoid driving and tasks requiring alertness while these persist);

nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals; use frequent mouth care and suck on sugarless candies); nightmares, inability to concentrate, confusion; changes in sexual function.

- Report dry mouth, difficulty in urination, excessive sedation, thoughts of suicide.

▽ amlodipine besylate

(*am loe' di been beh' sab layt*)

Norvaco

PREGNANCY CATEGORY C

Drug classes

Antianginal

Antihypertensive

Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells; inhibits transmembrane calcium flow, which results in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, depression of myocardial contractility, and dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac oxygen consumption, and in patients with vasospastic (Prinzmetal's) angina, increased delivery of oxygen to cardiac cells.

Indications

- Angina pectoris due to coronary artery spasm (Prinzmetal's variant angina)
- Chronic stable angina, alone or in combination with other drugs
- To reduce the risk of hospitalization due to angina and to reduce the need for coronary revascularization procedures in patients with angiographically documented CAD without heart failure or ejection fraction less than 40%
- Essential hypertension, alone or in combination with other antihypertensives

Contraindications and cautions

- Contraindicated with allergy to amlodipine, impaired hepatic function, sick sinus

syndrome, heart block (second or third degree), lactation.

- Use cautiously with heart failure, pregnancy.

Available forms

Tablets—2.5, 5, 10 mg

Dosages

Adults

Initially, 5 mg PO daily; dosage may be gradually increased over 10–14 days to a maximum dose of 10 mg PO daily.

Pediatric patients 6–17 yr

- *Hypertension*: 2.5–5 mg/day PO.

Geriatric patients or patients with hepatic impairment

Initially, 2.5–5 mg PO daily; dosage may be gradually adjusted over 7–14 days based on clinical assessment.

Pharmacokinetics

Route	Onset	Peak
Oral	Unknown	6–12 hr

Metabolism: Hepatic; $T_{1/2}$: 30–50 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue, lethargy*
- **CV:** *Peripheral edema, arrhythmias*
- **Dermatologic:** *Flushing, rash*
- **GI:** *Nausea, abdominal discomfort*

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Norvasc* (amlodipine) and *Navane* (thiothixene); use caution.

Assessment

- **History:** Allergy to amlodipine, impaired hepatic function, sick sinus syndrome, heart block, lactation, heart failure
- **Physical:** Skin lesions, color, edema; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds; liver evalu-

ation, GI normal output; LFTs, renal function tests, urinalysis

Interventions

⊗ **Warning** Monitor patient carefully (BP, cardiac rhythm, and output) while adjusting drug to therapeutic dose; use special caution if patient has heart failure.

- Monitor BP very carefully if patient is also on nitrates.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- Administer drug without regard to meals.

Teaching points

- Take with meals if upset stomach occurs.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (adjust lighting, noise, and temperature; medication may be ordered).
- Report irregular heartbeat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

▽ ammonium chloride (*ab mo' nee um*)

PREGNANCY CATEGORY C

Drug classes

Electrolyte

Urinary acidifier

Therapeutic actions

Converted to urea in the liver; liberated hydrogen and chloride ions in blood and extracellular fluid lower the pH and correct alkalosis; lowers the urinary pH, producing an acidic urine that changes the excretion rate of many metabolites and drugs.

Indications

- Treatment of hypochloremic states and metabolic alkalosis
- Acidification of urine

Contraindications and cautions

- Contraindicated with renal function impairment; hepatic impairment; metabolic

alkalosis due to vomiting of hydrochloric acid when it is accompanied by loss of sodium bicarbonate in the urine.

- Use cautiously with pregnancy, primary respiratory acidosis, high total CO₂ and buffer base, lactation.

Available forms

Injection—26.75% (5 mEq/mL)

Dosages

An oral dosage form of the drug is no longer commercially available.

Adults

Dosage is determined by patient's condition and tolerance; monitor dosage rate and amount by repeated serum bicarbonate determinations.

Pediatric patients

Safety and efficacy for injection in children have not been established.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	1–3 hr

Metabolism: Hepatic

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add contents of one or two vials (100–200 mEq) to 500 or 1,000 mL isotonic (0.9%) sodium chloride injection. Concentration should not exceed 1%–2% ammonium chloride. Avoid excessive heat; protect from freezing. If crystals do appear, warm the solution to room temperature in a water bath prior to use.

Infusion: Do not exceed rate of 5 mL/min in adults (1,000 mL infused over 3 hr). Infuse slowly. Reduce rate in infants and children.

Incompatibilities: Do not mix with levorphanol, norepinephrine, dobutamine.

Adverse effects

- **GI:** Severe hepatic impairment
- **Local:** Pain or irritation at injection site, fever, venous thrombosis, phlebitis, extravasation
- **Metabolic:** Metabolic acidosis, hypervolemia, **ammonia toxicity**—pallor, sweat-

ing, irregular breathing, retching, bradycardia, arrhythmias, twitching, seizures, coma; hypokalemia

Interactions

• **Drug-drug** • Decreased therapeutic levels due to increased elimination of amphetamine, methamphetamine, dextroamphetamine, ephedrine, flecainide, pseudoephedrine, methadone, mexiletine when taken with ammonium chloride • Increased effects of chlorpromamide with ammonium chloride

Nursing considerations

Assessment

- **History:** Renal or hepatic impairment; metabolic alkalosis due to vomiting of hydrochloric acid when it is accompanied by loss of sodium, respiratory acidosis
- **Physical:** P, BP; skin color, texture; T; injection site evaluation; LFTs, renal function tests, serum bicarbonate, urinalysis

Interventions

- Infuse IV slowly to avoid irritation; check infusion site frequently to monitor for reaction.
- Monitor IV doses for possible fluid overload.
- Monitor for acidosis (increased R, restlessness, sweating, increased blood pH); decrease infusion as appropriate. Ensure that sodium bicarbonate or sodium lactate is readily available in case of overdose.

Teaching points

- Frequent monitoring of blood tests is needed when receiving IV drugs to determine dosage and rate of drug.
- Report pain or irritation at IV site; confusion, restlessness, sweating, headache; severe GI upset, fever, chills.

amoxapine

(a *mox' a peen*)

PREGNANCY CATEGORY C

Drug classes

Anxiolytic
TCA

Therapeutic actions

Mechanism of action unknown; TCAs inhibit the reuptake of the neurotransmitters norepinephrine and serotonin, leading to an increase in their effects; anticholinergic at CNS and peripheral receptors; sedative.

Indications

- Relief of symptoms of depression in patients with neurotic or reactive depressive disorders and in those with endogenous and psychotic depression (endogenous depression most responsive)
- Treatment of depression accompanied with anxiety or agitation

Contraindications and cautions

- Contraindicated with hypersensitivity to tricyclic drugs; concomitant use with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation.
- Use cautiously with EST; preexisting CV disorders (severe coronary heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis); patients with bipolar disorder; elective surgery (discontinue as soon as possible before surgery), pregnancy.

Available forms

Tablets—25, 50, 100, 150 mg

Dosages

Adults

Initially, 50 mg PO bid–tid; gradually increase to 100 mg bid–tid by end of first wk if tolerated; increase above 300 mg/day only if this dosage ineffective for at least 2 wk. Hospitalized patients refractory to antidepressant therapy and with no history of seizures may be given up to 600 mg/day in divided doses; after effective dosage is established, drug may be given in a single dose at bedtime (maximum, 300 mg). Usual effective dose is 200–300 mg/day.

Pediatric patients

Not recommended for patients younger than 16 yr.

Geriatric patients

Initially, 25 mg bid–tid; if tolerated, dosage may be increased by end of first week to 50 mg bid–tid. For many elderly patients, 100–150 mg/day may be adequate; some may require up to 300 mg/day. Once effective dose is established, give as single dose at bedtime, not to exceed 300 mg.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	90 min	2–4 wk

Metabolism: Hepatic; $T_{1/2}$: 8–30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Disturbed concentration, sedation and anticholinergic (atropine-like) effects, confusion* (especially in elderly), hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, seizures, speech blockage, dysarthria, tinnitus, altered EEG
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure, stroke
- **Endocrine:** Elevated or depressed blood sugar, elevated prolactin levels, inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis, jaundice (rare); elevated transaminase, altered alkaline phosphatase
- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia,

testicular swelling in men; breast enlargement, menstrual irregularity, and galactorrhea in women; changes in libido; impotence

- **Hematologic:** Bone marrow depression
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, facial, tongue), drug fever
- **Withdrawal:** Symptoms on abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight gain or loss, sweating, alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

• **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine • Increased TCA levels with methylphenidate, phenothiazines, hormonal contraceptives, disulfiram, cimetidine, ranitidine • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths with MAOIs, furazolidone • Increased antidepressant response and cardiac arrhythmias with thyroid medication • Increased or decreased effects with estrogens • Delirium with disulfiram • Sympathetic hyperactivity, sinus tachycardia, hypertension, agitation with levodopa • Increased biotransformation of TCAs in patients who smoke cigarettes • Increased sympathomimetic (especially alpha-adrenergic) effects of direct-acting sympathomimetic drugs (norepinephrine, epinephrine) • Increased anticholinergic effects of anticholinergic drugs (including anticholinergic antiparkinsonians) • Increased response (especially CNS depression) to barbiturates • Decreased antihypertensive effect of clonidine, other antihypertensives

■ Nursing considerations

Assessment

• **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP; urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; psychiatric disorders; manic-depression; elective surgery

• **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

• Restrict drug access for depressed and potentially suicidal patients.

⊗ **Black box warning** Children, adolescents, and young adults have increased risk of suicidality; monitor patient carefully.

- Give most of dose at bedtime if drowsiness, severe anticholinergic effects occur (elderly patients may not tolerate single daily dose).
- Reduce dosage if minor side effects develop; discontinue if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.
- Encourage elderly men or men with prostate problems to void before taking drug.

Teaching points

- Do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid using alcohol, other sleep-inducing drugs, and over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; safety measures may need to be taken if severe; avoid driving or tasks requiring alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals, frequent mouth care, and sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty in urination, excessive sedation, thoughts of suicide.

amoxicillin trihydrate

(*a mox i sill' in try bigb' drayt*)

Amoxil, Apo-Amoxi (CAN), DisperMox, Gen-Amoxicillin (CAN), Moxatag **onc**, Novamoxin (CAN), Nu-Amoxi (CAN), Trimox

PREGNANCY CATEGORY B

Drug class

Antibiotic (penicillin–ampicillin type)

Therapeutic actions

Bactericidal: Inhibits synthesis of cell wall of sensitive organisms, causing cell death.

Indications

- Treatment of tonsillitis and pharyngitis caused by *Streptococcus pyogenes* (ER tablet)
- Infections due to susceptible strains of *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria gonorrhoeae*, *Streptococcus pneumoniae*, *Enterococcus faecalis*, streptococci, non–penicillinase-producing staphylococci
- *Helicobacter pylori* infection in combination with other agents
- Postexposure prophylaxis against *Bacillus anthracis*
- Unlabeled use: *Chlamydia trachomatis* in pregnancy, mild to moderate otitis media in children

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, or other allergens.
- Use cautiously with renal disorders, lactation.

Available forms

Chewable tablets—125, 200, 250, 400 mg; tablets—500, 875 mg; capsules—250, 500 mg; powder for oral suspension—125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL; tablets for oral suspension—200, 400 mg; ER tablets **onc**—775 mg

Available in oral preparations only.

Dosages

Adults and pediatric patients weighing more than 40 kg

- URIs, GU infections, skin and soft-tissue infections: Mild to moderate—250 mg PO every 8 hr—500 mg PO every 12 hr; severe infection—500 mg every 8 hr or 875 mg every 12 hr.
- Postexposure anthrax prophylaxis: 500 mg PO tid to complete a 60-day course after 14–21 days of a fluoroquinolone or doxycycline.
- Lower respiratory infections: 500 mg PO every 8 hr or 875 mg PO bid.
- Uncomplicated gonococcal infections: 3 g amoxicillin with 1 g probenecid PO as a single dose.
- *C. trachomatis* in pregnancy: 500 mg PO tid for 7 days or 875 mg PO bid.
- Tonsillitis or pharyngitis: 775 mg/day PO for 10 days with food (ER tablet).
- *H. pylori* infections: 1 g bid with clarithromycin 500 mg bid and lansoprazole 30 mg bid for 14 days.

Pediatric patients 3 mo and older weighing less than 40 kg

- URIs, GU infections, skin and soft-tissue infections: Mild to moderate infection—20 mg/kg/day PO in divided doses every 8 hr or 25 mg/kg/day PO in divided doses every 12 hr. Severe infection—40 mg/kg/day in divided doses every 8 hr or 45 mg/kg/day PO in divided doses every 12 hr.
- Postexposure anthrax prophylaxis: 80 mg/kg/day PO divided into 3 doses to complete a 60-day course after 14–21 days of fluoroquinolone or doxycycline therapy.

Pediatric patients 3 mo and older

- Mild to moderate URIs, GU infections, and skin infections: 20 mg/kg daily in divided doses every 8 hr or 25 mg/kg in divided doses every 12 hr.
- Acute otitis media: 80–90 mg/kg/day PO for 10 days (severe cases) or for 5–7 days (moderate cases).
- Gonorrhea in prepubertal children: 50 mg/kg PO with 25 mg/kg probenecid as a single dose (probenecid contraindicated in children younger than 2 yr).
- For lower respiratory infections, or severe URIs, GU, or skin infections: 40 mg/kg daily

in divided doses every 8 hr or 45 mg/kg daily in divided doses every 12 hr.

Pediatric patients up to 12 wk

Up to 30 mg/kg daily in divided doses every 12 hr.

Patients with renal impairment

Do not use 875-mg tablet if GFR is less than 30 mL/min. For GFR of 10–30 mL/min, 250–500 mg every 12 hr; for GFR less than 10 mL/min, 250–500 mg every 24 hr; for hemodialysis patients, 250–500 mg every 24 hr with additional doses during and after dialysis.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1 hr	6–8 hr

Metabolism: $T_{1/2}$: 1–1.4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black “hairy” tongue, nausea, vomiting, diarrhea, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, nonspecific hepatitis*
- **GU:** Nephritis
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time
- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Other:** *Superinfections*—oral and rectal moniliasis, vaginitis

Interactions

- **Drug-drug** • Increased effect with probenecid • Decreased effectiveness with tetracyclines, chloramphenicol • Decreased efficacy of hormonal contraceptives
- **Drug-food** • Delayed or reduced GI absorption with food

■ Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, or other allergens; renal disorders; lactation

- **Physical:** Culture infected area; skin color, lesion; R, adventitious sounds; bowel sounds; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

- Culture infected area prior to treatment; reculture area if response is not as expected.
- Give in oral preparations only; amoxicillin is not affected by food. Ensure that patient does not cut, crush, or chew ER tablets.
- Continue therapy for at least 2 days after signs of infection have disappeared; continuation for 10 full days is recommended.
- Use corticosteroids or antihistamines for skin reactions.

Teaching points

- Take this drug around-the-clock.
- Take the full course of therapy; do not stop because you feel better. Do not cut, crush, or chew ER tablets (*Moxatag*).
- This antibiotic is specific for this problem and should not be used to self-treat other infections.
- You may experience these side effects: Nausea, vomiting, GI upset (eat frequent small meals); diarrhea; sore mouth (frequent mouth care may help).
- Report unusual bleeding or bruising, sore throat, fever, rash, hives, severe diarrhea, difficulty breathing.

⚠ DANGEROUS DRUG

➤ **amphotericin B**
(*am foe ter' i sin*)

**amphotericin B
desoxycholate**

**amphotericin B,
lipid-based**

Abelcet, AmBisome, Amphotec

PREGNANCY CATEGORY B

Drug class

Antifungal

Therapeutic actions

Binds to sterols in the fungal cell membrane with a resultant change in membrane permeability, an effect that can destroy fungal cells and prevent their reproduction; fungicidal or fungistatic depending on concentration and organism.

Indications

- Reserve use for patients with progressive, potentially fatal infections: Cryptococcosis; North American blastomycosis; systemic candidiasis; disseminated moniliasis; coccidioidomycosis and histoplasmosis; mucormycosis caused by species of *Mucor*, *Rhizopus*, *Absidia*, *Conidiobolus*, *Basidiobolus*; sporotrichosis; aspergillosis. Not for use in treating noninvasive fungal infections
- Adjunct treatment of American mucocutaneous leishmaniasis (not choice in primary therapy)
- Treatment of aspergillosis in patients refractory to conventional therapy (*Abelcet*, *Amphotec*)
- Treatment of cryptococcal meningitis in HIV-infected patients (*AmBisome*)
- Treatment of invasive aspergillosis where renal toxicity precludes use of conventional amphotericin B (*Amphotec*)
- Treatment of presumed fungal infections in febrile, neutropenic patients (*AmBisome*)
- Treatment of *Aspergillus*, *Candida*, or *Cryptococcus* infections in patients intolerant to or refractory to conventional amphotericin B (*AmBisome*)
- Treatment of any type of progressive fungal infection that does not respond to conventional therapy
- Unlabeled use: Prophylactic to prevent fungal infections in bone marrow transplants, bladder irrigation for candidal cystitis, primary treatment of amoebic meningoencephalitis, ocular aspergillosis, treatment of severe meningitis in patients unresponsive to IV therapy (intrathecal administration)

Contraindications and cautions

- Contraindicated with allergy to amphotericin B, renal impairment, lactation (except when life-threatening and treatable only with this drug).
- Use cautiously with pregnancy.

Available forms

Injection—50 mg; suspension for injection—100 mg/20 mL; powder for injection—50, 100 mg/vial

Dosages

Adults and pediatric patients

Abelcet

Consider test dose; if tolerated, may proceed to regular dosing regimen.

- *Fungal infections, systemic*: 5 mg/kg/day given as a single infusion at 2.5 mg/kg/hr.

Amphotec

Use test dose (10 mL of final preparation infused over 15–30 min).

- *Aspergillosis*: Initially, 3–4 mg/kg/day, may increase to 6 mg/kg/day IV. Infuse at 1 mg/kg/hr over at least 2 hr.

AmBisome

Consider test dose; if tolerated, may proceed to regular dosing regimen.

- *Presumed fungal infection in febrile neutropenic patients*: 3 mg/kg/day IV.
- *Cryptococcal meningitis in HIV*: 6 mg/kg/day IV.
- *Aspergillosis*: 3 mg/kg/day IV, give over more than 2 hr.
- *Leishmaniasis*: 3 mg/kg/day IV, days 1–5, 14, and 21 for immunocompetent patients; 4 mg/kg/day IV, days 1–5, 10, 17, 24, 31, and 38 for immunocompromised patients.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	20–30 min	1–2 hr	20–24 hr

Metabolism: $T_{1/2}$: 24 hr initially and then 15 days; 173.4 hr (*Abelcet*)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Abelcet: Shake vial gently until no yellow sediment is seen. Withdraw dose, replace needle with a 5-micron filter needle. Inject into bag containing 5% dextrose injection to a concentration of 1 mg/mL. May be further diluted. Store vials in refrigerator; stable for 48 hr

once prepared if refrigerated, for 6 hr at room temperature.

Amphotec: Reconstitute with sterile water for injection. 10 mL to 50 mg/vial or 20 mL to 100 mg/vial. Dilute to 0.6 mg/mL. Refrigerate after reconstitution; use within 24 hr.

AmBisome: Add 12 mL sterile water to each vial to yield 4 mg/mL; immediately shake vial for 30 sec until yellow translucent suspension formed; draw up dose via syringe, attach 5 micron filter, and inject into appropriate volume at 5% dextrose to final concentration of 1–2 mg/mL (0.2–0.5 mg/mL for infants/small children).

Infusion: Amphotericin B: Protect from exposure to light if not infused within 8 hr of preparation. Infuse slowly over 6 hr.

Abelcet: Infuse at rate of 2.5 mg/kg/hr. If infusion takes more than 2 hr, remix bag by shaking.

Amphotec: Infuse at 1 mg/kg/hr over at least 2 hr; do not use an in-line filter.

AmBisome: Flush line with D₅W prior to infusion. Infuse over more than 2 hr if tolerated; stop immediately at any sign of anaphylactic reaction.

Incompatibilities: Do not mix with saline-containing solution, parenteral nutritional solutions, aminoglycosides, penicillins, phenothiazines, calcium preparations, cimetidine, metamizolol, methyl dopa, polymyxin, potassium chloride, ranitidine, verapamil, clindamycin, cotrimoxazole, dopamine, dobutamine, tetracycline, vitamins, lidocaine, procaine, or heparin. **If line must be flushed, do not use heparin or saline; use D₅W.**

Y-site incompatibilities: Foscarnet, ondansetron.

Adverse effects

Systemic administration

- **CNS:** Fever (often with shaking chills), headache, malaise, generalized pain
- **GI:** Nausea, vomiting, dyspepsia, diarrhea, cramping, epigastric pain, anorexia
- **GU:** Hypokalemia, azotemia, hyposthenuria, renal tubular acidosis, nephrocalcinosis
- **Hematologic:** Normochromic, normocytic anemia
- **Local:** Pain at the injection site with phlebitis and thrombophlebitis
- **Other:** Weight loss

Interactions

★ **Drug-drug** • Do not administer with corticosteroids unless these are needed to control symptoms • Increased risk of nephrotoxicity with other nephrotoxic antibiotics, antineoplastics, zidovudine • Increased effects and risk of toxicity of digitalis, skeletal muscle relaxants, flucytosine • Increased nephrotoxic effects with cyclosporine • Increased risk of hypokalemia with thiazide diuretics

■ Nursing considerations

CLINICAL ALERT!

Dosages between the amphotericin products are not the same and are not interchangeable. Ensure correct drug is ordered and given.

Assessment

- **History:** Allergy to amphotericin B, renal impairment, lactation
- **Physical:** Skin color, lesions; T; weight; injection site; orientation, reflexes, affect; bowel sounds, liver evaluation; LFTs, renal function tests; CBC and differential; culture of area involved

Interventions

⊗ **Black box warning** Reserve systemic use for progressive or potentially fatal infections; not for use in noninvasive disease; toxicity can be severe.

- Arrange for immediate culture of infection but begin treatment before lab results are returned.
- Monitor injection sites and veins for signs of phlebitis.
- Provide aspirin, antihistamines, and antiemetics, and maintain sodium balance to ease drug discomfort. Minimal use of IV corticosteroids may decrease febrile reactions. Meperidine has been used to relieve chills and fever.
- Amphotericin B products may cause severe electrolyte abnormalities, such as magnesium wasting. Monitor electrolytes often.
- Monitor renal function tests weekly; discontinue or decrease dosage of drug at any sign of increased renal toxicity.
- Continue topical administration for long-term therapy until infection is eradicated, usually 2–4 wk.

- Discontinue topical application if hypersensitivity reaction occurs.

Teaching points

- Long-term use of this drug will be needed; beneficial effects may not be seen for several weeks; the systemic form of the drug can only be given IV.
- For topical application, apply topical drug liberally to affected area after first cleansing area.
- Use good hygiene to prevent reinfection or spread of infection.
- You may experience these side effects: Nausea, vomiting, diarrhea (eat frequent small meals); discoloring, drying of the skin, staining of fabric with topical forms (washing with soap and water or cleaning fabric with standard cleaning fluid should remove stain); stinging, irritation with local application; fever, chills, muscle aches and pains, headache (medications may be ordered to help you to deal with these discomforts of the drug).
- Report pain, irritation at injection site; GI upset, nausea, loss of appetite; difficulty breathing; local irritation, burning (topical application).

ampicillin (*am pi sill' in*)

ampicillin sodium

Oral: Novo-Ampicillin (CAN), Principen

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Penicillin

Therapeutic actions

Bactericidal action against sensitive organisms; inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Treatment of infections caused by susceptible strains of *Shigella*, *Salmonella*, *S. typhosa*, *Escherichia coli*, *Haemophilus in-*

fluenzae, *Proteus mirabilis*, *Neisseria gonorrhoeae*, enterococci, gram-positive organisms (penicillin G-sensitive staphylococci, streptococci, pneumococci)

- Meningitis caused by *Neisseria meningitidis*
- Prevention of bacterial endocarditis following dental, oral, or respiratory procedures in very high-risk patients
- Unlabeled use: Prophylaxis in cesarean section in certain high-risk patients

Contraindications and cautions

- Contraindicated with allergies to penicillins, cephalosporins, or other allergens.
- Use cautiously with renal disorders.

Available forms

Capsules—250, 500 mg; powder for oral suspension—125 mg/5 mL, 250 mg/5 mL; powder for injection—250, 500 mg, 1, 2 g

Dosages

Maximum recommended dosage, 8–14 g/day (reserve 14 g for serious infections, such as meningitis, septicemia); may be given IV, IM, or PO. Use parenteral routes for severe infections; switch to oral route as soon as possible.

Adults

- *Prevention of bacterial endocarditis for dental, oral, or upper respiratory procedures in patients at high risk:* 2 g ampicillin IM or IV within 30 min of procedure.
- *GU infections:* 500 mg every 6 hr.
- *Respiratory tract infections:* 250 mg every 6 hr.
- *Digestive system infections:* 500 mg PO every 6 hr for 48–72 hr after patient becomes asymptomatic or eradication is evident.
- *STDs in patients allergic to tetracycline:* 3.5 g ampicillin PO with 1 g probenecid.

Pediatric patients

- *Prevention of bacterial endocarditis for GI or GU surgery or instrumentation:* 50 mg/kg ampicillin IM or IV within 30 minutes of procedure. Six hours later, give 25 mg/kg ampicillin IM or IV or 25 mg/kg amoxicillin PO.
- *Prevention of bacterial endocarditis for dental, oral, or upper respiratory procedures in patients at high risk:* 50 mg/kg ampicillin IM or IV within 30 min of procedure.

Adults and pediatric patients

- **Respiratory and soft-tissue infections:**
40 kg or more: 250–500 mg IV or IM every 6 hr.
Less than 40 kg: 25–50 mg/kg/day IM or IV in equally divided doses at 6- to 8-hr intervals.
20 kg or more: 250 mg PO every 6 hr.
Less than 20 kg: 50 mg/kg/day PO in equally divided doses every 6–8 hr.
- **GI and GU infections, including women with N. gonorrhoeae:**
More than 40 kg: 500 mg IM or IV every 6 hr.
40 kg or less: 50 mg/kg/day IM or IV in equally divided doses every 6–8 hr.
20 kg or more: 500 mg PO every 6 hr.
Less than 20 kg: 100 mg/kg/day PO in equally divided doses every 6–8 hr.
- **Bacterial meningitis:** 150–200 mg/kg/day by continuous IV drip and then IM injections in equally divided doses every 3–4 hr.
- **Septicemia:** 150–200 mg/kg/day IV for at least 3 days, then IM every 3–4 hr.

Patients with renal impairment

If creatinine clearance is 10–50 mL/min, give dose every 6–12 hr.

If clearance is less than 10 mL/min, give dose every 12 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	2 hr	6–8 hr
IM	15 min	1 hr	6–8 hr
IV	Immediate	5 min	6–8 hr

Metabolism: $T_{1/2}$: 1–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Reconstitute with sterile or bacteriostatic water for injection; piggyback vials may be reconstituted with sodium chloride injection; use reconstituted solution within 1 hr. Do not mix in the same IV solution as other antibiotics. Use within 1 hr after preparation because potency may decrease significantly after that.

Infusion: 125-, 250-, or 500-mg dose given over 3–5 min; 1- or 2-g dose given over 10–15 min.

IV piggyback: Administer alone or further dilute with compatible solution.

Compatibilities: Ampicillin is compatible with 0.9% sodium chloride, D₅W, or 0.45% sodium chloride solution, 10% invert sugar water, M/6 sodium lactate solution, lactated Ringer's solution, sterile water for injection. Diluted solutions are stable for 2–8 hr; check manufacturer's inserts for specifics. Discard solution after allotted time period.

Incompatibilities: Do not mix with lidocaine, verapamil, other antibiotics, dextrose solutions.

Y-site incompatibilities: Do not give with epinephrine, hydralazine, or ondansetron.

Adverse effects

- **CNS:** Lethargy, hallucinations, seizures
- **CV:** Heart failure
- **GI:** *Glossitis, stomatitis, gastritis, sore mouth, furry tongue, black "hairy" tongue, nausea, vomiting, diarrhea*, abdominal pain, bloody diarrhea, enterocolitis, pseudomembranous colitis, nonspecific hepatitis
- **GU:** **Nephritis**
- **Hematologic:** Anemia, thrombocytopenia, leukopenia, neutropenia, prolonged bleeding time
- **Hypersensitivity:** *Rash, fever, wheezing, anaphylaxis*
- **Local:** *Pain, phlebitis*, thrombosis at injection site (parenteral)
- **Other:** *Superinfections*—oral and rectal moniliasis, vaginitis

Interactions

• **Drug-drug** • Increased ampicillin effect with probenecid • Increased risk of rash with allopurinol • Decreased effectiveness with tetracyclines, chloramphenicol • Decreased efficacy of hormonal contraceptives, atenolol with ampicillin

• **Drug-food** • Oral ampicillin may be less effective with food; take on an empty stomach

• **Drug-lab test** • False-positive Coombs' test if given IV • Decrease in plasma estrogen concentrations in pregnant women • False-positive urine glucose tests if Clintest, Benedict's solution, or Fehling's solution is used; enzymatic glucose oxidase methods (*Clinistix, Tes-Tape*) should be used to check urine glucose

■ Nursing considerations

Assessment

- **History:** Allergies to penicillins, cephalosporins, or other allergens; renal disorders; lactation
- **Physical:** Culture infected area; skin color, lesion; R, adventitious sounds; bowel sounds; CBC, LFTs, renal function tests, serum electrolytes, Hct, urinalysis

Interventions

- Culture infected area before treatment; reculture area if response is not as expected.
- Check IV site carefully for signs of thrombosis or drug reaction.
- Do not give IM injections in the same site; atrophy can occur. Monitor injection sites.
- Administer oral drug on an empty stomach, 1 hr before or 2 hr after meals with a full glass of water; do not give with fruit juice or soft drinks.

Teaching points

- Take this drug around-the-clock.
- Take the full course of therapy; do not stop taking the drug if you feel better.
- Take the oral drug on an empty stomach, 1 hour before or 2 hours after meals; do not take with fruit juice or soft drinks; the oral solution is stable for 7 days at room temperature or 14 days refrigerated.
- This antibiotic is specific to your problem and should not be used to self-treat other infections.
- If you are a woman and you use a hormonal contraceptive, you should use a second form of birth control for 1–2 weeks while taking this drug.
- You may experience these side effects: Nausea, vomiting, GI upset (eat frequent small meals), diarrhea.
- Report pain or discomfort at sites, unusual bleeding or bruising, mouth sores, rash, hives, fever, itching, severe diarrhea, difficulty breathing.

▼ anagrelide hydrochloride

(an *agh'* rab *lide*)

Agrylin

PREGNANCY CATEGORY C

Drug class

Antiplatelet drug

Therapeutic actions

Reduces platelet production by decreasing megakaryocyte hypermaturation; inhibits cyclic AMP and ADP collagen-induced platelet aggregation. At therapeutic doses has no effect on WBC counts or coagulation parameters; may affect RBC parameters.

Indications

- Treatment of essential thrombocythemia secondary to myeloproliferative disorders to reduce elevated platelet count and the risk of thrombosis and to improve associated symptoms, including thrombohemorrhagic events

Contraindications and cautions

- Contraindicated with known allergy to anagrelide or severe hepatic or renal impairment.
- Use cautiously with renal or hepatic disorders, pregnancy, lactation, known heart disease, thrombocytopenia.

Available forms

Capsules—0.5, 1 mg

Dosages

Adults

Initially, 0.5 mg PO qid or 1 mg PO bid. After 1 wk, reevaluate and adjust the dosage as needed. Dosage is based on platelet counts; goal is less than 600,000. Do not increase by more than 0.5 mg/day each week. Maximum dose, 10 mg/day or 2.5 mg as a single dose.

Pediatric patients

Initially, 0.5 mg/day–0.5 mg qid. Adjust to lowest effective dose to keep platelet count below 600,000/mm³. Do not increase by more than 0.5 mg/day each week. Maximum dose, 10 mg/day or 2.5 mg in a single dose.

Patients with moderate hepatic impairment

Initially, 0.5 mg/day for at least 1 wk. Monitor patient closely. Do not increase dose by more than 0.5 mg/day in 1 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 1.3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, *headaches*, *asthenia*, paresthesias
- **CV:** **Heart failure**, tachycardia, **MI**, **complete heart block**, atrial fibrillation, hypotension, *palpitations*, **CVA**
- **GI:** *Diarrhea*, *nausea*, *vomiting*, *abdominal pain*, flatulence, dyspepsia, anorexia, **pancreatitis**, ulcer
- **Hematologic:** *Thrombocytopenia*, anemia
- **Other:** Rash, purpura, edema

Interactions

★ **Drug-food** • Risk of increased toxicity with grapefruit juice; avoid this combination

■ Nursing considerations

CLINICAL ALERT!

Confusion has been reported with *Agrylin* and *Aggrastat* (tirofiban); use caution.

Assessment

- **History:** Allergy to anagrelide, thrombocytopenia, hemostatic disorders, bleeding ulcer, intracranial bleeding, severe liver disease, lactation, renal disorders, pregnancy, known heart disease
- **Physical:** Skin color, lesions; orientation; bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Perform platelet counts every 2 days during the first week of therapy and at least weekly thereafter; if thrombocytopenia occurs, de-

crease dosage of drug and arrange for supportive therapy. During first 2 wk, also monitor CBC, LFTs, serum creatinine, BUN.

- Administer drug on an empty stomach if at all tolerated.
- Establish safety precautions to prevent injury and bleeding (eg, use an electric razor, avoid contact sports).
- Monitor BP before and periodically during therapy.
- Advise patient to use barrier contraceptives while receiving this drug; it may harm the fetus.
- Monitor patient for any sign of excessive bleeding—eg, bruises, dark stools—and monitor bleeding times.
- Mark chart of any patient receiving anagrelide to alert medical personnel of potential for increased bleeding in cases of surgery or dental surgery, invasive procedures.

Teaching points

- Take drug on an empty stomach.
- Do not drink grapefruit juice while on this drug.
- You will need frequent and regular blood tests to monitor your response to this drug.
- It may take longer than normal to stop bleeding while taking this drug, so avoid contact sports, use electric razors, and take other precautions to avoid bleeding. Apply pressure for extended periods to bleeding sites.
- Avoid pregnancy while taking this drug; it could harm the fetus; using barrier contraceptives is suggested.
- Notify any dentist or surgeon that you are taking this drug before invasive procedures.
- You may experience these side effects: Upset stomach, nausea, diarrhea, loss of appetite (eat frequent small meals).
- Report fever, chills, sore throat, rash, bruising, bleeding, dark stools or urine, palpitations, chest pain.

 **anakinra**
(ann ack' in rah)

Kineret

PREGNANCY CATEGORY B

Drug classes

Antiarthritic

Interleukin-1 receptor antagonist

Therapeutic actions

A recombinant human interleukin-1 receptor antagonist; blocks the activity of interleukin 1 that is elevated in response to inflammatory and immune stimulation and is responsible for the degradation of cartilage due to the rapid loss of proteoglycans in rheumatoid arthritis.

Indications

- Reduction of the signs and symptoms and slowing of progression of moderately to severely active rheumatoid arthritis in patients 18 years of age and older who have failed on one or more disease-modifying antirheumatic drugs (methotrexate, sulfasalazine, hydroxychloroquine, gold, penicillamine, leflunomide, azathioprine); used alone or with disease-modifying antirheumatic drugs other than tumor necrosis factor blocking agents

Contraindications and cautions

- Contraindicated with allergy to anakinra or proteins produced by *Escherichia coli*.
- Use cautiously with immunosuppression, active infection, pregnancy, lactation, renal impairment.

Available forms

Prefilled glass syringes—100 mg/0.67 mL

Dosages**Adults**

- 100 mg/day subcutaneously at approximately the same time each day.

Pediatric patients

- Safety and efficacy not established.

Patients with renal impairment

For patients with end-stage renal disease or creatinine clearance less than 30 mL/min, 100 mg every other day.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	3–7 hr

Metabolism: Tissue; $T_{1/2}$: 4–6 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache
- **GI:** Nausea, diarrhea, abdominal pain
- **Hematologic:** Neutropenia, thrombocytopenia
- **Respiratory:** URI, sinusitis
- **Other:** Injection site reactions, infections, flulike symptoms

Interactions

- *** Drug-drug** ⊗ **Warning** Increased risk of serious infections and neutropenia if combined with etanercept or other tumor necrosis factor blocking drugs; avoid this combination (if no alternative is available; use extreme caution and monitor patient closely)
- Immunizations given while on anakinra may be less effective

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between anakinra and amikacin; use caution.

Assessment

- **History:** Allergy to anakinra or proteins produced by *E. coli*, immunosuppression, renal impairment, pregnancy, lactation
- **Physical:** T, body weight, P, BP, R, adventitious sounds, CBC, renal function tests

Interventions

- Make sure that patient does not have an active infection before administering.
- Store the drug in the refrigerator, protected from light; use by expiration date because solution contains no preservatives.
- Administer the subcutaneous injection at about the same time each day.
- Inspect solution before injection. Do not use solution if it is discolored or contains particulate matter.
- Discard any unused portion of the drug; do not store for later use.

- Provide analgesics if headache or muscle pain are a problem.
- Monitor injection sites for erythema, ecchymosis, inflammation, and pain. Rotating sites may help to decrease severe reactions.
- Advise women of childbearing age to use a barrier form of contraception while taking this drug.
- Monitor CBC before and periodically during therapy; drug should not be given during active infections.

Teaching points

- This drug must be injected subcutaneously once each day at approximately the same time each day.
- The drug must be stored in the refrigerator, protected from light. Use the drug by the expiration date on the box; the drug contains no preservatives and will not be effective after that date. Do not use any drug that is discolored or contains particulate matter.
- You and a family member or significant other should learn the proper way to administer a subcutaneous injection, including the proper disposal of needles and syringes. Prepare a chart of injection sites to ensure that you rotate the sites. Dispose of syringes in appropriate container.
- Avoid infection while you are taking this drug; avoid crowded areas or people with known infections.
- This drug does not cure your rheumatoid arthritis, and appropriate therapies to deal with the disease should be followed.
- You may experience these side effects: Reactions at the injection site (rotating sites and applying heat may help); headache, pain (use of an analgesic may help; consult your health care provider); increased risk of infection (contact your health care provider at any sign of infection [fever, muscular aches and pains, respiratory problems] because it may be necessary to stop the drug during the infection).
- Report fever, chills, difficulty breathing, severe discomfort at injection site.

DANGEROUS DRUG

anastrozole

(an *abs'* trob zol)

Arimidex

PREGNANCY CATEGORY D

Drug class

Antiestrogen

Aromatase inhibitor

Therapeutic actions

Selective nonsteroidal aromatase inhibitor that significantly reduces serum estradiol levels with no significant effect on adrenocortical steroids or aldosterone.

Indications

- Treatment of advanced breast cancer in postmenopausal women with disease progression following tamoxifen therapy
- First-line treatment of postmenopausal women with hormone receptor positive or hormone receptor unknown locally advanced or metastatic breast cancer
- Adjuvant treatment of postmenopausal women with hormone receptor positive early breast cancer
- Unlabeled use: Male infertility

Contraindications and cautions

- Contraindicated with allergy to anastrozole, pregnancy, lactation.
- Use cautiously with hepatic or renal impairment, high cholesterol states.

Available forms

Tablets—1 mg

Dosages

Adults

1 mg PO daily.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	10–12 hr

Metabolism: Hepatic; $T_{1/2}$: 50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Depression, light-headedness, dizziness, asthenia, headache
- **CV:** Vasodilation, hypertension, ischemic CV events
- **Dermatologic:** *Hot flashes, rash*
- **GI:** *Nausea, vomiting*, food distaste, dry mouth, *pharyngitis*, constipation
- **GU:** Vaginal bleeding, vaginal pain, UTIs
- **Other:** Peripheral edema, *bone pain, back pain*; decreased bone density; increased HDL, LDL levels

Interactions

- *** Drug-drug** • Loss of effectiveness with estrogens; combination is not recommended
- Decreased effectiveness with tamoxifen; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to anastrozole, hepatic or renal impairment, pregnancy, lactation, treatment profile for breast cancer, hypercholesterolemia
- **Physical:** Skin lesions, color, turgor; pelvic examination; orientation, affect, reflexes; peripheral pulses, edema; LFTs, renal function tests

Interventions

- Administer once daily without regard to meals.
- Arrange for periodic lipid profiles during therapy.
- Arrange for appropriate analgesic measures if pain and discomfort become severe.

Teaching points

- Take the drug once a day without regard to meals.
- You may experience these side effects: Bone pain; hot flashes (staying in cool temperatures may help); nausea, vomiting (eat frequent small meals); dizziness, headache, light-headedness (use caution if driving or performing tasks that require alertness); birth defects (avoid pregnancy).

- Report changes in color of stool or urine, severe vomiting, or inability to eat.

anidulafungin

(an ab doo' lab fun gin)

Eraxis

PREGNANCY CATEGORY C

Drug classes

Antifungal
Echinocandin

Therapeutic actions

Inhibits glucan synthesis, an enzyme present in fungal cells but not human cells; this inhibition prevents the fungal cell wall from forming and results in cell death.

Indications

- Treatment of candidemia and other forms of *Candida* infections (intra-abdominal abscess, peritonitis)
- Treatment of esophageal candidiasis

Contraindications and cautions

- Contraindicated with hypersensitivity to anidulafungin or any other echinocandin, or to any component of the drug.
- Use cautiously with liver impairment, pregnancy, lactation.

Available forms

Single-use vials—50, 100 mg with diluent vial

Dosages

Adults

- Treatment of candidemia and other forms *Candida* infections: 200 mg by IV infusion on day 1, then 100 mg/day by IV infusion; generally continued for at least 14 days after the last positive culture.
- Esophageal candidiasis: 100 mg by IV infusion on day 1, then 50 mg/day by IV infusion for a minimum of 14 days and for at least 7 days following resolution of symptoms.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV infusion	Rapid	End of infusion

Metabolism: Degradation; $T_{1/2}$: 40–50 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Feces

IV FACTS

Preparation: Reconstitute with the diluent provided, giving a concentration of 3.33 mg/mL; then dilute with 5% dextrose injection or 0.9% sodium chloride injection to a concentration of 0.5 mg/mL. Store prepared solution at room temperature; must be used within 24 hr after dilution. Inspect solution for particulate matter or discoloration, and discard if observed.

Infusion: Infuse at no more than 1.1 mg/min.

Incompatibilities: Do not combine with any other drug or with any solution other than those listed.

Adverse effects

- **CNS:** Headache
- **CV:** Hypotension
- **GI:** Nausea, abdominal pain, vomiting, dyspepsia, elevated liver enzymes
- **Hematological:** Leukopenia, neutropenia
- **Other:** Rash, urticaria, flushing, pruritus

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to anidulafungin or any other echinocandin or to any component of the drug, hepatic impairment, pregnancy, lactation
- **Physical:** Skin, BP, abdominal examination, LFTs, culture of infected area

Interventions

- Culture infected area prior to starting drug; drug can be started before results are known, but appropriate adjustments in treatment should be made when culture results are evaluated.
- Periodically monitor LFTs to make sure hepatotoxicity does not occur.

- Suggest the use of contraceptive measures while using this drug; the potential effects on a fetus are not known.
- Advise nursing mothers that another method of feeding the baby will need to be used while on this drug.
- Provide supportive measures if histamine reaction occurs; symptoms include hypotension, flushing, rash. A reaction is less likely if infusion rate does not exceed 1.1 mg/min.

Teaching points

- This drug must be given by a daily IV infusion.
- It is very important to maintain your fluid and food intake, which will help healing. Notify your health care provider if nausea or vomiting prevents this.
- You may need blood tests to evaluate the effects of the drug on your body.
- It is not known how this drug could affect a fetus, if you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, another method of feeding the baby should be selected.
- You may experience these side effects: Headache, nausea (consult your health care provider, medications may be available that could help).
- Report changes in the color of urine or stool, rash, yellowing of the skin or eyes, extreme fatigue, shortness of breath, tightness in the chest.

antihemophilic factor (AHF, Factor VIII)

(an tee bee moe *fill* 'ik *fack*' tur)

Advate, Alphanate, Helixate FS, Hemofil M, Humate-P, Koate-DVI, Kogenate FS, Monoclate-P, Recombinate, ReFacto, Wilate, Xyntha

PREGNANCY CATEGORY C

Drug class

Antihemophilic

Therapeutic actions

A normal plasma protein that is needed for the transformation of prothrombin to thrombin, the final step of the intrinsic clotting pathway.

Indications

- Treatment of classical hemophilia (hemophilia A), in which there is a demonstrated deficiency of factor VIII; provides a temporary replacement of clotting factors to correct or prevent bleeding episodes or to allow necessary surgery
- Short-term prophylaxis (*ReFacto*) to reduce frequency of spontaneous bleeding
- Surgical and/or invasive procedures in patients with von Willebrand disease in whom desmopressin is ineffective or contraindicated to control bleeding; not for major surgery (*Advate*, *Alphanate*, *Xyntha*)
- Prevention of excessive bleeding during and after surgery in certain patients with mild to moderate and severe von Willebrand disease (*Advate*, *Humate-P*, *Xyntha*)

Contraindications and cautions

- Contraindicated with antibodies to mouse, hamster, or bovine proteins or to porcine or murine factor.
- Use cautiously with pregnancy.

Available forms

IV injection—250, 500, 1,000, 1,500, 2,000, 3,000 international units/vial in numerous preparations; 450, 900 units (*Wilate*)

Dosages

Adult and pediatric patients

Administer IV using a plastic syringe; dose depends on weight, severity of deficiency, and severity of bleeding. Follow treatment carefully with factor VIII level assays.

Formulas used as a guide for dosage are:

$$\text{Expected Factor VIII increase} \\ (\% \text{ of normal}) = \frac{\text{AHF/IU given} \times 2}{\text{weight in kg}}$$

$$\text{AHF/IU required} = \text{weight (kg)} \\ \times \text{desired factor VIII increase} \\ (\% \text{ of normal}) \times 0.5$$

- *Prophylaxis of spontaneous hemorrhage:* Level of factor VIII required to prevent spontaneous hemorrhage is 5% of normal; 30% of normal is the minimum required for hemostasis following trauma or surgery; smaller doses may be needed if treated early. *ReFacto* is given at least two times per wk for short-term prevention or to decrease the frequency of spontaneous musculoskeletal hemorrhage in patients with hemophilia.
- *Mild hemorrhage:* Do not repeat therapy unless further bleeding occurs.
- *Moderate hemorrhage or minor surgery:* 30%–50% of normal is desired for factor VIII levels; initial dose of 15–25 AHF/international units/kg with maintenance dose of 10–15 AHF/international units/kg every 8–12 hr is usually sufficient.
- *Severe hemorrhage:* Factor VIII level of 80%–100% normal is desired; initial dose of 40–50 AHF/international units/kg and a maintenance dose of 20–25 AHF/international units/kg is given every 8–12 hr.
- *Major surgery:* Dose of AHF to achieve factor VIII levels of 80%–100% of normal given an hour before surgery; repeat infusions may be necessary every 6–12 hr initially. Maintain factor VIII levels at at least 30% normal for a healing period of 10–14 days.
- *Surgery/invasive procedures:* Preoperative dose 60 international units/kg; infusion of 40–60 international units/kg at 8- to 12-hr intervals. *Children:* 75 international units/kg preoperatively; then 50–75 international units/kg infused at 8- to 12-hr intervals (*Alphanate*).
- *Dental extraction:* Factor VIII level of 60%–80% is recommended; administer 1 hr before procedure in combination with antifibrinolytic therapy.
- *Prevention of bleeding during and after surgery in patients with von Willebrand's disease:* 50–60 international units/kg IV loading dose for emergency surgery. For planned surgery, calculate as above and give 2 hr before surgery; repeat every 8–12 hr for up to 3 days (*Humate-P*).

Pharmacokinetics

Route	Onset
IV	Immediate

Metabolism: $T_{1/2}$: 12 hr

Distribution: Does not readily cross placenta

Excretion: Cleared from the body by normal metabolism

IV FACTS

Preparation: Reconstitute using solution provided. Refrigerate unconstituted preparations. Before reconstitution, warm diluent and dried concentrate to room temperature. Add diluent and rotate or shake vial until completely dissolved. Do not refrigerate reconstituted preparations; give within 3 hr of reconstitution.

Infusion: Give by IV only; use a plastic syringe; solutions may stick to glass. Give preparations at a rate of 2 mL/min; can be given at up to 10 mL/min; administration of entire dose in 5–10 min is generally well tolerated.

Adverse effects

- **Allergic reactions:** Erythema, hives, fever, backache, **bronchospasm**, urticaria, chills, nausea, *stinging at the infusion site*, vomiting, headache
- **Hematologic:** Hemolysis with large or frequently repeated doses
- **Other:** **Hepatitis, AIDS** (risks associated with repeated use of blood products)

■ Nursing considerations

Assessment

- **History:** Antibodies to mouse, hamster, or bovine protein; porcine or murine factor; von Willebrand's disease; pregnancy
- **Physical:** Skin color, lesions; P, peripheral perfusion; R, adventitious sounds; factor VIII levels, Hct, direct Coombs' test, HIV screening, hepatitis screening

Interventions

- Monitor pulse during administration; if a significant increase occurs, reduce the rate or discontinue and consult physician.
- Monitor patient's clinical response and factor VIII levels regularly; if no response is noted with large doses, consider the presence of

factor VIII inhibitors and need for anti-inhibitor complex therapy.

Teaching points

- Dosage is highly variable. All known safety precautions are taken to ensure that this blood product is pure and the risk of AIDS and hepatitis is as minimal as possible.
- Wear or carry a medical alert ID tag to alert medical emergency personnel that you require this treatment.
- Report headache; rash, itching; backache; difficulty breathing.

Emend

fosaprepitant

Emend for Injection

PREGNANCY CATEGORY B

Drug classes

Antiemetic

Substance P and neurokinin 1 receptor antagonist

Therapeutic actions

Selectively blocks human substance P and neurokinin 1 (NK1) receptors in the CNS, blocking the nausea and vomiting caused by

highly emetogenic chemotherapeutic agents. Does not affect serotonin, dopamine, or corticosteroid receptors.

Indications

- In combination with other antiemetics for prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of moderately or highly emetogenic cancer chemotherapy, including high-dose cisplatin
- Prevention of postoperative nausea and vomiting (oral)

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of aprepitant, concurrent use of pimozide, lactation.
- Use cautiously with concomitant use of any CYP3A4 inhibitors (docetaxel, vinblastine, vincristine, ifosfamide, irinotecan, imatinib, vinorelbine, paclitaxel, etoposide), warfarin and with pregnancy, severe hepatic impairment.

Available forms

Capsules—40, 80, 125 mg; powder for injection—115 mg (fosaprepitant)

Dosages

Adults

- **Highly emetogenic cancer chemotherapy:** 125 mg PO 1 hr prior to chemotherapy (day 1) and 80 mg PO once daily in the morning on days 2 and 3; given in combination with 12 mg dexamethasone PO 30 min before chemotherapy on day 1 and 8 mg dexamethasone PO days 2 to 4 and 32 mg ondansetron IV on day 1 only.
- **Moderately emetogenic cancer chemotherapy:** 125 mg PO 1 hr before chemotherapy on day 1 with 12 mg dexamethasone PO and two 8-mg doses ondansetron PO (the first 1 hr before, the second 8 hr after chemotherapy); 80 mg PO on days 2 and 3 in the morning.
- **Postoperative nausea and vomiting:** 40 mg PO within 3 hr before induction of anesthesia.

Pediatric patients

Safety and efficacy not established.

- **Parenteral administration (fosaprepitant):** 115 mg IV 30 min before chemotherapy on day 1 of antiemetic regimen; infuse over 15 min. Use oral form on days 2 and 3.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	4 hr

Metabolism: Hepatic metabolism, $T_{1/2}$: 9–13 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Inject 5 mL 0.9% sodium chloride along vial wall to prevent foaming. Swirl vial gently. Add to infusion bag containing 110 mL saline; gently invert bag two to three times. Drug is stable for 24 hr at room temperature.

Infusion: Infuse over 15 min.

Incompatibilities: Do not mix with other solutions; do not mix with divalent cations such as lactated Ringer's solution or Hartmann's solution.

Adverse effects

- **CNS:** Dizziness, *anorexia*, neuropathy, tinnitus, headache, insomnia, asthenia
- **GI:** *Constipation, diarrhea*, epigastric discomfort, gastritis, heartburn, *nausea*, vomiting, elevated ALT or AST, abdominal pain, stomatitis
- **Respiratory:** Hiccups
- **Other:** *Fatigue*, dehydration, fever, neutropenia

Interactions

- **Drug-drug** • Risk of increased serum levels and toxic effects of aprepitant and pimozide if combined; do not use this combination • Possible increased serum levels of docetaxel, paclitaxel, etoposide, irinotecan, ifosfamide, imatinib, vinorelbine, vinblastine, vincristine, paclitaxel; monitor patient very closely if this combination is used • Increased risk of decreased effectiveness of warfarin if combined with aprepitant; monitor patient closely and adjust warfarin dose as needed • Risk of decreased effectiveness of hormonal

contraceptives if combined with aprepitant; suggest using barrier contraceptives while aprepitant is being used • Risk of altered response when aprepitant is combined with any drug that inhibits CYP3A4; use caution when adding any drug to a regimen that contains aprepitant

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of aprepitant, concurrent use of pimozide; lactation, concomitant use of any CYP3A4 inhibitors; pregnancy
- **Physical:** T, orientation, reflexes, affect; bowel sounds; LFT, CBC

Interventions

- Administer first dose along with dexamethasone 1 hr before beginning of chemotherapy.
- Administer additional doses of dexamethasone as well as ondansetron as indicated as part of antiemetic regimen.
- Administer within 3 hr before induction of anesthesia if used to prevent postoperative nausea and vomiting.
- Establish safety precautions (eg, side rails, assistance with ambulation, proper lighting) if CNS, visual effects occur.
- Provide appropriate analgesics for headache if needed.
- Suggest the use of barrier contraceptives to women of childbearing age.

Teaching points

- When giving drug to prevent postoperative nausea and vomiting, incorporate teaching into overall teaching plan.
- This drug is given as part of a drug regimen to alleviate the nausea and vomiting associated with your chemotherapy drug; take the first dose 1 hour before your chemotherapy and then again in the morning of days 2 and 3; you will also be taking dexamethasone and, possibly, ondansetron with this drug.
- If you miss a dose, take the drug as soon as you think of it. If you miss an entire day, consult your health care provider. Do not take two doses in the same day.

- You should avoid getting pregnant while receiving chemotherapy. Using barrier contraceptives is advised; hormonal contraceptives may be ineffective while you are taking *Emend*.
- If you are nursing a baby, another method of feeding the baby should be used.
- Tell any health care provider who is taking care of you that you are taking this drug—it may react with many other drugs; you should not add or remove any drugs from your medical regimen without checking with your health care provider.
- You may experience these side effects: Dizziness, drowsiness (if these occur, use caution if driving or performing tasks that require alertness); constipation; headache (appropriate medication will be arranged to alleviate this problem).
- Report changes in color of urine or stool, severe constipation or diarrhea, severe headache.

▷ arformoterol tartrate (ar for mob' ter ol)

Brovana

PREGNANCY CATEGORY C

Drug classes

Beta₂-adrenergic agonist, long-acting
Bronchodilator

Therapeutic actions

Long-acting agonist that binds to beta₂-adrenergic receptors in the lungs, causing bronchodilation; also inhibits release of inflammatory mediators in the lung, blocking swelling and inflammation.

Indications

- Long-term maintenance treatment of bronchoconstriction in patients with COPD, including chronic bronchitis and emphysema

Contraindications and cautions

- Contraindicated with allergy to any component of the drug, acutely deteriorating COPD, acute bronchospasm.
- Use cautiously with CV disease, convulsive disorders, thyrotoxicosis, pregnancy, lactation.

Available forms

Inhalation solution—15 mcg/2 mL

Dosages**Adults**

15 mcg bid (morning and evening) by nebulization. Do not exceed total daily dose of 30 mcg.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Inhalation	Rapid	1 hour

Metabolism: Direct conjugation; $T_{1/2}$: 26 hr

Distribution: Crosses placenta; may pass into breast milk

Excretion: Urine

Adverse effects

- **CV:** Hypertension, prolonged QT interval, tachycardia, chest pain, peripheral edema
- **GI:** Diarrhea
- **Musculoskeletal:** Leg cramps
- **Respiratory:** **Paradoxical bronchospasm**, dyspnea, chest congestion, sinusitis, **increase in asthma-related deaths**
- **Skin:** Rash
- **Other:** Pain, flulike symptoms

Interactions

• **Drug-drug** • Potential for increased toxicity if combined with MAOIs, TCAs, drugs that prolong the QT interval; use caution • Risk for decreased therapeutic effects and severe bronchospasm if combined with beta-adrenergic blockers; avoid this combination if at all possible; use a beta-specific blocker if combination must be used • Increased risk of hypokalemia if combined with non-potassium-sparing diuretics

■ Nursing considerations**Assessment**

- **History:** Allergy to any component of the drug, acutely deteriorating COPD, acute bronchospasm, CV disease, convulsive disorders, thyrotoxicosis, pregnancy, lactation

- **Physical:** Skin color, lesions; R, adventitious sounds; P, BP, baseline ECG

Interventions

⊗ **Black box warning** Long-lasting beta agonists may increase risk of asthma-related death; alert patient accordingly.

- Ensure that drug is not used to treat acute attacks or worsening or deteriorating COPD.
- Instruct patient in the proper use of nebulizer; instruct patient not to swallow or inject solution.
- Ensure that patient continues with appropriate use of other drugs to manage COPD as instructed.
- Store foil pouches in the refrigerator; use immediately after opening.
- Arrange for periodic evaluation of respiratory condition while on this drug.

Teaching points

- This drug is not for use during an acute attack, use your rescue medication if you are having an acute problem.
- You should take this drug through your nebulizer in the morning and in the evening.
- You should be aware that this type of drug is associated with an increased risk of asthma-related deaths; you should discuss this with your health care provider.
- Use this drug in your nebulizer only; do not swallow or inject this solution.
- The foil pouches should be stored in the refrigerator and protected from heat and light. Do not use after the expiration date. Use immediately after opening the foil pouch.
- Do not use any solution that is discolored or contains particles.
- Arrange for periodic evaluation of your respiratory problem while on this drug.
- It is not known if this drug could affect a fetus. If you are pregnant, or are thinking about becoming pregnant, consult with your health care provider.
- It is not known how this drug could affect a nursing baby; discuss the use of this drug during lactation with your health care provider.
- You should continue to use other medications prescribed for the treatment of your COPD as directed by your health care provider.

- Report palpitations, worsening of your COPD, tremors, nervousness.

▽ argatroban

See Appendix U, *Less commonly used drugs*.

▽ aripiprazole

(air eb **pip'** rab zole)

Abilify, Abilify Discmelt

PREGNANCY CATEGORY C

Drug classes

Atypical antipsychotic

Dopamine, serotonin agonist and antagonist
Psychotropic drug

Therapeutic actions

Acts as an agonist at dopamine and serotonin sites and antagonist at other serotonin receptor sites; this combination of actions is thought to be responsible for the drug's effectiveness in treating schizophrenia, though the mechanism of action is not understood.

Indications

- Treatment of schizophrenia in patients 13 yr and older
- Treatment of major depressive disorder as adjunct to antidepressant therapy
- Treatment and maintenance of acute manic and mixed episodes associated with bipolar disorders in patients 10 yr and older
- Adjunct to lithium or valproate for acute treatment of manic or mixed episodes associated with bipolar disorder in patients 10 yr and older
- **NEW INDICATION:** Irritability associated with autistic disorder in children 6–17 yr
- Treatment of agitation associated with schizophrenia or bipolar disorder, manic or mixed (injection)
- Unlabeled use: Restless leg syndrome, cocaine dependence, Tourette syndrome

Contraindications and cautions

- Contraindicated with allergy to aripiprazole, lactation.

- Use cautiously with suicidal ideation, pregnancy, cerebral vascular disease or other conditions causing hypotension, known CV disease, seizure disorders, exposure to extreme heat, Alzheimer's disease, dysphagia (risk for aspiration pneumonia), parkinsonism, elderly patients with dementia-related psychosis.

Available forms

Tablets—2, 5, 10, 15, 20, 30 mg; oral solution—1 mg/mL; orally disintegrating tablets—10, 15 mg; injection—7.5 mg/mL

Dosages

Adults

- **Schizophrenia:** 10–15 mg/day PO. Increase dose every 2 wk to maximum of 30 mg/day. Oral solution may be substituted on a mg-to-mg basis up to 25 mg of tablet. Patients taking 30-mg tablets should receive 25 mg if switched to solution.
- **Bipolar disorder:** 15 mg/day PO as one dose; maintenance dosage, 15–30 mg/day PO. Oral solution may be substituted on a mg-to-mg basis to 25 mg. Patients taking 30-mg tablets should take 25 mg if switched to solution.
- **Major depressive disorder:** 2–15 mg/day as adjunct therapy. Dose adjustments up to 5 mg/day should occur at intervals of 1 wk or longer.
- **Agitation:** 5.25–15 mg IM; usual dose, 9.75 mg IM. Cumulative doses of up to 30 mg/day may be given.

Pediatric patients 13–17 yr

- **Schizophrenia:** Initially, 2 mg/day PO. Adjust to 5 mg/day after 2 days then to target dosage of 10 mg/day. Maximum, 30 mg/day.

Pediatric patients 10–17 yr

- **Bipolar disorder:** Initially, 2 mg/day; titrate to 5 mg/day after 2 days, then to 10 mg/day after another 2 days. Target dose, 10 mg/day; maximum dose, 30 mg/day.

Pediatric patients 6–17 yr

- **Irritability associated with autistic disorder:** 2 mg/day; titrate to maintenance dosage of 5–15 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3–5 hr
IM	Rapid	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 75 hr for extensive metabolizers and 146 hr for poor metabolizers

Distribution: May cross placenta; may enter breast milk

Excretion: Urine and feces

Adverse effects

- **CNS:** Headache, anxiety, insomnia, lightheadedness, somnolence, tremor, asthenia, tardive dyskinesia, blurred vision, **seizures (potentially life-threatening)**, akathisia, dizziness, restlessness
- **CV:** Orthostatic hypotension
- **Dermatologic:** Rash
- **GI:** Nausea, vomiting, constipation, diarrhea, abdominal pain, esophageal dysmotility
- **Respiratory:** Rhinitis, cough
- **Other:** Fever, **neuroleptic malignant syndrome, increased suicide risk, development of diabetes mellitus**

Interactions

*** Drug-drug** • Risk of serious toxic effects if combined with strong inhibitors of the CYP3A4 system (such as ketoconazole), if any of these drug are being used, initiate treatment with one-half the usual dose of aripiprazole and monitor patient closely • Potential for increased serum levels and toxicity if taken with potential CYP2D6 inhibitors—quinidine, fluoxetine, paroxetine; reduce the dose of aripiprazole to one-half the normal dose • Decreased serum levels and loss of effectiveness if combined with CYP3A4 inducers such as carbamazepine—dosage of aripiprazole should be doubled and the patient monitored closely • Risk of severe sedation, orthostatic hypotension if IM aripiprazole is combined with lorazepam injection • Risk of increased CNS depression and impairment if combined with alcohol or other CNS depressants

■ Nursing considerations

CLINICAL ALERT!

Reports have been noted of confusion of aripiprazole with proton pump inhibitors; use extreme caution.

Assessment

- **History:** Allergy to aripiprazole, lactation, suicidal ideation, pregnancy, hypotension or known CV disease, seizure disorders, exposure to extreme heat, patients with Alzheimer's disease, dysphagia, parkinsonism
- **Physical:** T, orientation, reflexes, vision; BP; R; abdominal examination

Interventions

⊗ **Black box warning** Elderly patients with dementia-related psychosis have an increased risk of death if given atypical antipsychotics; these drugs are not approved for treating patients with dementia-related psychosis.

⊗ **Black box warning** Risk of suicidal ideation increases with antidepressant drug use, especially in children, adolescents, and young adults. Observe and monitor patient accordingly.

- Dispense the least amount of drug possible to patients with suicidal ideation.
- Have patient place orally disintegrating tablet on tongue, allow to dissolve, then swallow.
- Protect patient from extremes of heat; monitor BP if overheating occurs.
- Administer drug once a day without regard to food.
- Establish baseline orientation and affect before beginning therapy.
- Ensure that patient is well hydrated while taking this drug.
- Monitor patient regularly for signs and symptoms of diabetes mellitus.
- Establish appropriate safety precautions if patient experiences adverse CNS effects.
- If a breast-feeding patient is taking this drug, suggest another method of feeding the baby.
- Advise women of childbearing age to use contraceptives while taking this drug.
- Consider switching to oral solution for patients who have difficulty swallowing.

Teaching points

- Take this drug once a day as prescribed. If you forget a dose, take the next dose as soon as you remember and then resume taking the drug the next day. Do not take more than one dose in any 24-hour period.
- If taking orally disintegrating tablet, place the tablet on your tongue, allow to dissolve,

and then swallow. It is recommended that you use no liquid to take the tablet; if you do use liquid, use the smallest amount possible.

- This drug may interact with many other medications and with alcohol. Alert any health care provider caring for you that you are taking this drug.
- This drug should not be taken during pregnancy or when nursing a baby; using barrier contraceptives is suggested.
- Make sure that you are well hydrated while taking this drug.
- You may experience these side effects: Dizziness, impaired thinking and motor coordination (use caution and avoid driving a car or performing other tasks that require alertness if you experience these effects); inability to cool body effectively (avoid extremes of heat, heavy exercise, dehydration while using this drug).
- Report severe dizziness, trembling, light-headedness, suicidal thoughts, blurred vision.

▽ armodafinil
(are moe daff' ib nill)

Nuvigil

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-IV

Drug class

CNS stimulant
Narcolepsy drug

Therapeutic actions

A CNS stimulant that helps to improve vigilance and decrease excessive daytime sleepiness associated with narcolepsy and other sleep disorders. May act through dopaminergic mechanisms; exact mechanism of action is not known. Not associated with the cardiac and other systemic stimulatory effects of amphetamines.

Indications

- To improve wakefulness in patients with excessive sleepiness associated with obstructive sleep apnea/hypopnea syndrome, narcolepsy, and shift work sleep disorder

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug or to modafinil.
- Use cautiously with a history of psychosis, depression, mania; pregnancy, lactation; history of drug abuse or dependence; hepatic impairment.

Available forms

Tablets—50, 150, 250 mg

Dosages

Adults

- *Obstructive sleep apnea/hypopnea syndrome, narcolepsy:* 150–250 mg/day PO as a single dose in the morning.
- *Shift work sleep disorder:* 150 mg/day PO taken 1 hr before start of work shift.

Patients with severe hepatic impairment, elderly patients

Consider use of a lower dose.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2 hr

Metabolism: Hepatic; T_{1/2}: 15 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, insomnia,* disturbance in attention, tremor, paresthesia, anxiety, depression, agitation, nervousness
- **CV:** Tachycardia, chest pain, palpitations
- **Dermatologic:** Dermatitis, **Stevens-Johnson syndrome,** rash
- **GI:** *Nausea, diarrhea, dry mouth, dyspepsia, constipation, vomiting, anorexia*
- **GU:** Polyuria
- **Respiratory:** Dyspnea
- **Other:** Fatigue, pyrexia, flulike symptoms, dependence

Interactions

- **Drug-drug** • Possible decreased effectiveness of hormonal contraceptives during and up to 1 month after treatment; suggest use of barrier contraceptive • Risk of increased levels and effects of warfarin, phenytoin, omeprazole, TCAs; dosage adjustment may be needed

• Risk of decreased levels and effectiveness of cyclosporine, ethinyl estradiol, midazolam, triazolam; dosage adjustment may be needed

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug or to modafinil, history of drug abuse or dependence, psychosis, depression, pregnancy, lactation, hepatic impairment
- **Physical:** T; skin color, lesions; orientation, affect, reflexes; bowel sounds; LFTs

Interventions

- Ensure proper diagnosis before administering drug to rule out underlying medical problems.
- Drug therapy should be part of a comprehensive program to include measures to improve sleep patterns.
- Administer once a day in the morning for narcolepsy or sleep apnea disorders; for shift work sleep disorders, have patient take tablet approximately 1 hour before shift begins.
- Establish safety precautions if CNS changes occur (dizziness, changes in thought process).

Teaching points

- This drug is a controlled substance with abuse potential; keep it in a secure place. It is illegal to sell or give this drug to other people.
- This drug should be part of an overall plan, including measures to improve your sleep habits. It is not a substitute for sleep.
- Your health care provider will run tests to accurately diagnose your sleep disorder.
- Take only your prescribed dose. Do not change your dosage or the time of day you are taking the drug without consulting your health care provider.
- Take your dose once each day in the morning if you have sleep apnea or narcolepsy. If you have shift work sleep disorder, take it 1 hour before your shift begins.
- Avoid drinking alcohol while you are taking this drug.
- This drug can decrease the effectiveness of hormonal contraceptives. The use of a barrier contraceptive is advised while you are taking this drug and for 1 month after you have stopped the drug.

- It is not known how this drug could affect a developing fetus. If you are pregnant or you wish to become pregnant, discuss this with your health care provider.
- It is not known how this drug could affect a nursing baby: if you are nursing a baby, consult with your health care provider.
- You may experience these side effects: dizziness, insomnia, nervousness, impaired thinking (do not drive a car or engage in activities that require alertness if these effects occur); headache (consult with your health care provider for possible medication to relieve this).
- Report rash; hives; peeling skin blisters; swelling of the face, eyes, lips, tongue, or throat; trouble swallowing or breathing; hoarse voice; chest pain or palpitations; thoughts of suicide; hallucinations; depression; or anxiety.

▷ arsenic trioxide

See Appendix U, *Less commonly used drugs*.

▷ asenapine

(*ah sin' ah peen*)

Saphris

PREGNANCY CATEGORY C

Drug classes

Atypical antipsychotic

Dopamine/serotonin antagonist

Therapeutic actions

Mechanism of action not fully understood; blocks dopamine and serotonin receptors in the brain and depresses the reticular activating system. Suppresses many of the negative aspects of schizophrenia, including blunted affect, social withdrawal, lack of motivation, and anger.

Indications

- Acute treatment of schizophrenia in adults
- Acute treatment of manic or mixed episodes associated with bipolar I disorder in adults

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of drug, pregnancy, lactation.

- Use cautiously in prolonged QT interval, history of seizures, diabetes, suicidal ideation.

Available forms

Sublingual tablets—5, 10 mg

Dosages

Adults

Schizophrenia: 5 mg sublingually bid
Bipolar disorder: 10 mg sublingually bid; may be decreased to 5 mg/day if needed

Pediatric patients

Safety and efficacy not established

Patients with hepatic impairment

Not recommended for patients with severe hepatic impairment, Child-Pugh C

Pharmacokinetics

Route	Onset	Peak
Sublingual	Rapid	30–90 min

Metabolism: Hepatic: $T_{1/2}$: 24 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine and feces

Adverse effects

- **CNS:** *Dizziness, somnolence, extrapyramidal disorders, akathisia*, tremor, lethargy, blurred vision, altered thinking
- **CV:** Orthostatic hypotension, hypotension, tachycardia, prolonged QT interval
- **GI:** *Nausea, diarrhea, dry mouth, abdominal discomfort*
- **GU:** Priapism, ejaculation failure
- **Respiratory:** URI, nasal pharyngitis
- **Other:** Fatigue, lethargy, bone marrow suppression, **neuroleptic malignant syndrome (NMS)**, hyperglycemia, *weight gain, gynecomastia, galactorrhea*

Interactions

*** Drug-drug** • Increased risk of serious cardiac arrhythmias if taken with other drugs that prolong QT interval; avoid this combination. If combination must be used, monitor patient carefully • Risk of increased effectiveness of antihypertensives if used in combination; monitor patient closely and adjust antihypertensive dosage as needed • Risk of increased CNS effects if combined with centrally acting drugs or alcohol; use caution if this combination is used

- Increased risk of toxic effects of both drugs if combined with fluvoxamine; use caution

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of drug; pregnancy, lactation; prolonged QT interval; history of seizures; diabetes; suicidal ideation
- **Physical:** Weight; orientation, affect, reflexes; BP, P; abdominal exam; liver evaluation (LFTs); ECG, CBC, blood glucose level

Interventions

- ⊗ **Black box warning** Risk of death increases if used in elderly patients with dementia-related psychosis. Do not use for these patients; drug not approved for this use.
- Obtain baseline ECG to rule out prolonged QT interval; monitor patient periodically throughout therapy.
- Place tablet under the tongue and allow to dissolve completely, which should occur within seconds. Tell patient not to swallow tablet. Ensure that patient avoids eating and drinking for 10 minutes after administration.
- Monitor patient regularly for signs and symptoms of increased blood glucose level.
- Provide safety measures, especially early in treatment, if orthostatic hypotension occurs.
- Advise patient who is nursing to select another method of feeding the baby.
- Monitor patient for signs and symptoms of NMS (high fever, muscle rigidity, altered mental status, high or low blood pressure, diaphoresis, tachycardia); discontinue drug and support patient if these occur. Carefully consider reintroduction of drug because NMS recurrence is likely.
- Provide safety measures as needed if patient develops extrapyramidal effects or orthostatic hypotension.
- Be aware that patient may experience changes in cognitive and motor function.
- Because of risk of suicidal ideation with treatment, limit amount of drug dispensed to the smallest effective amount, to decrease chances of overdose.
- Continue other measures being used to deal with schizophrenia or bipolar disorder.

Teaching points

- Take this drug once a day, exactly as prescribed.
- If you miss a dose, take the next dose as soon as you remember. Do not take more than the prescribed amount each day.
- Avoid alcohol while taking this drug. Tell your health care provider about any other drugs, over-the-counter drugs, or herbal therapies that you are using; serious drug interactions are possible.
- If you are diabetic, monitor your blood glucose level very carefully and adjust treatment as ordered.
- It is not known how this drug could affect a fetus. If you should become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug could affect a nursing baby. Because of the potential for serious adverse effects in an infant, you should use another method of feeding the baby while you are taking this drug.
- This drug may cause your blood pressure to fall when you stand up; this is called orthostatic hypotension.
- Use care when standing or changing positions, especially when starting the drug and when changing dosage.
- You may experience the following side effects: dizziness, changes in motor performance and impaired thinking (do not drive a car or engage in activities that require alertness if these effects occur), nausea, dry mouth (small frequent meals may help; sucking sugarless lozenges may also be helpful).
- Report fever accompanied by sweating, changes in mental status, muscle rigidity; heart palpitations; feeling faint; loss of consciousness; thoughts of suicide.

DANGEROUS DRUG

asparaginase

(a *spare*' a gi *nase*)

Elspar

PREGNANCY CATEGORY C

Drug class

Antineoplastic

Therapeutic actions

Asparaginase is an enzyme that hydrolyzes the amino acid asparagine, which is needed by some malignant cells (but not normal cells) for protein synthesis; it inhibits malignant cell proliferation by interruption of protein synthesis; maximal effect in G1 phase of the cell cycle.

Indications

- To induce remissions in children or adults with acute lymphocytic leukemia as combination therapy or as single agent when combined therapy is inappropriate or when other therapies fail

Contraindications and cautions

- Contraindicated with allergy to asparaginase, pancreatitis or history of pancreatitis, impaired hepatic function, bone marrow depression, lactation.
- Use cautiously with hyperglycemia, pregnancy, bleeding disorders, or immunosuppressed patients.

Available forms

Powder for injection—10,000 international units

Dosages

Adults and pediatric patients

- *Single-agent induction therapy:* Used only when combined therapy is inappropriate or when other therapies fail; 200 international units/kg/day IV for 28 days. Perform test dose before starting therapy.

Pediatric patients

- *Induction regimen I:* Prednisone 40 mg/m² per day PO in three divided doses for 15 days, followed by tapering of dosage as follows: 20 mg/m² for 2 days, 10 mg/m² for 2 days, 5 mg/m² for 2 days, 2.5 mg/m² for 2 days, and then discontinue. Vincristine sulfate 2 mg/m² IV once weekly on days 1, 8, 15; maximum dose should not exceed 2 mg. Asparaginase 1,000 international units/kg/day IV for 10 successive days beginning on day 22.
- *Induction regimen II:* Prednisone 40 mg/m² per day PO in three divided doses for 28 days, then gradually discontinue over 14 days.

Vincristine sulfate 1.5 mg/m² IV weekly for four doses on days 1, 8, 15, 22; maximum dose should not exceed 2 mg. Asparaginase 6,000 international units/m² IM on days 4, 7, 10, 13, 16, 19, 22, 25, 28.

- **Maintenance:** When remission is obtained, institute maintenance therapy; do not use asparaginase in maintenance regimen.

Pharmacokinetics

Route	Onset	Peak
IM	Varies	Unknown
IV	30–40 min	End of infusion

Metabolism: T_{1/2}: 8–30 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute vial with 5 mL of sterile water for injection or sodium chloride injection. Ordinary shaking does not inactivate the drug. May be used for direct IV injection or further diluted with sodium chloride injection or 5% dextrose injection. Stable for 8 hr once reconstituted; use only when clear. Discard any cloudy solution. Gelatinous, fiberlike particles may develop with standing; filter through a 5-micron filter if desired; do not use a 0.2-micron filter because drug may lose potency.

Infusion: Infuse over not less than 30 min into an already running IV infusion of sodium chloride injection or 5% dextrose injection.

Adverse effects

- **CNS:** CNS depression, confusion, agitation, hallucinations, somnolence
- **Endocrine:** Hyperglycemia—glucosuria, polyuria
- **GI:** *Hepatotoxicity, nausea, vomiting, anorexia, abdominal cramps, pancreatitis*
- **GU:** Uric acid nephropathy, **renal toxicity**
- **Hematologic:** Bleeding problems, **bone marrow depression**, thrombosis
- **Hypersensitivity:** *Rashes, urticaria, arthralgia*, respiratory distress to **anaphylaxis**

- **Other:** Chills, fever, weight loss, **hyperthermia**, fatigue

Interactions

• **Drug-drug** • Increased toxicity if given IV with or immediately before vincristine or prednisone • Diminished or decreased effect of methotrexate on malignant cells if given with or immediately after asparaginase

• **Drug-lab test** • Inaccurate interpretation of thyroid-function tests because of decreased serum levels of thyroxine-binding globulin; levels usually return to pretreatment levels within 4 wk of the last dose of asparaginase

Nursing considerations

Assessment

- **History:** Allergy to asparaginase, pancreatitis or history of pancreatitis, impaired hepatic function, bone marrow depression, lactation, hyperglycemia, pregnancy, bleeding disorders
- **Physical:** Weight; T; skin color, lesions; orientation, reflexes; liver evaluation, abdominal examination; CBC, blood sugar, LFTs, renal function tests, serum amylase, clotting time, urinalysis, serum uric acid levels

Interventions

⊗ **Black box warning** Administer only in a hospital setting; be prepared to treat anaphylaxis with each dose.

⊗ **Warning** Perform an intradermal skin test prior to initial administration and if there is a week or more between doses because of risk of severe hypersensitivity reactions. To prepare skin test solution, reconstitute 10,000-international units vial with 5 mL of diluent; withdraw 0.1 mL (200 international units/mL), and inject it into a vial containing 9.9 mL of diluent, giving a solution of 20 international units/mL. Use 0.1 mL of this solution (2 international units) for the skin test. Observe site for 1 hr for a wheal or erythema that indicates allergic reaction.

- Arrange for desensitization to hypersensitivity reaction. Check manufacturer's literature for desensitization dosages, or arrange for patient to receive *Erwinia* asparaginase

(available from the National Cancer Institute).

- Arrange for lab tests (CBC, serum amylase, blood glucose, LFT, uric acid) prior to therapy and frequently during therapy; arrange to decrease dose or stop drug if severe adverse effects occur.
- For IM administration, reconstitute by adding 2 mL of sodium chloride injection to the 10,000-international units vial. Stable for 8 hr once reconstituted; use only if clear. Limit injections at each site to 2 mL; if more is required use two injection sites.

⊗ **Warning** Monitor for signs of hypersensitivity (eg, rash, difficulty breathing). If any occur, discontinue drug and consult with physician.

⊗ **Warning** Monitor for pancreatitis; if serum amylase levels rise, discontinue drug and consult with physician.

⊗ **Warning** Monitor for hyperglycemia—reaction may resemble hyperosmolar, nonketotic hyperglycemia. If present, discontinue drug and be ready to use IV fluids and insulin.

- Prepare a calendar for patients who must return for specific treatments and additional therapy.

Teaching points

- Use a calendar to keep track of appointments for specific treatments and additional therapy. Drug can be given only in the hospital under the direct supervision of a physician.
- Have regular blood tests to monitor the drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, eat frequent small meals; good nutrition is important; dietary services are available; antiemetic may be ordered); fatigue, confusion, agitation, hallucinations, depression (reversible; use special precautions to avoid injury).
- Report fever, chills, sore throat; unusual bleeding or bruising; yellow skin or eyes; light-colored stools, dark urine; thirst, frequent urination.

▽ aspirin

Buffered aspirin products:
Adprin-B, Alka-Seltzer, Ascriptin, Bufferin, Buffex

PREGNANCY CATEGORY D

Drug classes

Analgesic (nonopioid)
Anti-inflammatory
Antiplatelet
Antipyretic
Antirheumatic
NSAID
Salicylate

Therapeutic actions

Analgesic and antirheumatic effects are attributable to aspirin's ability to inhibit the synthesis of prostaglandins, important mediators of inflammation. Antipyretic effects are not fully understood, but aspirin probably acts in the thermoregulatory center of the hypothalamus to block effects of endogenous pyrogen by inhibiting synthesis of the prostaglandin intermediary. Inhibition of platelet aggregation is attributable to the inhibition of platelet synthesis of thromboxane A_2 , a potent vasoconstrictor and inducer of platelet aggregation. This effect occurs at low doses and lasts for the life of the platelet (8 days). Higher doses inhibit the synthesis of prostacyclin, a potent vasodilator and inhibitor of platelet aggregation.

Indications

- Mild to moderate pain
- Fever
- Inflammatory conditions—rheumatic fever, rheumatoid arthritis, osteoarthritis, juvenile rheumatoid arthritis, spondyloarthropathies
- Reduction of risk of recurrent TIAs or stroke in patients with history of TIA due to fibrin platelet emboli or ischemic stroke

- Reduction of risk of death or nonfatal MI in patients with history of infarction or unstable angina pectoris or suspected acute MI
- Patients who have undergone revascularization procedures (eg, coronary artery bypass graft [CABG], percutaneous transluminal coronary angioplasty [PTCA], endarterectomy)
- Unlabeled use: Prophylaxis against cataract formation with long-term use

Contraindications and cautions

- Contraindicated with allergy to salicylates or NSAIDs (more common with nasal polyps, asthma, chronic urticaria); allergy to tartrazine (cross-sensitivity to aspirin is common); hemophilia, bleeding ulcers, hemorrhagic states, blood coagulation defects, hypoprothrombinemia, vitamin K deficiency (increased risk of bleeding); Reye syndrome.
- Use cautiously with impaired renal function; chickenpox, influenza (risk of Reye's syndrome in children and teenagers); children with fever accompanied by dehydration; surgery scheduled within 1 wk; peptic ulcer disease; gout; pregnancy (maternal anemia, antepartum and postpartum hemorrhage, prolonged gestation, and prolonged labor have been reported; readily crosses the placenta; possibly teratogenic; maternal ingestion of aspirin during late pregnancy has been associated with the following adverse fetal effects: low birth weight, increased intracranial hemorrhage, stillbirths, neonatal death); lactation.

Available forms

Tablets—81, 165, 325, 500, 650, 975 mg; SR tablets **onc**—650, 800 mg; suppositories: 120, 200, 300, 600 mg

Dosages

Available in oral and suppository forms. Also available as chewable tablets, gum; enteric coated, SR, and buffered preparations (SR aspirin is not recommended for antipyresis, short-term analgesia, or children younger than 12 yr).

Adults

- *Ischemic stroke, TIA*: 50–325 mg/day.

- *Angina, recurrent MI prevention*: 75–325 mg/day.
- *Suspected MI*: 160–325 mg as soon as possible; continue daily for 30 days.
- *CABG*: 325 mg 6 hr after procedure, then daily for 1 yr.
- *PTCA*: 325 mg 2 hr before procedure, then 160–325 mg/day.
- *Carotid endarterectomy*: 80 mg/day–650 mg bid started before the procedure and then continued after the procedure.
- *Spondyloarthritis*: Up to 4 g/day in divided doses.
- *Osteoarthritis*: Up to 3 g/day in divided doses.
- *Analgesic and antipyretic*: Tablets—325–1,000 mg, every 4–6 hr; maximum dosage, 4,000 mg/day; SR tablets—1,300 mg, then 650–1,300 mg every 8 hr; maximum dosage, 3,900 mg/day. Suppositories—1 rectally every 4 hr.
- *Arthritis and rheumatic conditions*: 3 g/day in divided doses.
- *Acute rheumatic fever*: 5–8 g/day; modify to maintain serum salicylate level of 15–30 mg/dL.

Pediatric patients

- *Analgesic and antipyretic*: 10–15 mg/kg/dose every 4 hr, up to 60–80 mg/kg/day. Do not administer to patients with chickenpox or influenza symptoms.

Age (yr)	Dosage (mg every 4 hr)
2–3	162
4–5	243
6–8	324
9–10	405
11	486
12 or older	648 (or 1 suppository, rectally)

- *Juvenile rheumatoid arthritis*: 90–130 mg/kg per 24 hr in divided doses at 6- to 8-hr intervals. Maintain a serum level of 150–300 mcg/mL.
- *Acute rheumatic fever*: Initially, 100 mg/kg/day, then decrease to 75 mg/kg/day for 4–6 wk. Therapeutic serum salicylate level is 150–300 mcg/mL.
- *Kawasaki disease*: 80–180 mg/kg/day; very high doses may be needed during acute

febrile period; after fever resolves, dosage may be adjusted to 10 mg/kg/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	5–30 min	15–120 min	3–6 hr
Rectal	1–2 hr	4–5 hr	6–8 hr

Metabolism: Hepatic (salicylate); $T_{1/2}$: 15 min–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **Acute aspirin toxicity:** Respiratory alkalosis, hyperpnea, tachypnea, hemorrhage, excitement, confusion, asterixis, pulmonary edema, seizures, tetany, metabolic acidosis, fever, coma, CV collapse, renal and respiratory failure (dose related, 20–25 g in adults, 4 g in children)
- **Aspirin intolerance:** Exacerbation of bronchospasm, rhinitis (with nasal polyps, asthma)
- **GI:** *Nausea, dyspepsia, heartburn, epigastric discomfort*, anorexia, hepatotoxicity
- **Hematologic:** *Occult blood loss, hemostatic defects*
- **Hypersensitivity:** Anaphylactoid reactions to anaphylactic shock
- **Salicylism:** *Dizziness, tinnitus, difficulty bearing, nausea*, vomiting, diarrhea, mental confusion, lassitude (dose related)

Interactions

★ **Drug-drug** • Increased risk of bleeding with oral anticoagulants, heparin • Increased risk of GI ulceration with steroids, alcohol, NSAIDs • Increased serum salicylate levels due to decreased salicylate excretion with urine acidifiers (ammonium chloride, ascorbic acid, methionine) • Increased risk of salicylate toxicity with carbonic anhydrase inhibitors, furosemide • Decreased serum salicylate levels with corticosteroids • Decreased serum salicylate levels due to increased renal excretion of salicylates with acetazolamide, methazolamide, certain antacids, alkalinizers • Decreased absorption of aspirin with nonabsorbable

antacids • Increased methotrexate levels and toxicity with aspirin • Increased effects of valproic acid secondary to displacement from plasma protein sites • Greater glucose lowering effect of sulfonylureas, insulin with large doses (more than 2 g/day) of aspirin • Decreased antihypertensive effect of captopril, beta-adrenergic blockers with salicylates; consider discontinuation of aspirin • Decreased uricosuric effect of probenecid, sulfapyrazone • Possible decreased diuretic effects of spironolactone, furosemide (in patients with compromised renal function) • Unexpected hypotension may occur with nitroglycerin

★ **Drug-lab test** • Decreased serum protein bound iodine (PBI) due to competition for binding sites • False-negative readings for urine glucose by glucose oxidase method and copper reduction method with moderate to large doses of aspirin • Interference with urine 5-HIAA determinations by fluorescent methods but not by nitrosonaphthol colorimetric method • Interference with urinary ketone determination by the ferric chloride method • Falsely elevated urine VMA levels with most tests; a false decrease in VMA using the Pisano method

■ Nursing considerations Assessment

- **History:** Allergy to salicylates or NSAIDs; allergy to tartrazine; hemophilia, bleeding ulcers, hemorrhagic states, blood coagulation defects, hypoprothrombinemia, vitamin K deficiency; impaired hepatic function; impaired renal function; chickenpox, influenza; children with fever accompanied by dehydration; surgery scheduled within 1 wk; pregnancy; lactation
- **Physical:** Skin color, lesions; T; eighth cranial nerve function, orientation, reflexes, affect; P, BP, perfusion; R, adventitious sounds; liver evaluation, bowel sounds; CBC, clotting times, urinalysis, stool guaiac, LFTs, renal function tests

Interventions

⊗ **Black box warning** Do not use in children and teenagers to treat chickenpox or flu symptoms without review for Reye's syndrome, a rare but fatal disorder.

- Give drug with food or after meals if GI upset occurs.
- Give drug with full glass of water to reduce risk of tablet or capsule lodging in the esophagus.
- Do not crush, and ensure that patient does not chew SR preparations.
- Do not use aspirin that has a strong vinegar-like odor.

⊗ **Warning** Institute emergency procedures if overdose occurs: Gastric lavage, induction of emesis, activated charcoal, supportive therapy.

Teaching points

- Take extra precautions to keep this drug out of the reach of children; this drug can be very dangerous for children.
- Use the drug only as suggested; avoid overdose. Avoid the use of other over-the-counter drugs while taking this drug. Many of these drugs contain aspirin, and serious overdose can occur.
- Take the drug with food or after meals if GI upset occurs.
- Do not cut, crush, or chew sustained-release products.
- Over-the-counter aspirins are equivalent. Price does not reflect effectiveness.
- You may experience these side effects: Nausea, GI upset, heartburn (take drug with food); easy bruising, gum bleeding (related to aspirin's effects on blood clotting).
- Report ringing in the ears; dizziness, confusion; abdominal pain; rapid or difficult breathing; nausea, vomiting, bloody stools.

▶ atazanavir sulfate (ab taz' ab nab veer)

Reyataz

PREGNANCY CATEGORY B

Drug classes

Anti-HIV drug
Antiviral
Protease inhibitor

Therapeutic actions

HIV-1 protease inhibitor; selectively inhibits processing of viral proteins in HIV-infected

cells, preventing the formation of mature viruses.

Indications

- In combination with other antiretrovirals for the treatment of HIV-1 infection

Contraindications and cautions

- Contraindicated with allergy to any components of the product, lactation (HIV-infected mothers are discouraged from breast-feeding).
- Use cautiously with pregnancy; hepatic impairment; signs of lactic acidosis; risk factors for lactic acidosis, including female gender and obesity; hemophilia.

Available forms

Capsules—100, 150, 200, 300 mg

Dosages

Adults

Therapy-naïve patients: 400 mg/day PO, taken with food. If taken with didanosine, give atazanavir with food 2 hr before or 1 hr after the didanosine. If taken with efavirenz, 400 mg/day PO of atazanavir, 100 mg ritonavir and 600 mg efavirenz as a single daily dose with food; atazanavir should not be used with efavirenz without ritonavir. If taken with tenofovir, 300 mg tenofovir PO with 300 mg atazanavir PO and 100 mg ritonavir PO once daily with food.

Therapy-experienced patients: 300 mg/day PO with 100 mg ritonavir PO taken with food. *Concomitant therapy:* With histamine-2 (H_2) receptor antagonists, do not exceed equivalent of 40 mg famotidine bid (for therapy-naïve patients) or 20 mg famotidine bid (for therapy-experienced patients); administer 300 mg atazanavir with 100 mg ritonavir simultaneously with first dose of H_2 -receptor antagonist. Administer second dose of H_2 -receptor antagonist 10 hr later. With proton pump inhibitors, do not exceed equivalent of 20 mg omeprazole. Administer 12 hr prior to atazanavir for therapy-naïve patients. Do not use proton pump inhibitors in therapy-experienced patients.

Pediatric patients 6–17 yr

Do not exceed recommended adult doses.

Patient type	Body weight (kg)	Atazanavir dose (mg)	Ritonavir dose (mg)
Therapy naïve	15 to less than 25	150	80
	25 to less than 32	200	100
	32 to less than 39	250	100
	39 or more	300	100
	25 to less than 32	200	100
Therapy experienced	32 to less than 39	250	100
	39 or more	300	100

Patients with hepatic impairment

300 mg/day PO with moderate impairment (Child-Pugh class B); do not use with severe hepatic impairment or hepatic insufficiency (Child-Pugh class C).

Patients with renal impairment

No dosage adjustment needed if patient is not on dialysis. Do not use in treatment-experienced patients with end-stage renal disease who are on hemodialysis. Treatment-naïve patients on dialysis should receive 300 mg with ritonavir 100 mg.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–2.5 hr

Metabolism: Hepatic; $T_{1/2}$: 6.5–7.9 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*, depression, insomnia, dizziness, peripheral neurologic symptoms
- **CV:** Prolonged PR interval
- **GI:** *Nausea*, diarrhea, abdominal pain, vomiting, jaundice, **severe hepatomegaly with steatosis, sometimes fatal; elevated liver enzymes and bilirubin**

- **Metabolic:** Lactic acidosis, sometimes severe; hyperglycemia
- **Respiratory:** Cough
- **Other:** *Rash*, arthralgia, fever, fatigue, pain, fat redistribution, back pain

Interactions

- *** Drug-drug** • Increased risk of severe toxicity if combined with other drugs that are metabolized via the CYP450 pathway—midazolam, triazolam, ergot derivatives, pimozide; the use of these drugs with atazanavir is contraindicated • Risk of increased toxicity of lovastatin, simvastatin, indinavir, proton pump inhibitors, irinotecan; coadministration of atazanavir with these drugs is not recommended • Increased risk of serious adverse effects if taken with sildenafil; encourage patient to report any adverse effects to the health care provider • Risk of decreased therapeutic effects of rifampin if combined with atazanavir; this combination is not recommended • Decreased absorption of atazanavir if taken with antacids or buffered medications; if this combination is used, administer atazanavir 1 hr before or 2 hr after these drugs • Potential for increased bleeding if combined with warfarin; if this combination is used, monitor INR carefully and adjust warfarin dosage accordingly • Risk of serious adverse effects if taken with bosentan without ritonavir; ensure that patients on bosentan taking atazanavir are also receiving ritonavir
- *** Drug-alternative therapy** • Decreased concentrations of atazanavir and loss of therapeutic effects if combined with St. John's wort; this combination is not recommended

Nursing considerations

Assessment

- **History:** Allergy to any components of the product, lactation, pregnancy, hepatic impairment, signs of lactic acidosis, obesity, hemophilia
- **Physical:** T; orientation, reflexes; R, adventitious sounds; abdominal examination, LFTs

Interventions

- Ensure that HIV antibody testing has been done before initiating therapy to reduce risk of emergence of HIV resistance.

- Ensure that patient is taking this drug in combination with other antiretroviral drugs.
- Monitor patients regularly to evaluate hepatic function; establish baseline ECG to monitor P-R interval.
- Administer this drug with food.
- ⊗ **Warning** Withdraw drug and monitor patient if patient develops signs of lactic acidosis or hepatotoxicity, including hepatomegaly and steatosis.
- Encourage women of childbearing age to use barrier contraceptives while taking this drug because the effects of the drug on the fetus are not known. If drug is used in pregnancy, patient should be registered with the antiretroviral pregnancy registry.
- Advise women who are lactating to find another method of feeding the baby; HIV-infected women are advised to not breast-feed.
- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others.

Teaching points

- Take this drug once a day with food and in combination with your other antiviral drugs.
- Take the drug every day; if you miss a dose, take it as soon as you remember and then take the next dose at the usual time the next day. Do not double any doses.
- Tell any other health care provider that you see that you are taking this drug; the drug interacts with many other drugs and caution may be needed; the drug also changes your ECG reading and that may be important.
- Avoid the use of St. John's wort while taking this drug; the effectiveness of this drug can be blocked.
- If you use *Viagra*, you could experience serious adverse effects with this drug; report any adverse effects to your health care provider.
- This drug does not cure your HIV infection and you will still be able to pass it to others; using condoms is advised. Women of childbearing age are discouraged from becoming pregnant while taking this drug; using barrier contraceptives is recommended.
- With some antiviral drugs, there is a redistribution of body fat—a “buffalo hump” may develop—and fat is distributed around the trunk while fat is lost in the limbs; the

long-term effects of this redistribution are not known.

- You may experience these side effects: Nausea, diarrhea, abdominal pain, headache (try to maintain nutrition and fluid intake as much as possible; eat frequent small meals; and always take the drug with food).
- Report severe weakness, muscle pain, trouble breathing, dizziness, cold feelings in your arms or legs, palpitations, yellowing of the eyes or skin.

atenolol (a *ten' o lole*)

Apo-Atenolol (CAN), Gen-Atenolol (CAN), Novo-Atenol (CAN), ratio-Atenolol (CAN), Tenormin

PREGNANCY CATEGORY D

Drug classes

Antianginal
Antihypertensive
Beta₁-selective adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney), thus decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption, decreasing the release of renin from the kidney, and lowering BP.

Indications

- Treatment of angina pectoris due to coronary atherosclerosis
- Hypertension, alone or with other drugs, especially diuretics
- Treatment of MI in hemodynamically stable patients
- Unlabeled uses: Prevention of migraine headaches; treatment of ventricular and supraventricular arrhythmias; prevention of variceal bleeding; unstable angina

Contraindications and cautions

- Contraindicated with sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, pregnancy,

hypersensitivity to any component of the drug.

- Use cautiously with renal failure, diabetes or thyrotoxicosis (atenolol can mask the usual cardiac signs of hypoglycemia and thyrotoxicosis), lactation, respiratory disease (including bronchospastic disease), heart failure (controlled by digoxin or diuretics).

Available forms

Tablets—25, 50, 100 mg

Dosages

Adults

- **Hypertension:** Initially, 50 mg PO once a day; after 1–2 wk, dose may be increased to 100 mg/day.
- **Angina pectoris:** Initially, 50 mg PO daily. If optimal response is not achieved in 1 wk, increase to 100 mg daily; up to 200 mg/day may be needed.
- **Acute MI:** 100 mg PO daily or 50 mg PO bid for 6–9 days or until discharge from the hospital.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal impairment

Dosage reduction is required because atenolol is excreted through the kidneys. For elderly patients, use initial dose of 25 mg/day PO. The following dosage is suggested for patients with renal impairment:

CrCl (mL/min)	Half-life (hr)	Maximum Dosage
15–35	16–27	50 mg/day
Less than 15	More than 27	25 mg/day

For patients on hemodialysis, give 25–50 mg after each dialysis; give only in hospital setting; severe hypotension can occur.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	24 hr

Metabolism: $T_{1/2}$: 6–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech
- **CV:** *Bradycardia, heart failure, cardiac arrhythmias, sinoatrial or AV nodal block, tachycardia*, peripheral vascular insufficiency, claudication, CVA, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramps
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH*

Interactions

- **Drug-drug** • Increased effects with verapamil, anticholinergics, quinidine • Increased risk of orthostatic hypotension with prazosin • Increased risk of lidocaine toxicity with atenolol • Possible increased BP-lowering effects with aspirin, bismuth subsalicylate, magnesium salicylate, sulfipyrazone, hormonal contraceptives • Decreased antihypertensive effects with NSAIDs, clonidine • Decreased antihypertensive and antianginal effects of atenolol with ampicillin, calcium salts • Possible increased hypoglycemic effect of insulin

★ **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ Nursing considerations

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, renal failure, diabetes or thyrotoxicosis, lactation, pregnancy
- **Physical:** Baseline weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose, cholesterol, triglycerides

Interventions

- ⊗ **Black box warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Take drug with meals if GI upset occurs.
- Do not stop taking this drug unless told to do so by a health care provider.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Dizziness, light-headedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

▷ atomoxetine hydrochloride

(at oh *mox'* ah teen)

Strattera

PREGNANCY CATEGORY C

Drug class

Selective norepinephrine reuptake inhibitor

Therapeutic actions

Selectively blocks the reuptake of norepinephrine at the neuronal synapse. The mech-

anism by which this action has a therapeutic effect in ADHD is not understood.

Indications

- Treatment of ADHD as part of a total treatment program
- Unlabeled use: Treatment of obesity

Contraindications and cautions

- Contraindicated with hypersensitivity to atomoxetine or constituents of *Strattera*; use of MAOIs within the past 14 days; narrow-angle glaucoma.
- Use cautiously with hypertension, tachycardia, CV or cerebrovascular disease, pregnancy, lactation, severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Available forms

Capsules—10, 18, 25, 40, 60, 80, 100 mg

Dosages

Adults and children over 70 kg

40 mg/day PO, increase after a minimum of 3 days to a target total daily dose of 80 mg PO given as a single dose in the morning or two evenly divided doses, in the morning and late afternoon or early evening; after 2–4 additional wk, total dosage may be increase to a maximum of 100 mg/day if needed.

Pediatric patients weighing 70 kg or less

Initially, 0.5 mg/kg/day PO; increase after a minimum of 3 days to a target total daily dose of approximately 1.2 mg/kg/day PO as a single daily dose in the morning; may be given in two evenly divided doses in the morning and late afternoon or early evening. Do not exceed 1.4 mg/kg or 100 mg/day, whichever is less.

Patients with hepatic impairment

For moderate hepatic impairment (Child-Pugh class B), reduce dose to 50% of the normal dose; for severe hepatic impairment (Child-Pugh class C), reduce dose to 25% of the normal dose.

Adverse effects

- **CNS:** Aggression, irritability, crying, somnolence, dizziness, *headache*, mood swings, *insomnia*, **possible suicidal ideation in children, adolescents, and young adults**
- **CV:** Palpitations, **sudden CV death**
- **Dermatologic:** Dermatitis, increased sweating
- **GI:** *Dry mouth, nausea*, dyspepsia, flatulence, *decreased appetite, constipation, upper abdominal pain, vomiting*
- **GU:** Urinary hesitation, urinary retention, dysmenorrhea, erectile problems
- **Respiratory:** *Cough*, rhinorrhea, sinusitis
- **Other:** Fever, rigors, sinusitis, weight loss, myalgia, fatigue

Interactions

★ **Drug-drug** • Possible increased serum levels if combined with potent CYP2D6 inhibitors—paroxetine, fluoxetine, quinidine; dosage adjustment may be necessary • Risk of neuroleptic malignant syndrome if combined with MAOIs; do not combine with an MAOI and do not give atomoxetine within 14 days of using an MAOI; do not start MAOI within 2 wk after discontinuing atomoxetine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to atomoxetine or constituents of *Strattera*; use of MAOIs within the past 14 days; narrow-angle glaucoma, hypertension, tachycardia, CV or cerebrovascular disease, pregnancy, lactation
- **Physical:** Height, weight, T; skin color, lesions; orientation, affect; P, BP, auscultation; R, adventitious sounds; bowel sounds, normal output

Interventions

- ☒ **Black box warning** Adolescents and children have an increased risk of suicidality when treated with atomoxetine. Monitor patient closely, and alert caregivers of risk.
- Ensure proper diagnosis before administering to children for behavioral syndromes; drug should not be used until other causes and concomitants of abnormal behavior

(learning disability, EEG abnormalities, neurologic deficits) are ruled out.

- Be aware that patient may be at increased risk for sudden CV death; evaluate use carefully and monitor patient.
- Ensure that drug is being used as part of an overall treatment program including education and psychosocial interventions.
- Be aware of an increased risk of inappropriate and aggressive behavior; monitor patient accordingly and include this information in teaching program.
- Arrange to interrupt drug dosage periodically in children being treated for behavioral disorders to determine if symptoms recur at an intensity that warrants continued drug therapy.
- Monitor growth and weight of children on long-term atomoxetine therapy.
- Administer drug before 6 PM to prevent insomnia if that is a problem.
- Monitor BP early in treatment, particularly with adult patients.
- Arrange for consult with school nurse for school-age patients receiving this drug.
- For women of childbearing age who are using this drug, suggest using contraceptives.

Teaching points

- Take this drug exactly as prescribed. It can be taken once a day in the morning; if adverse effects are a problem, the drug can be taken in two evenly divided doses in the morning and in the late afternoon or early evening.
- Do not open capsule; swallow it whole.
- Take drug before 6 PM to avoid nighttime sleep disturbance.
- Avoid the use of alcohol and over-the-counter drugs, including nose drops, cold remedies, and herbal therapies while taking this drug; some of these products cause dangerous effects. If you think that you need one of these preparations, consult your health care provider.
- The effects of this drug on the unborn baby are not known; women of childbearing age are advised to use contraceptives.
- You may experience these side effects: Dizziness, insomnia, moodiness (these effects may become less pronounced after a few days; avoid driving a car or engaging in activities

that require alertness if these occur; notify your health care provider if these are pronounced or bothersome); headache (analgesics may be available to help) loss of appetite, dry mouth (eat frequent small meals and suck on sugarless lozenges); thoughts of suicide (if you are a minor, report this to your parents or health care provider); changes in behavior.

- Report palpitations, dizziness, weight loss, severe dry mouth and difficulty swallowing, pregnancy, thoughts of suicide, aggressive or inappropriate behavior.

atorvastatin calcium (*ah tor' va stab tin*)

Lipitor

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic

HMG-CoA reductase inhibitor

Therapeutic actions

Inhibits HMG-CoA reductase, the enzyme that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDLs (associated with increased risk of CAD), and increases serum HDLs (associated with decreased risk of CAD); increases hepatic LDL recapture sites, enhances reuptake and catabolism of LDL; lowers triglyceride levels.

Indications

- Adjunct to diet in treatment of elevated total cholesterol, serum triglycerides, and LDL cholesterol and to increase HDL-C in patients with primary hypercholesterolemia (types IIa and IIb) and mixed dyslipidemia and primary dysbetalipoproteinemia, whose response to dietary restriction of saturated fat and cholesterol and other nonpharmacologic measures has not been adequate
- To reduce total cholesterol and LDL-C in patients with homozygous familial hypercholesterolemia as adjunct to lipid-lowering treatments

- Reduction of risk of MI and stroke in patients with type 2 diabetes and in those with multiple risk factors for CAD (such as age 55 or older, smoking, hypertension, low HDL-C, family history of early CAD) but no clinical evidence of CAD
- Adjunct to diet to treat elevated serum triglyceride levels (Fredrickson Type IV)
- Adjunct to diet in treatment of boys and postmenarchal girls ages 10–17 with heterozygous familial cholesterolemia if diet alone is not adequate to control lipid levels and LDL-C levels are 190 mg/dL or greater or if LDL-C level is 160 mg/dL or greater and there is a family history of premature CV disease or the child has two or more risk factors for the development of coronary disease
- Reduction of risk of MI, fatal and nonfatal stroke, revascularization procedures, heart failure, hospitalization, and angina in patients with clinically evident CAD
- Prevention of CV disease in adults without clinically evident coronary disease but with multiple risk factors for CAD; to reduce the risk of MI and risk for revascularization procedures and angina

Contraindications and cautions

- Contraindicated with allergy to atorvastatin, fungal byproducts, active hepatic disease, or unexplained and persistent elevations of transaminase levels, pregnancy, lactation.
- Use cautiously with impaired endocrine function, history of liver disease, alcoholism.

Available forms

Tablets—10, 20, 40, 80 mg

Dosages

Adults

Initially, 10–20 mg PO once daily without regard to meals; if more than 45% reduction in LDL is needed, may start with 40 mg daily; for maintenance, 10–80 mg PO daily. May be combined with bile acid-binding resin. Check lipid levels every 2–4 wk; adjust dose as needed.

Pediatric patients 10–17 yr

Initially, 10 mg PO daily. Maximum, 20 mg/day; do not change dose at intervals less than 4 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1–2 hr

Metabolism: Hepatic and cellular; $T_{1/2}$: 14 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile

Adverse effects

- **CNS:** *Headache*, asthenia
- **GI:** *Flatulence, abdominal pain, cramps, constipation, nausea*, dyspepsia, heartburn, **liver failure**
- **Respiratory:** Sinusitis, pharyngitis
- **Other:** **Rhabdomyolysis with acute renal failure**, arthralgia, myalgia, infections, cataracts

Interactions

- *** Drug-drug** • Possible severe myopathy or rhabdomyolysis with erythromycin, cyclosporine, nefazodone, tacrolimus, niacin, fibric acid derivatives, antifungals, clarithromycin, diltiazem, cimetidine, protease inhibitors, other HMG-CoA reductase inhibitors; limit dose to 10 mg/day with cyclosporine; limit dose to 20 mg/day with clarithromycin or protease inhibitors • Increased digoxin levels with possible toxicity if taken together; monitor digoxin levels • Increased estrogen levels with hormonal contraceptives; monitor patients on this combination
- *** Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has been reported between written orders for *Lipitor* (atorvastatin) and *Zyrtec* (cetirizine). Use extreme caution.

Assessment

- **History:** Allergy to atorvastatin, fungal byproducts; active hepatic disease; acute serious illness; pregnancy, lactation
- **Physical:** Orientation, affect, muscle strength; liver evaluation, abdominal ex-

amination; lipid studies, LFTs, renal function tests

Interventions

- Obtain LFTs as a baseline and periodically during therapy; discontinue drug if AST or ALT levels increase to 3 times normal levels.
- **⊗ Warning** Withhold atorvastatin in any acute, serious condition (severe infection, hypotension, major surgery, trauma, severe metabolic or endocrine disorder, seizures) that may suggest myopathy or serve as risk factor for development of renal failure.
- Ensure that patient has tried cholesterol-lowering diet regimen for 3–6 mo before beginning therapy.
- Administer drug without regard to food, but at same time each day.
- Atorvastatin may be combined with a bile acid-binding agent. Do not combine with other HMG-CoA reductase inhibitors or fibrates.
- Consult dietitian about low-cholesterol diets.
- **⊗ Warning** Ensure that patient is not pregnant and has appropriate contraceptives available during therapy; serious fetal damage has been associated with this drug.

Teaching points

- Take this drug once a day, at about the same time each day, preferably in the evening; may be taken with food. Do not drink grapefruit juice while taking this drug.
- Institute appropriate dietary changes.
- Arrange to have periodic blood tests while you are taking this drug.
- Alert any health care provider that you are taking this drug; it will need to be discontinued if acute injury or illness occurs.
- Do not become pregnant while you are taking this drug; use barrier contraceptives. If you wish to become pregnant or think you are pregnant, consult your health care provider.
- You may experience these side effects: Nausea (eat frequent small meals); headache, muscle and joint aches and pains (may lessen over time).
- Report muscle pain, weakness, tenderness; malaise; fever; changes in color of urine or stool; swelling.

atovaquone (a toe' va kwon)

Mepron

PREGNANCY CATEGORY C

Drug class

Antiprotozoal

Therapeutic actions

Directly inhibits enzymes required for nucleic acid and ATP synthesis in protozoa; effective against *Pneumocystis carinii*.

Indications

- Prevention and acute oral treatment of mild to moderate *P. carinii* pneumonia (PCP) in patients who are intolerant to trimethoprim-sulfamethoxazole

Contraindications and cautions

- Contraindicated with development or history of potentially life-threatening allergic reactions to any of the components of the drug.
- Use cautiously with severe PCP infections, the elderly, lactation, hepatic impairment.

Available forms

Suspension—750 mg/5 mL

Dosages

Adults and patients 13–16 yr

- *Prevention of PCP*: 1,500 mg PO daily with a meal.
- *Treatment of PCP*: 750 mg PO bid with food for 21 days.

Pediatric patients younger than 13 yr

Safety and efficacy not established.

Geriatric patients

Use caution, and evaluate patient response regularly.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–8 hr	3–5 days

Metabolism: $T_{1/2}$: 2.2–2.9 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Dizziness, *insomnia*, *headache*, depression
- **Dermatologic:** *Rash*, pruritus, sweating, dry skin
- **GI:** Constipation, *diarrhea*, *nausea*, *vomiting*, anorexia, abdominal pain, oral monilia infections
- **Other:** *Fever*; elevated liver enzymes, hyponatremia, increased cough, dyspnea, flu-like syndrome, sweating

Interactions

- ★ **Drug-drug** • Decreased effects if taken with rifamycins
- ★ **Drug-food** • Markedly increased absorption of atovaquone when taken with food

■ Nursing considerations Assessment

- **History:** History of potentially life-threatening allergic reactions to any components of the drug, severe PCP infections, elderly, lactation
- **Physical:** T, skin condition, neurologic status, abdominal evaluation, serum electrolytes, LFTs

Interventions

- Give drug with meals.
- Ensure that this drug is taken for 21 days as treatment.

Teaching points

- Take drug with food; food increases the absorption of the drug.
- You may experience these side effects: Dizziness, insomnia, headache (medication may be ordered); nausea, vomiting (eat frequent small meals); diarrhea or constipation (consult your health care provider for appropriate treatment); superinfections (therapy may be ordered); rash (good skin care may help).
- Report fever, mouth infection, severe headache, severe nausea or vomiting, rash.

▷ atropine sulfate*(a' troe peen)*

Parenteral and oral preparations: AtroPen, Sal-Tropine

Ophthalmic solution: Atropine Sulfate S.O.P., Isopto Atropine Ophthalmic

PREGNANCY CATEGORY C

Drug classes

Anticholinergic

Antidote

Antimuscarinic

Antiparkinsonian

Belladonna alkaloid

Diagnostic agent (ophthalmic preparations)

Parasympatholytic

Therapeutic actions

Competitively blocks the effects of acetylcholine at muscarinic cholinergic receptors that mediate the effects of parasympathetic postganglionic impulses, depressing salivary and bronchial secretions, dilating the bronchi, inhibiting vagal influences on the heart, relaxing the GI and GU tracts, inhibiting gastric acid secretion (high doses), relaxing the pupil of the eye (mydriatic effect), and preventing accommodation for near vision (cycloplegic effect); also blocks the effects of acetylcholine in the CNS.

Indications**Systemic administration**

- Antisialagogue for preanesthetic medication to prevent or reduce respiratory tract secretions
- Treatment of parkinsonism; relieves tremor and rigidity
- Restoration of cardiac rate and arterial pressure during anesthesia when vagal stimulation produced by intra-abdominal traction causes a decrease in pulse rate, lessening the degree of AV block when increased vagal tone is a factor (eg, some cases due to cardiac glycosides)
- Relief of bradycardia and syncope due to hyperactive carotid sinus reflex

- Relief of pylorospasm, hypertonicity of the small intestine, and hypermotility of the colon
- Relaxation of the spasm of biliary and ureteral colic and bronchospasm
- Relaxation of the tone of the detrusor muscle of the urinary bladder in the treatment of urinary tract disorders
- Control of crying and laughing episodes in patients with brain lesions
- Treatment of closed head injuries that cause acetylcholine release into CSF, EEG abnormalities, stupor, neurologic signs
- Relaxation of uterine hypertonicity
- Management of peptic ulcer
- Control of rhinorrhea of acute rhinitis or hay fever
- Antidote (with external cardiac massage) for CV collapse from overdose of parasympathomimetic (cholinergic) drugs (choline esters, pilocarpine), or cholinesterase inhibitors (eg, physostigmine, isoflurophate, organophosphorus insecticides)
- Antidote for poisoning by certain species of mushroom (eg, *Amanita muscaria*)
- **NEW INDICATION:** Initial treatment of muscarinic symptoms of insecticide or nerve agent poisoning

Ophthalmic preparations

- Diagnostically to produce mydriasis and cycloplegia-pupillary dilation in acute inflammatory conditions of the iris and uveal tract

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinergic drugs.

Systemic administration

- Contraindicated with glaucoma, adhesions between iris and lens; stenosing peptic ulcer; pyloroduodenal obstruction; paralytic ileus; intestinal atony; severe ulcerative colitis; toxic megacolon; symptomatic prostatic hypertrophy; bladder neck obstruction; bronchial asthma; COPD; cardiac arrhythmias; tachycardia; myocardial ischemia; impaired metabolic, hepatic, or renal function; myasthenia gravis.
- Use cautiously with Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism, pregnancy, lactation.

Ophthalmic solution

- Contraindicated with glaucoma or tendency to glaucoma.

Available forms

Tablets—0.4 mg; injection—0.05, 0.1, 0.3, 0.4, 0.5, 0.8, 1, 2 mg/mL; ophthalmic ointment—1%; ophthalmic solution—0.5%, 1%, 2%; auto-injector—0.25, 0.5, 1, 2 mg

Dosages**Adults****Systemic administration**

0.4–0.6 mg PO, IM, IV, or subcutaneously.

- **Hypotonic radiography:** 1 mg IM.
- **Surgery:** 0.5 mg (0.4–0.6 mg) IM (or subcutaneously or IV) prior to induction of anesthesia; during surgery, give IV; reduce dose to less than 0.4 mg with cyclopropane anesthesia.
- **Bradycardias:** 0.4–1 mg (up to 2 mg) IV every 1–2 hr as needed.
- **Antidote:** For poisoning due to cholinesterase inhibitor insecticides, give large doses of at least 2–3 mg parenterally, and repeat until signs of atropine intoxication appear; for rapid type of mushroom poisoning, give in doses sufficient to control parasympathetic signs before coma and CV collapse intervene. Auto-injector provides rapid administration.

Ophthalmic solution

- **For refraction:** Instill 1–2 drops into eye 1 hr before refracting.
- **For uveitis:** Instill 1–2 drops into eye tid.

Pediatric patients**Systemic administration**

Refer to the following table:

Weight	Dose (mg)
7–16 lb (3.2–7.3 kg)	0.1
16–24 lb (7.3–10.9 kg)	0.15
24–40 lb (10.9–18.1 kg)	0.2
40–65 lb (18.1–29.5 kg)	0.3
65–90 lb (29.5–40.8 kg)	0.4
> 90 lb (> 40.8 kg)	0.4–0.6

- **Surgery:** For infants weighing less than 5 kg, 0.04 mg/kg; infants weighing more than 5 kg, 0.03 mg/kg. Repeat every 4–6 hr as needed. For children, 0.01 mg/kg to a maximum of 4 mg; repeat every 4–6 hr.
- **Bradycardias:** 0.01–0.03 mg/kg IV.

Antidote:

90 lb or more: 2 mg auto-injector.

40–90 lb: 1-mg auto-injector.

15–40 lb: 0.5 mg auto-injector.

Less than 15 lb: Individualized doses of 0.25 mg.

Geriatric patients

More likely to cause serious adverse reactions, especially CNS reactions, in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	10–15 min	30 min	4 hr
IV	Immediate	2–4 min	4 hr
Subcut.	Varies	1–2 hr	4 hr
Topical	5–10 min	30–40 min	7–14 days

Metabolism: Hepatic; $T_{1/2}$: 2.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Give undiluted or dilute in 10 mL sterile water.

Infusion: Give direct IV; administer 1 mg or less over 1 min.

Adverse effects**Systemic administration**

- **CNS:** Blurred vision, mydriasis, cycloplegia, photophobia, increased IOP, headache, flushing, nervousness, weakness, dizziness, insomnia, mental confusion or excitement (after even small doses in the elderly), nasal congestion
- **CV:** *Palpitations, bradycardia* (low doses), *tachycardia* (higher doses)
- **GI:** *Dry mouth, altered taste perception, nausea, vomiting, dysphagia, heartburn, constipation, bloated feeling, paralytic ileus, gastroesophageal reflux*
- **GU:** *Urinary hesitancy and retention; impotence*
- **Other:** *Decreased sweating and predisposition to heat prostration, suppression of lactation*

Ophthalmic preparations

- **Local:** Transient stinging

- **Systemic:** Systemic adverse effects, depending on amount absorbed

Interactions

• **Drug-drug** • Increased anticholinergic effects with other drugs that have anticholinergic activity—certain antihistamines, certain antiparkinsonians, TCAs, MAOIs • Decreased antipsychotic effectiveness of haloperidol with atropine • Decreased effectiveness of phenothiazines, but increased incidence of paralytic ileus • If cholinesterase inhibitors and atropine are given together, opposing effects will render both drugs ineffective

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to anticholinergics; glaucoma; adhesions between iris and lens; stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, bronchial asthma, COPD, cardiac arrhythmias, myocardial ischemia, impaired metabolic, liver, or renal function, myasthenia gravis, Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism, lactation
- **Physical:** Skin color, lesions, texture; T; orientation, reflexes, bilateral grip strength; affect; ophthalmic examination; P; BP; R, adventitious sounds; bowel sounds, normal GI output; normal urinary output, prostate palpation; LFTs, renal function tests, ECG

Interventions

- Ensure adequate hydration; provide environmental control (temperature) to prevent hyperpyrexia.
- Have patient void before taking medication if urinary retention is a problem.

Teaching points

When used preoperatively or in other acute situations, incorporate teaching about the drug with teaching about the procedure; the ophthalmic solution is mainly used acutely and will not be self-administered by the patient; the following apply to oral medication for outpatients:

- Take as prescribed, 30 minutes before meals; avoid excessive dosage.
- Avoid hot environments; you will be heat intolerant, and dangerous reactions may occur.
- You may experience these side effects: Dizziness, confusion (use caution driving or performing hazardous tasks); constipation (ensure adequate fluid intake, proper diet); dry mouth (sugarless lozenges, frequent mouth care may help; may be transient); blurred vision, sensitivity to light (reversible; avoid tasks that require acute vision; wear sunglasses in bright light); impotence (reversible); difficulty in urination (empty the bladder prior to taking drug).
- Report rash; flushing; eye pain; difficulty breathing; tremors, loss of coordination; irregular heartbeat, palpitations; headache; abdominal distention; hallucinations; severe or persistent dry mouth; difficulty swallowing; difficulty in urination; constipation; sensitivity to light.

▽ auranofin

See Appendix U, *Less commonly used drugs*.

▽ azacitidine

See Appendix U, *Less commonly used drugs*.

▽ azathioprine

(ay za *thye'* oh preen)

Azasan, Imuran

PREGNANCY CATEGORY D

Drug class

Immunosuppressant

Therapeutic actions

Suppresses cell-mediated hypersensitivities and alters antibody production; exact mechanisms of action in increasing homograft survival and affecting autoimmune diseases not clearly understood.

Indications

- Renal homotransplantation: Adjunct for prevention of rejection
- Rheumatoid arthritis: Use only with adults meeting criteria for classic rheumatoid arthritis and not responding to conventional management
- Unlabeled use: Treatment of chronic ulcerative colitis, myasthenia gravis, Behçet's syndrome, Crohn's disease, clinically definite MS (alone or in combination with other drugs)

Contraindications and cautions

- Contraindicated with allergy to azathioprine; rheumatoid arthritis patients previously treated with alkylating agents, increasing their risk for neoplasia; pregnancy.
- Use cautiously with bone marrow suppression, hepatic impairment, lactation, serious infection.

Available forms

Tablets—50, 75, 100 mg; injection—100 mg/vial

Dosages

Adults

- **Renal homotransplantation:** Initially, 3–5 mg/kg/day PO or IV as a single dose on the day of transplant; for maintenance, use 1–3 mg/kg/day PO. Do not increase dose to decrease risk of rejection.
- **Rheumatoid arthritis:** Usually given daily; initial dose is 1 mg/kg PO given as a single dose or bid. Dose may be increased at 6–8 wk and thereafter by steps at 4-wk intervals. Dose increments should be 0.5 mg/kg/day up to a maximum dose of 2.5 mg/kg/day. Once patient is stabilized, dose should be decreased to lowest effective dose; decrease in 0.5-mg/kg increments. Patients who do not respond in 12 wk are probably refractory.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal impairment

Lower doses may be required because of decreased rate of excretion and increased sensitivity to the drug.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
IV	Immediate	30–45 min

Metabolism: Hepatic; $T_{1/2}$: 5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Add 10 mL sterile water for injection and swirl until a clear solution results; use within 24 hr. Further dilution into sterile saline or dextrose is usually made for infusion.

Infusion: Infuse over 30–60 min; can range from 5 min–8 hr for the daily dose.

Adverse effects

- **GI:** *Nausea, vomiting*, hepatotoxicity (especially in homograft patients)
- **Hematologic:** *Leukopenia, thrombocytopenia, macrocytic anemia*
- **Other: Serious infections** (fungal, bacterial, protozoal infections secondary to immunosuppression), *carcinogenesis* (increased risk of neoplasia, especially in homograft patients)

Interactions

★ **Drug-drug** • Increased effects with allopurinol; reduce azathioprine to one-third to one-fourth the usual dose • Reversal of the neuromuscular blockade of nondepolarizing neuromuscular junction blockers (atracurium, pancuronium, tubocurarine, vecuronium) with azathioprine

Nursing considerations

Assessment

- **History:** Allergy to azathioprine; rheumatoid arthritis patients previously treated with alkylating agents; pregnancy or male partners of women trying to become pregnant; lactation
- **Physical:** T; skin color, lesions; liver evaluation, bowel sounds; LFTs, renal function tests, CBC

Interventions

- Give drug IV if oral administration is not possible; switch to oral route as soon as possible.
- Administer in divided daily doses or with food if GI upset occurs.

⊗ **Black box warning** Monitor blood counts regularly; severe hematologic effects may require the discontinuation of therapy; increases risk of neoplasia. Alert patient accordingly.

Teaching points

- Take drug in divided doses with food if GI upset occurs.
- Avoid infections; avoid crowds or people who have infections. Notify your physician at once if you are injured.
- Notify your health care provider if you think you are pregnant or wish to become pregnant, or if you are a man whose sexual partner wishes to become pregnant.
- You may experience these side effects: Nausea, vomiting (take drug in divided doses or with food), diarrhea, rash.
- Report unusual bleeding or bruising, fever, sore throat, mouth sores, signs of infection, abdominal pain, severe diarrhea, darkened urine or pale stools, severe nausea and vomiting.

azithromycin

(ay zi thro my' sin)

Zithromax, Zmax

PREGNANCY CATEGORY B

Drug class

Macrolide antibiotic

Therapeutic actions

Bacteriostatic or bactericidal in susceptible bacteria.

Indications

- Treatment of lower respiratory infections: Acute bacterial exacerbations of COPD due to *Haemophilus influenzae*, *Moraxella catarrhalis*, *Streptococcus pneumoniae*; community-acquired pneumonia due to *S. pneu-*

moniae, *H. influenzae*, *Mycoplasma pneumoniae*; *Chlamydothilia pneumoniae*

- Treatment of lower respiratory infections: Streptococcal pharyngitis and tonsillitis due to *Streptococcus pyogenes* in those who cannot take penicillins
- Treatment of genital ulcer disease caused by *Haemophilus ducreyi* (chancroid) in men
- Treatment of uncomplicated skin infections due to *Staphylococcus aureus*, *S. pyogenes*, *Streptococcus agalactiae*
- Treatment of nongonococcal urethritis and cervicitis due to *Chlamydia trachomatis*; treatment of PID
- Treatment of otitis media caused by *H. influenzae*, *M. catarrhalis*, *S. pneumoniae* in children older than 6 mo
- Treatment of pharyngitis and tonsillitis caused by *S. pyogenes* in children older than 2 yr who cannot use first-line therapy
- Prevention and treatment of disseminated *Mycobacterium avium* complex (MAC) in patients with advanced HIV infection
- Treatment of patients with mild to moderate acute bacterial sinusitis caused by *H. influenzae*, *M. catarrhalis*, *S. pneumoniae* (Zmax)
- Treatment of mild to moderate community-acquired pneumonia caused by *C. pneumoniae*, *H. influenzae*, *M. pneumoniae*, *S. pneumoniae* (Zmax)
- Unlabeled uses: Uncomplicated gonococcal infections caused by *N. gonorrhoeae*, gonococcal pharyngitis caused by *N. gonorrhoeae*, chlamydial infections caused by *C. trachomatis*, prophylaxis after sexual attack, babesiosis, early Lyme disease, granuloma inguinale, treatment of cholera in adults

Contraindications and cautions

- Contraindicated with hypersensitivity to azithromycin, erythromycin, or any macrolide antibiotic, mild to moderate pneumonia, cystic fibrosis, bacteremia, immunocompromised patients, elderly patients.
- Use cautiously with gonorrhea or syphilis, pseudomembranous colitis, hepatic or renal impairment, lactation.

Available forms

Tablets—250, 500, 600 mg; powder for injection—500 mg; injection—2.5 g; powder for oral suspension—100 mg/5 mL, 200 mg/5 mL, 1 g/packet; bottles for oral suspension—2 g to be reconstituted with 60 mL water (*Zmax*)

Dosages

Adults

- *Mild to moderate acute bacterial exacerbations of COPD, pneumonia, pharyngitis and tonsillitis (as second-line), uncomplicated skin and skin structure infections:* 500 mg PO single dose on first day, followed by 250 mg PO daily on days 2–5 for a total dose of 1.5 g or 500 mg/day PO for 3 days.
- *Nongonococcal urethritis, genital ulcer disease, and cervicitis due to C. trachomatis:* A single 1-g PO dose.
- *Gonococcal urethritis and cervicitis:* A single dose of 2 g PO.
- *Disseminated MAC infections:* For prevention, 1,200 mg PO taken once weekly. For treatment, 600 mg/day PO with etambutol.
- *Acute sinusitis:* 500 mg/day PO for 3 days or a single 2-g dose of *Zmax*.
- *Mild to moderate acute bacterial sinusitis, community acquired pneumonia:* 2 g PO as a single dose (*Zmax*).
- *Community-acquired pneumonia:* 500 mg IV daily for at least 2 days; then 500 mg PO for a total of 7–10 days.
- *Mild community-acquired pneumonia:* 500 mg PO on day 1, then 250 mg PO for 4 days.
- *PID:* 500 mg IV daily for 1–2 days; then 250 mg/day PO for a total of 7 days.

Pediatric patients 6 mo and older

- *Otitis media:* Initially, 10 mg/kg PO as a single dose, then 5 mg/kg on days 2–5 or 30 mg/kg PO as a single dose.
- *Community-acquired pneumonia:* 10 mg/kg PO as a single dose on first day, then 5 mg/kg PO on days 2–5, or 60 mg/kg *Zmax* as a single dose; children weighing more than 34 kg (75 lb) should receive adult dosage.
- *Pharyngitis or tonsillitis:* 12 mg/kg/day PO on days 1–5 (maximum of 500 mg/day). Safety and efficacy for children younger than 2 yr have not been established.
- *Acute sinusitis:* 10 mg/kg/day PO for 3 days.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2.5–3.2 hr	24 hr

Metabolism: $T_{1/2}$: 11–48 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine—unchanged

IV FACTS

Preparation: Add 4.8 mL sterile water for injection to 500-mg vial. Shake until drug is dissolved; may be further diluted in 0.9% normal saline; 0.45% normal saline, D₅W in water, 5% dextrose in lactated Ringer's solution, 1/2 or 1/3 normal saline, lactated Ringer's solution, *Normosol-M* or *Normosol-R* in 5% dextrose. Drug is stable for 24 hr at room temperature or for 7 days refrigerated.

Infusion: Infuse over 60 minutes or longer. Guidelines: 1 mg/mL solution over 3 hr; 2 mg/mL over 1 hr.

Adverse effects

- **CNS:** Dizziness, headache, vertigo, somnolence, fatigue
- **GI:** *Diarrhea, abdominal pain, nausea, dyspepsia, flatulence, vomiting, melena, pseudomembranous colitis*
- **Other:** *Superinfections, angioedema, rash, photosensitivity, vaginitis*

Interactions

★ **Drug-drug** • Decreased serum levels and effectiveness of azithromycin with aluminum and magnesium-containing antacids • Possible increased effects of theophylline • Possible increased anticoagulant effects of warfarin

★ **Drug-food** • Food greatly decreases the absorption of azithromycin

Nursing considerations

Assessment

- **History:** Hypersensitivity to azithromycin, erythromycin, or any macrolide antibiotic; gonorrhea or syphilis, pseudomembranous colitis, hepatic or renal impairment, lactation
- **Physical:** Site of infection; skin color, lesions; orientation, GI output, bowel sounds, liver evaluation; culture and sensitivity tests of infection, urinalysis, LFTs, renal function tests

Interventions

- Culture site of infection before therapy.
- Administer on an empty stomach 1 hr before or 2–3 hr after meals. Food affects the absorption of this drug.
- Prepare *Zmax* by adding 60 mL water to bottle, shake well.
- Counsel patients being treated for STDs about appropriate precautions and additional therapy.

Teaching points

- Take the full course prescribed. Do not take with antacids. Tablets and oral suspension can be taken with or without food.
- Prepare *Zmax* by adding 60 mL (¼ cup) water to bottle, shake well, drink all at once.
- You may experience these side effects: Stomach cramping, discomfort, diarrhea; fatigue, headache (medication may help); additional infections in the mouth or vagina (consult your health care provider for treatment).
- Report severe or watery diarrhea, severe nausea or vomiting, rash or itching, mouth sores, vaginal sores.

aztreonam (az' tree ob nam)

Azactam, Cayston

PREGNANCY CATEGORY B

Drug class

Monobactam antibiotic

Therapeutic actions

Bactericidal: Interferes with bacterial cell wall synthesis, causing cell death in susceptible gram-negative bacteria, ineffective against gram-positive and anaerobic bacteria.

Indications

- Treatment of UTIs, lower respiratory infections, skin and skin-structure infections, septicemia, intra-abdominal infections and gynecologic infections caused by susceptible strains of *Escherichia coli*, *Enterobacter*, *Serratia*, *Proteus*, *Salmonella*, *Providen-*

cia, *Pseudomonas*, *Citrobacter*, *Haemophilus*, *Neisseria*, *Klebsiella*

- Adjunct to surgery in managing infections caused by susceptible organisms (especially gram-negative aerobic pathogens)
- **NEW INDICATION:** Improvement of respiratory symptoms in cystic fibrosis patients with *Pseudomonas aeruginosa* infections (inhalation)
- Unlabeled use: 1 g IM for treatment of acute uncomplicated gonorrhea as alternative to spectinomycin in penicillin-resistant gonococci

Contraindications and cautions

- Contraindicated with allergy to aztreonam.
- Use cautiously with immediate hypersensitivity reaction to penicillins or cephalosporins, renal and hepatic disorders, lactation.

Available forms

Powder for injection—500 mg, 1 g, 2 g; single-use vial for inhalation—75 mg

Dosages

Available for IV and IM use and inhalation; maximum recommended dose, 8 g/day.

Adults

- *UTIs*: 500 mg–1 g every 8–12 hr.
- *Moderately severe systemic infection*: 1–2 g every 8–12 hr.
- *Severe systemic infection*: 2 g every 6–8 hr.

Pediatric patients 9 mo and older

- *Mild to moderate infections*: 30 mg/kg every 8 hr.
- *Moderate to severe infections*: 30 mg/kg every 6–8 hr.

Maximum recommended dose, 120 mg/kg/day.

Adults and children 7 yr and older

Cystic fibrosis patients with P. aeruginosa infections: 75 mg inhalation using *Altera Nebulizer System* tid for 28 days; space doses at least 4 hr apart.

Geriatric patients or patients with renal impairment

Reduce dosage by one-half in patients who have estimated creatinine clearances between 10 and 30 mL/min/1.73m² after an initial loading dose of 1 or 2 g. For patients on hemodialysis, give 500 mg, 1 g, or 2 g initially;

maintenance dose should be one-fourth the usual initial dose at fixed intervals of 6, 8, or 12 hr. In serious or life-threatening infections, give an additional one-eighth of the initial dose after each hemodialysis session.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Varies	60–90 min	6–8 hr
IV	Immediate	30 min	6–8 hr
Inhalation	Immediate	10 min	6–8 hr

Metabolism: $T_{1/2}$: 1.5–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: After adding diluent to container, shake immediately and vigorously. Constituted solutions are not for multiple-dose use; discard any unused solution. Solution should be colorless to light straw yellow, or it may be slightly pink.

IV injection: Reconstitute contents of 15-mL vial with 6–10 mL sterile water for injection. Inject slowly over 3–5 min directly into vein or into IV tubing of compatible IV infusion.

IV infusion: Reconstitute contents of 100-mL bottle to make a final concentration of 20 mg/mL or less (add at least 50 mL of one of the following solutions per gram of aztreonam): 0.9% sodium chloride injection, Ringer's injection, lactated Ringer's injection, 5% or 10% dextrose injection, 5% dextrose and 0.2%, 0.45%, or 0.09% sodium chloride, sodium lactate injection, *Ionosol B with 5% Dextrose*, *Isolyte E*, *Isolyte E with 5% Dextrose*, *Isolyte M with 5% Dextrose*, *Normosol-R*, *Normosol-R and 5% Dextrose*, *Normosol-M and 5% Dextrose*, 5% and 10% mannitol injection, lactated Ringer's and 5% dextrose injection, *Plasma-Lyte M and 5% Dextrose*, *10% Travert Injection*, *10% Travert and Electrolyte no. 1, 2, or 3 Injection*. Use reconstituted solutions promptly after preparation; those prepared with sterile water for injection or sodium chloride injection should be used within 48 hr if stored at room temperature and within 7 days if refrigerated. Administer over 20–60 min. If giving into IV tubing that is used to administer other drugs, flush tubing with de-

livery solution before and after aztreonam administration.

Incompatibilities: Do not mix with nafcillin sodium, cephradine, metronidazole; other admixtures are not recommended because data are not available.

Y-site incompatibility: Vancomycin.

Adverse effects

- **Dermatologic:** *Rash, pruritus*
- **GI:** *Nausea, vomiting, diarrhea*, transient elevation of AST, ALT, LDH
- **Hypersensitivity:** **Anaphylaxis**
- **Local:** *Local phlebitis or thrombophlebitis* at IV injection site, swelling or discomfort at IM injection site
- **Respiratory:** Bronchospasm, cough, congestion, sore throat, wheezing (inhaled form)
- **Other:** Superinfections

Nursing considerations

Assessment

- **History:** Allergy to aztreonam, immediate hypersensitivity reaction to penicillins or cephalosporins, renal and hepatic disorders, lactation
- **Physical:** Skin color, lesions; injection sites; T; GI mucous membranes, bowel sounds, liver evaluation; GU mucous membranes; culture and sensitivity tests of infected area; LFTs, renal function tests

Interventions

- Arrange for culture and sensitivity tests of infected area before therapy. In acutely ill patients, therapy may begin before test results are known. If therapeutic effects are not noted, reculture area.
- For IM administration, reconstitute contents of 15-mL vial with at least 3 mL of diluent per gram of aztreonam. Appropriate diluents are sterile water for injection, bacteriostatic water for injection, 0.9% sodium chloride injection, bacteriostatic sodium chloride injection. Inject deeply into a large muscle mass. Do not mix with any local anesthetic.
- ⊗ **Warning** Discontinue drug and provide supportive measures if hypersensitivity reaction or anaphylaxis occurs.
- Monitor injection sites and provide comfort measures.

- Prepare inhaled form immediately before use. Administer using *Altera Nebulizer System*; each dose should take 2–3 min. Space doses at least 4 hr apart.
- Administer a bronchodilator before giving inhaled form: If bronchodilator is short-acting, give 15 min to 4 hr before each dose; if long-acting, give 30 min to 12 hr before each dose. If patient is on multiple inhaled therapies, use the following order—bronchodilator, mucolytic, *Gayston*.
- Provide treatment and comfort measures if superinfections occur.
- Monitor patient's nutritional status, and provide small, frequent meals and mouth care if GI effects or superinfections interfere with nutrition.

Teaching points

- This drug can be given IM or IV or by inhalation.
- If you are using the inhaled form, it may be stored at room temperature for up to 28 days. Do not use after expiration date. The powder must be diluted with the saline provided. Use immediately after you have prepared the drug. Do not mix with other solutions. Use only with the *Altera Nebulizer System*. Space your daily treatments at least 4 hr apart. Use this drug for the full 28 days. If you are using other inhaled drugs, take them in the following order—bronchodilators, mucolytics, then this drug.
- You may experience these side effects: Nausea, vomiting, diarrhea.
- Report pain, soreness at injection site; difficulty breathing; mouth sores; facial swelling.

bacitracin

(*bass i tray' sin*)

Powder for injection: Baci-IM, BaciJect (CAN)

Ophthalmic: AK-Tracin

Topical ointment: Baciguient (CAN)

PREGNANCY CATEGORY C

Drug class

Antibiotic

Therapeutic actions

Antibacterial; inhibits cell wall synthesis of susceptible bacteria, primarily staphylococci, causing cell death.

Indications

- IM: Pneumonia and empyema caused by susceptible strains of staphylococci in infants
- Ophthalmic preparations: Superficial ocular infections involving the conjunctiva or cornea caused by susceptible strains of staphylococci
- Topical ointment: Prophylaxis of minor skin abrasions; treatment of superficial infections of the skin caused by susceptible staphylococci

Contraindications and cautions

- Contraindicated with allergy to bacitracin, renal disease (IM use), lactation.
- Use cautiously with pregnancy, dehydration.

Available forms

Powder for injection—50,000 units; ophthalmic ointment—500 units/g; topical ointment—500 units/g

Dosages

Adults and pediatric patients

Ophthalmic

Administration and dosage vary depending on the product used. See the product's package insert.

Topical

Apply to affected area one to three times per day; cover with sterile bandage if needed. Do not use longer than 1 wk.

IM

Infants weighing less than 2.5 kg: 900 units/kg/day IM in two to three divided doses.

Infants weighing more than 2.5 kg: 1,000 units/kg/day IM in two to three divided doses.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	Rapid	1–2 hr	12–14 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **GI:** Nausea, vomiting
- **GU:** *Nephrotoxicity*
- **Local:** *Pain at injection site (IM); contact dermatitis (topical ointment); irritation, burning, stinging, itching, blurring of vision (ophthalmic preparations)*
- **Other:** Superinfections

Interactions

★ **Drug-drug** • Increased neuromuscular blockade and muscular paralysis with anesthetics, nondepolarizing neuromuscular blocking drugs, drugs with neuromuscular blocking activity • Increased risk of respiratory paralysis and renal failure with aminoglycosides

■ Nursing considerations

Assessment

- **History:** Allergy to bacitracin, renal disease, lactation
- **Physical:** Site of infection; skin color, lesions; normal urinary output; urinalysis, serum creatinine, renal function tests

Interventions

- For IM use, reconstitute 50,000-unit vial with 9.8 mL 0.9% sodium chloride injection with 2% procaine hydrochloride; reconstitute the 10,000-unit vial with 2 mL of diluent (resulting concentration of 5,000 units/mL). Do not use diluents containing parabens; precipitates can form. Refrigerate unconstituted vials. Reconstituted solutions are stable for 1 wk, refrigerated.
- For topical application, cleanse the area before applying new ointment.
- Culture infected area before therapy.
- Ensure adequate hydration to prevent renal toxicity.

⊗ **Black box warning** During IM therapy, monitor renal function tests daily; risk of serious renal toxicity.

Teaching points

- Give ophthalmic preparation as follows: Tilt head back; place medication inside the eyelid and close eyes; gently hold the inner

corner of the eye for 1 minute. Do not touch tube to eye. For topical application, cleanse area being treated before applying new ointment; cover with sterile bandage (if possible).

- You may experience these side effects: Superinfections (frequent hygiene measures, medications may help); transient burning, stinging, or blurring of vision (ophthalmic).
- Report rash or skin lesions; change in urinary voiding patterns; changes in vision, severe stinging, or itching (ophthalmic).

▽ baclofen (bak' loe fen)

Apo-Baclofen (CAN), Gen-Baclofen (CAN), Kemstro, Lioresal, Lioresal Intrathecal, PMS-Baclofen (CAN), ratio-Baclofen (CAN)

PREGNANCY CATEGORY C

Drug class

Centrally acting skeletal muscle relaxant

Therapeutic actions

Precise mechanism not known; GABA analogue but does not appear to produce clinical effects by actions on GABA-minergic systems; inhibits both monosynaptic and polysynaptic spinal reflexes; CNS depressant.

Indications

- Alleviation of signs and symptoms of spasticity resulting from MS, particularly for the relief of flexor spasms and concomitant pain, clonus, muscular rigidity (for patients with reversible spasticity to aid in restoring residual function); treatment of severe spasticity (intrathecal route)
- Spinal cord injuries and other spinal cord diseases—may be of some value (oral)
- Unlabeled uses: Trigeminal neuralgia (tic douloureux); may be beneficial in reducing spasticity in cerebral palsy in children (intrathecal use); intractable hiccups unresponsive to other therapies, alcohol and opiate withdrawal (oral), GERD, migraine prevention

Contraindications and cautions

- Contraindicated with hypersensitivity to baclofen; skeletal muscle spasm resulting from rheumatic disorders.
- Use cautiously with stroke, cerebral palsy, Parkinson's disease, seizure disorders, lactation, pregnancy.

Available forms

Tablets—10, 20 mg; intrathecal—0.05 mg/mL, 10 mg/20 mL, 10 mg/5 mL; oral disintegrating tablets—10, 20 mg

Dosages

Adults

Oral

Individualize dosage; start at low dosage and increase gradually until optimum effect is achieved (usually 40–80 mg/day). The following dosage schedule is suggested: 5 mg PO tid for 3 days; 10 mg tid for 3 days; 15 mg tid for 3 days; 20 mg tid for 3 days. Thereafter, additional increases may be needed, but do not exceed 80 mg/day (20 mg qid); use lowest effective dose. If benefits are not evident after a reasonable trial period, gradually withdraw the drug.

Intrathecal

Refer to manufacturer's instructions on pump implantation and initiation of long-term infusion. Testing is usually done with 50 mcg/mL injected into intrathecal space over 1 min. Patient is observed for 4–8 hr, then dose of 75 mcg/1.5 mL is given; patient is observed for 4–8 hr; a final screening bolus of 100 mcg/2 mL is given 24 hr later if the response is still not adequate. Patients who do not respond to this dose are not candidates for the implant. Maintenance dose is determined by monitoring patient response. Maintenance dose for spasticity of cerebral origin ranges from 22–1,400 mcg/day. Maintenance dose for spasticity of spinal cord origin ranges from 12–2,003 mcg/day; usual range is 300–800 mcg/day. Smallest dose possible to achieve muscle tone without adverse effects is desired.

Pediatric patients

Safety for use in children younger than 12 yr not established; orphan drug use to decrease spasticity in children with cerebral palsy is being studied.

Geriatric patients or patients with renal impairment

Dosage reduction may be necessary; monitor closely (drug is excreted largely unchanged by the kidneys).

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	2 hr	4–8 hr
Intrathecal	30–60 min	4 hr	4–8 hr

Metabolism: Hepatic; $T_{1/2}$: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient drowsiness, dizziness, weakness, fatigue, confusion, headache, insomnia*
- **CV:** *Hypotension*, palpitations
- **GI:** Nausea, constipation
- **GU:** *Urinary frequency*, dysuria, enuresis, impotence
- **Other:** Rash, pruritus, ankle edema, excessive perspiration, weight gain, nasal congestion, increased AST, elevated alkaline phosphatase, elevated blood sugar

Interactions

★ **Drug-drug** • Increased CNS depression with alcohol, other CNS depressants

Nursing considerations

Assessment

- **History:** Hypersensitivity to baclofen, skeletal muscle spasm resulting from rheumatic disorders, stroke, cerebral palsy, Parkinson's disease, seizure disorders, lactation, pregnancy
- **Physical:** Weight; T; skin color; lesions; orientation, affect, reflexes, bilateral grip strength, visual examination; P, BP; bowel sounds, normal GI output, liver evaluation; normal urinary output; LFTs, renal function tests, blood and urine glucose

Interventions

- Patients given implantable device for intrathecal delivery need to learn about the programmable delivery system, frequent checks; how to adjust dose and programming.

- Give with caution to patients whose spasticity contributes to upright posture or balance in locomotion or whenever spasticity is used to increase function.

⊗ **Black box warning** Taper dosage gradually to prevent hallucinations, possible psychosis, rhabdomyolysis, or other serious effects; abrupt discontinuation can cause serious reactions.

Teaching points

- Take this drug exactly as prescribed. Do not stop taking this drug without consulting your health care provider; abrupt discontinuation may cause hallucinations or other serious effects.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs because these could cause dangerous effects.
- Do not take this drug during pregnancy. If you decide to become pregnant or find that you are pregnant, consult your health care provider.
- You may experience these side effects: Drowsiness, dizziness, confusion (avoid driving or engaging in activities that require alertness); nausea (eat frequent small meals); insomnia, headache, painful or frequent urination (effects reversible; will go away when the drug is discontinued).
- Report frequent or painful urination, constipation, nausea, headache, insomnia, or confusion that persists or is severe.

balsalazide disodium

(bal sal' a zyde)

Colazal

PREGNANCY CATEGORY B

Drug class

Anti-inflammatory

Therapeutic actions

Mechanism of action is unknown; thought to be direct, delivered intact to the colon; a local anti-inflammatory effect occurs in the colon where balsalazide is converted to mesalamine (5-ASA), which blocks cyclooxygenase and inhibits prostaglandin production in the colon.

Indications

- Treatment of mildly to moderately active ulcerative colitis

Contraindications and cautions

- Contraindicated with hypersensitivity to salicylates or mesalamine.
- Use cautiously with renal impairment, pregnancy, lactation.

Available forms

Capsules—750 mg

Dosages

Adults

Three 750-mg capsules PO tid for a total daily dose of 6.75 g. Continue for up to 12 wk.

Pediatric patients 5–17 yr

Three 750-mg capsules PO tid (6.75 g/day) with or without food for 8 wk, or one 750 mg capsule PO tid (2.25 g/day) with or without food for 8 wk.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces and urine

Adverse effects

- **CNS:** Headache, fatigue, malaise, depression, dizziness, asthenia, insomnia
- **GI:** Abdominal pain, cramps, vomiting, discomfort; gas; flatulence; nausea; diarrhea, dyspepsia, bloating, hemorrhoids, rectal pain, constipation, diarrhea, dry mouth
- **Other:** Flulike symptoms, rash, fever, cold, back pain, peripheral edema, arthralgia

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between Colazal (balsalazide) and Clozaril (clozapine). Serious effects have occurred; use extreme caution.

Assessment

- **History:** Hypersensitivity to salicylates; renal impairment; pregnancy, lactation

- **Physical:** T, hair status; reflexes, affect; abdominal examination, rectal examination; urinary output, renal function tests

Interventions

- Administer with meals. May be given for up to 12 wk (8 wk for children 5–17 yr).
- Monitor patients with renal impairment for possible adverse effects.
- Observe for possible worsening of ulcerative colitis.
- Ensure ready access to bathroom facilities if diarrhea occurs.
- Offer support and encouragement to deal with GI discomfort, CNS effects.
- Arrange for appropriate measures to deal with headache, arthralgia, GI problems.
- Provide small, frequent meals if GI upset is severe.
- Maintain all therapy (such as dietary restrictions, reduced stress) necessary to support remission of the ulcerative colitis.

Teaching points

- Take the drug without regard to meals in evenly divided doses. You can swallow the capsule whole, or you can open it and sprinkle the contents on applesauce.
- Maintain all of the usual restrictions and therapy that apply to your colitis. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Abdominal cramping, discomfort, pain, diarrhea (ensure ready access to bathroom facilities, taking the drug with meals may help), headache, fatigue, fever, flulike symptoms (consult health care provider if these become bothersome, medications may be available to help); rash, itching (skin care may help; consult your health care provider if this becomes a problem).
- Report severe diarrhea, malaise, fatigue, fever, blood in the stool.

Apo-Beclomethasone (CAN),
Gen-Beclo AQ (CAN),
Propaderm (CAN), QVAR,
ratio-Beclomethasone AQ (CAN)

beclomethasone dipropionate monohydrate

Beconase AQ

PREGNANCY CATEGORY C

Drug classes

Corticosteroid
Glucocorticoid
Hormone

Therapeutic actions

Anti-inflammatory effects; local administration into lower respiratory tract or nasal passages maximizes beneficial effects on these tissues while decreasing the likelihood of adverse corticosteroid effects from systemic absorption.

Indications

- Maintenance treatment of asthma as prophylactic therapy in patients 5 yr and older
- Respiratory inhalant use: Control of bronchial asthma that requires corticosteroids along with other therapy
- Intranasal use: Relief of symptoms of seasonal or perennial rhinitis that respond poorly to other treatments; prevention of recurrence of nasal polyps following surgical removal

Contraindications and cautions

- Respiratory inhalant therapy: Contraindicated with acute asthmatic attack, status asthmaticus. Use caution with systemic fungal infections (may cause exacerbations), allergy to any ingredient, lactation.
- Intranasal therapy: Use caution with untreated local infections (may cause exacerbations); nasal septal ulcers, recurrent

epistaxis, nasal surgery or trauma (interferes with healing); lactation.

Available forms

Inhalation aerosol—40 mcg/actuation, 80 mcg/actuation; nasal spray—0.042%

Dosages

Respiratory inhaled use

Adults and children 12 yr and older

40–160 mcg bid. Do not exceed 320 mcg/bid.

Pediatric patients 5–11 yr

40 mcg bid. Do not exceed 80 mcg bid.

Pediatric patients younger than 5 yr

Do not use.

Intranasal therapy

Each actuation delivers 42 mcg. Discontinue therapy after 3 wk if no significant symptomatic improvement.

Adults and children 12 yr and older

One to two inhalations (42–84 mcg) in each nostril bid (total dose 168–336 mcg/day).

Pediatric patients 6–12 yr

One inhalation in each nostril bid. Total dose 168 mcg. With more severe symptoms, may increase to two inhalations in each nostril bid (336 mcg).

Pharmacokinetics

Route	Onset	Peak
Inhalation	Rapid	1–2 wk

Metabolism: Lungs, GI, and liver; $T_{1/2}$: 3–15 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

Respiratory inhaled use

- **Endocrine:** Cushing's syndrome with overdose, suppression of HPA function due to systemic absorption
- **Local:** Oral, laryngeal, pharyngeal irritation, fungal infections

Intranasal use

- **Local:** Nasal irritation, fungal infections
- **Respiratory:** Epistaxis, rebound congestion, perforation of the nasal septum, anosmia

- **Other:** Headache, nausea, urticaria

Nursing considerations

Assessment

- **History:** Acute asthmatic attack, status asthmaticus; systemic fungal infections; allergy to any ingredient; lactation; untreated local infections, nasal septal ulcers, recurrent epistaxis, nasal surgery or trauma
- **Physical:** Weight, T, P, BP, auscultation; R, adventitious sounds; chest radiograph before respiratory inhaled therapy; examination of nares before intranasal therapy

Interventions

⊗ **Black box warning** Taper systemic steroids carefully during transfer to inhalational steroids; deaths resulting from adrenal insufficiency have occurred during and after transfer from systemic to aerosol steroids.

- Use decongestant nose drops to facilitate penetration of intranasal steroids if edema or excessive secretions are present.

Teaching points

- This respiratory inhalant has been prescribed to prevent asthmatic attacks, not for use during an attack.
- Allow at least 1 minute between puffs (respiratory inhalant); if you also are using an inhalational bronchodilator (albuterol, lev-albuterol, metaproterenol, epinephrine), use it several minutes before using the steroid aerosol.
- Rinse your mouth after using the respiratory inhalant aerosol.
- Use a decongestant before the intranasal steroid, and clear your nose of all secretions if nasal passages are blocked; intranasal steroids may take several days to produce full benefit.
- Use this product exactly as prescribed; do not take more than prescribed, and do not stop taking the drug without consulting your health care provider. The drug must not be stopped abruptly but must be slowly tapered.
- You may experience these side effects: Local irritation (use the device correctly), headache (consult your health care provider for treatment).
- Report sore throat or sore mouth.

benazepril hydrochloride

(ben a' za pril)

Lotensin

PREGNANCY CATEGORY D

Drug classes

ACE inhibitor

Antihypertensive

Therapeutic actions

Blocks ACE from converting angiotensin I to angiotensin II, a potent vasoconstrictor, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action.

Indications

- Treatment of hypertension alone or in combination with thiazide-type diuretics
- Unlabeled uses: nondiabetic neuropathy, heart failure, post MI, diabetes, chronic kidney disease, recurrent stroke prevention

Contraindications and cautions

- Contraindicated with allergy to benazepril or other ACE inhibitors, pregnancy, history of angioedema.
- Use cautiously with impaired renal function, immunosuppression, hypotension, heart failure, salt or volume depletion, lactation, first trimester of pregnancy, hyperkalemia.

Available forms

Tablets—5, 10, 20, 40 mg

Dosages

Adults

Initial dose, 10 mg PO daily. Maintenance dose, 20–40 mg/day PO, single or two divided doses. Patients using diuretics should discontinue them 2–3 days prior to benazepril therapy. If BP is not controlled, add diuretic slowly. If diuretic cannot be discontinued, begin benazepril therapy with 5 mg. Maximum dose, 80 mg.

Pediatric patients (6 yr and older)

0.1–0.6 mg/kg/day. Starting dose for monotherapy—0.2 mg/kg/day. Do not exceed 0.6 mg/kg/day (40 mg daily).

Patients with renal impairment

For creatinine clearance less than 30 mL/min (serum creatinine greater than 3 mg/dL), 5 mg PO daily. Dosage may be gradually increased until BP is controlled, up to a maximum of 40 mg/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	0.5–1 hr	3–4 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 10–11 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, fatigue, headache, somnolence
- **CV:** Angina pectoris, hypotension in salt- or volume-depleted patients, palpitations
- **Dermatologic:** Rash, pruritus, diaphoresis, flushing, **Stevens-Johnson syndrome**
- **GI:** *Nausea*, abdominal pain, vomiting, constipation
- **Respiratory:** *Cough*, asthma, bronchitis, dyspnea, sinusitis
- **Other:** Angioedema, impotence, decreased libido, asthenia, myalgia, arthralgia

Interactions

* **Drug-drug** • Increased risk of hypersensitivity reactions with allopurinol • Increased coughing with capsaicin • Decreased antihypertensive effects with indomethacin and other NSAIDs • Increased lithium levels and neurotoxicity may occur if combine • Increased risk of hyperkalemia with potassium-sparing diuretics or potassium supplements

■ Nursing considerations

Assessment

- **History:** Allergy to benazepril or other ACE inhibitors, impaired renal function, heart failure, salt or volume depletion, lactation, pregnancy

- **Physical:** Skin color, lesions, turgor; T; P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

⊗ **Warning** Alert surgeon: Note use of benazepril on patient's chart; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

- Monitor patient for possible drop in BP secondary to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.

⊗ **Black box warning** Ensure that patient is not pregnant; fetal abnormalities and death have occurred if used during second or third trimester. Encourage use of contraceptive measures.

- Reduce dosage in patients with impaired renal function.

Teaching points

- Do not stop taking the medication without consulting your health care provider.
- Be careful with any conditions that may lead to a drop in blood pressure (such as diarrhea, sweating, vomiting, dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- You should not become pregnant while on this drug. Serious fetal abnormalities could occur; use of contraceptives is advised.
- You may experience these side effects: GI upset, loss of appetite (transient effects; if persistent, consult health care provider); light-headedness (transient; change position slowly, and limit activities to those that do not require alertness and precision); dry cough (irritating but not harmful; consult your health care provider).
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heartbeat, chest pains; swelling of the face, eyes, lips, tongue, difficulty breathing, persistent cough.

DANGEROUS DRUG

bendamustine hydrochloride

(ben' dah moos' teen)

Treanda

PREGNANCY CATEGORY D

B

Drug classes

Antineoplastic
Alkylating agent

Therapeutic actions

Cytotoxic; alkylates DNA and RNA and inhibits several enzymatic processes, leading to cell death.

Indications

- Treatment of chronic lymphocytic leukemia (CLL)
- **NEW INDICATION:** Treatment of indolent B-cell non-Hodgkin lymphoma that has progressed during or within 6 mo of rituximab therapy or a rituximab-containing regimen

Contraindications and cautions

- Contraindicated with known hypersensitivity to bendamustine or mannitol, pregnancy, lactation, moderate or severe hepatic impairment, severe renal impairment.
- Use cautiously in patients with moderate renal impairment, mild hepatic impairment.

Available forms

Single-use vials—25, 100 mg

Dosages

Adults

- *CLL:* 100 mg/m² IV over 30 min on days 1 and 2 of a 28-day cycle for up to 6 cycles; dosage may need to be lowered based on patient response and drug toxicity.
- *Non-Hodgkin lymphoma:* 120 mg/m² IV over 60 min on days 1 and 2 of a 21-day cycle for up to 8 cycles; dosage may need to be adjusted based on patient response.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic or renal impairment

Use caution with mild or moderate dysfunction; do not use with severe dysfunction.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

IV FACTS

Preparation: Reconstitute 100-mg vial with 20 mL sterile water for injection; solution should be clear yellow with concentration of 5 mg/mL. Withdraw desired dose and transfer immediately to 500 mL 0.9% sodium chloride injection or 500 mL 2.5% dextrose/0.45% sodium chloride injection within 30 min of reconstitution; thoroughly mix bag. Drug is stable for 24 hr if refrigerated, 3 hr at room temperature.

Infusion: Administer complete infusion over 30 min (CLL) or 60 min for non-Hodgkin lymphoma.

Incompatibilities: Do not mix in solution with any other medications. Administer only with sterile water for injection diluent and 0.9% sodium chloride injection or 2.5% dextrose/0.45% sodium chloride injection.

Adverse effects

- **Dermatologic:** Rash to **toxic skin reactions**, pruritus
- **GI:** *Diarrhea, nausea, vomiting*
- **Hematologic:** *Myelosuppression*, hyperuricemia
- **Respiratory:** Nasopharyngitis, cough
- **Other:** *Infusion reaction*, tumor lysis syndrome, *infections, fever, fatigue*, chills, weight loss

Interactions

★ **Drug-drug** • Concurrent use of CYP1A2 inhibitors (fluvoxamine, ciprofloxacin) or inducers (omeprazole, nicotine) can lead to treatment failure or increased toxicity; an alternative treatment should be considered

Nursing considerations Assessment

- **History:** Hypersensitivity to mannitol or bendamustine, pregnancy, lactation, hepatic or renal impairment
- **Physical:** T; skin color, lesions; R, adventitious sounds; GI exam, renal function tests, LFTs

Interventions

- Monitor hematopoietic function before therapy and weekly during therapy to monitor patient response and ensure dosage is reduced when needed.
- Review safety precautions for bone marrow suppression with patient, such as avoiding infections and injuries and arranging rest periods throughout the day.
- Monitor patient carefully during infusion; severe infusion reactions have been reported. Antihistamines, antipyretics and corticosteroids may be needed if reactions do occur. Consider discontinuing drug if severe reactions occur.
- Monitor patient for tumor lysis syndrome, especially during the first cycle; provide appropriate fluid volume, monitor electrolytes, and consider prophylactic allopurinol for high-risk patients.
- Assess skin regularly. If skin reactions occur and become severe or progressive, drug may need to be stopped.

Teaching points

- Mark your calendar with the days you will need to have IV infusions.
- You will need to have regular blood tests, including tests right before your infusion, to monitor the drug's effects on your body and determine the dose you will need.
- You may feel tired because your red blood cell count is decreased. Plan rest periods during the day.
- You may experience increased bruising and bleeding because your platelet count is decreased. Try to avoid activities that could lead to injury.
- You are susceptible to infection because your white blood cell count is decreased. Avoid crowded places, people with known

infections, and digging in the dirt (unless you are wearing gloves).

- This drug could harm a fetus. You should use contraceptive measures while you are on this drug. If you become pregnant, notify your health care provider immediately.
- It is not known how this drug could affect a nursing baby. Because of the potential for serious adverse effects to the baby, another method of feeding the baby should be used while you are on this drug.
- You may experience these side effects: Nausea, vomiting (small, frequent meals may help; medication may be available to relieve these symptoms), diarrhea (medications may also help this symptom), rash.
- Report rash of any kind, any signs of infection (fever, fatigue, muscle aches and pains), significant bleeding, shortness of breath, swelling of the face, persistent or severe nausea, vomiting, or diarrhea.

benzonatate (ben zoe' na tate)

Benzonatate Softgels OTC, Tessalon OTC,
Tessalon Perles OTC

PREGNANCY CATEGORY C

Drug class

Antitussive (nonopioid)

Therapeutic actions

Related to the local anesthetic tetracaine; anesthetizes the stretch receptors in the respiratory passages, lungs, and pleura, hampering their activity and reducing the cough reflex at its source.

Indications

- Symptomatic relief of nonproductive cough
- Unlabeled use: May be used to reduce cough reflex during procedures (ie, endoscopy)

Contraindications and cautions

- Contraindicated with allergy to benzonatate or related compounds (tetracaine); lactation.
- Use cautiously with pregnancy.

Available forms

Capsules OTC—100, 200 mg

Dosages

Adults and pediatric patients 10 yr and older

100–200 mg PO tid; up to 600 mg/day may be used.

Pharmacokinetics

Route	Onset	Duration
Oral	15–20 min	3–8 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Sedation, headache, mild dizziness, hallucinations, nasal congestion, sensation of burning in the eyes
- **Dermatologic:** Pruritus, skin eruptions
- **GI:** Constipation, nausea, GI upset
- **Other:** Vague “chilly” feeling, numbness in the chest

■ Nursing considerations

Assessment

- **History:** Allergy to benzonatate or related compounds (tetracaine); lactation, pregnancy
- **Physical:** Nasal mucous membranes; skin color, lesions; orientation, affect; adventitious sounds

Interventions

⊗ **Warning** Administer orally; caution patient not to chew or break capsules but to swallow them whole; choking could occur if drug is released in the mouth.

Teaching points

- Swallow the capsules whole; do not chew or break capsules because numbness of the throat and mouth could occur, and swallowing could become difficult.
- You may experience these side effects: Rash, itching (skin care may help); constipation, nausea, GI upset; sedation, dizziness (avoid driving or tasks that require alertness).
- Report restlessness, tremor, difficulty breathing, constipation, rash, bizarre behavior.

benzotropine mesylate*(benz' troe peen)*

Apo-Benzotropine (CAN), Cogentin

PREGNANCY CATEGORY C

Drug class

Antiparkinsonian (anticholinergic type)

Therapeutic actions

Has anticholinergic activity in the CNS that is believed to help normalize the hypothesized imbalance of cholinergic and dopaminergic neurotransmission in the basal ganglia of the brain of a parkinsonism patient. Reduces severity of rigidity and, to a lesser extent, akinesia and tremor; less effective overall than levodopa; peripheral anticholinergic effects suppress secondary symptoms of parkinsonism, such as drooling.

Indications

- Adjunct in the therapy of parkinsonism (post-encephalitic, arteriosclerotic, and idiopathic types)
- Control of extrapyramidal disorders (except tardive dyskinesia) due to neuroleptic drugs (phenothiazines)

Contraindications and cautions

- Contraindicated with hypersensitivity to benzotropine; glaucoma, especially angle-closure glaucoma; pyloric or duodenal obstruction, stenosing peptic ulcers, achalasia (megaesophagus); prostatic hypertrophy or bladder neck obstructions; myasthenia gravis.
- Use cautiously with tachycardia, cardiac arrhythmias, hypertension, hypotension, hepatic or renal impairment, alcoholism, chronic illness, work in hot environments; hot weather; lactation, Alzheimer's disease, pregnancy.

Available forms

Tablets—0.5, 1, 2 mg; injection—1 mg/mL

Dosages**Adults**

- *Parkinsonism*: Initially, 0.5–1 mg PO at bedtime; a total daily dose of 0.5–6 mg given at bedtime or in two to four divided

doses is usual. Increase initial dose in 0.5-mg increments at 5- to 6-day intervals to the smallest amount necessary for optimal relief. Maximum daily dose, 6 mg. May be given IM or IV in same dosage as oral. When used with other drugs, gradually substitute benzotropine for all or part of them and gradually reduce dosage of the other drug.

- *Drug-induced extrapyramidal symptoms*: For acute dystonic reactions, initially, 1–2 mg IM (preferred) or IV to control condition; may repeat if parkinsonian effect begins to return. After that, 1–4 mg PO daily or bid to prevent recurrences. Some patients may require higher doses.
- *Extrapyramidal disorders occurring early in neuroleptic treatment*: 1–2 mg PO bid to tid. Withdraw drug after 1 or 2 wk to determine its continued need; reinstitute if disorder reappears.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Strict dosage regulation may be necessary; patients older than 60 yr often develop increased sensitivity to the CNS effects of anticholinergic drugs.

Pharmacokinetics

Route	Onset	Duration
Oral	1 hr	6–10 hr
IM, IV	15 min	6–10 hr

Metabolism: Hepatic; T_{1/2}: Unknown**Distribution**: Crosses placenta; enters breast milk**Excretion**: Unknown**IV FACTS**

Preparation: Give undiluted. Store in tightly covered, light-resistant container. Store at room temperature.

Injection: Administer direct IV at a rate of 1 mg over 1 min.

Adverse effects**Peripheral anticholinergic effects**

- **CV**: Tachycardia, palpitations, hypotension, orthostatic hypotension

- **Dermatologic:** Rash, urticaria, other dermatoses
- **EENT:** *Blurred vision*, mydriasis, diplopia, increased intraocular tension, angle-closure glaucoma
- **GI:** *Dry mouth, constipation*, dilation of the colon, paralytic ileus, *nausea*, vomiting, epigastric distress
- **GU:** *Urinary retention, urinary hesitancy*, dysuria, difficulty achieving or maintaining an erection
- **Other:** Flushing, decreased sweating, elevated temperature

CNS effects, characteristic of centrally acting anticholinergic drugs

- **CNS:** Disorientation, confusion, memory loss, hallucinations, psychoses, agitation, nervousness, delusions, delirium, paranoia, euphoria, excitement, light-headedness, dizziness, depression, drowsiness, weakness, giddiness, paresthesia, heaviness of the limbs
- **Other:** Muscular weakness, muscular cramping; inability to move certain muscle groups (high doses), numbness of fingers

Interactions

★ **Drug-drug** • Paralytic ileus, sometimes fatal, when given with other anticholinergic drugs, or drugs that have anticholinergic properties (phenothiazines, TCAs) • Additive adverse CNS effects (toxic psychosis) with other drugs that have CNS anticholinergic properties (TCAs, phenothiazines) • Possible masking of the development of persistent extrapyramidal symptoms, tardive dyskinesia, in patients on long-term therapy with antipsychotic drugs (phenothiazines, haloperidol) • Decreased therapeutic efficacy of antipsychotic drugs (phenothiazines, haloperidol), possibly due to central antagonism

■ **Nursing considerations**

Assessment

• **History:** Hypersensitivity to benztropine; glaucoma; pyloric or duodenal obstruction, stenosing peptic ulcers, achalasia; prostatic hypertrophy or bladder neck obstructions; myasthenia gravis; cardiac arrhythmias, hypertension, hypotension; hepatic or renal impairment; alcoholism, chronic illness,

people who work in hot environments; lactation, pregnancy

- **Physical:** Weight; T; skin color; lesions; orientation, affect, reflexes, bilateral grip strength, visual examination including tonometry; P, BP, orthostatic BP; adventitious sounds; bowel sounds, normal output, liver evaluation; normal urinary output, voiding pattern, prostate palpation; LFTs, renal function tests

Interventions

- Decrease dosage or discontinue temporarily if dry mouth makes swallowing or speaking difficult.
- Do not give to patients on cholinesterase inhibitors. Benztropine directly counteracts the effects of these drugs.

⊗ **Warning** Give with caution and reduce dosage in hot weather. Drug interferes with sweating and body's ability to maintain heat equilibrium; provide sugarless lozenges or ice chips to suck for dry mouth.

- Give with meals if GI upset occurs; give before meals for dry mouth; give after meals if drooling or nausea occurs.
- Ensure patient voids before receiving each dose if urinary retention is a problem.

Teaching points

- Take this drug exactly as prescribed.
- Avoid alcohol, sedatives, and over-the-counter drugs (could cause dangerous effects).
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or engaging in activities that require alertness and visual acuity); nausea (eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips); painful or difficult urination (empty bladder immediately before each dose); constipation (maintain adequate fluid intake and exercise regularly); use caution in hot weather (you are susceptible to heat prostration).
- Report difficult or painful urination, constipation, rapid or pounding heartbeat, confusion, eye pain, or rash.

beractant (natural lung surfactant)

(ber *ak'* tant)

Survanta

PREGNANCY CATEGORY
UNKNOWN

Drug class

Lung surfactant

Therapeutic actions

A natural bovine compound containing lipids and apoproteins that reduce surface tension and allow expansion of the alveoli; replaces the surfactant missing in the lungs of neonates suffering from respiratory distress syndrome (RDS).

Indications

- Prophylactic treatment of infants at risk of developing RDS; infants with birth weights less than 1,250 g or infants with birth weights more than 1,250 g who have evidence of pulmonary immaturity
- Rescue treatment of premature infants who have developed RDS

Contraindications and cautions

- Because beractant is used as an emergency drug in acute respiratory situations, the benefits usually outweigh any possible risks.

Available forms

Suspension—25 mg/mL suspended in 0.9% sodium chloride injection

Dosages

Pediatric patients

Accurate determination of birth weight is essential for correct dosage. Beractant is instilled into the trachea using a catheter inserted into the endotracheal tube.

- *Prophylactic treatment:* Give first dose of 100 mg phospholipids/kg birth weight (4 mL/kg) soon after birth. After determining the needed dose, inject one-quarter of the dose into the endotracheal tube over

2–3 sec. Remove the catheter and ventilate the baby. Repeat the procedure to give the remaining one-quarter dose. A repeat dose may be given no sooner than 6 hr after previous dose if infant remains intubated and requires at least 30% inspired oxygen to maintain a partial pressure of arterial oxygen of 80 mm Hg or less. Four doses can be administered in the first 48 hr of life.

- *Rescue treatment:* Administer 100 mg phospholipids/kg birth weight (4 mL/kg) intratracheally. Administer the first dose as soon as possible after the diagnosis of RDS is made and patient is on the ventilator. Repeat doses can be given based on clinical improvement and blood gases. Administer subsequent doses no sooner than every 6 hr.

Pharmacokinetics

Route	Onset	Peak
Intratracheal	Immediate	Hours

Metabolism: Normal surfactant metabolic pathways; $T_{1/2}$: Unknown

Distribution: Lung tissue

Adverse effects

- **CNS:** Seizures
- **CV:** *Patent ductus arteriosus*, **intraventricular hemorrhage**, **hypotension**, **bradycardia**
- **Hematologic:** Hyperbilirubinemia, thrombocytopenia
- **Respiratory:** **Pneumothorax**, **pulmonary air leak**, **pulmonary hemorrhage**, **apnea**, pneumomediastinum, emphysema
- **Other:** *Sepsis*, *nonpulmonary infections*

■ Nursing considerations

Assessment

- **History:** Time of birth, exact birth weight
- **Physical:** Skin T, color; R, adventitious sounds, oximeter, endotracheal tube position and patency, chest movement; ECG, P, BP, peripheral perfusion, arterial pressure (desirable); oxygen saturation, blood gases, CBC; muscular activity, facial expression, reflexes

Interventions

- Monitor ECG and transcutaneous oxygen saturation continually during administration.
- Ensure that endotracheal tube is in the correct position, with bilateral chest movement and lung sounds.
- Have staff view manufacturer's teaching video before regular use to cover all the technical aspects of administration.
- Suction the infant immediately before administration, but do not suction for 1 hr after administration unless clinically necessary.
- Inspect vial for discoloration. Vial should contain off-white to brown liquid. Gently mix. Warm to room temperature before using—20 min standing or 8 min warmed by hand. Do not use other warming methods.
- Store drug in refrigerator. Protect from light. Enter drug vial only once. Discard remaining drug after use. Unopened, unused vials warmed to room temperature may be returned to refrigerator within 8 hr of warming.
- Insert 5 French catheter into the endotracheal tube; do not instill into the mainstem bronchus.
- Instill dose slowly; inject one-fourth dose over 2–3 sec; remove catheter and reattach infant to ventilator for at least 30 sec or until stable; repeat procedure administering one-fourth dose at a time.
- Do not suction infant for 1 hr after completion of full dose; do not flush catheter.
- Continually monitor patient's color, lung sounds, ECG, oximeter, and blood gas readings during administration and for at least 30 min after.

Teaching points

- Details of drug effects and administration are best incorporated into parents' comprehensive teaching program.

betamethasone

(bay ta meth' a sone)

betamethasone

Topical dermatologic ointment, cream, lotion, gel

betamethasone dipropionate

(dye prob py' ob nayt)

Topical dermatologic ointment, cream, lotion, aerosol: Diprolene, Diprolene AF, Diprosone, Maxivate, Taro-Sone (CAN)

betamethasone sodium phosphate and acetate

Systemic, IM, and local intra-articular, intralesional, intradermal injection: Celestone Soluspan

betamethasone valerate

(val ayr' ayt)

Topical dermatologic ointment, cream, lotion: Betaderm (CAN), Beta-Val, Luxiq, Prevox B (CAN), Psorion Cream, Valisone

PREGNANCY CATEGORY C

Drug classes

Corticosteroid (long-acting)
Glucocorticoid
Hormone

Therapeutic actions

Binds to intracellular corticosteroid receptors, thereby initiating many natural complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

Systemic administration

- Treatment of primary or secondary adrenocorticoid insufficiency
- Hypercalcemia associated with cancer

- Short-term management of inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (eg, SLE), dermatologic diseases (eg, pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders: Thrombocytopenia purpura, erythroblastopenia
- Ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas
- Trichinosis with neurologic or myocardial involvement

Intra-articular or soft-tissue administration

- Arthritis, psoriatic plaques, and so forth

Dermatologic preparations

- Relief of inflammatory and pruritic manifestations of steroid-responsive dermatoses

Contraindications and cautions

Systemic (oral and parenteral) administration

- Contraindicated with infections, especially tuberculosis, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections, lactation.

All forms

- Use cautiously with kidney or liver disease, hypothyroidism, ulcerative colitis with impending perforation, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, heart failure, hypertension, thromboembolic disorders, osteoporosis, seizure disorders, diabetes mellitus.

Available forms

Syrup—0.6 mg/5 mL; injection—3 mg betamethasone sodium phosphate with 3 mg betamethasone acetate; ointment—0.1%, 0.05%; cream—0.01%, 0.05%, 0.1%; lotion—0.1%, 0.05%; gel—0.05%

Dosages

Adults

Systemic administration

Individualize dosage, based on severity and response. Give daily dose before 9 AM to minimize adrenal suppression. Reduce initial dosage in small increments until the lowest dose that maintains satisfactory clinical response is reached. If long-term therapy is

needed, alternate-day therapy with a short-acting corticosteroid should be considered. After long-term therapy, withdraw drug slowly to prevent adrenal insufficiency.

- **Oral (betamethasone):** Initial dosage, 0.6–7.2 mg/day.
- **IM (betamethasone sodium phosphate; betamethasone sodium phosphate and acetate):** Initial dosage, 0.5–9 mg/day. Dosage range is one-third to one-half oral dose given every 12 hr. In life-threatening situations, dose can be in multiples of the oral dose.

Intrabursal, intra-articular, intradermal, intralesional (betamethasone sodium phosphate and acetate)

0.25–2 mL intra-articular, depending on joint size; 0.2 mL/cm³ intradermally, not to exceed 1 mL/wk; 0.25–1 mL at 3- to 7-day intervals for disorders of the foot.

Topical dermatologic cream, ointment (betamethasone dipropionate)

Apply sparingly to affected area daily or bid.

Pediatric patients

Systemic administration

Individualize dosage on the basis of severity and response rather than by formulae that correct adult doses for age or weight. Carefully observe growth and development in infants and children on prolonged therapy.

Pharmacokinetics

Route	Onset	Duration
Systemic	Varies	3 days

Metabolism: Hepatic; $T_{1/2}$: 36–54 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis, cataracts, increased IOP, glaucoma (in long-term therapy)
- **CV:** Hypotension, shock, hypertension, and heart failure secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias

- **Electrolyte imbalance:** *Na⁺ and fluid retention*, hypokalemia, hypocalcemia
- **Endocrine:** Amenorrhea, irregular menses, growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state (long-term effect), increased blood sugar, increased serum cholesterol, decreased T₃ and T₄ levels, HPA suppression with systemic therapy longer than 5 days
- **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention, nausea, vomiting, *increased appetite, weight gain (long-term therapy)*
- **Musculoskeletal:** Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
- **Other:** *Immunosuppression, aggravation, or masking of infections; impaired wound healing*; thin, fragile skin; petechiae, ecchymoses, purpura, striae; subcutaneous fat atrophy; hypersensitivity or anaphylactoid reactions

Effects related to various local routes of steroid administration

- **Intra-articular:** Osteonecrosis, tendon rupture, infection
- **Intralesional therapy:** Blindness when applied to face and head
- **Topical dermatologic ointments, creams, sprays:** *Local burning, irritation*, acneiform lesions, striae, skin atrophy, skin infections

Interactions

- **Drug-drug** • Risk of severe deterioration of muscle strength in myasthenia gravis patients receiving ambenonium, edrophonium, neostigmine, pyridostigmine • Decreased steroid blood levels with barbiturates, phenytoin, rifampin • Decreased effectiveness of salicylates with betamethasone
- **Drug-lab test** • False-negative nitroblue-tetrazolium test for bacterial infection • Suppression of skin test reactions

■ Nursing considerations

Assessment

- **History:** (systemic administration): Infections, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections; kidney or liver disease; hypothy-

roidism; ulcerative colitis with impending perforation; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease; heart failure; hypertension; thromboembolic disorders; osteoporosis; seizure disorders; diabetes mellitus; lactation

- **Physical:** Baseline weight, T, reflexes and grip strength, affect and orientation, P, BP, peripheral perfusion, prominence of superficial veins, R and adventitious sounds, serum electrolytes, blood glucose

Interventions

Systemic use

- Give daily dose before 9 AM to mimic normal peak corticosteroid blood levels.
- Increase dosage when patient is subject to stress.
- Taper doses when discontinuing high-dose or long-term therapy.
- Do not give live-virus vaccines with immunosuppressive doses of corticosteroids.

Topical dermatologic preparations

- Examine area for infections and skin integrity before application.
- Administer cautiously to pregnant patients; topical corticosteroids have caused teratogenic effects and can be absorbed from systemic site.

- ⊗ **Warning** Use caution when occlusive dressings or tight diapers cover affected area; these can increase systemic absorption of the drug.
- Avoid prolonged use near eyes, in genital and rectal areas, and in skin creases.

Teaching points

Systemic use

- Do not stop taking the oral drug without consulting your health care provider.
- Take single dose or alternate-day doses before 9 AM.
- Avoid exposure to infections; ability to fight infections is reduced.
- Wear a medical alert tag so emergency care providers will know that you are on this medication.
- You may experience these side effects: Increase in appetite, weight gain (counting calories may help); heartburn, indigestion (eat frequent small meals; take antacids); poor wound healing (consult your health

care provider); muscle weakness, fatigue (frequent rest periods will help).

- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry stools, fever, prolonged sore throat, colds or other infections, worsening of original disorder.

Intrabursal, intra-articular therapy

- Do not overuse joint after therapy, even if pain is gone.

Topical dermatologic preparations

- Apply sparingly; do not cover with tight dressings.
- Avoid contact with the eyes.
- Report irritation or infection at the site of application.

betaxolol hydrochloride

(*beb tax' oh lol*)

Ophthalmic: Betoptic, Betoptic S

Oral: Kerlone

PREGNANCY CATEGORY C

Drug classes

Antiglaucoma drug

Antihypertensive

Beta₁-selective adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney), decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption, decreasing the release of renin from the kidney, and lowering BP. Decreases IOP by decreasing the secretion of aqueous humor.

Indications

- Oral: Hypertension, used alone or with other antihypertensive agents, particularly thiazide-type diuretics
- Ophthalmic: Treatment of ocular hypertension and open-angle glaucoma alone or in combination with other antiglaucoma drugs

Contraindications and cautions

- Contraindicated with sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure.
- Use cautiously with renal failure, diabetes, or thyrotoxicosis (betaxolol masks the cardiac signs of hypoglycemia and thyrotoxicosis), lactation, pregnancy.

Available forms

Tablets—10, 20 mg; ophthalmic solution (0.5%)—5.6 mg/mL; ophthalmic suspension (0.25%)—2.8 mg/mL

Dosages

Adults

Oral

Initially, 10 mg PO daily, alone or added to diuretic therapy. Full antihypertensive effect is usually seen in 7–14 days. If desired response is not achieved, dose may be doubled.

Ophthalmic

One or two drops bid to affected eye or eyes.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with severe renal impairment; patients undergoing dialysis

Oral

Consider reducing initial dose to 5 mg PO daily.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2 hr	12–15 hr
Ophthalmic	≤ 30 min	2 hr	12 hr

Metabolism: Hepatic; $T_{1/2}$: 14–22 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

Oral form

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, laryngospasm, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech

- **CV:** *Bradycardia, heart failure, cardiac arrhythmias, sinoatrial or AV nodal block, tachycardia*, peripheral vascular insufficiency, claudication, stroke, **pulmonary edema**, hypertension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance, development of ANA*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH

Betaxolol ophthalmic solution

- **CNS:** Insomnia, depressive neurosis
- **Local:** *Brief ocular discomfort, occasional tearing, itching, decreased corneal sensitivity*, corneal staining, keratitis, photophobia

Interactions

- **Drug-drug** • Increased effects with verapamil, anticholinergics • Increased risk of orthostatic hypotension with prazosin • Possible increased antihypertensive effects with aspirin, bismuth subsalicylate, magnesium salicylate, sulfipyrazone, hormonal contraceptives • Decreased antihypertensive effects with NSAIDs • Possible increased hypoglycemic effect of insulin with betaxolol
- **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ **Nursing considerations**

Assessment

- **History:** Sinus bradycardia, second- or third-degree heart block, cardiogenic shock, heart failure, renal failure, diabetes or thyrotoxicosis, lactation, pregnancy

- **Physical:** Baseline weight, skin condition, neurologic status, P, BP, ECG, R, renal and thyroid function tests, blood and urine glucose

Interventions

- **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may develop, exacerbating angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).
- With ophthalmic use, protect eye from injury if corneal sensitivity is lost.

Teaching points

- Administer eye drops as instructed to minimize systemic absorption of the drug.
- Take oral drug as prescribed.
- Do not stop taking unless told to do so by a health care provider.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Dizziness, light-headedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat; eye pain or irritation (ophthalmic).

bethanechol chloride (*beh than' e kole*)

PMS-Bethanechol (CAN), Urecholine

PREGNANCY CATEGORY C

Drug class

Parasympathomimetic

Therapeutic actions

Acts at cholinergic receptors in the urinary bladder (and GI tract) to mimic the effects of acetylcholine and parasympathetic stimulation; increases the tone of the detrusor muscle and causes the emptying of the urinary bladder; not destroyed by the enzyme

cholinesterase, so effects are more prolonged than those of acetylcholine.

Indications

- Acute postoperative and postpartum nonobstructive urinary retention and neurogenic atony of the urinary bladder with retention
- Unlabeled use: Reflux esophagitis, gastroesophageal reflux (pediatric use)

Contraindications and cautions

- Contraindicated with unusual sensitivity to bethanechol or tartrazine, hyperthyroidism, peptic ulcer, latent or active asthma, bradycardia, vasomotor instability, coronary artery disease, epilepsy, parkinsonism, hypotension, obstructive uropathies or intestinal obstruction, recent surgery on GI tract or bladder.
- Use cautiously with lactation, pregnancy.

Available forms

Tablets—5, 10, 25, 50 mg

Dosages

Determine and use the minimum effective dose; larger doses may increase side effects.

Adults

10–50 mg PO three or four times a day. Initial dose of 5–10 mg with gradual increases hourly until desired effect is seen; or until 50 mg has been given.

Pediatric patients

Safety and efficacy not established for children.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–90 min	60–90 min	1–6 hr

Metabolism: Unknown

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

Adverse effects

- **CV:** Transient heart block, **cardiac arrest**, orthostatic hypotension (with large doses)
- **GI:** *Abdominal discomfort, salivation, nausea, vomiting*, involuntary defecation, abdominal cramps, diarrhea, belching
- **GU:** Urinary urgency

• **Respiratory:** Dyspnea

• **Other:** Malaise, headache, *sweating, flushing*

Interactions

• **Drug-drug** • Increased cholinergic effects with other cholinergic drugs, cholinesterase inhibitors • Critical drop in BP may occur if taken with ganglionic blockers

■ Nursing considerations

Assessment

- **History:** Unusual sensitivity to bethanechol or tartrazine, hyperthyroidism, peptic ulcer, latent or active asthma, bradycardia, vasomotor instability, CAD, epilepsy, parkinsonism, hypotension, obstructive uropathies or intestinal obstruction, recent surgery on GI tract or bladder, lactation, pregnancy
- **Physical:** Skin color, lesions; T; P; rhythm, BP; bowel sounds, urinary bladder palpation; bladder tone evaluation, urinalysis

Interventions

- Administer on an empty stomach (1 hr before or 2 hr after meals) to avoid nausea and vomiting.
- Monitor response to establish minimum effective dose.
- ⊗ **Warning** Keep atropine readily available to reverse overdose or severe response.
- Monitor bowel function, especially in elderly patients who may become impacted or develop serious intestinal problems.

Teaching points

- Take this drug on an empty stomach (1 hour before or 2 hours after meals) to avoid nausea and vomiting.
- Dizziness, light-headedness, or fainting may occur when getting up from sitting or lying down.
- You may experience these side effects: Increased salivation, sweating, flushing, abdominal discomfort.
- Report diarrhea, headache, belching, sub-sternal pressure or pain, dizziness.

▷ bevacizumab

See Appendix U, *Less commonly used drugs*.

▷ bexarotene

See Appendix U, *Less commonly used drugs*.

▷ bicalutamide

PREGNANCY CATEGORY C

Drug class

Antidiarrheal

Therapeutic actions

Adsorbent actions remove irritants from the intestine; forms a protective coating over the mucosa and soothes the irritated bowel lining.

Indications

- To control diarrhea, gas, upset stomach, indigestion, heartburn, nausea
- To reduce the number of bowel movements and help firm stool
- To control traveler's diarrhea
- Unlabeled use: Prevention of traveler's diarrhea; treatment of chronic infantile diarrhea

Contraindications and cautions

- Contraindicated with allergy to any components or to aspirin or other salicylates.
- Use cautiously with pregnancy, lactation.

Available forms

Caplets—262 mg; chewable tablets—262 mg; liquid—87 mg/5 mL, 130 mg/15 mL, 262 mg/15 mL, 524 mg/15 mL; suspension—525 mg/15 mL; tablets—262 mg

Dosages

Adults and children 12 yr and older
2 tablets or 30 mL PO, repeat every 30 min–1 hr as needed, up to eight doses per 24 hr.

- **Traveler's diarrhea:** 1 ounce every 30 min for a total of 8 doses.

Pediatric patients 9–11 yr

One tablet or 15 mL (1 tablespoon) PO.

Pediatric patients 6–8 yr

Two-thirds tablet or 10 mL (2 teaspoons) PO.

Pediatric patients 3–5 yr

One-third tablet or 5 mL (1 teaspoon) PO.

Pediatric patients younger than 3 yr

Dosage not established.

Pharmacokinetics

Route	Onset
Oral	Varies

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta

Excretion: Urine

Adverse effects

- **GI:** *Darkening of the stool*, impaction in infants or debilitated patients
- **Salicylate toxicity:** Ringing in the ears, rapid respirations

Interactions

★ **Drug-drug** • Increased risk of salicylate toxicity with aspirin-containing products • Increased toxic effects of methotrexate, valproic acid if taken with salicylates • Use caution with drugs used for diabetes • Decreased effectiveness with corticosteroids • Decreased absorption of oral tetracyclines • Decreased effectiveness of sulfipyrazone with salicylates
★ **Drug-lab test** • May interfere with radiologic examinations of GI tract; bismuth is radiopaque

■ Nursing considerations

Assessment

- **History:** Allergy to any components

- **Physical:** T; orientation, reflexes; R and depth of respirations; abdominal examination, bowel sounds; serum electrolytes; acid-base levels

Interventions

- Shake liquid well before administration; have patient chew tablets thoroughly or dissolve in mouth; do not swallow whole.
- Discontinue drug if any sign of salicylate toxicity (ringing in the ears) occurs.

Teaching points

- Take this drug as prescribed; do not exceed prescribed dosage. Shake liquid well before using. Chew tablets thoroughly or let them dissolve in your mouth; do not swallow whole.
- Darkened stools may occur.
- Do not take this drug with other drugs containing aspirin or aspirin products; serious overdose can occur.
- Report fever or diarrhea that does not stop after 2 days, ringing in the ears, rapid respirations.

bisoprolol fumarate

(bis *oh'* pro lole *few'* mah rate)

Apo-Bisoprolol (CAN), Zebeta

PREGNANCY CATEGORY C

Drug classes

Antihypertensive

Beta₁-selective adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors (primarily beta₁) of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney), thus decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption, decreasing the release of renin from the kidney, and lowering BP.

Indications

- Management of hypertension, used alone or with other antihypertensives

Contraindications and cautions

- Contraindicated with sinus bradycardia, second- or third-degree heart block, cardiogenic shock.
- Use cautiously with renal failure, diabetes or thyrotoxicosis (bisoprolol can mask the usual cardiac signs of hypoglycemia and thyrotoxicosis), pregnancy, lactation, and in those with bronchospastic disease, heart failure.

Available forms

Tablets—5, 10 mg

Dosages

Adults

Initially, 5 mg PO daily, alone or added to diuretic therapy; 2.5 mg may be appropriate; up to 20 mg PO daily has been used.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

Initially, 2.5 mg PO; adjust, and use extreme caution in dose titration.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2 hr	12–15 hr

Metabolism: Hepatic; T_{1/2}: 9–12 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **Allergic reactions:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, *fatigue*, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech, *headache*
- **CV:** *Bradycardia*, *heart failure*, *cardiac arrhythmias*, *sinoatrial or AV nodal block*, *tachycardia*, peripheral vascular insufficiency, claudication, stroke, **pulmonary edema**, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin

- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia, ischemic colitis, renal and mesenteric arterial thrombosis, retroperitoneal fibrosis, hepatomegaly, acute pancreatitis
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramp
- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis, pharyngitis (less likely than with propranolol)
- **Other:** *Decreased exercise tolerance, development of antinuclear antibodies*, hyperglycemia or hypoglycemia, elevated serum transaminase, alkaline phosphatase, and LDH

Interactions

- **Drug-drug** • Increased effects with verapamil, anticholinergics • Increased risk of orthostatic hypotension with prazosin • Possible increased BP-lowering effects with aspirin, bismuth subsalicylate, magnesium salicylate, sulfipyrazone, hormonal contraceptives • Decreased antihypertensive effects with NSAIDs • Possible increased hypoglycemic effect of insulin • Possible masking of hypoglycemic symptoms in patients with diabetes
- **Drug-lab test** • Possible false results with glucose or insulin tolerance tests

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Zebeta* (bisoprolol) and *DiaBeta* (glyburide); use caution.

Assessment

- **History:** Sinus bradycardia, cardiac arrhythmias, cardiogenic shock, heart failure, renal failure, diabetes or thyrotoxicosis, pregnancy, lactation
- **Physical:** Baseline weight, skin condition, neurologic status, P, BP, ECG, R, LFTs, renal function tests, blood and urine glucose

Interventions

⊗ **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias). Taper drug gradually over 2 wk with monitoring.

- Be aware that half-life can be up to 21 hr in patients with cirrhosis.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

Teaching points

- Do not stop taking this drug unless instructed to do so by a health care provider.
- Avoid over-the-counter medications.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Dizziness, light-headedness, loss of appetite, nightmares, depression, sexual impotence.
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

Antineoplastic

Therapeutic actions

Inhibits DNA, RNA, and protein synthesis in susceptible cells, preventing cell division; cell cycle phase-specific agent with major effects in G2 and M phases.

Indications

- Palliative treatment of squamous cell carcinoma, lymphomas, testicular carcinoma, alone or with other drugs
- Treatment of malignant pleural effusion and prevention of recurrent pleural effusions
- Unlabeled uses: Mycosis fungoides, osteosarcoma, AIDS-related Kaposi sarcoma, germ cell tumors, sclerosis of pleural effusions, palliative treatment of children with lymphomas, malignant pericardial effusion, malignant peritoneal effusion, warts (intralesional)

Contraindications and cautions

- Contraindicated with allergy to bleomycin sulfate; lactation, pregnancy.
- Use cautiously with pulmonary disease; hepatic or renal impairment.

Available forms

Powder for injection—15, 30 units

Dosages**Adults**

Treat lymphoma patients with 2 units or less for the first two doses; if no acute anaphylactoid reaction occurs, use the regular dosage schedule:

- *Squamous cell carcinoma, non-Hodgkin's lymphoma, testicular carcinoma*: 0.25–0.5 unit/kg IV, IM, or subcutaneously, once or twice weekly.
- *Hodgkin's lymphoma*: 0.25–0.5 unit/kg IV, IM, or subcutaneously once or twice weekly. After a 50% response, give maintenance dose of 1 unit/day or 5 units/wk, IV or IM. Response should be seen within 2 wk (Hodgkin's lymphoma, testicular tumors) or 3 wk (squamous cell cancers). If no improvement is seen by then, it is unlikely to occur.
- *Malignant pleural effusion*: 60 units dissolved in 50–100 mL 0.9% saline solution, given via thoracostomy tube.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	10–20 min
IM, Subcut.	15–20 min	30–60 min

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve contents of 15-unit vial with 1–5 mL or 30-unit vial with 2–10 mL physiologic saline, sterile water for injection, or bacteriostatic water for injection. Do not use D₅W or dextrose-containing diluents; stable for 24 hr at room temperature in saline solution. Powder should be refrigerated.

Infusion: Infuse slowly over 10 min.

Incompatibilities: Incompatible in solution with aminophylline, ascorbic acid, carbenicillin, diazepam, hydrocortisone, methotrexate, mitomycin, nafcillin, penicillin G, terbutaline.

Adverse effects

- **Dermatologic:** *Rash, striae, vesiculation, hyperpigmentation, skin tenderness, hyperkeratosis, nail changes, alopecia, pruritus*
- **GI:** *Hepatic toxicity, stomatitis, vomiting, anorexia, weight loss*
- **GU:** *Renal toxicity*
- **Hypersensitivity:** Idiosyncratic reaction similar to anaphylaxis: Hypotension, mental confusion, fever, chills, wheezing (lymphoma patients, 1% occurrence)
- **Respiratory:** *Dyspnea, rales, pneumonitis, pulmonary fibrosis*
- **Other:** *Fever, chills*

Interactions

★ **Drug-drug** • Decreased serum levels and effectiveness of digoxin and phenytoin • Increased risk of pulmonary toxicity if combined with oxygen use

Nursing considerations**Assessment**

- **History:** Allergy to bleomycin sulfate, pregnancy, lactation, pulmonary disease, hepatic or renal impairment
- **Physical:** T; skin color, lesions; weight; R, adventitious sounds; liver evaluation, abdominal status; PFTs, urinalysis, LFTs, renal function tests, chest radiograph

Interventions

- Reconstitute for IM or subcutaneous use by dissolving contents of 15-unit vial in 1–5 mL, 30-unit vial with 2–10 mL of sterile water for injection, sodium chloride for injection, bacteriostatic water for injection.
- Label drug solution with date and hour of preparation; check label before use. Stable at room temperature for 24 hr in 0.9% sodium chloride; discard after that time.

⊗ **Black box warning** Monitor pulmonary function regularly and chest radiograph weekly or biweekly to monitor onset of pulmonary toxicity; consult physician immediately if changes occur. Risk is markedly increased with doses over 400 units/day.

- Arrange for periodic monitoring of LFTs and renal function tests.
- Advise women of childbearing age to avoid pregnancy while on this drug.

⊗ **Black box warning** Be alert for rare, severe idiosyncratic reaction including fever, chills, hypertension in lymphoma patients.

Teaching points

- This drug has to be given by injection. Mark calendar with dates for injection.
- This drug may cause fetal harm; using a barrier contraceptive is advised.
- You may experience these side effects: Rash, skin lesions, loss of hair, changes in nails (you may want to invest in a wig, skin care may help); loss of appetite, nausea, mouth sores (try frequent mouth care, eat frequent small meals; maintain good nutrition).
- Report difficulty breathing, cough, yellowing of skin or eyes, severe GI upset, fever, chills.

▷ bortezomib

See Appendix U, *Less commonly used drugs*.

▷ bosentan

(*bow sen' tan*)

Tracleer

PREGNANCY CATEGORY X

Drug classes

Endothelin receptor antagonist

Pulmonary antihypertensive
Vasodilator

Therapeutic actions

Specifically blocks receptor sites for endothelin ET_A and ET_B in the endothelium and vascular smooth muscles; these endothelins are elevated in plasma and lung tissue of patients with pulmonary arterial hypertension.

Indications

- Treatment of pulmonary arterial hypertension in patients with World Health Organization class II or class IV symptoms, to improve exercise ability and to decrease the rate of clinical worsening
- Unlabeled uses: Improvement of microcirculatory blood flow in splanchnic organs during septic shock; prevention of Reynaud's phenomenon; prevention of digital ulcers in systemic sclerosis

Contraindications and cautions

- Contraindicated with allergy to bosentan, severe liver impairment, pregnancy, lactation.
- Use cautiously with hepatic impairment, anemia.

Available forms

Tablets—62.5, 125 mg

Dosages

Adults

62.5 mg PO bid for 4 wk. Then, for patients weighing 40 kg or more, maintenance dose is 125 mg PO bid. For patients weighing less than 40 kg, but older than 12 yr, maintenance dose is 62.5 mg PO bid. Administer in the morning and evening.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Avoid use in moderate to severe hepatic impairment; reduce dosage and monitor patients closely with mild hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–5 hr

Metabolism: Hepatic; T_{1/2}: 5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile

Adverse effects

- **CNS:** *Headache*, fatigue
- **CV:** *Flushing, edema, hypotension*, palpitations
- **EENT:** *Nasopharyngitis*
- **GI:** Liver injury, dyspepsia
- **Hematologic:** Decreased Hgb level, decreased Hct
- **Skin:** Pruritus

Interactions

★ **Drug-drug** • Potential for decreased effectiveness of hormonal contraceptives; advise using barrier contraceptives • Bosentan serum concentrations increased with cyclosporine A, and cyclosporine A concentrations decrease by 50% with bosentan; avoid this combination • Decreased serum levels of statins if combined with bosentan; if the combination is used, patients should have serum cholesterol levels monitored regularly • Increased risk of liver damage if combined with glyburide; avoid this combination • Increased bosentan concentrations with ketoconazole and tacrolimus; monitor patients for adverse effects • Risk of serious toxicity if taken with atazanavir without ritonavir; always administer atazanavir with ritonavir if bosentan is needed. Give bosentan at 62.5 mg every other day, starting 10 days after starting ritonavir. If patient on bosentan is to be started on ritonavir, stop bosentan 3 days before starting ritonavir; resume bosentan 10 days after starting ritonavir.

■ Nursing considerations

Assessment

- **History:** Allergy to bosentan, severe liver impairment, anemia, pregnancy, lactation
- **Physical:** Skin color and lesions, orientation, BP, LFTs, CBC, Hgb level, pregnancy test

Interventions

⊗ **Black box warning** Make sure that the patient is not pregnant before initiating therapy and that patient will conform to use of two forms of contraception during therapy

and for 1 mo after stopping drug. Verify pregnancy status monthly.

⊗ **Black box warning** Obtain baseline and then monthly liver enzyme levels; dosage reduction or drug withdrawal is indicated at signs of elevated liver enzymes.

⊗ **Warning** Obtain baseline Hgb level and then repeat at 1 and 3 mo, then every 3 mo. If Hgb drops, the situation should be evaluated and appropriate action taken.

- Do not administer to any patient taking cyclosporine or glyburide.
- Administer in the morning and in the evening with or without food.
- ⊗ **Warning** Monitor patients who are discontinuing bosentan; dose may need to be tapered to avoid sudden worsening of disease.
- Provide analgesics as appropriate for patients who develop headache.
- Monitor patient's functional level to note improvement in exercise tolerance.
- Maintain other measures used to treat pulmonary arterial hypertension.

Teaching points

- This drug is only available through the Tracleer Access Program. You will need to be enrolled in the program before beginning therapy.
- Take drug exactly as prescribed, in the morning and the evening.
- This drug should not be taken during pregnancy; serious fetal abnormalities have occurred. A negative pregnancy test will be required before the drug is started. The use of barrier contraceptives is advised; hormonal contraceptives may not be effective.
- Keep a chart of your exercise tolerance to help monitor improvement in your condition.
- Continue your usual procedures for treating your pulmonary arterial hypertension.
- You will need monthly blood tests to evaluate the effect of this drug on your liver and your hemoglobin.
- You may experience these side effects: Headache (analgesics may be available that will help); stomach upset (taking the drug with food may help).
- Report swelling, changes in color of urine or stool, yellowing of the eyes or skin.

botulinum toxin type A

(*bot' yoo lin um*)

Botox, Botox Cosmetic

PREGNANCY CATEGORY C

B

Drug class

Neurotoxin

Therapeutic actions

Blocks neuromuscular transmission by binding to receptor sites on the motor nerve terminals and inhibiting the release of acetylcholine; this blocking results in localized muscle denervation, which causes local muscle paralysis; this denervation can lead to muscle atrophy and reinnervation if the muscle develops new acetylcholine receptors.

Indications

- Temporary improvement in the appearance of moderate to severe glabellar lines—associated with corrugator or procerus muscle activity in adults 65 yr and younger (*Botox Cosmetic*)
- Treatment of cervical dystonia in adults to decrease severity of abnormal head position and neck pain (*Botox* only)
- Treatment of severe primary axillary hyperhidrosis that is not adequately managed with topical agents (*Botox* only)
- Treatment of strabismus and blepharospasm associated with dystonia in patients 12 yr and older (*Botox* only)
- **NEW INDICATION:** Treatment of spasticity of the elbow, wrist, and fingers in adults following stroke, traumatic brain injury, progression of multiple sclerosis (*Botox* only)
- Unlabeled uses: Achalasia, cosmetic improvement of facial lines and wrinkles, gustatory sweating, hand dystonia, tension headache, palmar hyperhidrosis, sialorrhea

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of the drug, active infection at the injection site area.

- Use cautiously with peripheral neuropathic diseases (amyotrophic lateral sclerosis [ALS], motor neuropathies); neuromuscular disorders such as myasthenia gravis; inflammation in the injection area; compromised respiratory function, bronchitis, or URIs when used for limb spasticity; lactation, pregnancy; known CV disease.

Available forms

Powder for injection—100 units/vial

Dosages

Adults

- *Glabellar lines:* Total of 20 units (0.5 mL solution) injected as divided doses of 0.1 mL into each of five sites—two in each corrugator muscle, and one in the procerus muscle; injections usually need to be repeated every 3–4 mo to maintain effect.
- *Cervical dystonia:* 236 units (range 198–300 units) divided among affected muscles and injected into each muscle in patients with known tolerance. In patients without prior use, 100 units or less, then adjust dosage based on patient response.
- *Primary axillary hyperhidrosis:* 50 units per axilla injected intradermally 0.1–0.2 mL aliquots at multiple sites (10–15), approximately 1–2 cm apart. Repeat as needed.
- *Blepharospasm associated with dystonia:* 1.25–2.5 units injected into the medial and lateral pretarsal orbicularis oculi of the lower lid and upper lid. Repeat approximately every 3 mo.
- *Strabismus associated with dystonia:* 1.25–50 units in any one muscle.
- *Upper limb spasticity:* Base dosage on muscles affected and severity of activity; electromyographic guidance is recommended. Use no more than 50 units per site.

Pharmacokinetics

Not absorbed systemically

Adverse effects

- **CNS:** *Headache*, blepharoptosis, transient ptosis, *dizziness*
- **CV:** Arrhythmias, **MI** (patients with preexisting disease), hypertension

- **GI:** Nausea, difficulty swallowing, dyspepsia, tooth disorder
- **Respiratory:** Pneumonia, bronchitis, sinusitis, pharyngitis, URI, breathing difficulty
- **Other:** Redness, edema, and pain at injection site, *flu-like symptoms*, paralysis of facial muscles, facial pain, infection, skin tightness, ecchymosis, **anaphylactic reactions, spread of toxin effects that can lead to death**

Interactions

★ **Drug-drug** • Risk for additive effects if combined with aminoglycosides or other drugs that interfere with neuromuscular transmission—neuromuscular junction blockers, lincosamides, quinidine, magnesium sulfate, anticholinesterases, succinylcholine, polymyxin; use extreme caution if this combination is used

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug; active infection in the injection site area, pregnancy, peripheral neuropathic diseases (ALS, motor neuropathies), neuromuscular disorders such as myasthenia gravis, inflammation in the injection area, lactation, known CV disease
- **Physical:** T; reflexes; R, respiratory auscultation, assessment of injection site and muscle function

Interventions

⊗ **Black box warning** Drug is not for the treatment of muscle spasticity; toxin may spread from injection area and cause signs and symptoms of botulism (CNS alterations, trouble speaking and swallowing, loss of bladder control). Use only for approved indications.

- Store vials in the refrigerator before reconstitution.
- Reconstitute with 0.9% sterile, preservative-free saline as indicated for each use using a 21-gauge needle. Inject saline into vial; gently rotate vial to reconstitute and label vial with time and date of reconstitution. Reconstituted solution may be refrigerated but must be used within 4 hr. Discard after that time.

- Inspect vial for particulate matter or discoloration before use.
- Check manufacturer's guidelines for appropriate needle-gauge for each use.

⊗ **Warning** Ensure that epinephrine is readily available in case of anaphylactic reaction to the drug.

- Inform the patient that the effect of the drug may not be seen for 1 or 2 days, with the full effect taking up to a week. The effect usually lasts 3–4 mo. Do not administer the drug more often than every 3–4 mo.
- Advise patient not to become pregnant while this drug is being used; advise using contraceptives.

Teaching points

- This drug will be injected into your muscles to block the contraction of particular muscles.
- The effects of the drug may not be apparent for 1–2 days and may not be fully apparent for a week. The effects of the drug persist for 3–4 months.
- Avoid pregnancy while using this drug; the effects on the fetus are not known. If you become pregnant or desire to become pregnant, consult your health care provider. Using contraceptives is advised.
- You may experience these side effects: Pain, redness at injection site, and headache (analgesics may be helpful), drooping of the eyelid (this is usually transient), nausea, flu-like symptoms.
- Report difficulty swallowing, facial paralysis; difficulty speaking; difficulty breathing; persistent pain, redness, or swelling at injection site.

▷ botulinum toxin type B

See Appendix U, *Less commonly used drugs*.

bromocriptine mesylate

(broe moe krip' teen mess' ab late)

Apo-Bromocriptine (CAN), Cycloset, Parlodel, Parlodel SnapTabs

PREGNANCY CATEGORY B

Drug classes

Antiparkinsonian

Dopamine receptor agonist

Semisynthetic ergot derivative

Therapeutic actions

Parkinsonism: Acts as an agonist directly on postsynaptic dopamine receptors of neurons in the brain, mimicking the effects of the neurotransmitter dopamine, which is deficient in parkinsonism. Unlike levodopa, bromocriptine does not require biotransformation by the nigral neurons that are deficient in parkinsonism patients; thus, bromocriptine may be effective when levodopa has begun to lose its efficacy.

Hyperprolactinemia: Acts directly on postsynaptic dopamine receptors of the prolactin-secreting cells in the anterior pituitary, mimicking the effects of prolactin inhibitory factor, inhibiting the release of prolactin and galactorrhea. Also restores normal ovulatory menstrual cycles in patients with amenorrhea or galactorrhea, and inhibits the release of growth hormone in patients with acromegaly.

Diabetes: Stimulates CNS dopamine activity, which improves glycemic control; exact mechanism of action not known, but these patients may have decreased dopamine activity as part of their metabolic syndrome.

Indications

- Treatment of postencephalitic or idiopathic Parkinson's disease; may provide additional benefit in patients currently maintained on optimal dosages of levodopa with or without carbidopa, beginning to deteriorate or develop tolerance to levodopa, and experiencing "end of dose failure" on levodopa therapy; may allow reduction of levodopa dosage and decrease the dyskinesias and "on-

off" phenomenon associated with long-term levodopa therapy

- Short-term treatment of amenorrhea or galactorrhea associated with hyperprolactinemia due to various etiologies, excluding demonstrable pituitary tumors
- Treatment of hyperprolactinemia associated with pituitary adenomas to reduce elevated prolactin levels, cause shrinkage of macroprolactinomas; may be used to reduce the tumor mass before surgery
- Female infertility associated with hyperprolactinemia in the absence of a demonstrable pituitary tumor
- Acromegaly; used alone or with pituitary irradiation or surgery to reduce serum growth hormone level
- Treatment of type 2 diabetes as monotherapy or in combination with other antidiabetics (*Cycloset* only)
- Unlabeled uses: Hepatic encephalopathy, traumatic brain injury

Contraindications and cautions

- Contraindicated with hypersensitivity to bromocriptine or any ergot alkaloid; severe ischemic heart disease or peripheral vascular disease; pregnancy, lactation.
- Use cautiously with history of MI with residual arrhythmias (atrial, nodal, or ventricular); renal or hepatic disease, history of peptic ulcer (fatal bleeding ulcers have occurred in patients with acromegaly treated with bromocriptine).

Available forms

Capsules—5 mg; tablets—0.8, 2.5 mg

Dosages

Adults and pediatric patients 15 yr and older

Give drug with food; individualize dosage; increase dosage gradually to minimize side effects; adjust dosage carefully to optimize benefits and minimize side effects.

- **Hyperprolactinemia:** Initially, 1.25–2.5 mg PO daily; an additional 2.5-mg tablet may be added as tolerated every 2–7 days until optimal response is achieved; therapeutic dosage range is 2.5–15 mg/day.
- **Acromegaly:** Initially, 1.25–2.5 mg PO for 3 days at bedtime; add 1.25–2.5 mg as

tolerated every 3–7 days until optimal response is achieved. Evaluate patient monthly, and adjust dosage based on growth hormone levels. Usual dosage range is 20–30 mg/day; do not exceed 100 mg/day; withdraw patients treated with pituitary irradiation for a yearly 4- to 8-wk reassessment period.

- **Parkinson's disease:** 1.25 mg PO bid; assess every 2 wk, and adjust dosage carefully to ensure lowest dosage producing optimal response. If needed, increase dosage by increments of 2.5 mg/day every 14–28 days; do not exceed 100 mg/day.
- **Type 2 diabetes:** 0.8 mg/day PO in the morning within 2 hr of waking; increase by 1 tablet per wk to maximum daily dose of 6 tablets (4.8 mg) or until maximum tolerated dose between 2 and 6 tablets/day (*Cycloset*).

Pediatric patients

Safety for use in patients younger than 16 yr not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–3 hr	14 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr (initial phase), 45–50 hr (terminal phase)

Excretion: Bile

Adverse effects

Hyperprolactinemic indications

- **CNS:** Dizziness, fatigue, light-headedness, nasal congestion, drowsiness, headache, CSF rhinorrhea in patients who have had transphenoidal surgery, pituitary radiation
- **CV:** Hypotension
- **GI:** *Constipation, diarrhea, nausea, vomiting, abdominal cramps*

Physiologic lactation

- **CNS:** Headache, dizziness, nausea, vomiting, fatigue, syncope
- **CV:** Hypotension
- **GI:** Diarrhea, cramps

Acromegaly

- **CNS:** Nasal congestion, digital vasospasm, drowsiness
- **CV:** Exacerbation of Raynaud's syndrome, *orthostatic hypotension*

- **GI:** *Nausea, constipation, anorexia, indigestion, dry mouth, vomiting, GI bleeding*

Parkinson's disease

- **CNS:** Abnormal involuntary movements, hallucinations, confusion, "on-off" phenomenon, dizziness, drowsiness, faintness, asthenia, visual disturbance, ataxia, insomnia, depression, vertigo
- **CV:** *Hypotension, shortness of breath*
- **GI:** *Nausea, vomiting, abdominal discomfort, constipation*

Interactions

- **Drug-drug** • Increased serum bromocriptine levels and increased pharmacologic and toxic effects with erythromycin • Decreased effectiveness with phenothiazines for treatment of prolactin-secreting tumors • Increased bromocriptine adverse effects if combined with sympathomimetics

Nursing considerations

Assessment

- **History:** Hypersensitivity to bromocriptine or any ergot alkaloid; severe ischemic heart disease or peripheral vascular disease; pregnancy; history of MI with residual arrhythmias; hepatic, renal disease; history of peptic ulcer, lactation
- **Physical:** Skin T (especially fingers), color, lesions; nasal mucous membranes; orientation, affect, reflexes, bilateral grip strength, vision examination, including visual fields; P, BP, orthostatic BP, auscultation; R, depth, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, CBC with differential

Interventions

- Evaluate patients with amenorrhea or galactorrhea before drug therapy begins; syndrome may result from pituitary adenoma that requires surgical or radiation procedures.
- Arrange to administer drug with food.
- Taper dosage in patients with Parkinson's disease if drug must be discontinued.
- Monitor hepatic, renal, and hematopoietic function periodically during therapy.

Teaching points

- Take drug exactly as prescribed with food; take the first dose at bedtime while lying down.
- If taking this drug for diabetes, take once a day in the morning. Continue diet and exercise program. You may also be taking other antidiabetic drugs.
- Do not discontinue drug without consulting health care provider (patients with macroadenoma may experience rapid growth of tumor and recurrence of original symptoms).
- Use barrier contraceptives while taking this drug (amenorrhea or galactorrhea); pregnancy may occur before menses, and the drug is contraindicated in pregnancy (estrogen contraceptives may stimulate a prolactinoma).
- You may experience these side effects: Drowsiness, dizziness, confusion (avoid driving or engaging in activities that require alertness); nausea (take the drug with meals, eat frequent small meals); dizziness or faintness when getting up (change position slowly, be careful climbing stairs); headache, nasal stuffiness (medication may help).
- Report fainting; light-headedness; dizziness; uncontrollable movements of the face, eyelids, mouth, tongue, neck, arms, hands, or legs; mental changes; irregular heartbeat or palpitations; severe or persistent nausea or vomiting; coffee-ground vomitus; black tarry stools; vision changes (macroadenoma); any persistent watery nasal discharge (hyperprolactinemic).

brompheniramine maleate (parabromdylamine maleate)

(*brome fen ir' a meen mal' ee ate*)

BroveX, BroveX CT, J-Tan, Lodrane XR, LoHist 12 Hour **ORC**, P-TeX, VaZol

PREGNANCY CATEGORY C

Drug class

Antihistamine (alkylamine type)

Therapeutic actions

Competitively blocks the effects of histamine at H₁-receptor sites; has anticholinergic (atropine-like), antipruritic, and sedative effects.

Indications

- Symptomatic relief of symptoms associated with perennial and seasonal allergic rhinitis—runny nose, sneezing, itching nose and throat, watery eyes
- Temporary relief of sneezing and runny nose due to common cold; treatment of allergic and nonallergic pruritic symptoms; mild urticaria and angioedema; amelioration of allergic reactions to blood or plasma; adjunctive therapy in anaphylactic reactions (*VaZol*)

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, allergy to tartrazine (*BroveX CT*), third trimester of pregnancy (newborn or premature infants may have severe reactions).
- Use cautiously with lactation, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthma attack, bladder neck obstruction, pyloroduodenal obstruction. Use cautiously in the elderly (this population is extremely sensitive to anticholinergic side effects of this drug).

Available forms

Chewable tablets—12 mg; ER tablets **ORC**—6 mg; ER capsules **ORC**—12 mg; drops—1 mg; liquid—2 mg/5 mL; oral suspension—4 mg/5 mL, 8 mg/5 mL, 10 mg/5 mL, 12 mg/5 mL

Dosages

Adults and pediatric patients 12 yr and older

ER tablets: 6–12 mg PO every 12 hr. Chewable tablets: 12–24 mg PO every 12 hr, maximum 48 mg/day. ER capsules: 12–24 mg/day PO. Oral suspension (*BroveX*): 5–10 mL (12–24 mg) PO every 12 hr; maximum 48 mg/day. Oral liquid: 10 mL (4 mg) PO 4 times/day. Oral suspension (*Lodrane XR*): 5 mL PO every 12 hr; do not exceed 2 doses/day.

Pediatric patients 6–12 yr

ER tablets: 6 mg PO every 12 hr. Chewable tablets: 6–12 mg PO every 12 hr, maximum 24 mg/day. ER capsules: 12 mg/day PO. Oral liquid: 5 mL (2 mg) PO 4 times/day. Oral

suspension (*BroveX*): 5 mL (12 mg) PO every 12 hr; maximum 24 mg/day. Oral suspension (*Lodrane XR*): 2.5 mL PO every 12 hr; up to 5 mL/day.

Pediatric patients 2–6 yr

Chewable tablets: 6 mg PO every 12 hr; maximum 12 mg/day. Oral liquid: 2.5 mL (1 mg) PO 4 times/day. Oral suspension (*BroveX*): 2.5 mL (6 mg) PO every 12 hr up to 12 mg/day. Oral suspension (*Lodrane XR*): 1.25 mL PO every 12 hr; maximum 2.5 mg/day.

Pediatric patients 12 mo–2 yr

Oral suspension: 1.25 mL (3 mg) PO every 12 hr up to 2.5 mL (6 mg)/day. Oral liquid: Titrate dose based on 0.5 mg/kg/day PO in equally divided doses four times/day.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	1–2 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 12–35 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, faintness, disturbed coordination*, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, hysteria, tingling, heaviness and weakness of the hands
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress*, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea or constipation
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido, impotence
- **Hematologic:** Hemolytic anemia, hypoplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia
- **Hypersensitivity:** Urticaria, rash, **anaphylactic shock**, photosensitivity

- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal stuffiness, dry mouth, dry nose, dry throat, sore throat

Interactions

- **Drug-drug** • Increased sedation with alcohol, other CNS depressants • Increased and prolonged anticholinergic (drying) effects with MAOIs

Nursing considerations Assessment

- **History:** Allergy to any antihistamines, tartrazine, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, third trimester of pregnancy, lactation
- **Physical:** Skin color; lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Give orally with food if GI upset occurs.
- Ensure that patient does not cut, crush, or chew ER forms.

Teaching points

- Take as prescribed; avoid excessive dosage; take with food if GI upset occurs. Swallow extended-release forms whole; do not cut, crush, or chew them.
- Avoid alcohol while on this drug; serious sedation could occur.
- Oral liquid and oral suspensions differ in strength; do not use interchangeably.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); epigastric distress, diarrhea or constipation (take with meals); dry mouth (frequent mouth care, sucking sugarless lozenges may help); thickening of bronchial secretions, dryness of nasal mucosa (try a humidifier).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

budesonide*(byoo des' oh nide)*

Inhalation: Entocort (CAN), Pulmicort Flexhaler, Pulmicort Respules, Rhinocort Aqua, Rhinocort Turbuhaler (CAN)

Oral: Entocort EC ONC

PREGNANCY CATEGORY B, C (ORAL)

Drug class

Corticosteroid

Therapeutic actions

Anti-inflammatory effect; local administration into nasal passages maximizes beneficial effects on these tissues, while decreasing the likelihood of adverse effects from systemic absorption.

Indications

- *Rhinocort Aqua:* Management of symptoms of seasonal or perennial allergic rhinitis in adults and children
- *Respules/Flexhaler:* Maintenance treatment of asthma as prophylactic therapy in adults and children age 6 yr and older and for patients requiring corticosteroids for asthma
- Inhalation suspension: Maintenance treatment and prophylaxis therapy of asthma in children 12 mo–8 yr
- Oral: Treatment and maintenance of clinical remission for up to 3 mo of mild to moderate active Crohn's disease involving the ileum or ascending colon

Contraindications and cautions**Inhalation**

- Contraindicated with hypersensitivity to drug or for relief of acute asthma or bronchospasm.
- Use cautiously with TB, systemic infections, lactation.

Oral

- Contraindicated with hypersensitivity to drug, lactation.
- Use cautiously with TB, hypertension, diabetes mellitus, osteoporosis, peptic ulcer disease, glaucoma, cataracts, family history of diabetes or glaucoma, other conditions in

which glucocorticosteroids may have unwanted effects.

Nasal

- Contraindicated with hypersensitivity to drug, nasal infections, nasal trauma, nasal septal ulcers, recent nasal surgery.
- Use cautiously with lactation, TB, systemic infection.

Available forms

Spray—32 mcg/actuation; dry powder for inhalation (*Pulmicort Flexhaler*)—90 mcg (delivers 80 mcg), 180 mcg (delivers 160 mcg); inhalation suspension—0.25 mg/2 mL, 0.5 mg/2 mL, 1 mg/2 mL; capsules ONC—3 mg

Dosages**Nasal inhalation****Adults and patients 6 yr and older**

Initial dose, 64 mcg/day given as 1 spray (32 mcg) in each nostril once daily. After desired clinical effect is achieved, reduce dosage to the smallest dose possible to maintain the control of symptoms. Maximum daily dose for patients older than 12 yr is 256 mcg/day given as 4 sprays per nostril once daily. Patients 6 to younger than 12 yr should not exceed 128 mcg/day (given as 2 sprays per nostril once daily). Generally takes approximately 2 wk to achieve maximum clinical effect.

Pulmicort Flexhaler**Adults**

360 mcg bid; maximum dose, 720 mcg bid.

Pediatric patients 6 yr and older

180 mcg bid; maximum dose, 360 mcg bid.

Pulmicort Respules**Pediatric patients 12 mo–8 yr**

0.5–1 mg once daily or in two divided doses using jet nebulizer.

Oral**Adults**

9 mg/day PO taken in the morning for up to 8 wk. Recurrent episodes may be retreated for 8-wk periods. Maintenance treatment, 6 mg/day PO for up to 3 mo, then taper until cessation is complete.

Pediatric patients younger than 6 yr

Safety and efficacy not established.

Patients with hepatic impairment

Monitor patients very closely for signs of hypercorticism; reduced dosage should be considered with these patients.

Pharmacokinetics

Route	Onset	Peak	Duration
Intranasal, inhaled	Immediate	Rapid	8–12 hr
Oral	Slow	0.5–10 hr	Unknown

Metabolism: Hepatic; $T_{1/2}$: 2–3.6 hr (oral); $T_{1/2}$: 2.8 hr (inhalation)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, lethargy, fatigue, paresthesias, nervousness*
- **Dermatologic:** Rash, edema, pruritus, alopecia
- **Endocrine:** HPA suppression, Cushing's syndrome with overdosage and systemic absorption
- **GI:** Nausea, dyspepsia, dry mouth
- **Local:** *Nasal irritation, fungal infection*
- **Respiratory:** Epistaxis, rebound congestion, *pharyngitis, cough*
- **Other:** Chest pain, asthenia, moon face, acne, bruising, *back pain*

Interactions**Oral use**

* **Drug-drug** • Increased risk of corticosteroid toxic effects if combined with ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, erythromycin, or other known CYP3A4 inhibitors; if drugs must be used together, decrease dosage of budesonide and monitor patient closely

* **Drug-food** • Risk of increased toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations**Assessment**

- **History:** Untreated local nasal infections, nasal trauma, septal ulcers, recent nasal surgery, lactation
- **Physical:** BP, P, auscultation; R, adventitious sounds; examination of nares

Interventions**Inhalation**

⊗ **Black box warning** Taper systemic steroids carefully during transfer to inhalational steroids; deaths from adrenal insufficiency have occurred.

- Arrange for use of decongestant nose drops to facilitate penetration if edema, excessive secretions are present.
- Use spray within 6 mo of opening. Shake well before each use.
- Store *Pulmicort Respules* upright and protected from light; gently shake before use; open envelopes should be discarded after 2 wk.
- Store *Flexhaler* tightly closed at room temperature. Do not remove or twist mouthpiece. Do not immerse in water or use liquid to clean *Flexhaler*.

Nasal inhalation

- Prime pump eight times before first use. If not used for 2 consecutive days, reprime with 1 spray or until fine mist appears. If not used for more than 14 days, rinse applicator and reprime with 2 sprays or until fine mist appears.

Oral

- Make sure patient does not cut, crush, or chew capsules; they must be swallowed whole.
- Administer the drug once each day, in the morning; have patient avoid drinking grapefruit juice.
- Encourage patient to complete full 8 wk of drug therapy.

⊗ **Warning** Monitor patient for signs of hypercorticism—acne, bruising, moon face, swollen ankles, hirsutism, skin striae, buffalo hump—which could indicate need to decrease dosage.

Teaching points**Inhalation**

- Do not use more often than prescribed; do not stop without consulting your health care provider.
- It may take several days to achieve good effects; do not stop if effects are not immediate.
- Use decongestant nose drops first if nasal passages are blocked.

- Store *Pulmicort Respules* upright, protect from light; discard open envelopes after 2 weeks; gently shake before use.
- Store *Flexhaler* at room temperature. Keep tightly closed. Do not immerse in water and do not use liquid to clean the device. Do not twist or remove mouthpiece.
- You may experience these side effects: Local irritation (use your device correctly), dry mouth (suck sugarless lozenges).
- Prime the pump eight times before its first use. If it is not used for 2 consecutive days, reprime it with 1 spray or until a fine mist appears. If it is not used for more than 14 days, rinse the applicator off and reprime it with 2 sprays or until fine mist appears.
- Report sore mouth, sore throat, worsening of symptoms, severe sneezing, exposure to chickenpox or measles, eye infections.

Oral

- Take the drug once a day in the morning. Do not cut, crush, or chew the capsules, they must be swallowed whole.
- If you miss a day, take the capsules as soon as you remember them. Take the next day's capsules at the regular time. Do not take more than three capsules in a day.
- Take the full course of the drug therapy (8 weeks in most cases).
- Do not take this drug with grapefruit juice; avoid grapefruit juice entirely while using this drug.
- You may experience these side effects: Dizziness, headache (avoid driving or operating dangerous machinery if these effects occur); nausea, flatulence (small, frequent meals may help; try to maintain your fluid and food intake).
- Report chest pain, ankle swelling, respiratory infections, increased bruising.

bumetanide (*byoo met' a nide*)

Burinex (CAN)

PREGNANCY CATEGORY C

Drug class

Loop (high-ceiling) diuretic

Therapeutic actions

Inhibits the reabsorption of sodium and chloride from the proximal and distal renal tubules and the loop of Henle, leading to a natriuretic diuresis.

Indications

- Edema associated with heart failure, hepatic and renal disease (including nephrotic syndrome)
- Unlabeled use: Treatment of adult nocturia (not effective in men with BPH)

Contraindications and cautions

- Contraindicated with allergy to bumetanide or sulfonamides; electrolyte depletion; anuria, severe renal failure; hepatic coma, lactation.
- Use cautiously with SLE; gout; diabetes mellitus; pregnancy.

Available forms

Tablets—0.5, 1, 2 mg; injection—0.25 mg/mL

Dosages

Adults

Oral

0.5–2 mg/day PO in a single dose; may repeat at 4- to 5-hr intervals up to a maximum daily dose of 10 mg. Intermittent dosage schedule of drug and rest days is 3–4 on/1–2 off, which is most effective with edema.

Parenteral

0.5–1 mg IV or IM. Give over 1–2 min. Dose may be repeated at intervals of 2–3 hr if response is not sufficient. Do not exceed 10 mg/day.

Pediatric patients

Not recommended for patients younger than 18 yr.

Geriatric patients or patients with renal impairment

Initiate at lower dose and consider decreased renal, hepatic, and cardiac function.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1–2 hr	4–6 hr
IV	Minutes	15–30 min	30–60 min

Metabolism: $T_{1/2}$: 60–90 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: May be given direct IV or diluted in solution with D₅W, 0.9% sodium chloride, or lactated Ringer's solution. Discard unused solution after 24 hr.

Injection: Give by direct injection slowly, over 1–2 min; do not exceed 10 mg/day.

Adverse effects

- **CNS:** *Asterixis, dizziness, vertigo, paresthesias, confusion, fatigue, nystagmus, weakness, headache, drowsiness, fatigue, blurred vision, tinnitus, irreversible hearing loss*
- **CV:** *Orthostatic hypotension, volume depletion, cardiac arrhythmias, thrombophlebitis*
- **GI:** *Nausea, anorexia, vomiting, diarrhea, gastric irritation and pain, dry mouth, acute pancreatitis, jaundice*
- **GU:** *Polyuria, nocturia, glycosuria, renal failure*
- **Hematologic:** *Hypokalemia, leukopenia, anemia, thrombocytopenia*
- **Local:** *Pain, phlebitis at injection site*
- **Other:** *Muscle cramps and muscle spasms, weakness, arthritic pain, fatigue, hives, photosensitivity, rash, pruritus, sweating, nipple tenderness*

Interactions

★ **Drug-drug** • Decreased diuresis and natriuresis with NSAIDs and probenecid • Increased risk of cardiac glycoside toxicity (secondary to hypokalemia) • Increased risk of ototoxicity if taken with aminoglycoside antibiotics, cisplatin

■ Nursing considerations**Assessment**

- **History:** Allergy to bumetanide, electrolyte depletion, anuria, severe renal failure, hepatic coma, SLE, gout, diabetes mellitus, lactation
- **Physical:** Skin color, lesions; edema; orientation, reflexes, hearing; pulses, baseline ECG, BP, orthostatic BP, perfusion; R, pattern, adventitious sounds; liver evaluation, bowel sounds; urinary output patterns; CBC, serum electrolytes (including calcium), blood glucose, LFTs, renal function tests, uric acid, urinalysis

Interventions

- Give with food or milk to prevent GI upset.
- Mark calendars or use reminders if intermittent therapy is best for treating edema.
- Give single dose early in day so increased urination will not disturb sleep.
- Avoid IV use if oral use is possible.
- ⊗ **Black box warning** Arrange to monitor serum electrolytes, hydration, and hepatic function during long-term therapy; water and electrolyte depletion can occur.
- Provide diet rich in potassium or supplemental potassium.

Teaching points

- Record alternate day or intermittent therapy on a calendar or dated envelopes.
- Take the drug early in the day so increased urination will not disturb sleep; take with food or meals to prevent GI upset.
- Weigh yourself on a regular basis, at the same time and in the same clothing; record the weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes; hazardous activities, such as driving; and alcohol consumption); sensitivity to sunlight (use sunglasses, sunscreen, wear protective clothing); increased thirst (suck sugarless lozenges; use frequent mouth care); loss of body potassium (a potassium-rich diet, or supplement will be needed).
- Report weight change of more than 3 pounds in 1 day; swelling in ankles or fingers; unusual bleeding or bruising; nausea, dizziness, trembling, numbness, fatigue; muscle weakness or cramps.

DANGEROUS DRUG

buprenorphine hydrochloride
(byoo pre nor' feen)

Buprenex, Butrans Transdermal System CIII, Subutex

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-III

Drug class

Opioid agonist-antagonist analgesic

Therapeutic actions

Acts as an agonist at specific opioid receptors in the CNS to produce analgesia; also acts as an opioid antagonist; exact mechanism of action not understood.

Indications

- Parenteral: Relief of moderate to severe pain
- Oral: Treatment of opioid dependence, preferably used as induction treatment

Contraindications and cautions

- Contraindicated with hypersensitivity to buprenorphine.
- Use cautiously with physical dependence on opioid analgesics (withdrawal syndrome may occur); compromised respiratory function; increased intracranial pressure (buprenorphine may elevate CSF pressure; may cause miosis and coma, which could interfere with patient evaluation), myxedema, Addison's disease, toxic psychosis, prostatic hypertrophy or urethral stricture, acute alcoholism, delirium tremens, kyphoscoliosis, biliary tract dysfunction (may cause spasm of the sphincter of Oddi), hepatic or renal impairment, lactation, pregnancy.

Available forms

Injection—0.324 mg/mL (equivalent to 0.3 mg); sublingual tablets (*Subutex*)—2, 8 mg; transdermal patches—5, 10, 20 mcg/hr

Dosages**Adults and pediatric patients older than 13 yr****Parenteral**

- **Relief of pain:** 0.3 mg IM or by slow (over 2 min) IV injection. May repeat once, 30–60 min after first dose; repeat every 6 hr as needed. If necessary, nonrisk patients may be given up to 0.6 mg by deep IM injection.

Adults and pediatric patients 16 yr and older**Oral**

- **Opioid dependence:** Initially, 8 mg on day 1, 16 mg on day 2. On day 3 and onward, use buprenorphine/naloxone combination (*Sub-*

oxone) for maintenance. Maintenance dose, 12–16 mg/day sublingually (*Suboxone*).

Pediatric patients (2–12 yr)

2–6 mcg/kg of body weight IM or slow IV injection every 4–6 hr.

Geriatric or debilitated patients

Reduce dosage to one-half usual adult dose.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15 min	1 hr	6 hr
IV	10 min	30–45 min	6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

IV FACTS

Preparation: May be diluted with isotonic saline, lactated Ringer's solution, 5% dextrose and 0.9% saline, 5% dextrose. Protect from light and excessive heat.

Injection: Administer slowly over 2 min.

Compatibilities: Compatible IV with scopolamine HBr, haloperidol, glycopyrrolate, droperidol and hydroxyzine HCl.

Incompatibilities: Do not mix with diazepam and lorazepam.

Adverse effects

- **CNS:** *Sedation, dizziness or vertigo, headache*, confusion, dreaming, psychosis, euphoria, weakness, fatigue, nervousness, slurred speech, paresthesia, depression, malaise, hallucinations, depersonalization, coma, tremor, dysphoria, agitation, seizures, tinnitus
- **CV:** *Hypotension*, hypertension, tachycardia, bradycardia, Wenckebach's block
- **Dermatologic:** *Sweating*, pruritus, rash, pallor, urticaria
- **EENT:** *Miosis*, blurred vision, diplopia, conjunctivitis, visual abnormalities, amblyopia
- **GI:** *Nausea, vomiting*, dry mouth, constipation, flatulence
- **Local:** Injection site reaction
- **Respiratory:** *Hypoventilation*, dyspnea, cyanosis, apnea

Interactions

★ **Drug-drug** • Potentiation of effects of buprenorphine with other opioid analgesics, phenothiazines, tranquilizers, barbiturates, general anesthetics, benzodiazepines

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to buprenorphine, physical dependence on opioid analgesics, compromised respiratory function, increased intracranial pressure, myxedema, Addison's disease, toxic psychosis, prostatic hypertrophy or urethral stricture, acute alcoholism, delirium tremens, kyphoscoliosis, biliary tract dysfunction, hepatic or renal impairment, lactation, pregnancy
- **Physical:** Skin color, texture, lesions; orientation, reflexes, bilateral grip strength, affect; pupil size, vision; pulse, auscultation, BP; R, adventitious sounds; bowel sounds, normal output, liver palpation; prostate palpation, normal urine output; LFTs, renal, thyroid, adrenal function tests

Interventions

⊗ **Warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available in case respiratory depression occurs.

- Have the patient hold sublingual tablets (*Subutex*) beneath the tongue until they dissolve; these tablets should not be swallowed. Place all tablets for a single dose under patient's tongue at once; if not possible, place two tablets at a time. If using the transdermal patch, apply patch to clean, dry area; leave in place for 7 days. Remove old patch before applying new one.
- Instruct patient being treated for opioid dependence that CNS depression and death can occur with overdose of these drugs, or if this drug is combined with sedatives, alcohol, tranquilizers, antidepressants, or benzodiazepines.
- Manage overdose by providing ventilation and support.

Teaching points

- Hold sublingual tablets under the tongue until they dissolve. Do not swallow these tablets. If possible, place all tablets for a sin-

gle dose under the tongue at once; if not possible, place two tablets at a time. If using the transdermal system, apply patch to clean, dry area; leave patch in place for 7 days. Remove old patch before applying new one.

- Inform all health care or emergency workers that you are opioid dependent and using this drug for maintenance; serious effects could occur if certain drugs are used with this drug.
- Avoid combining *Subutex* with any alcohol, antidepressants, sedatives, benzodiazepines, or tranquilizers; serious CNS depression could occur. Do not crush and inject these tablets.
- Overdose with *Subutex* can result in coma and death; use this drug exactly as prescribed.
- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness); nausea, loss of appetite (lie quietly, eat frequent small meals).
- Report severe nausea, vomiting, palpitations, shortness of breath or difficulty breathing, urinary difficulty.

▽ **buPROPion**
(byoo *proe'* pee on)

buPROPion hydrobromide
Aplenzin **ORC**

buPROPion hydrochloride
Budeprion SR **ORC**, Budeprion XL **ORC**,
Wellbutrin, Wellbutrin SR **ORC**,
Wellbutrin XL **ORC**, Zyban

PREGNANCY CATEGORY C

Drug classes

Antidepressant
Smoking deterrent

Therapeutic actions

The neurochemical mechanism of the antidepressant effect of bupropion is not understood; it is chemically unrelated to other antidepressant agents; it is a weak blocker of

neuronal uptake of serotonin and norepinephrine and inhibits the reuptake of dopamine to some extent.

Indications

- Treatment of major depressive disorder
- Aid to smoking cessation treatment (*Zyban*)
- Prevention of major depressive episodes in patients with seasonal affective disorder (*Wellbutrin XL*)
- Unlabeled uses: treatment of neuropathic pain, ADHD, weight loss, aphthous ulcers, migraine prevention, PMDD

Contraindications and cautions

- Contraindicated with hypersensitivity to bupropion; history of seizure disorder, bulimia or anorexia, head trauma, CNS tumor (increased risk of seizures); treatment with MAOIs; lactation.
- Use cautiously with renal or liver disease; heart disease, history of MI, pregnancy.

Available forms

Tablets—75, 100 mg; SR tablets **ORC**—100, 150, 200 mg; ER tablets **ORC**—150, 200, 300 mg; 174, 348, 522 mg (*Aplenzin*)

Dosages

Adults

- **Depression:** 300 mg PO given as 100 mg tid; begin treatment with 100 mg PO bid; if clinical response warrants, increase to 300 mg/day (given as 100 mg tid) 3 days after beginning treatment. If 4 wk after treatment, no clinical improvement is seen, dose may be increased to 150 mg PO tid (450 mg/day). Do not exceed 150 mg in any one dose. Discontinue drug if no improvement occurs at the 450-mg/day level. *SR:* 150 mg PO bid; allow at least 8 hr between doses. *ER:* Initially, 150 mg/day PO as a once-a-day dose; range 300–450 mg/day. *ER (Aplenzin):* 174–348 mg/day PO.
- **Smoking cessation:** 150 mg (*Zyban*) PO daily for 3 days, then increase to 300 mg/day in two divided doses at least 8 hr apart. Treat for 7–12 wk.
- **Seasonal affective disorder:** 150 mg (*Wellbutrin XL*) PO daily in the morning; may increase after 1 wk to 300 mg/day PO. Begin

in autumn and taper off (150 mg/day for 2 wk before discontinuation) in early spring.

Pediatric patients

Safety and efficacy in patients younger than 18 yr not established.

Patients with impaired renal function

Bupropion is excreted through the kidneys; use with caution, and monitor patients carefully.

Patients with impaired hepatic function

Consider reduced dose or frequency in patients with mild or moderate impairment. For those with severe impairment, do not exceed 75 mg/day (*Wellbutrin*), 100 mg/day or 150 mg every other day (*Wellbutrin SR*), 150 mg every other day (*Wellbutrin XL* and *Zyban*), or 174 mg/48 hr (*Aplenzin*).

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2 hr	8–12 hr
SR Oral	Varies	3 hr	16–20 hr
ER Oral	Varies	5 hr	15–25 hr

Metabolism: Hepatic; $T_{1/2}$: 14 hr; 21 hr (*Wellbutrin SR*)

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Agitation*, dizziness, *insomnia*, *headache*, *migraine*, *tremor*, ataxia, incoordination, seizures, mania, alterations in libido, hallucinations, visual disturbances
- **CV:** *Tachycardia*, edema, ECG abnormalities, chest pain, shortness of breath
- **Dermatologic:** Rash, alopecia, dry skin
- **GI:** *Dry mouth*, *constipation*, nausea, vomiting, stomatitis
- **GU:** Nocturia, vaginal irritation, testicular swelling
- **Other:** *Weight loss*, flulike symptoms

Interactions

★ **Drug-drug** • Increased risk of adverse effects with levodopa, amantadine, fluvoxamine, paroxetine, cyclophosphamide, sertraline • Increased risk of toxicity with MAOIs • Increased risk of seizures with drugs that lower seizure threshold, including alcohol

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to bupropion, history of seizure disorder, bulimia or anorexia, head trauma, CNS tumor; treatment with MAOI, renal or hepatic disease, heart disease, lactation
- **Physical:** Skin, weight; orientation, affect, vision, coordination; P, rhythm, auscultation; R, adventitious sounds; bowel sounds, condition of mouth

Interventions

- Give drug three times a day for depression; do not administer more than 150 mg in any one dose. Administer SR forms twice a day with at least 8 hr between doses. Administer ER forms once a day. Caution patient not to cut, crush, or chew ER or SR forms.
- Increase dosage slowly to reduce the risk of seizures.
- Administer 100-mg immediate-release tablets four times a day for depression, with at least 6 hr between doses, if patient is receiving more than 300 mg/day; use combinations of 75-mg tablets to avoid giving more than 150 mg in any single dose.
- Arrange for patient evaluation after 6 wk.
- Discontinue MAOI therapy for at least 14 days before beginning bupropion.
- Monitor hepatic and renal function tests in patients with a history of hepatic or renal impairment.
- Have patient quit smoking within first 2 wk of treatment for smoking cessation; may be used with transdermal nicotine.

⊗ **Black box warning** Monitor response and behavior; suicide is a risk in depressed patients, children, adolescents, and young adults. Serious mental health events, including changes in behavior, depression, and hostility, have been reported.

Teaching points

- Take this drug in equally divided doses three to four times a day as prescribed for depression. Take sustained-release forms twice a day, at least 8 hours apart. Do not combine doses or make up missed doses. Take once a day, or divided into two doses at least 8 hours

apart for smoking cessation. Do not cut, crush, or chew ER or SR forms.

- Avoid or limit the use of alcohol while on this drug. Seizures can occur if these are combined.
- May be used with transdermal nicotine; most effective for smoking cessation if combined with behavioral support program.
- You may experience these side effects: Dizziness, lack of coordination, tremor (avoid driving or performing tasks that require alertness); dry mouth (use frequent mouth care, suck sugarless lozenges); headache, insomnia (consult your health care provider if these become a problem; do not self-medicate); nausea, vomiting, weight loss (eat frequent small meals).
- Report dark urine, light-colored stools; rapid or irregular heartbeat; hallucinations; severe headache or insomnia; thoughts of suicide; fever, chills, sore throat.

▷ busPIRone hydrochloride

(byoo *spye'* rone)

Apo-Buspirone (CAN), BuSpar, CO Buspirone (CAN), Gen-Buspirone (CAN), PMS-Buspirone (CAN)

PREGNANCY CATEGORY B

Drug class

Anxiolytic

Therapeutic actions

Mechanism of action not known; lacks anti-seizure, sedative, or muscle relaxant properties; binds serotonin receptors, but the clinical significance is unclear.

Indications

- Management of anxiety disorders or short-term relief of symptoms of anxiety
- Unlabeled use: Decreasing the symptoms (aches, pains, fatigue, cramps, irritability) of PMS, traumatic brain injury

Contraindications and cautions

- Contraindicated with hypersensitivity to buspirone; marked liver or renal impairment; lactation.
- Use cautiously with pregnancy, mild renal or hepatic impairment.

Available forms

Tablets—5, 7.5, 10, 15, 30 mg

Dosages

Adults

Initially, 15 mg/day PO (7.5 mg bid). Increase dosage 5 mg/day at intervals of 2–3 days to achieve optimal therapeutic response. Do not exceed 60 mg/day. Divided doses of 20–30 mg/day have been used.

Pediatric patients

Safety and efficacy for patients younger than 18 yr not established.

Pharmacokinetics

Route	Onset	Peak
Oral	7–10 days	40–90 min

Metabolism: Hepatic; $T_{1/2}$: 3–11 hr

Distribution: May enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, headache, nervousness, insomnia, light-headedness*, excitement, dream disturbances, drowsiness, decreased concentration, anger, hostility, confusion, depression, tinnitus, blurred vision, numbness, paresthesia, incoordination, tremor, depersonalization, dysphoria, noise intolerance, euphoria, akathisia, fearfulness, loss of interest, dissociative reaction, hallucinations, suicidal ideation, seizures, altered taste and smell, involuntary movements, slowed reaction time
- **CV:** Nonspecific chest pain, tachycardia or palpitations, syncope, hypotension, hypertension
- **GI:** *Nausea, dry mouth, vomiting, abdominal or gastric distress, diarrhea*, constipation, flatulence, anorexia, increased appetite, salivation, irritable colon, rectal bleeding

- **GU:** Urinary frequency, urinary hesitancy, dysuria, increased or decreased libido, menstrual irregularity, spotting

- **Respiratory:** Hyperventilation, shortness of breath, chest congestion

- **Other:** Musculoskeletal aches and pains, sweating, clamminess, sore throat, nasal congestion

Interactions

- **Drug-drug** • Give with caution to patients taking alcohol, other CNS depressants • Decreased effects with fluoxetine • Increased serum levels of buspirone if taken with erythromycin, itraconazole; decrease buspirone dose to 2.5 mg and monitor closely if these combinations are used • Risk of increased haloperidol levels if combined • Risk of marked hypertension if combined with MAOIs

- **Drug-food** • Risk of increased serum levels and toxicity if taken with grapefruit juice

Nursing considerations

Assessment

- **History:** Hypersensitivity to buspirone, marked liver or renal impairment, lactation
- **Physical:** Weight; T; skin color; lesions; mucous membranes, throat color; lesions, orientation, affect, reflexes, vision examination; P, BP; R, adventitious sounds; bowel sounds, normal GI output, liver evaluation; normal urinary output, voiding pattern; LFTs, renal function tests, urinalysis, CB and differential

Interventions

- Provide sugarless lozenges or ice chips if dry mouth or altered taste occurs.
- Arrange for analgesic for headache or musculoskeletal aches.

Teaching points

- Take this drug exactly as prescribed.
- Avoid the use of alcohol, sleep-inducing, or over-the-counter drugs and grapefruit juice; these could cause dangerous effects.
- You may experience these side effects: Drowsiness, dizziness, light-headedness (avoid driving or operating complex machinery); GI upset (eat frequent small meals); dry mouth (suck ice chips or sugarless candies); dreams,

nightmares, difficulty concentrating or sleeping, confusion, excitement (reversible; will stop when the drug is discontinued).

- Report abnormal involuntary movements of facial or neck muscles, motor restlessness; sore or cramped muscles; abnormal posture; yellowing of the skin or eyes.

⚠ DANGEROUS DRUG

busulfan
(byoo sul' fan)

Busulfex, Myleran

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic

Therapeutic actions

Cytotoxic: Interacts with cellular thiol groups causing cell death; cell cycle nonspecific.

Indications

- Tablets: Palliative treatment of chronic myelogenous leukemia; less effective in patients without the Philadelphia chromosome (Ph1); ineffective in the blastic stage
- Injection: In combination with cyclophosphamide as conditioning regimen prior to allogeneic hematopoietic progenitor cell transplant for CML
- Oral: Other myeloproliferative disorders, including severe thrombocytosis and polycythemia vera, myelofibrosis; bone marrow transplantation

Contraindications and cautions

- Contraindicated with allergy to busulfan, history of resistance to busulfan, chronic lymphocytic leukemia, acute leukemia, blastic phase of chronic myelogenous leukemia, hematopoietic depression, pregnancy, lactation.
- Use cautiously with bone marrow suppression, history of seizure disorders, hepatic impairment.

Available forms

Tablets—2 mg; injection—6 mg/mL

Dosages

Adults

Oral

- *Remission induction:* 4–8 mg or 60 mcg/kg (WBC count more likely to drop with doses above 4 mg/day) total dose PO daily. Continue until WBC has dropped to 15,000/mm³; WBC may continue to fall for 1 mo after drug is discontinued. Normal WBC count is usually achieved in approximately 12–20 wk in most cases.
- *Maintenance therapy:* Resume treatment with induction dosage when WBC count reaches 50,000/mm³. If remission is shorter than 3 mo, maintenance therapy of 1–3 mg PO daily is advised to keep hematologic status under control.

Parenteral

- *Conditioning regimen:* 0.8 mg/kg of ideal body weight or actual body weight, whichever is lower, as a 2-hr infusion every 6 hr for 4 consecutive days (16 doses) via central venous catheter.

Pediatric patients

Oral

Children may be dosed at 60–120 mcg/kg/day or 1.8–4.6 mg/m²/day (body surface) for remission induction.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral, IV	30 min–2 hr	2–3 hr	4 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute to 10 times the busulfan volume using 0.9% sodium chloride injection or D₅W. Use enclosed filter when withdrawing drug from ampule. Final concentration should be greater than or equal to 0.5 mg/mL. Use strict aseptic technique. Always add busulfan to the diluent. Mix by inverting bag several times. Stable at room temperature for 8 hr, then discard.

Infusion: Use an infusion pump to deliver total dose over 2 hr. Flush catheter with 5 mL D₅W or 0.9% sodium chloride before and after each dose. Infusion must be completed within 8 hr.

Incompatibilities: Do not infuse with any other solution or drugs.

Adverse effects

- **CNS:** Seizures
- **CV:** Hypertension, tachycardia, thrombosis
- **Dermatologic:** *Hyperpigmentation*, urticaria, **Stevens-Johnson syndrome**, erythema nodosum, alopecia, porphyria cutanea tarda, excessive dryness and fragility of the skin with anhidrosis
- **EENT:** Cataracts (with prolonged use)
- **Endocrine:** *Amenorrhea*, *ovarian suppression*, *menopausal symptoms*, interference with spermatogenesis, testicular atrophy, syndrome resembling adrenal insufficiency (weakness, fatigue, anorexia, weight loss, nausea, vomiting, melanoderma)
- **GI:** Dryness of the oral mucous membranes and cheilosis; *nausea*, *vomiting*, abdominal pain, anorexia
- **GU:** Hyperuricemia
- **Hematologic:** *Leukopenia*, *thrombocytopenia*, *anemia*, **pancytopenia** (prolonged)
- **Respiratory:** **Pulmonary dysplasia**
- **Other:** Cancer

■ Nursing considerations

Assessment

- **History:** Allergy to or history of resistance to busulfan, chronic lymphocytic leukemia, acute leukemia, blastic phase of chronic myelogenous leukemia, hematopoietic depression, pregnancy, lactation, hepatic impairment, seizure disorders
- **Physical:** Weight; skin color, lesions, turgor; earlobe tophi; eye examination; bilateral hand grip; R, adventitious sounds; mucous membranes; CBC, differential; urinalysis; serum uric acid; PFTs; bone marrow examination if indicated

Interventions

⊗ **Black box warning** Arrange for blood tests to evaluate bone marrow function prior to therapy as well as weekly dur-

ing and for at least 3 wk after therapy has ended. Severe bone marrow suppression is possible.

⊗ **Warning** Arrange for respiratory function tests before beginning therapy, periodically during therapy, and periodically after busulfan therapy has ended, to monitor for pulmonary dysplasia.

- Reduce dosage in cases of bone marrow depression.
- Give at the same time each day.
- Suggest barrier contraceptive use during therapy.
- ⊗ **Warning** Ensure patient is hydrated before and during therapy; alkalization of the urine or allopurinol may be needed to prevent adverse effects of hyperuricemia.
- Monitor patient for cataracts.
- Administer IV busulfan through a central venous catheter.
- Premedicate patient receiving IV busulfan with phenytoin to decrease occurrence of seizures.
- Medicate patient receiving IV busulfan with antiemetics prior to the first dose and on a fixed schedule through the administration regimen.

Teaching points

Oral drug

- Take drug at the same time each day.
- Drink 10–12 glasses of fluid each day.
- Have regular medical follow-up, including blood tests, to monitor effects of the drug.
- Consider using barrier contraceptives. This drug has been known to cause fetal damage.
- You may experience these side effects: Darkening of the skin, rash, dry and fragile skin (skin care suggestions will be outlined for you to help to prevent skin breakdown); weakness, fatigue (consult with health care provider if pronounced); loss of appetite, nausea, vomiting, weight loss (eat frequent small meals); amenorrhea in women, change in sperm production in men (may affect fertility).
- Report unusual bleeding or bruising; fever, chills, sore throat; stomach, flank, or joint pain; cough, shortness of breath.

▷ butabarbital sodium (secbutobarbital, secbutobarbitone)

(byoo ta *bar'* bi tal)

Butisol Sodium

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-III

Drug classes

Barbiturate (intermediate acting)

Sedative-hypnotic

Therapeutic actions

General CNS depressant; barbiturates inhibit impulse conduction in the ascending reticular activating system, depress the cerebral cortex, alter cerebellar function, depress motor output, and can produce excitation (especially with subanesthetic doses in the presence of pain), sedation, hypnosis, anesthesia, deep coma.

Indications

- Short-term use as a sedative and hypnotic

Contraindications and cautions

- Contraindicated with hypersensitivity to barbiturates, tartrazine (in 30-, 50-mg tablets, and elixir marketed as *Butisol Sodium*); manifest or latent porphyria; marked liver impairment; nephritis; severe respiratory distress, respiratory disease with dyspnea, obstruction, or cor pulmonale; previous addiction to sedative-hypnotic drugs.
- Use cautiously with acute or chronic pain (may cause paradoxical excitement or mask important symptoms); seizure disorders (abrupt discontinuation of daily doses can result in status epilepticus); lactation (can cause drowsiness in nursing infants); fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease, status asthmaticus, shock, uremia; impaired liver or kidney function, debilitation, pregnancy.

Available forms

Tablets—15, 30, 50 mg

Dosages

Adults

- *Daytime sedation*: 15–30 mg PO three to four times a day.
- *Hypnotic*: 50–100 mg PO at bedtime. Drug loses effectiveness within 2 wk and should not be used longer than that.
- *Preanesthetic sedation*: 50–100 mg PO 60–90 min before surgery. It is not considered safe to administer oral medication when a patient is NPO for surgery or anesthesia.

Pediatric patients

- *Preanesthetic sedation*: 2–6 mg/kg; maximum dose 100 mg. Use caution: Barbiturates may produce irritability, excitability, inappropriate tearfulness, and aggression.

Geriatric patients or patients with debilitating disease or hepatic or renal impairment

Reduce dosage and monitor closely; may produce excitement, depression, or confusion.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	45–60 min	3–4 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 50–100 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, agitation, confusion, hyperkinesia, ataxia, vertigo, CNS depression, nightmares, lethargy, residual sedation (hangover), paradoxical excitement, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, thinking abnormality*
- **CV:** *Bradycardia, hypotension, syncope*
- **GI:** *Nausea, vomiting, constipation, diarrhea, epigastric pain*
- **Hypersensitivity:** Rashes, angioneurotic edema, serum sickness, morbilliform rash, urticaria; rarely, exfoliative dermatitis, **Stevens-Johnson syndrome**
- **Respiratory:** *Hypoventilation, apnea, respiratory depression, laryngospasm, bronchospasm, circulatory collapse*

- **Other:** Anaphylaxis, angioedema, tolerance, psychological and physical dependence; **withdrawal syndrome**

Interactions

• **Drug-drug** • Increased CNS depression with alcohol • Decreased effects of theophyllines, oral anticoagulants, beta-blockers, doxycycline, corticosteroids, hormonal contraceptives and estrogens, metronidazole, phenylbutazones, quinidine, carbamazepine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to barbiturates, tartrazine, manifest or latent porphyria; marked liver impairment, nephritis, respiratory disease; previous addiction to sedative-hypnotic drugs, acute or chronic pain, seizure disorders, fever, hyperthyroidism, diabetes mellitus, severe anemia, cardiac disease, shock, uremia, debilitation, pregnancy, lactation
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, blood and urine glucose, BUN

Interventions

- Monitor responses and blood levels if any of the interacting drugs (see Interactions) are given with butabarbital; suggest alternatives to hormonal contraceptives.
- ⊗ **Warning** Keep resuscitative equipment readily available in case of respiratory depression or hypersensitivity reaction.
- Taper dosage gradually after repeated use, especially in epileptic patients.

Teaching points

- This drug will make you drowsy and less anxious.
- Try not to get up after you have received this drug (request assistance to sit up or move about).

Outpatients taking this drug

- Take this drug exactly as prescribed.
- This drug is habit-forming; its effectiveness in facilitating sleep stops after a short time. Do not take drug longer than 2 weeks (for insomnia), and do not increase the dosage without consulting your health care provider.

- Consult the care provider if the drug appears to be ineffective.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; they may cause dangerous effects.
- Use an alternative to hormonal contraceptives; avoid becoming pregnant while taking this drug.
- You may experience these side effects: Drowsiness, dizziness, hangover, impaired thinking (less pronounced after a few days; avoid driving or dangerous activities); complex sleep disorders; GI upset (take the drug with food); nightmares, difficulty concentrating, fatigue, nervousness (reversible, will go away when drug is discontinued).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, pregnancy, complex sleep-related behaviors.

⚠ DANGEROUS DRUG

▶ butorphanol tartrate (byoo tor' fa nole)

Stadol

PREGNANCY CATEGORY C
(DURING PREGNANCY)

PREGNANCY CATEGORY D
(DURING LABOR AND DELIVERY)

CONTROLLED SUBSTANCE C-IV

Drug class

Opioid agonist-antagonist analgesic

Therapeutic actions

Acts as an agonist at opioid receptors in the CNS to produce analgesia, sedation (therapeutic effects), but also acts to cause hallucinations (adverse effect); has low abuse potential.

Indications

- Relief of moderate to severe pain when use of an opioid analgesic is appropriate
- For preoperative or preanesthetic medication, to supplement balanced anesthesia, and to relieve parturient pain (parenteral)
- Nasal spray: Relief of migraine headache pain and relief of moderate to severe pain

Contraindications and cautions

- Contraindicated with hypersensitivity to butorphanol or benzethonium chloride preservative, physical dependence on an opioid analgesic, pregnancy, lactation.
- Use cautiously with bronchial asthma, COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, renal or hepatic impairment, geriatric patients.

Available forms

Injection—1 mg/mL, 2 mg/mL; nasal spray—10 mg/mL

Dosages**Adults****IM**

Usual single dose is 2 mg every 3–4 hr; patient must be able to remain recumbent. Dosage range is 1–4 mg every 3–4 hr; single doses should not exceed 4 mg.

- *Preoperative*: 2 mg IM, 60–90 min before surgery.

IV

Usual single dose is 1 mg every 3–4 hr. Dosage range is 0.5–2 mg every 3–4 hr.

- *Balanced anesthesia*: 2 mg IV shortly before induction or 0.5–1 mg IV in increments during anesthesia.

IV or IM

- *Labor*: 1–2 mg IV or IM at full term during early labor; repeat every 4 hr. Use alternative analgesia for pain associated with delivery or if delivery is expected within 4 hr.

Nasal

- *Relief of pain*: 1 mg (1 spray per nostril). May repeat in 60–90 min if adequate relief is not achieved. May repeat two-dose sequence every 3–4 hr.

Pediatric patients

Not recommended for patients younger than 18 yr.

Geriatric patients or patients with renal or hepatic impairment**Parenteral**

Use one-half the usual dose at least 6 hr apart. Monitor patient response.

Nasal

Initially, 1 mg. Allow 90–120 min to elapse before a second dose is given.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	0.5–1 hr	3–4 hr
IM	10–15 min	0.5–1 hr	3–4 hr
Nasal	15 min	1–2 hr	4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 2.1–9.2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: May be given undiluted. Store at room temperature. Protect from light.

Injection: Administer direct IV over 3–5 min.

Compatibilities: Do not mix in solution with dimenhydrinate or pentobarbital.

Y-site compatibility: Enalaprilat.

Adverse effects

- **CNS**: Sedation, clamminess, sweating, headache, vertigo, floating feeling, dizziness, lethargy, confusion, light-headedness, nervousness, unusual dreams, agitation, euphoria, hallucinations
- **CV**: Palpitation, increase or decrease in BP
- **Dermatologic**: Rash, hives, pruritus, flushing, warmth, sensitivity to cold
- **EENT**: Diplopia, blurred vision
- **GI**: *Nausea*, dry mouth
- **Respiratory**: Slow, shallow respiration

Interactions

★ **Drug-drug** ★ Potentiation of effects of butorphanol when given with barbiturate anesthetics

Nursing considerations**Assessment**

- **History**: Hypersensitivity to butorphanol, physical dependence on a narcotic analgesic, pregnancy, lactation, bronchial asthma, COPD, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, renal or hepatic impairment

- **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; pulse, auscultation, BP; R, adventitious sounds; bowel sounds, normal output; LFTs, renal function tests

Interventions

- Ensure that opioid antagonist facilities for assisted or controlled respiration is readily available during parenteral administration.

Teaching points

- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (avoid driving, performing other tasks that require alertness); nausea, loss of appetite (lie quietly, eat frequent small meals).
- Report severe nausea, vomiting, palpitations, shortness of breath or difficulty breathing, nasal lesions or discomfort (nasal spray).

▷ **C1-Inhibitor (human)**

▷ **cabazitaxel**

See Appendix U, *Less commonly used drugs*.

▷ **caffeine**
(*kaf een'*)

Caffedrine, Enerjets, Fastlene, Keep Alert, Keep Going, Molie, NoDoz, Overtime, Stay Awake, Valentine, Vivarin

caffeine citrate
Cafcit

PREGNANCY CATEGORY C

Drug classes

Analeptic
CNS stimulant
Xanthine

Therapeutic actions

Increases calcium permeability in sarcoplasmic reticulum, promotes the accumulation of

cAMP, and blocks adenosine receptors; stimulates the CNS, cardiac activity, gastric acid secretion, and diuresis.

Indications

- An aid in staying awake and restoring mental awareness
- Adjunct to analgesic formulations
- IM: Possibly an analeptic in conjunction with supportive measures to treat respiratory depression associated with overdose with CNS depressants
- Caffeine citrate: Short-term treatment of apnea of prematurity in infants between 28 and 33 wk gestation
- Unlabeled uses: Headache, obesity, alcohol intoxication, postprandial hypotension

Contraindications and cautions

- Contraindicated with duodenal ulcers, diabetes mellitus, lactation.
- Use cautiously with pregnancy, renal or hepatic impairment, depression, CV disease.

Available forms

Tablets—200 mg; capsules—200 mg; lozenges—75 mg; injection—250 mg/mL; caffeine citrate injection and oral solution—20 mg/mL

Dosages

20 mg caffeine citrate = 10 mg caffeine base; use caution.

Adults

- 100–200 mg PO every 3–4 hr as needed.
- *Respiratory depression:* 500 mg–1 g caffeine and sodium benzoate (250–500 mg caffeine) IM; do not exceed 2.5 g/day; may be given IV in severe emergency situation.

Pediatric patients

- *Neonatal apnea:* 20 mg/kg IV over 30 min followed 24 hours later by 5 mg/kg/day IV over 10 min or PO as maintenance (*CAF CIT*).

Pharmacokinetics

Route	Onset	Peak
Oral	15 min	15–45 min
IV	Immediate	End of infusion

Metabolism: Hepatic; T_{1/2}: 3–7.5 hr, 100 hr (neonates)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve 10 g caffeine citrate powder in 250 mL sterile water for injection USP to 500 mL; filter and autoclave. Final concentration is 10 mg/mL caffeine base (20 mg/mL caffeine citrate). Stable for 3 mo. Or dissolve 10 mg caffeine powder and 10.9 g citric acid powder in bacteriostatic water for injection, USP to 1 L. Sterilize by filtration. **CAFCIT:** 60 mg/3 mL vial may be diluted to achieve desired dose.

Infusion: IV single dose of 500 mg caffeine may be given slowly over 2 min in emergency situations; not recommended. **CAFCIT:** Give 20 mg/kg as a single dose over 30 min; maintain with infusion of 5 mg/kg/day.

Adverse effects

- **CNS:** *Insomnia, restlessness, excitement, nervousness, tinnitus, muscular tremor, headaches, light-headedness*
- **CV:** *Tachycardia, hypertension, extrasystoles, palpitations*
- **GI:** Nausea, vomiting, diarrhea, stomach pain
- **GU:** *Diuresis*
- **Other:** Withdrawal syndrome: Headache, anxiety, muscle tension

Interactions

- **Drug-drug** • Increased CNS effects of caffeine with cimetidine, hormonal contraceptives, disulfiram, ciprofloxacin, mexiletine
- Decreased effects of caffeine while smoking
- Increased serum levels of theophylline, clozapine with caffeine
- **Drug-food** • Decreased absorption of iron if taken with or 1 hr after coffee or tea
- **Drug-alternative therapy** • Avoid concomitant administration with guarana, ma huang, or ephedra; may cause additive effects
- **Drug-lab test** • Possible false elevations of serum urate, urine VMA, resulting in false-positive diagnosis of pheochromocytoma or neuroblastoma

Nursing considerations

Assessment

- **History:** Depression, duodenal ulcer, diabetes mellitus, lactation, pregnancy
- **Physical:** Neurologic status, P, BP, ECG, normal urinary output, abdominal examination, blood glucose

Interventions

- **Warning** Do not stop the drug abruptly after long-term use to avoid withdrawal reactions.
- Monitor diet for caffeine-containing foods that may contribute to overdose.
- Parents of infants being treated with caffeine citrate for apnea should have drug information incorporated into the overall teaching plan.

Teaching points

- Do not stop taking this drug abruptly; withdrawal symptoms may occur.
- Avoid foods high in caffeine (coffee, tea, cola, chocolate), which may cause symptoms of overdose.
- Avoid driving or dangerous activities if dizziness, tremors, or restlessness occur.
- Consult your health care provider if fatigue continues.
- You may experience these side effects: Diuresis, restlessness, insomnia, muscular tremors, light-headedness; nausea, abdominal pain.
- Report abnormal heart rate, dizziness, palpitations.

calcitonin

(*kal si toe' nin*)

calcitonin, salmon

Apo-Calcitonin (CAN), Calcimar, Caltine (CAN), Fortical, Miacalcin, Miacalcin Nasal Spray, Osteocalcin, Salmonine

PREGNANCY CATEGORY C
(SALMON)

Drug classes

Hormone
Calcium regulator

Therapeutic actions

The calcitonins are polypeptide hormones secreted by the thyroid; salmon calcitonin appears to be a chemically identical polypeptide to human calcitonin but with greater potency per milligram and longer duration; inhibits bone resorption; lowers elevated serum calcium in children and patients with Paget's disease; increases the excretion of filtered phosphate, calcium, and sodium by the kidney.

Indications

- Treatment of Paget's disease
- Treatment of postmenopausal osteoporosis in conjunction with adequate calcium and vitamin D intake to prevent loss of bone mass
- Treatment of hypercalcemia, emergency treatment (injection only)

Contraindications and cautions

- Contraindicated with allergy to salmon calcitonin or fish products, lactation.
- Use cautiously with renal insufficiency, osteoporosis, pernicious anemia.

Available forms

Injection—200 units/mL; nasal spray—200 units/actuation

Dosages

Adults

Calcitonin, salmon

- *Skin testing*: 0.1 mL of a 10 units/mL solution injected subcutaneously.
- *Paget's disease*: Initial dose, 100 units/day IM or subcutaneously. For maintenance, 50 units/day or every other day. Actual dose should be determined by patient response.
- *Postmenopausal osteoporosis*: 100 units every other day IM or subcutaneously, with supplemental calcium (calcium carbonate, 1.5 g/day) and vitamin D (400 units/day) or 200 units intranasally daily, alternating nostrils daily.
- *Hypercalcemia*: Initial dose, 4 units/kg every 12 hr IM or subcutaneously. If response is not satisfactory after 1–2 days, increase to 8 units/kg every 12 hr; if response remains unsatisfactory after 2 more days, increase to 8 units/kg every 6 hr.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
IM, Subcut.	15 min	16–25 min	8–24 hr
Nasal	Rapid	31–39 min	8–24 hr

Metabolism: Renal; $T_{1/2}$: 43 min (salmon), 1 hr (human)

Distribution: May enter breast milk

Excretion: Urine

Adverse effects

- **Dermatologic:** *Flushing of face or hands, rash*
- **GI:** *Nausea, vomiting*
- **GU:** *Urinary frequency*
- **Local:** *Local inflammatory reactions at injection site, nasal irritation (nasal spray)*

■ Nursing considerations

Assessment

- **History:** Allergy to salmon calcitonin or fish products, lactation, osteoporosis, pernicious anemia, renal disease
- **Physical:** Skin lesions, color, T; muscle tone; urinalysis, serum calcium, serum alkaline phosphatase and urinary hydroxyproline excretion

Interventions

- ⊗ **Warning** Give skin test to patients with any history of allergies; salmon calcitonin is a protein, and risk of allergy is significant. Prepare solution for skin test as follows: Withdraw 0.05 mL of the 200 units/mL solution into a tuberculin syringe. Fill to 1 mL with sodium chloride injection. Mix well. Discard 0.9 mL, and inject 0.1 mL (about 1 unit) subcutaneously into the inner aspect of the forearm. Observe after 15 min; the presence of a wheal or more than mild erythema indicates a positive response.
- Ensure that parenteral calcium is readily available in case hypocalcemic tetany develops.
- Monitor serum alkaline phosphatase and urinary hydroxyproline excretion prior to therapy and during first 3 mo and every 3–6 mo during long-term therapy.
- Periodically examine urine sediment for casts in patients on chronic therapy.

⊗ **Warning** Inject doses of more than 2 mL IM, not subcutaneously; use multiple injection sites.

- Refrigerate nasal spray until activated, then store at room temperature.

Teaching points

- This drug is given IM or subcutaneously; you or a significant other must learn how to do this at home. Refrigerate the drug vials. Dispose of needles and syringes in an appropriate container.
- For intranasal use, alternate nostrils daily; notify health care provider if significant nasal irritation occurs.
- Before first use, activate spray by holding bottle upright and depressing the two white side arms toward bottle six times, until a faint spray appears.
- You may experience these side effects: Nausea, vomiting (this passes); irritation at injection site (rotate sites); flushing of the face or hands, rash.
- Report twitching, muscle spasms, dark urine, hives, rash, difficulty breathing.

calcium salts

(*kal si' uhm*)

calcium carbonate

Apo-Cal (CAN), Calcite 500 (CAN), Caltrate, Chooz, Equilet, Os-Cal, Oyst-Cal, PMS-Calcium (CAN), Surpass, Tums

calcium chloride

calcium glubionate

Calcionate, Calciquid

calcium gluconate

Cal-G

calcium lactate

Cal-Lac

PREGNANCY CATEGORY C

Drug classes

Antacid

Electrolyte

Therapeutic actions

Essential element of the body; helps maintain the functional integrity of the nervous and muscular systems; helps maintain cardiac function, blood coagulation; is an enzyme cofactor and affects the secretory activity of endocrine and exocrine glands; neutralizes or reduces gastric acidity (oral use).

Indications

- Dietary supplement when calcium intake is inadequate
- Treatment of calcium deficiency in tetany of the newborn, acute and chronic hypoparathyroidism, pseudohypoparathyroidism, postmenopausal and senile osteoporosis, rickets, osteomalacia
- Prevention of hypocalcemia during exchange transfusions
- Adjunctive therapy for insect bites or stings, such as black widow spider bites; sensitivity reactions, particularly when characterized by urticaria; depression due to overdose of magnesium sulfate; acute symptoms of lead colic
- Calcium chloride: Combats the effects of hyperkalemia as measured by ECG, pending correction of increased potassium in the extracellular fluid
- Improves weak or ineffective myocardial contractions when epinephrine fails in cardiac resuscitation, particularly after open heart surgery
- Calcium carbonate: Symptomatic relief of upset stomach associated with hyperacidity; hyperacidity associated with peptic ulcer, gastritis, peptic esophagitis, gastric hyperacidity, hiatal hernia
- Calcium carbonate: Prophylaxis of GI bleeding, stress ulcers, and aspiration pneumonia; possibly useful
- Unlabeled use: Treatment of hypertension in some patients with indices suggesting calcium “deficiency”; treatment of premenstrual syndrome (calcium glubionate)

Contraindications and cautions

- Contraindicated with allergy to calcium, renal calculi, hypercalcemia, ventricular fibrillation during cardiac resuscitation and patients with the risk of existing digitalis toxicity.
- Use cautiously with renal impairment, pregnancy, lactation.

Available forms

Tablets—250, 500, 650, 975 mg, 1 g, 1.25 g, 1.5 g; powder—2,400 mg; injection—10%, 1.1 g/5 mL; syrup—1.8 g/5 mL; chewable tablets—400, 420, 500, 750, 850, 1,000, 1,177, 1,250 mg; gum—300, 400, 500 mg

Dosages**Adults****Calcium carbonate or lactate**

- *RDA*:
14–18 yr: 1,300 mg/day
19–50 yr: 1,000 mg/day
Older than 50 yr: 1,200 mg/day
Pregnant or lactating
14–18 yr: 1,300 mg/day
19–50 yr: 1,000 mg/day
- *Dietary supplement*: 500 mg–2 g PO, bid–qid.
- *Antacid*: 0.5–2 g PO calcium carbonate as needed.

Calcium chloride

For IV use only. 1 g contains 273 mg (13.6 mEq) calcium.

- *Hypocalcemic disorders*: 500 mg–1 g at intervals of 1–3 days; response may dictate more frequent injections.
- *Magnesium intoxication*: 500 mg promptly. Observe patient for signs of recovery before giving another dose.
- *Hyperkalemic ECG disturbances of cardiac function*: Adjust dosage according to ECG response.
- *Cardiac resuscitation*: 500 mg–1 g IV or 200–800 mg into the ventricular cavity.

Calcium gluconate

IV infusion preferred. 1 g contains 93 mg (4.65 mEq) calcium. 0.5–2 g as required; daily dose 1–15 g.

Pediatric patients**Calcium carbonate or lactate**

- *RDA*:
0–6 mo: 210 mg/day
7–12 mo: 270 mg/day

1–3 yr: 500 mg/day
4–8 yr: 800 mg/day
9–13 yr: 1,300 mg/day

Calcium gluconate

200–500 mg/day IV (2–5 mL of 10% solution); for infants, no more than 200 mg IV (2 mL of 10% solution) given in divided doses.

Pharmacokinetics

Route	Onset	Peak
Oral	3–5 min	N/A
IV	Immediate	3–5 min

Metabolism: Hepatic; $T_{1/2}$: 1–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Warm solutions to body temperature; use a small needle inserted into a large vein to decrease irritation.

Infusion: Infuse slowly, 0.5–2 mL/min. Stop infusion if patient complains of discomfort; resume when symptoms disappear. Repeated injections are often necessary.

Incompatibilities: Avoid mixing calcium salts with carbonates, phosphates, sulfates, tartrates, amphotericin, cefazolin, clindamycin, dobutamine, prednisolone.

Adverse effects

- **CV**: *Slowed heart rate, tingling, “beat waves”* (rapid IV administration); *peripheral vasodilation, local burning, drop in BP* (calcium chloride injection)
- **Local**: *Local irritation*, severe necrosis, sloughing and abscess formation (IM, subcutaneous use of calcium chloride)
- **Metabolic**: Hypercalcemia (*anorexia, nausea, vomiting, constipation*, abdominal pain, dry mouth, thirst, polyuria), *rebound hyperacidity* and milk-alkali syndrome (hypercalcemia, alkalosis, renal damage with calcium carbonate used as an antacid)

Interactions

★ **Drug-drug** • Decreased serum levels of oral tetracyclines, oral fluoroquinolones, salicylates, iron salts with oral calcium salts; give

these drugs at least 1 hr apart • Increased serum levels of quinidine and possible toxicity with calcium salts • Antagonism of effects of verapamil with calcium • Decreased effect of thyroid hormone replacement; space doses 2 hr apart if this combination is used

* **Drug-food** • Decreased absorption of oral calcium when taken concurrently with oxalic acid (found in rhubarb and spinach), phytic acid (bran and whole cereals), phosphorus (milk and dairy products)

* **Drug-lab test** • False-negative values for serum and urinary magnesium

■ Nursing considerations

Assessment

- **History:** Allergy to calcium; renal calculi; hypercalcemia; ventricular fibrillation during cardiac resuscitation; digitalis toxicity, renal impairment, pregnancy, lactation
- **Physical:** Injection site; P, auscultation, BP, peripheral perfusion, ECG; abdominal examination, bowel sounds, mucous membranes; serum electrolytes, urinalysis

Interventions

- Give drug hourly for first 2 wk when treating acute peptic ulcer. During healing stage, administer 1–3 hr after meals and at bedtime.
- Do not administer oral drugs within 1–2 hr of antacid administration.
- Have patient chew antacid tablets thoroughly before swallowing; follow with a glass of water or milk.
- Give calcium carbonate antacid 1 and 3 hr after meals and at bedtime.
- ⊗ **Warning** Avoid extravasation of IV injection; it irritates the tissues and can cause necrosis and sloughing. Use a small needle in a large vein.
- Have patient remain recumbent for a short time after IV injection.
- Administer into ventricular cavity during cardiac resuscitation, not into myocardium.
- Warm calcium gluconate if crystallization has occurred.
- Monitor serum phosphorus levels periodically during long-term oral therapy.
- Monitor cardiac response closely during parenteral treatment with calcium.

Teaching points

Parenteral

- Report any pain or discomfort at the injection site as soon as possible.

Oral

- Take drug between meals and at bedtime. Ulcer patients must take drug as prescribed. Chew tablets thoroughly before swallowing, and follow with a glass of water or milk.
- Do not take with other oral drugs. Absorption of those medications can be blocked; take other oral medications at least 1–2 hours after calcium carbonate.
- You may experience these side effects: Constipation (can be medicated), nausea, GI upset, loss of appetite (special dietary consultation may be necessary).
- Report loss of appetite, nausea, vomiting, abdominal pain, constipation, dry mouth, thirst, increased voiding.

▽ **calfactant (DDPC, natural lung surfactant)**
(*cal fak' tant*)

Infasurf

Drug class

Lung surfactant

Therapeutic actions

A natural bovine compound containing lipids and apoproteins that reduce surface tension, allowing expansion of the alveoli; replaces the surfactant missing in the lungs of neonates suffering from RDS.

Indications

- Prophylactic treatment of infants at risk of developing RDS; infants less than 29 wk gestation
- Rescue treatment of premature infants up to 72 hr of age who have developed RDS and require endotracheal intubation; best if started within 30 min after birth

Contraindications and cautions

- Because calfactant is used as an emergency drug in acute respiratory situations, the benefits usually outweigh any possible risks.

Available forms

Intratracheal suspension—35 mg/mL

Dosages**Infants**

Accurate determination of birth weight is essential for determining appropriate dosage. Calfactant is instilled into the trachea using a catheter inserted into the endotracheal tube.

- **Prophylactic and rescue treatment:** Instill 3 mL/kg of birth weight in two doses of 1.5 mL/kg each. Repeat doses of 3 mL/kg of birth weight up to a total of three doses 12 hr apart.

Pharmacokinetics

Route	Onset	Peak
Intratracheal	Immediate	Hours

Metabolism: Normal surfactant metabolic pathways; $T_{1/2}$: less than 24 hr

Distribution: Lung tissue

Excretion: Unknown

Adverse effects

- **CNS: Seizures, intracranial hemorrhage**
- **CV: Patent ductus arteriosus, intraventricular hemorrhage, hypotension, bradycardia**
- **Hematologic: Hyperbilirubinemia, thrombocytopenia**
- **Respiratory: Pneumothorax, pulmonary air leak, pulmonary hemorrhage** (more often seen with infants weighing less than 700 g), *apnea*, pneumomediastinum, emphysema
- **Other: Sepsis, nonpulmonary infections**

■ Nursing considerations**Assessment**

- **History:** Time of birth, exact birth weight
- **Physical:** T, color; R, adventitious sounds, oximeter, endotracheal tube position and patency, chest movement; ECG, P, BP, peripheral perfusion, arterial pressure (desirable); oxygen saturation, blood gases, CBC; muscular activity, facial expression, reflexes

Interventions

- Arrange for appropriate assessment and monitoring of critically ill infant.

- Monitor ECG and transcutaneous oxygen saturation continually during administration.
- Ensure that endotracheal tube is in the correct position, with bilateral chest movement and lung sounds.
- Do not dilute or mix calfactant with any other drugs or solutions. Administer as provided. Warm unopened vials to room temperature. Gently swirl to mix contents.
- Suction the infant immediately before administration; but do not suction for 2 hr after administration unless clinically necessary.
- Store drug in refrigerator. Protect from light. Enter drug vial only once. Discard remaining drug after use. Avoid repeated warmings to room temperature.
- Administer through a side-port adapter into the endotracheal tube or insert 5 French feeding catheter into the endotracheal tube; do not instill into the mainstream bronchus.
- Two attendants, one to instill drug and one to monitor, are needed. Administer total dose in two aliquots of 1.5 mL/kg each. After each instillation, position infant on either right or left side dependent. Administer while continuing ventilation over 20–30 breaths for each aliquot, with small bursts timed during inspiration cycles. A pause followed by evaluation of respiratory status and repositioning should separate the two aliquots. May repeat doses of 3 mL/kg up to a total of three doses 12 hr apart.
- Endotracheal suctioning and/or reintubation is sometimes needed if signs of airway obstruction occur after surfactant.

⊗ **Warning** Continually monitor patient color, lung sounds, ECG, oximeter and blood gas readings during administration and for at least 30 min following administration.

- Maintain appropriate interventions for critically ill infant.
- Offer support and encouragement to parents.

Teaching points

- Parents of the critically ill infant will need a comprehensive teaching and support program. Details of drug effects and administration are best incorporated into the comprehensive program.

canakinumab

See Appendix U, *Less commonly used drugs*.

candesartan cilexetil (*can dab sar' tan*)

Atacand

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Angiotensin II receptor antagonist

Antihypertensive

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in vascular smooth muscle and adrenal gland; this action blocks the vasoconstriction effect of the renin–angiotensin system as well as the release of aldosterone leading to decreased BP.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensives
- Treatment of heart failure (New York Heart Association class II–IV, ejection fraction 40% or less) to reduce risk of CV death and to reduce hospitalization for heart failure; may be combined with an ACE inhibitor

Contraindications and cautions

- Contraindicated with hypersensitivity to candesartan, pregnancy (use during the second or third trimester can cause injury or even death to the fetus), lactation.
- Use cautiously with renal impairment, hypovolemia.

Available forms

Tablets—4, 8, 16, 32 mg

Dosages

Adults

- **Hypertension:** Usual starting dose, 16 mg PO daily. Can be administered in divided

doses bid with a total daily dose of 32 mg/day. Dose range: 8–32 mg a day.

- **Heart failure:** 4 mg/day PO; may be doubled at 2 wk intervals to achieve target dose of 32 mg/day PO as a single dose.

Pediatric patients 6 to younger than 17 yr

More than 50 kg: 8–16 mg/day PO; range, 4–32 mg/day PO once daily or in divided doses. **Less than 50 kg:** 4–8 mg/day PO; range, 4–16 mg/day PO.

1 to younger than 6 yr

Initially, 0.20 mg/kg/day oral suspension; range, 0.05–0.4 mg/kg/day oral suspension once daily or in divided doses.

Patients with volume depletion

Consider using lower dose; keep patient under close medical supervision.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: 9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, syncope, muscle weakness
- **CV:** Hypotension
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** *Diarrhea, abdominal pain, nausea*, constipation, dry mouth, dental pain
- **Respiratory:** *URI symptoms*, cough, sinus disorders
- **Other:** Cancer in preclinical studies, back pain, fever, gout

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to candesartan, pregnancy, lactation, renal impairment, hypovolemia
- **Physical:** Skin lesions, turgor; T; reflexes, affect; BP; R, respiratory auscultation; renal function tests

Interventions

- Administer without regard to meals.
- Have pharmacist prepare oral suspension for children 1–6 yr.

⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy, suggest the use of barrier birth control while using candesartan; fetal injury and deaths have been reported. When pregnancy is detected, discontinue candesartan as soon as possible.

- Find an alternate method of feeding the baby for a nursing mother. Depression of the renin-angiotensin system in infants is potentially very dangerous.

⊗ **Warning** Alert surgeon and mark patient's chart with notice that candesartan is being taken. The blockage of the renin-angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.

- If BP control does not reach desired levels, diuretics or other antihypertensives may be added to candesartan. Monitor patient's BP carefully.
- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea—excessive hypotension can occur.

Teaching points

- Take this drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while on this drug; if you become pregnant or desire to become pregnant, consult your health care provider.
- Maintain your fluid intake, especially in situations that could cause loss of fluids, such as diarrhea, vomiting, or excessive sweating.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache (medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important, consult with your dietitian to maintain nutrition); symptoms of URI, cough (do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy.

DANGEROUS DRUG

capecitabine

(kap ab seat' ab been)

Xeloda

PREGNANCY CATEGORY D

C

Drug classes

Antimetabolite
Antineoplastic

Therapeutic actions

A prodrug of 5-fluorouridine that is readily converted to 5-FU; inhibits thymidylate synthetase, leading to inhibition of DNA and RNA synthesis and cell death.

Indications

- Treatment of breast cancer in patients with metastatic breast cancer resistant to both paclitaxel and doxorubicin or doxorubicin-equivalent chemotherapy
- Treatment of breast cancer in combination with docetaxel in patients with metastatic disease after failure with anthracycline chemotherapy
- Treatment of metastatic colorectal cancer as first-time treatment when treatment with fluoropyrimidine therapy is preferred
- Adjuvant post-surgery treatment of patients with Dukes C colon cancer who have undergone complete resection of the primary tumor who are candidates for single oral agent chemotherapy

Contraindications and cautions

- Contraindicated with allergy to 5-FU; pregnancy; lactation; severe renal impairment, concomitant warfarin therapy.
- Use cautiously with renal or hepatic impairment, severe diarrhea or intestinal disease, coronary artery disease, bleeding disorders (adverse cardiac effects are more common).

Available forms

Tablets—150, 500 mg

Dosages

Adults

- *Breast and colorectal cancer:* Starting dose, 2,500 mg/m²/day PO in two divided doses

12 hr apart within 30 min after a meal for 2 wk followed by a 1-wk rest period; given in 3-wk cycles.

- **Adjuvant post-surgery Dukes C colon cancer:** 1,250 mg/m² PO twice daily, morning and evening within 30 min after a meal, for 2 wk, followed by 1 wk rest, given as 3-wk cycles for a total of 8 cycles (24 wk).

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic impairment

These patients may be more sensitive to the toxic effects of the drug. Monitor closely and decrease dosage as needed to avoid toxicity.

Patients with renal impairment

For creatinine clearance 51–80 mL/min, no adjustment recommended, but monitor carefully; for creatinine clearance 30–50 mL/min, reduce dosage by 75%; for creatinine clearance less than 30 mL/min, use is contraindicated.

- **Patients on concurrent therapy with docetaxel:** Severe toxicity may result, as manifested by NCIC grade 2–4 toxicity criteria; monitor/adjust doses of both drugs as needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.5 hr

Metabolism: Hepatic and cellular; T_{1/2}: 45 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Lungs, urine

Adverse effects

- **CNS:** Fatigue, paresthesias, headache, dizziness, insomnia
- **CV: MI,** angina, arrhythmias, ECG changes
- **Dermatologic:** *Hand-and-foot syndrome* (numbness, dysesthesias, tingling, pain, swelling, blisters, pain), *dermatitis*, nail disorders
- **GI: Diarrhea, anorexia, nausea, vomiting, cramps, constipation, stomatitis**
- **Hematologic:** *Leukopenia, thrombocytopenia*, anemia
- **Other:** Fever, edema, myalgia

Interactions

★ **Drug-drug** ⊗ **Warning** Increased capecitabine levels and toxicity, with possibility of death, when combined with leucovorin; avoid this combination.

⊗ **Black box warning** Increased risk of excessive bleeding and even death if combined with warfarin anticoagulants; avoid this combination. If the combination must be used, INR and prothrombin levels should be monitored very closely and anticoagulant dose adjusted as needed.

- Increased capecitabine levels when taken with antacids
- Increased phenytoin levels if taken together; consider reduction of phenytoin dose

Nursing considerations

Assessment

- **History:** Allergy to 5-FU; impaired hepatic or renal function; pregnancy; lactation; diarrhea, intestinal disease, coronary disease, warfarin therapy
- **Physical:** Weight; T; skin lesions, color; orientation, reflexes, affect, sensation; P, BP, cardiac rhythm, peripheral perfusion; mucous membranes, liver evaluation, abdominal examination; CBC, differential; LFTs, renal function tests

Interventions

- Evaluate renal function before starting therapy to ensure accurate dosage.
- Always administer drug with food, within 30 min of a meal. Have patient swallow drug with water.
- Monitor for toxicities, especially if used with docetaxel; dosage may need to be adjusted based on toxicity.
- ⊗ **Warning** Arrange for discontinuation of drug therapy if any sign of toxicity occurs—severe nausea, vomiting, diarrhea, hand-and-foot syndrome, stomatitis.
- Monitor nutritional status and fluid and electrolyte balance when GI effects occur; provide supportive care and fluids as needed; loperamide may be helpful for severe diarrhea.
- Provide frequent mouth care for stomatitis or mouth sores.
- ⊗ **Warning** Arrange for frequent small meals and dietary consultation to maintain nutrition when GI effects are severe.

- Protect patient from exposure to infection; monitor temperature and CBC regularly.
- Suggest use of barrier contraceptives while patient is using this drug; serious birth defects can occur.
- Monitor for toxicities, especially if used with docetaxel; dosage may need to be adjusted, based on toxicity.

Teaching points

- Take this drug every 12 hours, within 30 minutes of a meal; always take the drug after you have eaten and have food in your stomach. Swallow the tablets with water.
- Prepare a calendar of treatment days to follow. The drug is given in 3-week cycles.
- Arrange to have frequent, regular medical follow-up, including frequent blood tests to follow the effects of the drug on your body.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised. This drug can cause serious birth defects if taken during pregnancy.
- You may experience these side effects: Nausea, vomiting, loss of appetite (medication may be ordered to help; eat frequent small meals; it is very important to maintain your nutrition while you are taking this drug); mouth sores (frequent mouth care will be needed); diarrhea (have ready access to bathroom facilities if this occurs).
- Report fever, chills, sore throat; chest pain; mouth sores; pain or tingling in hands or feet; severe nausea, vomiting or diarrhea (more than five episodes of any of these per day); dizziness.

▷ capreomycin (kap ree ob mye' sin)

Capastat Sulfate

PREGNANCY CATEGORY C

Drug classes

Antibiotic

Antituberculous ("third line")

Therapeutic actions

Polypeptide antibiotic; mechanism of action against *Mycobacterium tuberculosis* unknown.

Indications

- Treatment of pulmonary tuberculosis that is not responsive to first-line antituberculosis agents but is sensitive to capreomycin in conjunction with other antituberculosis agents

Contraindications and cautions

- Contraindicated with allergy to capreomycin; preexisting auditory impairment.
- Use cautiously with lactation, renal impairment, pregnancy.

Available forms

Powder for injection—1 g/10 mL

Dosages

Always give in combination with other antituberculous.

Adults

1 g daily (not to exceed 20 mg/kg/day) IM or IV for 60–120 days, followed by 1 g IM two to three times weekly for 12–24 mo. Can also give IV infusion after further dilution in 100 mL 0.9% sodium chloride and infuse over 60 min.

Pediatric patients

15 mg/kg/day IM or IV (maximum 1 g) has been recommended but safety and efficacy have not been established.

Geriatric patients or patients with renal impairment

CrCl (mL/min)	Dose (mg/kg) at These Intervals		
	24 hr	48 hr	72 hr
0–9	1.29	2.58	3.87
10	2.43	4.87	7.3
20	3.58	7.16	10.7
30	4.72	9.45	14.2
40	5.87	11.7	–
50	7.01	14	–
60	8.16	–	–
80	10.4	–	–
100	12.7	–	–
110	13.9	–	–

Pharmacokinetics

Route	Onset	Peak	Duration
IM	20–30 min	1–2 hr	8–12 hr

Metabolism: $T_{1/2}$: 4–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve vial contents in 2 mL 0.9% sodium chloride or sterile water and allow 3 min for full dissolution. Further dilute in 100 mL 0.9% sodium chloride.

Infusion: Infuse over 60 min.

Adverse effects

- **CNS:** *Ototoxicity*
- **GI:** Hepatic impairment
- **GU:** *Nephrotoxicity*
- **Hematologic:** Leukocytosis, leukopenia, eosinophilia, hypokalemia
- **Hypersensitivity:** Urticaria, rashes, fever
- **Local:** Pain, induration at injection sites, sterile abscesses

Interactions

• **Drug-drug** • Increased nephrotoxicity and ototoxicity if used with similarly toxic drugs • Increased risk of peripheral neuromuscular blocking action with nondepolarizing muscle relaxants (atracurium, pancuronium, tubocurarine, vecuronium)

Nursing considerations

Assessment

- **History:** Allergy to capreomycin; renal insufficiency; auditory impairment; lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, audiometric measurement, vestibular function tests; liver evaluation; LFTs, renal function tests, CBC, serum K⁺

Interventions

- Arrange for culture and sensitivity studies before use.
- Administer this drug only when other forms of therapy have failed.
- Administer only in conjunction with other antituberculotics to which the mycobacteria are susceptible.
- Prepare solution by dissolving in 2 mL of 0.9% sodium chloride injection or sterile water for injection; allow 2–3 min for dissolution.

To administer 1 g, use entire vial—if less than 1 g is needed, see the manufacturer's instructions for dilution. Reconstituted solution may be stored for 24 hr refrigerated. Solution may acquire a straw color and darken with time; this is not associated with loss of potency. Can also give IV infusion after further dilution in 100 mL 0.9% sodium chloride and infuse over 60 min.

- Administer by deep IM injection into a large muscle mass.

⊗ **Black box warning** Arrange for audiometric testing and assessment of vestibular function, renal function tests, and serum potassium before and at regular intervals during therapy; risk of renal failure, auditory damage is severe.

⊗ **Black box warning** Be aware that safety of drug has not been established in children or pregnant women.

Teaching points

- This drug can be given by IM injection or IV infusion.
- Take this drug regularly; avoid missing doses. You must not discontinue this drug without first consulting your health care provider.
- Arrange to have regular, periodic medical checkups, including blood tests.
- You may experience these side effects: Loss of hearing, dizziness, vertigo (avoid injury).
- Report rash, loss of hearing, decreased urine output, palpitations.

▽ captopril

(*kap' toe pril*)

Apo-Capto (CAN), Capoten, Gen-Captopril (CAN), PMS-Captopril (CAN)

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Blocks ACE from converting angiotensin I to angiotensin II, a powerful vasoconstrictor, leading to decreased BP, decreased aldosterone secretion, a small increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action.

Indications

- Treatment of hypertension alone or in combination with thiazide-type diuretics
- Treatment of heart failure in patients unresponsive to conventional therapy; used with diuretics and cardiac glycosides
- Treatment of diabetic nephropathy
- Treatment of left ventricular dysfunction after MI
- Unlabeled uses: Management of hypertensive crises; treatment of rheumatoid arthritis; diagnosis of anatomic renal artery stenosis, hypertension related to scleroderma renal crisis; diagnosis of primary aldosteronism, idiopathic edema; Barter's syndrome; Raynaud's syndrome

Contraindications and cautions

- Contraindicated with allergy to captopril, history of angioedema, second or third trimester of pregnancy.
- Use cautiously with renal impairment, heart failure, salt or volume depletion, history of renal artery stenosis, lactation.

Available forms

Tablets—12.5, 25, 50, 100 mg

Dosages

Adults

- **Hypertension:** 25 mg PO bid or tid; if satisfactory response is not noted within 1–2 wk, increase dosage to 50 mg bid–tid; usual range is 25–150 mg bid–tid PO with a mild thiazide diuretic. Do not exceed 450 mg/day.
- **Heart failure:** Initially, 6.25–12.5 mg PO tid in patients who may be salt or volume depleted. Usual initial dose, 25 mg PO tid; maintenance dose, 50–100 mg PO tid. Do not exceed 450 mg/day. Use in conjunction with diuretic and cardiac glycoside therapy.
- **Left ventricular dysfunction after MI:** 50 mg PO tid, starting as early as 3 days post-

MI. (Initial dose of 6.25 mg, then 12.5 mg tid, increasing slowly to 50 mg tid.)

- **Diabetic nephropathy:** Reduce dosage; suggested dose is 25 mg PO tid.

Pediatric patients

Safety and efficacy not established.

Geriatric patients and patients with renal impairment

Excretion is reduced in renal failure; use smaller initial dose; adjust at smaller doses with 1- to 2-wk intervals between increases; slowly adjust to smallest effective dose. Use a loop diuretic with renal impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	15 min	30–90 min

Metabolism: $T_{1/2}$: 2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CV:** *Tachycardia*, angina pectoris, heart failure, **MI**, Raynaud's syndrome, hypotension in salt- or volume-depleted patients
- **Dermatologic:** Alopecia, *rash*, *pruritus*, scalded mouth sensation, pemphigoidlike reaction, exfoliative dermatitis, photosensitivity
- **GI:** *Gastric irritation*, *aphthous ulcers*, *peptic ulcers*, *dysgeusia*, cholestatic jaundice, hepatocellular injury, anorexia, constipation
- **GU:** *Proteinuria*, renal insufficiency, renal failure, polyuria, oliguria, urinary frequency
- **Hematologic:** Neutropenia, agranulocytosis, thrombocytopenia, hemolytic anemia, **pancytopenia**
- **Other:** *Cough*, malaise, dry mouth, lymphadenopathy

Interactions

- **Drug-drug** • Increased risk of hypersensitivity reactions with allopurinol • Decreased antihypertensive effects with indomethacin
- Increased captopril effects with probenecid
- **Drug-food** • Decreased absorption of captopril with food
- **Drug-lab test** • False-positive test for urine acetone

■ Nursing considerations**Assessment**

- **History:** Allergy to captopril, history of angioedema, impaired renal function, heart failure, salt or volume depletion, pregnancy, lactation
- **Physical:** Skin color, lesions, turgor; T; P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC and differential

Interventions

- Administer 1 hr before meals.

⊗ **Black box warning** Ensure that patient is not pregnant before beginning treatment. Encourage use of contraceptives; if pregnancy is detected, stop drug.

⊗ **Warning** Alert surgeon and mark patient's chart with notice that captopril is being taken; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

- Monitor patient for drop in BP secondary to reduction in fluid volume (due to excessive perspiration, dehydration, vomiting, or diarrhea); excessive hypotension may occur.
- Reduce dosage in patients with impaired renal function.

Teaching points

- Take drug 1 hour before meals; do not take with food. Do not stop taking drug without consulting your health care provider.
- Watch for drop in blood pressure (occurs most often with diarrhea, sweating, vomiting, or dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- Severe fetal damage can occur if captopril is taken during pregnancy. Use of contraceptives is advised; if pregnancy should occur, stop drug and notify health care provider.
- Avoid over-the-counter medications, especially cough, cold, or allergy medications that may contain ingredients that will interact with ACE inhibitors. Consult your health care provider.
- You may experience these side effects: cough, GI upset, loss of appetite, change in taste per-

ception (limited effects, will pass); mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, light-headedness (usually passes after the first few days; change position slowly, and limit activities to those that do not require alertness and precision).

- Report mouth sores; sore throat; fever; chills; swelling of the hands or feet; irregular heart-beat; chest pains; swelling of the face, eyes, lips, or tongue; difficulty breathing.

▽ carbamazepine*(kar ba maz' e peen)*

Apo-Carbamazepine (CAN),
 Carbatrol **ONC**, Epitol, Equetro **ONC**,
 Gen-Carbamazepine CR (CAN) **ONC**,
 PMS-Carbamazepine (CAN),
 Tegretol, Tegretol-XR **ONC**

PREGNANCY CATEGORY D**Drug class**

Antiepileptic

Therapeutic actions

Mechanism of action not understood; anti-epileptic activity may be related to its ability to inhibit polysynaptic responses and block post-tetanic potentiation. Drug is chemically related to the TCAs.

Indications

- Refractory seizure disorders: Partial seizures with complex symptoms (psychomotor, temporal lobe epilepsy), generalized tonic-clonic (grand mal) seizures, mixed seizure patterns or other partial or generalized seizures. Reserve for patients unresponsive to other agents with seizures difficult to control or who are experiencing marked side effects, such as excessive sedation
- Trigeminal neuralgia (tic douloureux): Treatment of pain associated with true trigeminal neuralgia; also beneficial in glossopharyngeal neuralgia
- Treatment of acute manic and mixed episodes associated with bipolar 1 disorder (*Equetro*)

- Unlabeled uses: Certain psychiatric disorders, including schizoaffective illness, resistant schizophrenia, and dyscontrol syndrome associated with limbic system dysfunction; alcohol withdrawal (800–1,000 mg/day); restless leg syndrome (100–300 mg/day at bedtime); non-neuritic pain syndrome (600–1,400 mg/day)

Contraindications and cautions

- Contraindicated with hypersensitivity to carbamazepine or TCAs, history of bone marrow depression, concomitant use of MAOIs, lactation, pregnancy.
- Use cautiously with history of adverse hematologic reaction to any drug (increased risk of severe hematologic toxicity), glaucoma or increased IOP; history of cardiac, hepatic, or renal damage; psychiatric patients (may activate latent psychosis).

Available forms

Tablets—200 mg; chewable tablets—100 mg; ER tablets **oac**—100, 200, 400 mg; ER capsules **oac**—100, 200, 300 mg; suspension—100 mg/5 mL

Dosages

Individualize dosage; a low initial dosage with gradual increase is advised.

Adults

- **Epilepsy:** Initial dose, 200 mg PO bid on the first day; increase gradually by up to 200 mg/day in divided doses every 6–8 hr, until best response is achieved. **Suspension:** 100 mg PO qid. Do not exceed 1,200 mg/day in patients older than age 15; doses up to 1,600 mg/day have been used in adults (rare). For maintenance, adjust to minimum effective level, usually 800–1,200 mg/day.
- **Trigeminal neuralgia:** Initial dose, 100 mg PO bid on the first day; may increase by up to 200 mg/day, using 100-mg increments every 12 hr as needed. Do not exceed 1,200 mg/day. For maintenance, control of pain can usually be maintained with 400–800 mg/day (range 200–1,200 mg/day). Attempt to reduce the dose to the minimum effective level or to discontinue the drug at least once every 3 mo. **Suspension:** Start at 50 mg PO qid; increase by 50 mg PO qid as needed to maximum dose.

- **Combination therapy:** When added to existing antiepileptic therapy, do so gradually while other antiepileptics are maintained or discontinued.
- **Bipolar I disorder:** 200–600 mg/day PO in divided doses; may be increased in 200 mg/day increments. Do not exceed 1,600 mg/day (*Equetro*).

Pediatric patients older than 12 yr

Use adult dosage. Do not exceed 1,000 mg/day in patients 12–15 yr; 1,200 mg/day in patients older than 15 yr.

Pediatric patients 6–12 yr

Initial dose, 100 mg PO bid on the first day. Increase gradually by adding 100 mg/day at 6- to 8-hr intervals until best response is achieved. Do not exceed 1,000 mg/day. Dosage also may be calculated on the basis of 20–30 mg/kg/day in divided doses tid–qid.

Pediatric patients younger than 6 yr

Optimal daily dose, less than 35 mg/kg/day.

Geriatric patients

Use caution; may cause confusion, agitation.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	4–5 hr
ER oral	Slow	3–12 hr

Metabolism: Hepatic; $T_{1/2}$: 25–65 hr, then 12–17 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, drowsiness, unsteadiness*, disturbance of coordination, confusion, headache, fatigue, visual hallucinations, depression with agitation, behavioral changes in children, talkativeness, speech disturbances, abnormal involuntary movements, paralysis and other symptoms of cerebral arterial insufficiency, peripheral neuritis and paresthesias, tinnitus, hyperacusis, blurred vision, transient diplopia and oculomotor disturbances, nystagmus, scattered punctate cortical lens opacities, conjunctivitis, ophthalmoplegia, fever, chills; SIADH, suicidal ideation

- **CV:** Heart failure, increased hypertension, hypotension, syncope and collapse, edema, primary thrombophlebitis, thrombophlebitis recurrence, aggravation of CAD, arrhythmias and AV block; **CV complications**
- **Dermatologic:** Pruritic and erythematous rashes, urticaria, **Stevens-Johnson syndrome**, photosensitivity reactions, alterations in pigmentation, exfoliative dermatitis, alopecia, diaphoresis, erythema multiforme and nodosum, purpura, aggravation of lupus erythematosus
- **GI:** *Nausea, vomiting*, gastric distress, abdominal pain, diarrhea, constipation, anorexia, dryness of mouth or pharynx, glossitis, stomatitis; abnormal LFT, cholestatic and hepatocellular jaundice, **hepatitis, massive hepatic cellular necrosis with total loss of intact liver tissue**
- **GU:** Urinary frequency, acute urinary retention, oliguria with hypertension, renal failure, azotemia, impotence, proteinuria, glycosuria, elevated BUN, microscopic deposits in urine
- **Hematologic: Hematologic disorders** (severe bone marrow suppression)
- **Respiratory:** Pulmonary hypersensitivity characterized by fever, dyspnea, pneumonitis or pneumonia

Interactions

★ **Drug-drug** • Increased serum levels and manifestations of toxicity with erythromycin, cimetidine, danazol, isoniazid, propoxyphene, verapamil; dosage of carbamazepine may need to be reduced (reductions of about 50% recommended with erythromycin) • Increased CNS toxicity with lithium • Increased risk of hepatotoxicity with isoniazid (MAOI qualities); because of the chemical similarity of carbamazepine to the TCAs and because of the serious adverse interaction of TCAs and MAOIs, discontinue MAOIs for minimum of 14 days before carbamazepine administration • Decreased absorption with charcoal • Decreased serum levels and decreased effects of carbamazepine with barbiturates • Increased metabolism but no loss of seizure control with phenytoin, primidone • Increased metabolism of phenytoin, valproic acid • Decreased anti-coagulant effect of warfarin, oral anticoagu-

lants; dosage of warfarin may need to be increased during concomitant therapy but decreased if carbamazepine is withdrawn • Decreased effects of nondepolarizing muscle relaxants, haloperidol • Decreased antimicrobial effects of doxycycline

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to carbamazepine or TCAs; history of bone marrow depression; concomitant use of MAOIs; history of adverse hematologic reaction to any drug; glaucoma or increased IOP; history of cardiac, hepatic, or renal damage; psychiatric history; lactation; pregnancy
- **Physical:** Weight; T, skin color, lesions; palpation of lymph glands; orientation, affect, reflexes; ophthalmologic examination (including tonometry, funduscopy, slit lamp examination); P, BP, perfusion; auscultation; peripheral vascular examination; R, adventitious sounds; bowel sounds, normal output; oral mucous membranes; normal urinary output, voiding pattern; CBC including platelet, reticulocyte counts and serum iron; LFTs, urinalysis, BUN, thyroid function tests, EEG

Interventions

- Use only for classifications listed. Do not use as a general analgesic. Use only for epileptic seizures that are refractory to other safer agents.
- Give drug with food to prevent GI upset.
- Do not mix suspension with other medications or elements—precipitation may occur.
- ⊗ **Warning** Reduce dosage, discontinue, or substitute other antiepileptic medication gradually. Abrupt discontinuation of all antiepileptic medication may precipitate status epilepticus.
- ⊗ **Warning** There is an increased risk of suicidal ideation with antiepileptic administration. Caution patient and monitor accordingly.
- Suspension will produce higher peak levels than tablets—start with a lower dose given more frequently.
- Ensure that patient swallows ER tablets whole—do not cut, crush, or chew. *Equetro* capsules may be opened and contents sprinkled over soft food, such as 1 tsp applesauce.

- Arrange for frequent LFTs; discontinue drug immediately if hepatic impairment occurs.
- ⊗ **Black box warning** There is a risk of aplastic anemia and agranulocytosis. Arrange for patient to have CBC, including platelet, reticulocyte counts, and serum iron determination, before initiating therapy; repeat weekly for the first 3 mo of therapy and monthly thereafter for at least 2–3 yr. Discontinue drug if there is evidence of marrow suppression, as follows:

Erythrocytes	Less than 4 million/mm ³
Hct	Less than 32%
Hgb	Less than 11 gm/dL
Leukocytes	Less than 4,000/mm ³
Platelets	Less than 100,000/mm ³
Reticulocytes	Less than 0.3% (20,000/mm ²)
Serum iron	Less than 150 g/100 mL

- Arrange for frequent eye examinations, urinalysis, and BUN determinations.
- Arrange for frequent monitoring of serum levels of carbamazepine and other antiepileptics given concomitantly, especially during the first few weeks of therapy. Adjust dosage on basis of data and clinical response.
- Counsel women who wish to become pregnant; advise the use of barrier contraceptives.
- Evaluate for therapeutic serum levels (usually 4–12 mcg/mL).

Teaching points

- Take drug with food as prescribed. Swallow extended-release tablets whole; do not cut, crush, or chew them. If using *Equetro* capsules, they may be opened and contents sprinkled over soft food, such as 1 teaspoon of applesauce.
- Do not discontinue this drug abruptly or change dosage, except on the advice of your physician.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- Arrange for frequent checkups, including blood tests, to monitor your response to this drug. Keep all appointments for checkups.
- Use contraceptives at all times; if you wish to become pregnant, you should consult your physician.

- Wear a medical alert tag at all times so that any emergency medical personnel will know that you have epilepsy and are taking anti-epileptic medication.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving or performing other tasks requiring alertness or visual acuity); GI upset (take the drug with food or milk, eat frequent small meals).
- Report bruising, unusual bleeding, abdominal pain, yellowing of the skin or eyes, pale feces, darkened urine, impotence, central nervous system disturbances, edema, fever, chills, sore throat, mouth ulcers, rash, pregnancy, thoughts of suicide.

DANGEROUS DRUG

carboplatin

(kar' boe pla tin)

Paraplatin

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic

Therapeutic actions

Cytotoxic: Heavy metal that produces cross-links within and between strands of DNA, thus preventing cell replication; cell cycle nonspecific.

Indications

- Initial treatment of advanced ovarian carcinoma in combination with other antineoplastics
- Palliative treatment of patients with ovarian carcinoma recurrent after prior chemotherapy, including patients who have been treated with cisplatin
- Unlabeled uses: Alone or with other agents to treat small-cell lung cancer, squamous cell cancer of the head and neck, endometrial cancer, relapsed or refractory acute leukemia, seminoma of testicular cancer

Contraindications and cautions

- Contraindicated with history of severe allergic reactions to carboplatin, cisplatin, platinum compounds, mannitol; severe bone marrow depression; lactation.

- Use cautiously in renal impairment, pregnancy, history of neuropathic disorders.

Available forms

Powder for injection—50, 150, 450 mg; injection—10 mg/mL

Dosages

Adults

- *As a single agent:* 360 mg/m² IV on day 1 every 4 wk. Do not repeat single doses of carboplatin until the neutrophil count is at least 2,000/mm³ and the platelet count is at least 100,000/mm³. These adjustments of dosage can be used: For platelets more than 100,000 and neutrophils more than 2,000, use dosage 125% of prior course; for platelets 50,000–100,000 and neutrophils 500–2,000, no adjustment in dosage; for platelets less than 50,000 and neutrophils less than 500—dosage 75% of previous course. Doses of more than 125% are not recommended. May also be given at 300 mg/m² in combination with cyclophosphamide.

Pediatric patients

Safety and efficacy not established.

Geriatric patients and patients with renal impairment

Increased risk of bone marrow depression with renal impairment. Use caution.

CrCl (mL/min)	Dose (mg/m ² on Day 1)
41–59	250
16–40	200
15 or less	No data available

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	48–96 hr

Metabolism: T_{1/2}: 1.2–2 hr, then 2.6–5.9 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Immediately before use, reconstitute the contents of each vial with sterile

water for injection, D₅W, or sodium chloride injection. For a concentration of 10 mg/mL, combine 50-mg vial with 5 mL of diluent, 150-mg vial with 15 mL of diluent, or 450-mg vial with 45 mL of diluent. Carboplatin can be further diluted using D₅W or sodium chloride injection. Store unopened vials at room temperature. Protect from exposure to light. Reconstituted solution is stable for 8 hr at room temperature. Discard after 8 hr. Do not use needles of IV administration sets that contain aluminum; carboplatin can precipitate and lose effectiveness when in contact with aluminum.

Infusion: Administer by slow infusion lasting at least 15 min.

Adverse effects

- **CNS:** *Peripheral neuropathies*, ototoxicity, visual disturbances, change in taste perception
- **GI:** *Vomiting, nausea, abdominal pain, diarrhea, constipation*
- **GU:** *Increased BUN or serum creatinine*
- **Hematologic:** **Bone marrow depression**; *decreased serum sodium, magnesium, calcium, potassium*
- **Hypersensitivity:** *Anaphylactic-like reaction, rash, urticaria, erythema, pruritus, bronchospasm*
- **Other:** *Pain, alopecia, asthenia, cancer*

Interactions

- **Drug-drug** • Decreased potency of carboplatin and precipitate formation in solution using needles or administration sets containing aluminum

Nursing considerations Assessment

- **History:** Severe allergic reactions to carboplatin, cisplatin, platinum compounds, mannitol; severe bone marrow depression; renal impairment; pregnancy, lactation
- **Physical:** Weight, skin, and hair evaluation; eighth cranial nerve evaluation; reflexes; sensation; CBC, differential; renal function tests; serum electrolytes; serum uric acid; audiogram

Interventions

⊗ **Black box warning** Evaluate bone marrow function before and periodically during therapy. Do not give next dose if bone marrow depression is marked. Consult physician for dosage.

⊗ **Black box warning** Ensure that epinephrine, corticosteroids, and antihistamines are readily available in case of anaphylactic-like reactions, which may occur within minutes of administration.

- Arrange for an antiemetic if nausea and vomiting are severe.

Teaching points

- This drug can only be given IV. Prepare a calendar of treatment days.
- Use contraceptives while taking this drug. This drug may cause birth defects or miscarriages.
- Have frequent, regular medical follow-up, including frequent blood tests to monitor drug effects.
- You may experience these side effects: Nausea, vomiting (medication may be ordered; eat frequent small meals); numbness, tingling, loss of taste, ringing in ears, dizziness, loss of hearing; rash, loss of hair (you can use a wig or scarves).
- Report loss of hearing, dizziness; unusual bleeding or bruising; fever, chills, sore throat; leg cramps, muscle twitching; changes in voiding patterns; difficulty breathing.

carboprost tromethamine

(kar' boe prost)

Hemabate

PREGNANCY CATEGORY C

Drug classes

Abortifacient
Prostaglandin

Therapeutic actions

Stimulates the myometrium of the gravid uterus to contract in a manner that is similar to the contractions of the uterus during labor, thus evacuating the contents of the gravid uterus.

Indications

- Termination of pregnancy 13–20 wk from the first day of the last menstrual period
- Evacuation of the uterus in instance of missed abortion or intrauterine fetal death in the second trimester
- Postpartum hemorrhage due to uterine atony unresponsive to conventional methods

Contraindications and cautions

- Contraindicated with allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease.
- Use cautiously with history of asthma; hypotension; hypertension; CV, adrenal, renal, or hepatic disease; anemia; jaundice; diabetes; epilepsy; scarred uterus; cervicitis, infected endocervical lesions; acute vaginitis.

Available forms

Injection—250 mcg/mL

Dosages

Adults

- **Abortion:** Initially, 250 mcg (1 mL) IM; give 250 mcg IM at 1.5- to 3.5-hr intervals, depending on uterine response; may be increased to 500 mcg if uterine contractility is inadequate after several 250-mcg doses; do not exceed 12 mg total dose or continuous administration over 2 days.
- **Refractory postpartum uterine bleeding:** 250 mcg IM as one dose; in some cases, multiple doses at 15- to 90-min intervals may be used; do not exceed a total dose of 2 mg (8 doses).

Pharmacokinetics

Route	Onset	Peak
IM	15 min	2 hr

Metabolism: Hepatic and lung; $T_{1/2}$: 8 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, paresthesias, *flushing*, anxiety, weakness, syncope, dizziness
- **CV:** *Hypotension*, arrhythmias, chest pain
- **GI:** Vomiting, diarrhea, *nausea*

- **GU:** Endometritis, **perforated uterus, uterine rupture**, uterine or vaginal pain, incomplete abortion
- **Respiratory:** Coughing, dyspnea
- **Other:** Chills, diaphoresis, backache, breast tenderness, eye pain, skin rash, pyrexia

■ Nursing considerations

Assessment

- **History:** Allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease; history of asthma; hypotension; hypertension; anemia; jaundice; diabetes; epilepsy; scarred uterus; cervicitis, infected endocervical lesions; acute vaginitis
- **Physical:** T; BP, P, auscultation; R, adventitious sounds; bowel sounds, liver evaluation; vaginal discharge, pelvic examination, uterine tone; LFTs, renal function tests, WBC, urinalysis, CBC

Interventions

- Refrigerate unopened vials.
- Administer a test dose of 100 mcg (0.4 mL) prior to abortion if indicated.
- Administer by deep IM injection.
- Arrange for pretreatment or concurrent treatment with antiemetics and antidiarrheals to decrease the incidence of GI side effects.
- ⊗ **Warning** Ensure that abortion is complete or that other measures are used to complete the abortion if drug effects are not sufficient.
- Monitor T, using care to differentiate prostaglandin-induced pyrexia from post-abortion endometritis pyrexia.
- Monitor uterine tone and vaginal discharge during procedure and several days after to assess drug effects and recovery.
- Ensure adequate hydration throughout procedure.

Teaching points

- Several IM injections may be required to achieve desired effect.
- You may experience these side effects: Nausea, vomiting, diarrhea, uterine or vaginal pain, fever, headache, weakness, dizziness.
- Report severe pain, difficulty breathing, palpitations, eye pain, rash.

▽ carglumic acid

See Appendix U, *Less commonly used drugs.*

▽ carisoprodol (isomeprobamate)

(*kar eye soe 'proe' dol*)

Soma

PREGNANCY CATEGORY C

Drug class

Centrally acting skeletal muscle relaxant

Therapeutic actions

Precise mechanism not known; chemically related to meprobamate, an anxiolytic; has sedative properties; also found in animal studies to inhibit interneuronal activity in descending reticular formation and spinal cord; does not directly relax tense skeletal muscles.

Indications

- Relief of discomfort associated with acute, painful musculoskeletal conditions as an adjunct to rest, physical therapy, and other measures

Contraindications and cautions

- Contraindicated with allergic or idiosyncratic reactions to carisoprodol, meprobamate (reported cross-reactions with meprobamate); acute intermittent porphyria, suspected porphyria, lactation.
- Use cautiously with renal or hepatic impairment, pregnancy.

Available forms

Tablets—350 mg

Dosages

Adults and children older than 12 yr

250–350 mg PO tid–qid; take last dose at bedtime for a maximum of 2–3 wk.

Pediatric patients

Not recommended for children younger than 12 yr.

Geriatric patients or patients with hepatic or renal impairment

Dosage reduction may be necessary; monitor closely.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30 min	1–2 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, drowsiness, vertigo, ataxia, tremor, agitation, irritability*
- **CV:** Tachycardia, orthostatic hypotension, facial flushing
- **GI:** Nausea, vomiting, hiccups, epigastric distress
- **Hypersensitivity: Allergic or idiosyncratic reactions** (seen with first to fourth dose in patients new to drug)—rash, erythema multiforme, pruritus, eosinophilia, fixed drug eruption; asthmatic episodes, fever, weakness, dizziness, angioneurotic edema, smarting eyes, hypotension, **anaphylactoid shock**

■ Nursing considerations

Assessment

- **History:** Allergic or idiosyncratic reactions to carisoprodol, meprobamate; acute intermittent porphyria, suspected porphyria; lactation
- **Physical:** T; skin color, lesions; orientation, affect; P, BP, orthostatic BP; bowel sounds, liver evaluation; LFTs, renal function tests, CBC

Interventions

⊗ **Warning** Monitor patient for potentially serious idiosyncratic reactions—most likely with first few doses.

- Reduce dose with hepatic impairment.
- Provide safety measures if CNS effects occur.
- Drug may be habit forming. Monitor patient.

Teaching points

- Take this drug exactly as prescribed; do not take a higher dosage; take with food if GI upset occurs.

- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects; if you feel you need one of these preparations, consult your health care provider.
- You may experience these side effects: Drowsiness, dizziness, vertigo (avoid driving or activities that require alertness); dizziness when you get up or climb stairs (avoid sudden changes in position, use caution climbing stairs); nausea (take drug with food, eat frequent small meals); insomnia, headache, depression (transient effects).
- Report rash, severe nausea, dizziness, insomnia, fever, difficulty breathing.

⚠ DANGEROUS DRUG

▶ carmustine (BCNU)

(*car mus' teen*)

BicNU, Gliadel

PREGNANCY CATEGORY D

Drug classes

Alkylating agent, nitrosourea
Antineoplastic

Therapeutic actions

Cytotoxic: Alkylates DNA and RNA and inhibits several enzymatic processes, leading to cell death.

Indications

- Palliative therapy alone or with other agents (injection) for brain tumors: Glioblastomas, brainstem glioma, medullablastoma, astrocytoma, ependymoma, metastatic brain tumors
- Hodgkin's lymphoma and non-Hodgkin's lymphomas (as secondary therapy)
- Multiple myeloma (with prednisone)
- Adjunct to surgery for the treatment of recurrent glioblastoma as implantable wafer after removal of tumor (wafer)
- Treatment of newly diagnosed high-grade malignant glioma as adjunct to surgery and radiation (wafer)
- Unlabeled uses: Treatment of mycosis fungoides (topical), cutaneous T-cell lymphoma, hematopoietic stem-cell transplantation, colorectal carcinoma, malignant melanoma

Contraindications and cautions

- Contraindicated with allergy to carmustine.
- Use cautiously with radiation therapy, chemotherapy, hematopoietic depression, impaired renal or hepatic function, pregnancy (teratogenic and embryotoxic), lactation.

Available forms

Powder for injection—100 mg; wafer (*Gliadel*)—7.7 mg

Dosages

⊗ **Black box warning** Do not give doses more often than every 6 wk because of delayed bone marrow toxicity.

Adults and pediatric patients

IV

As single agent in untreated patients, 150–200 mg/m² IV every 6 wk as a single dose or in divided daily injections (75–100 mg/m² on 2 successive days). Do not repeat dose until platelets exceed 100,000/mm³, leukocytes exceed 4,000/mm³. Adjust dosage after initial dose based on hematologic response, as follows:

Leukocytes	Platelets	Percentage of Prior Dose to Give
More than 4,000	More than 100,000	100%
3,000–3,999	75,000–99,999	100%
2,000–2,999	25,000–74,999	70%
Less than 2,000	Less than 25,000	50%

Wafer

Implanted in resection cavity as part of a surgical procedure; up to 8 wafers at a time.

Pharmacokinetics

Route	Onset	Peak
IV	Immediate	15 min
Wafer	Absorbed locally	Unknown

Metabolism: Hepatic; T_{1/2}: 15–30 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Lungs, urine

IV FACTS

Preparation: Reconstitute with 3 mL of supplied sterile diluent, then add 27 mL of sterile water for injection to the alcohol solution; resulting solution contains 3.3 mg/mL of carmustine in 10% ethanol, pH is 5.6–6; may be further diluted with 5% dextrose injection. Refrigerate unopened vials. Protect reconstituted solution from light; lacking preservatives, solution decomposes with time, but is stable for 8 hr at room temperature. Check vials before use for absence of oil film residue; if present, discard vial.

Infusion: Administer reconstituted solution by IV drip over 1–2 hr; shorter infusion time may cause intense pain and burning. Stability of dextrose-diluted solutions at a concentration of 0.2 mg/mL is 8 hr at room temperature.

Incompatibility: Do not add to sodium bicarbonate.

Adverse effects

- **CNS:** Ocular toxicity—nerve fiber-layer infarcts, retinal hemorrhage
- **GI:** *Nausea, vomiting, stomatitis, hepatotoxicity*
- **GU:** Renal toxicity—decreased renal size, azotemia, **renal failure**
- **Hematologic:** *Myelosuppression, leukopenia, thrombocytopenia, anemia* (delayed for 4–6 wk)
- **Respiratory:** *Pulmonary infiltrates, pulmonary fibrosis*
- **Other:** *Local burning at site of injection; intense flushing of the skin, suffusion of the conjunctiva with rapid IV infusion; cancer*

Interactions

* **Drug-drug** • Increased toxicity and myelosuppression with cimetidine • Decreased serum levels of digoxin, phenytoin • Risk of corneal and epithelial damage with mitomycin

Nursing considerations Assessment

- **History:** Allergy to carmustine; radiation therapy; chemotherapy; hematopoietic depression; impaired renal or hepatic function; pregnancy; lactation

- **Physical:** T; weight; ophthalmologic examination; R, adventitious sounds; mucous membranes, liver evaluation; CBC, differential; urinalysis, LFTs, renal function tests; PFTs

Interventions

⊗ **Black box warning** Evaluate hematopoietic function before therapy and weekly during and for at least 6 wk after therapy to monitor for bone marrow suppression.

- Do not give full dosage within 2–3 wk after a full course of radiation therapy or chemotherapy because of the risk of severe bone marrow depression; reduced dosage may be needed.

⊗ **Black box warning** Monitor patient for pulmonary toxicity and delayed toxicity, which can occur years after therapy; even death can occur. Cumulative doses of 1,400 mg/m² increase the risk.

- Unopened foil pouches of wafer may be kept at ambient room temperature for a maximum of 6 hr.
- Reduce dosage in patients with depressed bone marrow function.
- Arrange for pretherapy medicating with antiemetic to decrease the severity of nausea and vomiting.
- Monitor injection site for any adverse reaction; accidental contact of carmustine with the skin can cause burning and hyperpigmentation of the area.
- Monitor ophthalmologic status.
- Monitor urine output for volume and any sign of renal failure.
- Monitor LFTs, renal function tests, and PFTs.

Teaching points

- This drug can only be given IV or implanted during surgery.
- Maintain your fluid intake and nutrition.
- Use birth control; this drug can cause severe birth defects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (an antiemetic may be ordered; eat frequent small meals); increased susceptibility to infection (avoid exposure to infection by avoiding crowded places; avoid injury).
- Report unusual bleeding or bruising, fever, chills, sore throat, stomach or flank pain, changes in vision, difficulty breathing, short-

ness of breath, burning or pain at IV injection site.

carteolol hydrochloride

(*kar' tee oh lol*)

Cartrol

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Beta blocker

Therapeutic actions

Blocks beta-adrenergic receptors of the sympathetic nervous system in the heart and juxtaglomerular apparatus (kidney), thus decreasing the excitability of the heart, decreasing cardiac output and oxygen consumption, decreasing the release of renin from the kidney, and lowering BP.

Indications

- Management of hypertension, alone or with other drugs
- Reduction of IOP in chronic open-angle glaucoma (ophthalmic solution)

Contraindications and cautions

- Contraindicated with sinus bradycardia (HR 45 beats per min or less), second- or third-degree heart block (PR interval more than 0.24 sec), cardiogenic shock, heart failure, asthma, COPD, lactation, hypersensitivity to beta blockers.
- Use cautiously with diabetes or thyrotoxicosis, hepatic impairment, renal failure, pregnancy.

Available forms

Tablets—2.5, 5 mg; ophthalmic solution—1%

Dosages

Adults

Oral

Initially, 2.5 mg as a single daily oral dose, alone or with a diuretic. If inadequate, gradually increase to 5–10 mg as a single daily dose. Doses of more than 10 mg are not likely

to produce further benefit and may decrease response. For maintenance, 2.5–5 mg PO daily.

Ophthalmic

1 drop in affected eye or eyes bid.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with impaired renal function

Oral

Because bioavailability increases twofold, lower doses may be required. For creatinine clearance greater than 60 mL/min, administer every 24 hr; creatinine clearance of 20–60 mL/min, administer every 48 hr; creatinine clearance less than 20 mL/min, administer every 72 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–3 hr	24–48 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **Allergic:** Pharyngitis, erythematous rash, fever, sore throat, **laryngospasm**, respiratory distress
- **CNS:** Dizziness, vertigo, tinnitus, fatigue, emotional depression, paresthesias, sleep disturbances, hallucinations, disorientation, memory loss, slurred speech (carteolol is less lipid-soluble than propranolol; it is less likely to penetrate the blood–brain barrier and cause CNS effects)
- **CV:** *Bradycardia, heart failure, cardiac arrhythmias, sinoatrial or AV nodal block, tachycardia*, peripheral vascular insufficiency, claudication, CVA, pulmonary edema, hypotension
- **Dermatologic:** Rash, pruritus, sweating, dry skin
- **EENT:** Eye irritation, dry eyes, conjunctivitis, blurred vision
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, nausea, vomiting*, anorexia
- **GU:** *Impotence, decreased libido*, Peyronie's disease, dysuria, nocturia, frequent urination
- **Musculoskeletal:** Joint pain, arthralgia, muscle cramps

- **Respiratory: Bronchospasm**, dyspnea, cough, bronchial obstruction, nasal stuffiness, rhinitis

- **Other:** *Decreased exercise tolerance, development of antinuclear antibodies, hyperglycemia or hypoglycemia, elevated serum transaminase*

Interactions

- **Drug–drug** • Increased effects with verapamil • Decreased effects of theophyllines and carteolol if taken concurrently • Increased risk of orthostatic hypotension with prazosin • Possible increased BP-lowering effects with aspirin, bismuth subsalicylate, magnesium salicylate, sulfapyrazone • Decreased antihypertensive effects with NSAIDs, clonidine • Possible increased hypoglycemic effect of insulin • Initial hypertensive episode followed by bradycardia if combined with epinephrine • Peripheral ischemia and possible gangrene if combined with ergot alkaloids
- **Drug–lab test** • Monitor for possible false results with glucose or insulin tolerance tests

Nursing considerations Assessment

- **History:** Arrhythmias, cardiogenic shock, heart failure, asthma, COPD, pregnancy, lactation, diabetes or thyrotoxicosis
- **Physical:** Weight, skin condition, neurologic status, P, BP, ECG, respiratory status, renal and thyroid function tests, blood and urine glucose

Interventions

- Give carteolol (oral) once a day. Monitor response and maintain at lowest possible dose.
- **Warning** Do not discontinue drug abruptly after long-term therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias); taper drug gradually over 2 wk with monitoring.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).
- Monitor IOP of patients receiving eye drops; if pressure not controlled, institute concomitant therapy.

Teaching points

- Follow instructions for instillation of eye-drops carefully.
- Do not stop taking this drug unless told to do so by a health care provider.
- Avoid driving or dangerous activities if dizziness or weakness occurs.
- You may experience these side effects: Loss of appetite, nightmares, depression, sexual impotence. (Discuss these side effects with your health care provider if they become a concern.)
- Report difficulty breathing, night cough, swelling of extremities, slow pulse, confusion, depression, rash, fever, sore throat.

carvedilol (kar vah' da lol)

Apo-Carvedilol (CAN), Coreg, Coreg CR , PMS-Carvedilol (CAN), ratio-Carvedilol (CAN)

PREGNANCY CATEGORY C

Drug classes

Alpha- and beta-adrenergic blocker
Antihypertensive

Therapeutic actions

Competitively blocks alpha-, beta-, and beta₂-adrenergic receptors and has some sympathomimetic activity at beta₂-receptors. Both alpha and beta blocking actions contribute to the BP-lowering effect; beta blockade prevents the reflex tachycardia seen with most alpha-blocking drugs and decreases plasma renin activity. Significantly reduces plasma renin activity.

Indications

- Hypertension, alone or with other oral drugs, especially diuretics
- Treatment of mild to severe heart failure of ischemic or cardiomyopathic origin with digitalis, diuretics, ACE inhibitors
- Left ventricular dysfunction (LVD) after MI
- Unlabeled uses: Angina (25–50 mg bid), hiccoughs, idiopathic cardiomyopathy

Contraindications and cautions

- Contraindicated with decompensated heart failure, bronchial asthma, heart block, cardiogenic shock, hypersensitivity to carvedilol, pregnancy, lactation.
- Use cautiously with hepatic impairment, peripheral vascular disease, thyrotoxicosis, diabetes, anesthesia, major surgery.

Available forms

Tablets—3.125, 6.25, 12.5, 25 mg; CR capsules —10, 20, 40, 80 mg

Dosages

Adults

- **Hypertension:** 6.25 mg PO bid; maintain for 7–14 days, then increase to 12.5 mg PO bid if needed to control BP. Do not exceed 50 mg/day.
- **Heart failure:** Monitor patient very closely, individualize dose based on patient response. Initial dose, 3.125 mg PO bid for 2 wk, may then be increased to 6.25 mg PO bid. Do not increase doses at intervals shorter than 2 wk. Maximum dose, 25 mg PO bid in patients weighing less than 85 kg or 50 mg PO bid in patients weighing more than 85 kg.
- **LVD following MI:** 6.25 mg PO bid; increase after 3–10 days to target dose of 25 mg bid.

For conversion from tablets to CR capsules, follow these instructions. For dosage of 6.25 mg daily (3.125 mg bid), give 10 mg CR capsules once daily. For 12.5 mg (6.25 mg bid), give 20 mg CR capsules once daily. For 25 mg (12.5 mg bid), give 40 mg CR capsules once daily. For 50 mg (25 mg bid), give 80 mg CR capsules once daily.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic impairment

Do not administer to any patient with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	30 min	8–10 hr

Metabolism: Hepatic; T_{1/2}: 7–10 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, feces

Adverse effects

- **CNS:** *Dizziness, vertigo, tinnitus, fatigue*, emotional depression, paresthesias, sleep disturbances
- **CV:** *Bradycardia*, orthostatic hypertension, heart failure, cardiac arrhythmias, pulmonary edema, *hypotension*
- **GI:** *Gastric pain, flatulence, constipation, diarrhea, hepatic failure*
- **Respiratory:** *Rhinitis*, pharyngitis, dyspnea
- **Other:** *Fatigue*, back pain, infections

Interactions

- * **Drug-drug** • Increased effectiveness of antidiabetics; monitor blood glucose and adjust dosages appropriately • Increased effectiveness of clonidine; monitor patient for potential severe bradycardia and hypotension • Increased serum levels of digoxin; monitor serum levels and adjust dosage accordingly • Increased plasma levels of carvedilol with rifampin • Potential for dangerous conduction system disturbances with verapamil or diltiazem; if this combination is used, closely monitor ECG and BP
- * **Drug-food** • Slowed rate of absorption but not decreased effectiveness with food

■ Nursing considerations**Assessment**

- **History:** Heart failure, bronchial asthma, heart block, cardiogenic shock, hypersensitivity to carvedilol, pregnancy, lactation, hepatic impairment, peripheral vascular disease, thyrotoxicosis, diabetes, anesthesia or major surgery
- **Physical:** Baseline weight, skin condition, neurologic status, P, BP, ECG, respiratory status, LFTs, renal and thyroid function tests, blood and urine glucose

Interventions

- ⊗ **Warning** Do not discontinue drug abruptly after chronic therapy (hypersensitivity to catecholamines may have developed, causing exacerbation of angina, MI, and ventricular arrhythmias); taper drug gradually over 2 wk with monitoring.
- Consult with physician about withdrawing drug if patient is to undergo surgery (withdrawal is controversial).

- Give with food to decrease orthostatic hypotension and adverse effects.
- Ensure that patient swallows controlled-release capsules whole; do not cut, crush, or allow patient to chew capsules.
- Monitor for orthostatic hypotension and provide safety precautions.
- Monitor diabetic patient closely; drug may mask hypoglycemia or worsen hyperglycemia.

⊗ **Warning** Monitor patient for any sign of hepatic impairment (pruritus, dark urine or stools, anorexia, jaundice, pain); arrange for LFTs and discontinue drug if tests indicate liver injury. Do not restart carvedilol.

Teaching points

- Take drug with meals.
- Do not cut, crush, or chew controlled-release capsules; swallow capsules whole.
- Do not stop taking drug unless instructed to do so by a health care provider.
- Avoid use of over-the-counter medications.
- If you are diabetic, promptly report changes in glucose level.
- You may experience these side effects: Depression, dizziness, light-headedness (avoid driving or performing dangerous activities; getting up and changing positions slowly may help ease dizziness), decreased tears with contact lenses.
- Report difficulty breathing, swelling of extremities, changes in color of stool or urine, very slow heart rate, continued dizziness.

▷ caspofungin acetate

See Appendix U, *Less commonly used drugs*.

▷ cefaclor

(*sef' a klor*)

Apo-Cefaclor (CAN), Ceclor, Ceclor Pulvules, Cefaclor **END**, Raniclор

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (second generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Streptococcus pyogenes*
- URIs caused by *S. pyogenes*
- Dermatologic infections caused by *Staphylococcus aureus*
- UTIs caused by *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*, coagulase-negative staphylococci
- Otitis media caused by *S. pneumoniae*, *H. influenzae*, *S. pyogenes*, staphylococci
- ER tablets: Acute exacerbations of chronic bronchitis, secondary infections of acute bronchitis, pharyngitis, and tonsillitis due to *S. pyogenes*; uncomplicated skin infections
- Unlabeled use: Acute uncomplicated UTI in select patients, single 2-g dose

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Capsules—250, 500 mg; chewable tablets—125, 187, 250, 375 mg; ER tablets **cmc**—375, 500 mg; powder for oral suspension—125 mg/5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL

Dosages

Adults

250 mg PO every 8 hr or 375–500 mg every 12 hr for 7–10 days; dosage may be doubled in severe cases. **Do not exceed 4 g/day.**

Pediatric patients

20 mg/kg per day PO in divided doses every 8 hr; in severe cases 40 mg/kg/day may be given. **Do not exceed 1 g/day.**

- *Otitis media and pharyngitis*: Total daily dosage may be divided and administered every 12 hr.

Pharmacokinetics

Route	Peak	Duration
Oral	30–60 min	8–10 hr

Metabolism: $T_{1/2}$: 30–60 min

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** Bone marrow depression
- **Hypersensitivity:** Ranging from rash to fever to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*

Interactions

- **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Decreased serum level of ER form if taken with antacids; separate by at least 2 hr
- **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy, pregnancy or lactation
- **Physical:** Renal function tests, respiratory status, skin status, culture and sensitivity tests of infected area

Interventions

- Culture infection site before drug therapy.
- Give drug with meals or food to decrease GI discomfort. Ensure that patient swallows ER tablets whole; do not cut, crush, or allow patient to chew them.

- Refrigerate suspension after reconstitution, and discard after 14 days.
- Discontinue drug if hypersensitivity reaction occurs.
- Give patient yogurt or buttermilk in case of diarrhea.
- Arrange for oral vancomycin for serious colitis that fails to respond to discontinuation of drug.

Teaching points

- Take this drug with meals or food.
- Complete the full course of this drug, even if you feel better.
- Do not cut, crush, or chew ER form; swallow tablets whole.
- This drug is prescribed for this particular infection; do not self-treat any other infection.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea; headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness or fatigue; unusual bleeding or bruising.

cefadroxil (sef a drox' ill)

Apo-Cefadroxil (CAN)

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (first generation)

Therapeutic actions

Bactericidal: Inhibits the formation of bacterial cell wall, causing the cell's death.

Indications

- UTIs caused by *Escherichia coli*, *Proteus mirabilis*, *Klebsiella* species
- Pharyngitis, tonsillitis caused by group A beta-hemolytic streptococci
- Skin and skin structure infections caused by staphylococci, streptococci

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Capsules—500 mg; tablets—1,000 mg; powder for oral suspension—125 mg/5 mL, 250 mg/5 mL, 500 mg/5 mL

Dosages

Adults

- *UTIs*: 1–2 g/day PO in single dose or two divided doses for uncomplicated lower UTIs. For all other UTIs, 2 g/day in two divided doses.
- *Skin and skin-structure infections*: 1 g/day PO in single dose or two divided doses.
- *Pharyngitis, tonsillitis caused by group A beta-hemolytic streptococci*: 1 g/day PO in single dose or two divided doses for 10 days.

Pediatric patients

- *UTIs, dermatologic infections*: 30 mg/kg per day PO in divided doses every 12 hr.
- *Pharyngitis, tonsillitis caused by group A beta-hemolytic streptococci*: 30 mg/kg/day in single or two divided doses, continue for 10 days.

Geriatric patients or patients with impaired renal function

1 g PO loading dose, followed by 500 mg PO at these intervals:

CrCl (mL/min)	Interval (hr)
25–50	12
10–25	24
0–10	36

Pharmacokinetics

Route	Peak	Duration
Oral	1.5–2 hr	20–22 hr

Metabolism: T_{1/2}: 78–96 min

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias

- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, pseudomembranous colitis*, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**
- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*

Interactions

- *** Drug-drug** • Decreased bactericidal activity if used with bacteriostatic agents • Increased serum levels of cephalosporins if used with probenecid • Increased nephrotoxicity with aminoglycosides
- *** Drug-lab test** • False-positive urine glucose using Benedict's solution, Fehling's solution, Clintest tablets • False-positive direct Coombs' test • Falsely elevated urinary 17-ketosteroids

■ Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy, pregnancy or lactation, renal failure
- **Physical:** Renal function tests, respiratory status, skin status, culture and sensitivity tests of infected area

Interventions

- Culture infection site before drug therapy.
- Give drug with meals or food to decrease GI discomfort.
- Refrigerate suspension after reconstitution, and discard after 14 days; shake refrigerated suspension well before using.
- Discontinue if hypersensitivity reaction occurs.
- Give the patient yogurt or buttermilk in case of diarrhea.

⊗ **Warning** Arrange for oral vancomycin for serious colitis that fails to respond to discontinuation of drug.

Teaching points

- Take this drug only for this infection; do not use to treat other problems; complete the full course of therapy, even if you feel better.
- Refrigerate the suspension, and discard unused portion after 14 days; shake suspension well before each use.

- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food), diarrhea, headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

▽ cefdinir

(sef' din er)

Omnicef

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

Adults and adolescents

- Community-acquired pneumonia caused by *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Streptococcus pneumoniae*, *Moraxella catarrhalis*
- Acute exacerbations of chronic bronchitis caused by *H. influenzae*, *H. parainfluenzae*, *S. pneumoniae*, *M. catarrhalis*
- Acute maxillary sinusitis caused by *H. influenzae*, *S. pneumoniae*, *M. catarrhalis*
- Pharyngitis and tonsillitis caused by *Streptococcus pyogenes*
- Uncomplicated skin and skin structure infections caused by *Staphylococcus aureus*, *S. pyogenes*

Pediatric patients

- Acute bacterial otitis media caused by *H. influenzae*, *S. pneumoniae*, *M. catarrhalis*
- Pharyngitis and tonsillitis caused by *S. pyogenes*
- Uncomplicated skin and skin-structure infections caused by *S. aureus*, *S. pyogenes*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.

- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Capsules—300 mg; oral suspension—125 mg/5 mL; 250 mg/5 mL

Dosages

Adults and adolescent patients

- *Community-acquired pneumonia, uncomplicated skin or skin-structure infections*: 300 mg PO every 12 hr for 10 days.
- *Acute exacerbation of chronic bronchitis, acute maxillary sinusitis, pharyngitis, or tonsillitis*: 300 mg every 12 hr PO for 10 days or 600 mg every 24 hr PO for 10 days.

Pediatric patients 6 mo–12 yr

- *Otitis media, acute maxillary sinusitis, pharyngitis, tonsillitis*: 7 mg/kg every 12 hr PO or 14 mg/kg every 24 hr PO for 10 days up to maximum dose of 600 mg/day.
- *Skin and skin-structure infections*: 7 mg/kg PO every 12 hr for 10 days.

Patients with renal impairment

For adults with creatinine clearance less than 30 mL/min, 300 mg PO daily. For patients on dialysis, 300 mg PO every other day; start with 300 mg PO at the end of dialysis and then every other day.

Pediatric patients with renal impairment

For creatinine clearance less than 30 mL/min, 7 mg/kg (up to 300 mg) once daily.

Pharmacokinetics

Route	Peak	Duration
Oral	60 min	8–10 hr

Metabolism: $T_{1/2}$: 100 min

Distribution: Crosses the placenta, enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence*, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** Bone marrow depression

- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**; serum sickness reaction

- **Other:** *Superinfections*

Interactions

- **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects if taken with oral anticoagulants • Interferes with absorption of cefdinir if taken with antacids containing magnesium or aluminum or with iron supplements; separate by at least 2 hr

- **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy; pregnancy or lactation, renal failure
- **Physical:** Renal function tests, respiratory status, skin status; culture and sensitivity tests of infected area

Interventions

- Arrange for culture and sensitivity tests of infected area before beginning drug therapy and during therapy if infection does not resolve.
- Reconstitute oral suspension by adding 38 mL water to the 60 mL bottle, 63 mL water to the 100 mL bottle; shake well before each use. Store at room temperature. Discard after 10 days.
- Give drug with meals; arrange for small, frequent meals if GI complications occur. Separate antacids or iron supplements by 2 hr from the cefdinir dose.
- Arrange for treatment of superinfections if they occur.

Teaching points

- Take this drug with meals or food. Store suspension at room temperature, shake well before each use; discard any drug after 10 days.
- Complete the full course of this drug, even if you feel better before the course of treatment is over.

- This drug is prescribed for this particular infection; do not self-treat any other infection with this drug.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (taking the drug with food may help); diarrhea (stay near bathroom facilities); headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

▷ cefditoren pivoxil (*sef' di tore en*)

Spectracef

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Cephalosporin

Therapeutic actions

Bactericidal. Inhibits synthesis of susceptible gram-negative and gram-positive bacterial cell wall, causing cell death. Effective in the presence of beta-lactamases, including penicillinases and cephalosporinases.

Indications

- Acute exacerbations of chronic bronchitis caused by *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Streptococcus pneumoniae*, *Moraxella catarrhalis*
- Community-acquired pneumonia caused by *H. influenzae*, *H. parainfluenzae*, *S. pneumoniae*, *M. catarrhalis*
- Pharyngitis and tonsillitis caused by *Streptococcus pyogenes*
- Uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus*, *S. pyogenes*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins, carnitine deficiencies, milk protein hypersensitivities, renal failure, lactation.
- Use cautiously with renal or hepatic impairment, pregnancy.

Available forms

Tablets—200 mg

Dosages

Adults and patients older than 12 yr

- *Uncomplicated skin or skin-structure infections; pharyngitis or tonsillitis:* 200 mg PO bid for 10 days.
- *Acute exacerbation of chronic bronchitis, community-acquired pneumonia:* 400 mg PO bid for 10 days (chronic bronchitis) or 14 days (pneumonia).

Patients with renal impairment

For creatinine clearance 30–49 mL/min, 200 mg PO bid; creatinine clearance less than 30 mL/min, 200 mg PO daily.

Pharmacokinetics

Route	Peak	Duration
Oral	1.5–3 hr	8–10 hr

Metabolism: $T_{1/2}$: 100–115 min

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine, primarily unchanged

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias, nervousness
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity, vaginitis, urinary frequency
- **Hematologic:** Bone marrow depression, carnitine deficiency with long-term use
- **Hypersensitivity:** Ranging from *rash* to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*

Interactions

★ **Drug-drug** • Increased bleeding effects if taken with oral anticoagulants • Interference with absorption of cefditoren if taken with antacids containing magnesium or aluminum or with histamine₂-receptor antagonists; separate by at least 2 hr if concomitant use is necessary

★ **Drug-lab test** • Possibility of false results on tests of urine glucose using Bene-

dict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy, carnitine deficiency, milk protein hypersensitivity, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Renal function tests, respiratory status, skin status, culture and sensitivity tests of infected area, GI function, orientation, affect

Interventions

- Arrange for culture and sensitivity tests of infected area before therapy and during therapy if infection does not resolve.
- Do not administer for longer than 10 days; risk of carnitine deficiency with prolonged use.
- ⊗ **Warning** Do not administer drug to patients with hypersensitivity to sodium caseinate or milk protein; this is not lactose intolerance.
- Give drug with meals; arrange for small, frequent meals if GI complications occur. Separate antacids or histamine₂-receptor antagonists by 2 hr from the cefditoren dose.
- Arrange for treatment of superinfections if they occur.

Teaching points

- Take this drug with meals or food.
- Complete the full course of this drug, even if you feel better before the course of treatment is over.
- This drug is prescribed for this particular infection; do not self-treat any other infection with this drug.
- Do not take this drug with antacids or histamine₂-receptor antagonists because they decrease absorption.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (taking the drug with food may help); diarrhea (stay near bathroom facilities); headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing;

unusual tiredness, fatigue; unusual bleeding or bruising.

▽ cefepime hydrochloride

(*sef' ab peem*)

Maxipime

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- UTIs caused by *Escherichia coli*, *Proteus mirabilis*, *Klebsiella* species, including *Klebsiella pneumoniae*
- Pneumonia caused by *Streptococcus pneumoniae*, *Pseudomonas aeruginosa*, *K. pneumoniae*, *Enterobacter*
- Uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus* group or *Streptococcus pyogenes*
- Empiric therapy for febrile neutropenic patients
- Complicated intra-abdominal infections in combination with metronidazole

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Powder for injection—500 mg; 1, 2 g

Dosages

Adults

- 0.5–2 g IV or IM every 12 hr.
- *Mild to moderate UTI:* 0.5–1 g IM or IV every 12 hr for 7–10 days.
- *Severe UTI:* 2 g IV every 12 hr for 10 days.

CrCl (mL/min)	Recommended Maintenance Schedule			
More than 60 (Normal recommended schedule)	500 mg every 12 hr	1 g every 12 hr	2 g every 12 hr	2 g every 8 hr
30–60	500 mg every 24 hr	1 g every 24 hr	2 g every 24 hr	2 g every 12 hr
11–29	500 mg every 24 hr	500 mg every 24 hr	1 g every 24 hr	2 g every 24 hr
Less than 11	250 mg every 24 hr	250 mg every 24 hr	500 mg every 24 hr	1 g every 24 hr
CAPD	500 mg every 48 hr	1 g every 48 hr	2 g every 48 hr	2 g every 48 hr
Hemodialysis*	1 g on day 1, then 500 mg every 24 hr thereafter			1 g every 24 hr

*On hemodialysis days, cefepime should be administered following hemodialysis. Whenever possible, cefepime should be administered at the same time each day.

- *Moderate to severe pneumonia:* 1–2 g IV every 12 hr for 10 days.
- *Moderate to severe skin infections:* 2 g IV every 12 hr for 10 days.
- *Empiric therapy for febrile neutropenic patients:* 2 g IV every 8 hr for 7 days.
- *Complicated intra-abdominal infections:* 2 g IV every 12 hr for 7–10 days.

Pediatric patients older than 2 mo, weighing less than 40 kg

50 mg/kg/day dose IV or IM every 12 hr for 7–10 days depending on severity of infection. If treating febrile neutropenia, give every 8 hr.

Geriatric patients or patients with impaired renal function

Use recommended adult starting dose and then maintenance dose as shown in the table at the top of the page.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	30 min	1.5–2 hr	10–12 hr
IV	Immediate	5 min	10–12 hr

Metabolism: T_{1/2}: 102–138 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Dilute with 50–100 mL 0.9% sodium chloride, 5% and 10% dextrose injection, M/6 sodium lactate injection, 5% dextrose and 0.9% sodium chloride injection, lactated Ringer's and 5% dextrose injection,

Normosol-R, Normosol-M and D₅W injection. Diluted solution is stable for 24 hr at room temperature or up to 7 days if refrigerated. Protect from light.

Infusion: Infuse slowly over 30 min.

Incompatibilities: Do not mix with ampicillin, metronidazole, vancomycin, gentamicin, tobramycin, or aminophylline. If concurrent therapy is needed, administer each drug separately. If possible, do not give any other drug in same solution as cefepime.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** Bone marrow depression
- **Hypersensitivity:** Ranging from *rash* to **fever** to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*, pain, abscess (redness, tenderness, heat, tissue sloughing), inflammation at injection site, *phlebitis*, *disulfiram-like reaction with alcohol*

Interactions

- **Drug-drug** • Increased nephrotoxicity with aminoglycosides; monitor renal function tests • Increased bleeding effects with oral anticoagulants; reduced dosage may be needed
- Increased toxicity if combined with alcohol; avoid this combination during and for 3 days after completing therapy

C

★ **Drug-lab test** • False reports of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy; pregnancy, lactation
- **Physical:** Renal function tests, respiratory status, skin status; culture and sensitivity tests of infection area, injection site

Interventions

- Culture infected area and arrange for sensitivity tests before beginning therapy.
- Reconstitute for IM use with 0.9% sodium chloride, 5% dextrose injection, 0.5% or 1% lidocaine HCl or bacteriostatic water with parabens or benzyl alcohol. Reserve IM use for mild to moderate UTIs due to *E. coli*.
- Have vitamin K available in case hypoprothrombinemia occurs.

Teaching points

- Do not drink alcohol while taking this drug and for 3 days after drug has been stopped; severe reactions may occur.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea (stay near bathroom); headache, dizziness.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

▷ cefotaxime sodium

(sef'oh tak's'eem)

Claforan

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections caused by *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Klebsiella* species, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Enterobacter* species, *Serratia marcescens*, *Streptococcus pyogenes*, indole-positive *Proteus* and *Pseudomonas* species
- UTIs caused by *Enterococcus* species, *S. epidermidis*, *S. aureus*, *Citrobacter* species, *Enterobacter* species, *E. coli*, *Klebsiella* species, *P. mirabilis*, *Proteus* species, *S. marcescens*, *Pseudomonas* species
- Gynecologic infections caused by *S. epidermidis*, *Enterococcus* species, *E. coli*, *P. mirabilis*, *Bacteroides* species, *Clostridium* species, *Peptococcus* species, *Peptostreptococcus* species, streptococci; and uncomplicated gonorrhea caused by *N. gonorrhoeae*
- Dermatologic infections caused by *S. aureus*, *E. coli*, *Serratia* species, *Proteus* species, *Klebsiella* species, *Enterobacter* species, *Pseudomonas*, *S. marcescens*, *Bacteroides* species, *Peptococcus* species, *Peptostreptococcus* species, *P. mirabilis*, *S. epidermidis*, *S. pyogenes*, *Enterococcus* species
- Septicemia caused by *E. coli*, *Klebsiella* species, *S. marcescens*
- Peritonitis and intra-abdominal infections caused by *E. coli*, *Peptostreptococcus* species, *Bacteroides* species, *Peptococcus* species, *Klebsiella* species
- CNS infections caused by *E. coli*, *H. influenzae*, *Neisseria meningitidis*, *S. pneumoniae*, *K. pneumoniae*
- Bone and joint infections caused by *S. aureus*
- Perioperative prophylaxis

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Powder for injection—500 mg, 1, 2 g; injection—1, 2 g

Dosages**Adults**

2–8 g/day IM or IV in equally divided doses every 6–8 hr. Do not exceed 12 g/day.

- **Gonorrhea:** 0.5–1 g IM in a single injection.
- **Disseminated infection:** 1–2 g IV every 8 hr.
- **Perioperative prophylaxis:** 1 g IV or IM 30–90 min before surgery.
- **Cesarean section:** 1 g IV after cord is clamped and then 1 g IV or IM at 6 and 12 hr.

Pediatric patients 1 mo–12 yr weighing less than 50 kg

50–180 mg/kg/day IV or IM in four to six divided doses.

Pediatric patients 1–4 wk

50 mg/kg IV every 8 hr.

Pediatric patients 0–1 wk

50 mg/kg IV every 12 hr.

Geriatric patients or patients with reduced renal function

For creatinine clearance less than 20 mL/min, reduce dosage by half.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	5 min	18–24 hr
IM	5–10 min	30 min	18–24 hr

Metabolism: $T_{1/2}$: 1 hr

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute for intermittent IV injection with 1 or 2 g with 10 mL sterile water for injection. Reconstitute vials for IV infusion with 10 mL of sterile water for injection. Reconstitute infusion bottles with 50 or 100 mL of 0.9% sodium chloride injection or 5% dextrose injection. Drug solution may be further diluted with 50–100 mL of 5% or 10% dextrose injection; 5% dextrose and 0.2%, 0.45%, or 0.9% sodium chloride injection; lactated Ringer's solution; 0.9% sodium chloride injection; sodium lactate injection (M/6); 10% invert sugar. Reconstituted solution is stable for 24 hr at room temperature or 5 days if

refrigerated. Powder and reconstituted solution darken with storage.

Infusion: Inject slowly into vein over 3–5 min or over a longer time through IV tubing; give intermittent IV infusions over 20–30 min. If administered with aminoglycosides, administer at different sites.

Incompatibilities: Do not mix in solutions with aminoglycoside solutions.

Y-site incompatibility: Hetastarch.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**—decreased WBC count, decreased platelets, decreased Hct
- **Hypersensitivity:** Ranging from rash to fever to **anaphylaxis**; serum sickness reaction
- **Local:** Pain, abscess at injection site, *phlebitis*, inflammation at IV site
- **Other:** *Superinfections, disulfiram-like reaction with alcohol*

Interactions

• **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Risk of severe toxicity if combined with alcohol; avoid this combination during and for 3 days after completing therapy

• **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations**Assessment**

- **History:** Hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infection site, and arrange for sensitivity tests before and during therapy if expected response is not seen.

- Reconstitution of drug varies by size of package; see manufacturer's directions for details.
- Reconstitute drug for IM use with sterile water or bacteriostatic water for injection; divide doses of 2 g and administer at two different sites by deep IM injection.
- Discontinue if hypersensitivity reaction occurs.

Teaching points

- Avoid alcohol while taking this drug and for 3 days after because severe reactions often occur.
- You may experience these side effects: Stomach upset, diarrhea.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

cefoxitin sodium

(*se fox' i tin*)

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (second generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections caused by *Streptococcus pneumoniae*, *Staphylococcus aureus*, streptococci, *Escherichia coli*, *Klebsiella*, *Haemophilus influenzae*, *Bacteroides*
- Skin and skin structure infections caused by *S. aureus*, *Staphylococcus epidermidis*, streptococci, *E. coli*, *Proteus mirabilis*, *Klebsiella*, *Bacteroides*, *Clostridium*, *Peptococcus*, *Peptostreptococcus*
- UTIs caused by *E. coli*, *P. mirabilis*, *Klebsiella*, *Morganella morganii*, *Proteus rettgeri*, *Proteus vulgaris*, *Providencia*
- Uncomplicated gonorrhea caused by *Neisseria gonorrhoeae*
- Intra-abdominal infections caused by *E. coli*, *Klebsiella*, *Bacteroides*, *Clostridium*

- Gynecologic infections caused by *E. coli*, *N. gonorrhoeae*, *Bacteroides*, *Clostridium*, *Peptococcus*, *Peptostreptococcus*, group B streptococci
- Septicemia caused by *S. pneumoniae*, *S. aureus*, *E. coli*, *Klebsiella*, *Bacteroides*
- Bone and joint infections caused by *S. aureus*
- Perioperative prophylaxis

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Powder for injection—1, 2 g; injection—1 g/50 mL, 2 g/50 mL in D₅W

Dosages

Adults

1–2 g IM or IV every 6–8 hr, depending on the severity of the infection.

- *Uncomplicated gonorrhea*: 2 g IM with 1 g oral probenecid.
- *Uncomplicated lower respiratory infections, UTIs, skin infections*: 1 g every 6–8 hr IV.
- *Moderate to severe infections*: 1 g every 4 hr IV to 2 g every 6–8 hr IV.
- *Severe infections*: 2 g every 4 hr IV or 3 g every 6 hr IV.
- *Perioperative prophylaxis*: 2 g IV or IM 30–60 min prior to initial incision and every 6 hr for 24 hr after surgery.
- *Cesarean section*: 2 g IV as soon as the umbilical cord is clamped, followed by 2 g IM or IV at 4 and 8 hr, then every 6 hr for up to 24 hr.
- *Transurethral prostatectomy*: 1 g prior to surgery and then 1 g every 8 hr for up to 5 days.

Pediatric patients 3 mo or older

80–160 mg/kg/day IM or IV in divided doses every 4–6 hr. Do not exceed 12 g/day.

- *Prophylactic use*: 30–40 mg/kg per dose IV or IM every 6 hr.

Geriatric patients or patients with impaired renal function

IV loading dose of 1–2 g. If patient is on hemodialysis, give loading dose after session. Maintenance dosages are as follows:

CrCl (mL/min)	Maintenance Dosage
30–50	1–2 g every 8–12 hr
10–29	1–2 g every 12–24 hr
5–9	0.5–1 g every 12–24 hr
Less than 5	0.5–1 g every 24–48 hr

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	5 min	6–8 hr
IM	5–10 min	20–30 min	6–8 hr

Metabolism: $T_{1/2}$: 45–60 min

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: For IV intermittent administration, reconstitute 1 or 2 g with 10–20 mL sterile water for injection. For continuous IV infusion, add reconstituted solution to 5% dextrose injection, 0.9% sodium chloride injection, 5% dextrose and 0.9% sodium chloride injection, or 5% dextrose injection with 0.02% sodium bicarbonate solution. Store dry powder in cool, dry area. Powder and reconstituted solution darken with storage. Infusion bottles stable for 24 hr at room temperature; reconstituted vials stable for 6 hr at room temperature.

Infusion: For intermittent administration, slowly inject over 3–5 min, or give over longer time through IV tubing; discontinue other solutions temporarily. If given with aminoglycosides, give each at a different site.

Incompatibilities: Do not mix aminoglycosides and cefoxitin in the same IV solution.

Y-site incompatibility: Hetastarch.

Adverse effects

• **CNS:** Headache, dizziness, lethargy, paresthesias

- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**—decreased WBC count, decreased platelets, decreased Hct
- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**, serum sickness reaction
- **Local:** Pain, abscess at injection site, *phlebitis*, inflammation at IV site
- **Other:** *Superinfections*, *disulfiram-like reaction with alcohol*

Interactions

• **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction may occur if alcohol is taken during or within 72 hr after cefoxitin administration

• **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations**Assessment**

- **History:** Hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infection site, and arrange for sensitivity tests before and during therapy if expected response is not seen.
- Reconstitute each gram for IM use with 2 mL sterile water for injection or with 2 mL of 0.5% lidocaine HCl solution (without epinephrine) to decrease pain at injection site. Inject deeply into large muscle group.
- Dry powder and reconstituted solutions darken slightly at room temperature.
- Have vitamin K available in case hypoprothrombinemia occurs.
- Discontinue if hypersensitivity reaction occurs.

Teaching points

- Avoid alcohol while taking this drug and for 3 days after because severe reactions often occur.
- You may experience these side effects: Stomach upset, diarrhea.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

▷ cefpodoxime proxetil*(sef'poe docks' eem)*

Vantin

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections, including community-acquired pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*
- URIs, including acute maxillary sinusitis, caused by *Streptococcus pyogenes*, *H. influenzae*, *Moraxella catharrhalis*
- Uncomplicated skin and skin structure infections caused by *Staphylococcus aureus*, *S. pyogenes*
- UTIs caused by *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*, *Staphylococcus saprophyticus*
- Otitis media caused by *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*
- STD caused by *Neisseria gonorrhoeae*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Tablets—100, 200 mg; oral suspension—50 mg/5 mL, 100 mg/5mL

Dosages**Adults**

100–400 mg every 12 hr PO depending on severity of infection; continue for 5–14 days.

Pediatric patients

5 mg/kg per dose PO every 12 hr; do not exceed 100–200 mg per dose; continue for 10 days.

- **Acute otitis media:** 10 mg/kg/day PO divided every 12 hr; do not exceed 400 mg/day; continue for 5 days.

Geriatric patients or patients with renal impairment

For creatinine clearance less than 30 mL/min, increase dosing interval to every 24 hr. For patient on hemodialysis, give dose three times weekly after session.

Pharmacokinetics

Route	Peak	Duration
Oral	30–60 min	16–18 hr

Metabolism: T_{1/2}: 120–180 min**Distribution:** Crosses the placenta; enters breast milk**Excretion:** Renal, unchanged**Adverse effects**

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** Bone marrow depression
- **Hypersensitivity:** Ranging from rash to fever to **anaphylaxis**; serum sickness reaction
- **Other:** Superinfections

Interactions

- **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants

★ **Drug-food** • Increased absorption and increased effects of cefpodoxime if taken with food

★ **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Penicillin or cephalosporin allergy, pregnancy or lactation, renal failure
- **Physical:** Renal function tests, respiratory status, skin status; culture and sensitivity tests of infected area

Interventions

- Culture infection site before drug therapy.
- Give drug with meals or food to enhance absorption.
- Store solution in refrigerator. Shake well before using; use within 14 days, then discard.
- Discontinue drug if hypersensitivity reaction occurs.
- Give the patient yogurt or buttermilk in case of diarrhea.
- Arrange for oral vancomycin for serious colitis that fails to respond to discontinuation.

Teaching points

- Take this drug with food.
- Complete the full course of this drug even if you feel better.
- If using suspension, store in refrigerator and shake well before each use. Discard after 14 days.
- This drug is prescribed for this particular infection; do not self-treat any other infection.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea; headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

 **cefprozil**
(sef'pro'zil)

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (second generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Pharyngitis or tonsillitis caused by *Streptococcus pyogenes*
- Secondary bacterial infection of acute bronchitis and exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catarrhalis*
- Dermatologic infections caused by *Staphylococcus aureus*, *S. pyogenes*
- Otitis media caused by *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*
- Acute sinusitis caused by *S. pneumoniae*, *S. aureus*, *H. influenzae*, *M. catarrhalis*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Tablets—250, 500 mg; powder for suspension—125 mg/5 mL, 250 mg/5 mL

Dosages

Adults

250–500 mg PO every 12–24 hr. Continue treatment for 10 days.

Pediatric patients

Acute sinusitis, otitis media

- 6 mo–12 yr: 7.5–15 mg/kg PO every 12 hr for 10 days.

Pharyngitis, tonsillitis

- 2–12 yr: 7.5 mg/kg PO every 12 hr; continue treatment for 10 days.

Skin and skin structure infection

- 2–12 yr: 20 mg/kg PO once daily; continue treatment for 10 days.

Geriatric patients or patients with renal impairment

For creatinine clearance of 30–120 mL/min, use standard dose; for creatinine clearance of 0–29 mL/min, use 50% of standard dose.

Pharmacokinetics

Route	Peak	Duration
Oral	6–10 hr	24–28 hr

Metabolism: $T_{1/2}$: 78 min

Distribution: Crosses the placenta, enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence*, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**
- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*

Interactions

- * **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects if taken with oral anticoagulants
- * **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clintest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations**Assessment**

- **History:** Penicillin or cephalosporin allergy, pregnancy or lactation, renal failure
- **Physical:** Renal function tests, respiratory status, skin status, culture and sensitivity tests of infected area

Interventions

- Culture infection site before drug therapy.
- Give drug with food to decrease GI discomfort.
- Refrigerate suspension after reconstitution, and discard after 14 days.
- Discontinue if hypersensitivity reaction occurs.
- Give the patient yogurt or buttermilk in case of diarrhea.
- Arrange for oral vancomycin for serious colitis that fails to respond to discontinuation.

Teaching points

- Take this drug with food.
- Complete the full course of this drug, even if you feel better.
- This drug is prescribed for this particular infection; do not use it to self-treat any other infection.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea; headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

▷ ceftazidime

(*sef taz' i deem*)

Ceptaz, Fortaz, Tazicef, Tazidime

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections caused by *Pseudomonas aeruginosa*, other *Pseudomonas*, *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Klebsiella*, *Haemophilus influenzae*, *Proteus mirabilis*, *Escherichia coli*, *Enterobacter*, *Serratia*, *Citrobacter*
- UTIs caused by *P. aeruginosa*, *Enterobacter*, *E. coli*, *Klebsiella*, *P. mirabilis*, *Proteus*
- Gynecologic infections caused by *E. coli*
- Skin and skin structure infections caused by *P. aeruginosa*, *S. aureus*, *E. coli*, *Serratia*, *Proteus*, *Klebsiella*, *Enterobacter*, *Streptococcus pyogenes*
- Septicemia caused by *P. aeruginosa*, *E. coli*, *Klebsiella*, *H. influenzae*, *Serratia*, *S. pneumoniae*, *S. aureus*
- Intra-abdominal infections caused by *E. coli*, *S. aureus*, *Bacteroides*, *Klebsiella*

- CNS infections caused by *H. influenzae*, *Neisseria meningitidis*
- Bone and joint infections caused by *P. aeruginosa*, *Klebsiella*, *Enterobacter*, *S. aureus*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Powder for injection—500 mg, 1, 2 g; injection—1, 2 g

Dosages

Adults

Usual dose, 1 g (range 250 mg–2 g) every 8–12 hr IM or IV. Do not exceed 6 g/day. Dosage will vary with infection.

- *UTI*: 250–500 mg IV or IM every 8–12 hr.
- *Pneumonia, skin and skin structure infections*: 500 mg–1 g IV or IM every 8 hr.
- *Bone and joint infections*: 2 g IV every 12 hr.
- *Gynecologic, intra-abdominal, life-threatening infections, meningitis*: 2 g IV every 8 hr.

Pediatric patients 1 mo–12 yr

30–50 mg/kg IV every 8 hr. Do not exceed 6 g/day.

Pediatric patients 0–4 wk

30 mg/kg IV every 12 hr.

Geriatric patients or patients with reduced renal function

Loading dose of 1 g IV, followed by:

CrCl (mL/min)	Dosage
31–50	1 g every 12 hr
16–30	1 g every 24 hr
6–15	500 mg every 24 hr
5 or less	500 mg every 48 hr

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	1 hr	24–28 hr
IM	30 min	1 hr	24–28 hr

Metabolism: $T_{1/2}$: 114–120 min

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute drug for direct IV injection with sterile water for injection. Reconstituted solution is stable for 24 hr at room temperature for *Fortaz* and *Tazidime*, or 18 hr at room temperature for *Ceptaz* and *Tazicef* or 7 days if refrigerated. For 500-mg vial, mix with 5 mL diluent; resulting concentration, 11 mg/mL. For 1-g vial, mix with 5 (10) mL diluent; resulting concentration, 180 (100) mg/mL. For 2-g vial, mix with 10 mL diluent; resulting concentration, 170–180 mg/mL.

Infusion: For IV, reconstitute 1- or 2-g infusion pack with 100 mL sterile water for injection; infuse slowly. For direct injection, slowly over 3–5 min. For infusion, over 30 min. If patient is also receiving aminoglycosides, administer at separate sites.

Incompatibilities: Do not mix with sodium bicarbonate injection or aminoglycoside solutions.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**—decreased WBC count, decreased platelets, decreased Hct
- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**; serum sickness reaction
- **Local:** Pain, abscess at injection site; *phlebitis*, inflammation at IV site
- **Other:** *Superinfections*, *disulfiram-like reaction with alcohol*

Interactions

• **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction if combined with alcohol during or for 3 days after completion of therapy

• **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations**Assessment**

- **History:** Hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infection site, and arrange for sensitivity tests before and during therapy if expected response is not seen.
- Reconstitute drug for IM use with sterile water or bacteriostatic water for injection or with 0.5% or 1% lidocaine HCl injection to reduce pain; inject deeply into large muscle group.

⊗ **Warning** Do not mix with aminoglycoside solutions. Administer these drugs separately.

- Powder and reconstituted solution darken with storage.
- Have vitamin K available in case hypoprothrombinemia occurs.
- Discontinue if hypersensitivity reaction occurs.

Teaching points

- Avoid alcohol while taking this drug and for 3 days after because severe reactions often occur.
- You may experience these side effects: Stomach upset or diarrhea.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

ceftibuten*(sef ta byoo' ten)*

Cedax

PREGNANCY CATEGORY B**Drug classes**

Antibiotic

Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Acute bacterial exacerbations of chronic bronchitis due to *Haemophilus influenzae*, *Moraxella catarrhalis*, *Streptococcus pneumoniae*
- Acute bacterial otitis media due to *H. influenzae*, *M. catarrhalis*, *Streptococcus pyogenes*
- Pharyngitis and tonsillitis due to *S. pyogenes*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure; lactation, pregnancy.

Available forms

Capsules—400 mg; oral suspension—90 mg/5 mL

Dosages**Adults**

400 mg PO daily for 10 days.

Pediatric patients

9 mg/kg/day PO for 10 days to a maximum daily dose of 400 mg/day.

Patients with renal impairment**CrCl**

CrCl (mL/min)	Dose
More than 50	9 mg/kg or 400 mg PO every 24 hr
30–49	4.5 mg/kg or 200 mg PO every 24 hr
5–29	2.25 mg/kg or 100 mg PO every 24 hr

Pharmacokinetics

Route	Peak	Duration
Oral	30–60 min	8–10 hr

Metabolism: $T_{1/2}$: 30–60 min**Distribution:** Crosses placenta; enters breast milk**Excretion:** Urine, unchanged**Adverse effects**

- **CNS:** Headache, dizziness, lethargy, paresthesias

- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic: Bone marrow depression**
- **Hypersensitivity:** Ranging from *rash* to *fever* to **anaphylaxis**; serum sickness reaction
- **Other:** *Superinfections*

Interactions

• **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction may occur if alcohol is taken within 72 hr after administration

• **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Allergy to penicillin or cephalosporin; pregnancy, lactation, renal failure
- **Physical:** Renal function tests, respiratory status, skin status; culture and sensitivity tests of infection

Interventions

- Culture infection site before beginning drug therapy.
- Give capsules with meals to decrease GI discomfort; suspension must be given on an empty stomach at least 2 hr before or 1 hr after meals.
- Refrigerate suspension after reconstitution; shake vigorously before use and discard after 14 days.
- Discontinue drug if hypersensitivity reaction occurs.
- Give patient yogurt or buttermilk in case of diarrhea.
- Arrange for treatment of superinfections.
- Reculture infection if patient fails to respond.

Teaching points

- Take capsules with meals or food; suspension must be taken on an empty stomach, at least 2 hours before or 1 hour after meals.

- Refrigerate suspension; shake vigorously after use and discard after 14 days.
- Complete the full course of this drug, even if you feel better before the course of treatment is over.
- Avoid alcohol while taking this drug and for 3 days after completion of therapy; serious reactions can occur.
- This drug is prescribed for this particular infection; do not use it to self-treat any other infection.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea; headache, dizziness.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

ceftriaxone sodium (sef try ax' obn)

Rocephin

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Cephalosporin (third generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Lower respiratory infections caused by *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Klebsiella*, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Enterobacter aerogenes*, *Serratia marcescens*, *Haemophilus parainfluenzae*, *Streptococcus* (excluding enterococci)
- Acute bacterial otitis media caused by *S. pneumoniae*, *H. influenzae*, *Moraxella catarrhalis*
- UTIs caused by *E. coli*, *Klebsiella*, *Proteus vulgaris*, *Proteus mirabilis*, *Morganella morganii*
- Gonorrhea caused by *Neisseria gonorrhoeae*
- Intra-abdominal infections caused by *E. coli*, *Klebsiella pneumoniae*

- PID caused by *N. gonorrhoeae*
- Skin and skin structure infections caused by *S. aureus*, *Klebsiella*, *Enterobacter cloacae*, *P. mirabilis*, *Staphylococcus epidermidis*, *Pseudomonas aeruginosa*, *Streptococcus* (excluding enterococci)
- Septicemia caused by *E. coli*, *S. pneumoniae*, *H. influenzae*, *S. aureus*, *K. pneumoniae*
- Bone and joint infections caused by *S. aureus*, *Streptococcus* (excluding enterococci), *P. mirabilis*, *S. pneumoniae*, *E. coli*, *K. pneumoniae*, *Enterobacter*
- Meningitis caused by *H. influenzae*, *S. pneumoniae*, *Neisseria meningitidis*
- Perioperative prophylaxis for patients undergoing coronary artery bypass surgery and in contaminated or potentially contaminated surgical procedures (eg, vaginal or abdominal hysterectomy)
- Unlabeled uses: Treatment of Lyme disease in doses of 2 g IV daily for 14–28 days, epididymitis, proctitis, proctocolitis, enteritis

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Powder for injection—2 g; injection—1, 2 g

Dosages

Adults

- 1–2 g/day IM or IV once a day or in equal divided doses bid. Do not exceed 4 g/day.
- **Gonorrhea:** Single 250-mg IM dose.
 - **Meningitis:** 1–2 g IM or IV once a day or in equal divided doses bid for 4–14 days. Longer therapy may be required. Do not exceed 4 g/day.
 - **Perioperative prophylaxis:** Give 1 g IV 30–120 min before surgery.

Pediatric patients

- 50–75 mg/kg/day IV or IM in divided doses every 12 hr. Do not exceed 2 g/day.
- **Meningitis:** 100 mg/kg/day IV or IM in divided doses every 12 hr for 7–14 days. Do not exceed 4 g/day. Loading dose of 100 mg/kg may be used.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	Immediate	15–18 hr
IM	30 min	1.5–4 hr	15–18 hr

Metabolism: $T_{1/2}$: 5–10 hr

Distribution: Crosses the placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute reconstituted solution for IV infusion with 50–100 mL of 5% or 10% dextrose injection, 5% dextrose and 0.45% or 0.9% sodium chloride injection, 0.9% sodium chloride injection, 10% invert sugar, 5% sodium bicarbonate, *FreAmine 111*, *Normosol-M in 5% Dextrose*, *Ionosol-B in 5% Dextrose*, 5% or 10% mannitol, sodium lactate.

Package Size	Diluent to Add	Resulting Concentration
250-mg vial	2.4 mL	100 mg/mL
500-mg vial	4.8 mL	100 mg/mL
1-g vial	9.6 mL	100 mg/mL
2-g vial	19.2 mL	100 mg/mL
Piggyback 1 g	10 mL	
Piggyback 2 g	20 mL	

Stability of reconstituted and diluted solution depends on diluent, concentration and type of container (eg, glass, PVC); check manufacturer's inserts for specific details. Protect drug from light.

Infusion: Administer by intermittent infusion over 15–30 min. Do not mix ceftriaxone with any other antimicrobial drug.

Incompatibilities: Do not mix aminoglycosides and ceftriaxone in the same IV solution.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence*, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**—decreased WBC count, decreased platelets, decreased Hct

- **Hypersensitivity:** *Ranging from rash to fever to anaphylaxis*; serum sickness reaction
- **Local:** *Pain*, abscess at injection site; *phlebitis*, inflammation at IV site
- **Other:** *Superinfections, disulfiram-like reaction with alcohol*

Interactions

• **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction may occur if alcohol is taken within 72 hr after ceftriaxone administration

• **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinistest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations

Assessment

- **History:** Hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infection site, and arrange for sensitivity tests before and during therapy if expected response is not seen.
- Reconstitute for IM use with sterile water for injection, 0.9% sodium chloride solution, 5% dextrose solution, bacteriostatic water with 0.9% benzyl alcohol, or 1% lidocaine solution (without epinephrine); inject deeply into a large muscle group.
- Check manufacturer's inserts for specific details. Stability of reconstituted and diluted solution depends on diluent, concentration and type of container (eg, glass, PVC).
- Protect drug from light.
- ⊗ **Warning** Do not mix ceftriaxone with any other antimicrobial drug.
- Monitor ceftriaxone blood levels in patients with severe renal impairment and in patients with renal and hepatic impairment.
- Have vitamin K available in case hypoprothrombinemia occurs.
- Discontinue if hypersensitivity reaction occurs.

Teaching points

- Avoid alcohol while taking this drug and for 3 days after because severe reactions often occur.
- You may experience these side effects: Stomach upset or diarrhea.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

▷ cefuroxime

(*se fyoor ox' eem*)

cefuroxime axetil

Ceftin 

cefuroxime sodium

Zinacef

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (second generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

Oral (*cefuroxime axetil*)

- Pharyngitis, tonsillitis caused by *Streptococcus pyogenes*
- Otitis media caused by *Streptococcus pneumoniae*, *S. pyogenes*, *Haemophilus influenzae*, *Moraxella catarrhalis*
- Acute bacterial maxillary sinusitis caused by *S. pneumoniae*, *H. influenzae*
- Lower respiratory infections caused by *S. pneumoniae*, *Haemophilus parainfluenzae*, *H. influenzae*
- UTIs caused by *Escherichia coli*, *Klebsiella pneumoniae*
- Uncomplicated gonorrhea (urethral and endocervical)
- Skin and skin structure infections, including impetigo caused by *Streptococcus aureus*, *S. pyogenes*
- Treatment of early Lyme disease

Parenteral (cefuroxime sodium)

- Lower respiratory infections caused by *S. pneumoniae*, *S. aureus*, *E. coli*, *Klebsiella pneumoniae*, *H. influenzae*, *S. pyogenes*
- Dermatologic infections caused by *S. aureus*, *S. pyogenes*, *E. coli*, *K. pneumoniae*, *Enterobacter*
- UTIs caused by *E. coli*, *K. pneumoniae*
- Uncomplicated and disseminated gonorrhea caused by *N. gonorrhoeae*
- Septicemia caused by *S. pneumoniae*, *S. aureus*, *E. coli*, *K. pneumoniae*, *H. influenzae*
- Meningitis caused by *S. pneumoniae*, *H. influenzae*, *S. aureus*, *N. meningitidis*
- Bone and joint infections due to *S. aureus*
- Perioperative prophylaxis
- Treatment of acute bacterial maxillary sinusitis in patients 3 mo–12 yr

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Tablets —125, 250, 500 mg; suspension—125 mg/5 mL, 250 mg/5 mL; powder for injection—750 mg, 1.5 g; injection—750 mg, 1.5 g

Dosages**Oral****Adults and patients 12 yr and older**

250 mg bid. For severe infections, may be increased to 500 mg bid. Treat for up to 10 days.

- *Uncomplicated UTIs*: 250 mg bid. Treat for 7–10 days.
- *Uncomplicated gonorrhea*: 1,000 mg once as a single dose.

Pediatric patients younger than 12 yr

125 mg bid.

Acute otitis media:

3 mo–12 yr: 250 mg PO bid for 10 days in children who can swallow tablets whole. Or, 30 mg/kg/day (maximum, 1 g/day) in two divided doses for 10 days (oral solution).

Pharyngitis or tonsillitis:

3 mo–12 yr: 125 mg PO every 12 hr for 10 days in children who can swallow tablets whole. Or, 20 mg/kg/day (maximum, 500 mg/day) in two divided doses for 10 days (oral solution).

Acute sinusitis:

3 mo–12 yr: 250 mg PO bid for 10 days in children who can swallow tablets whole. Or, 30 mg/kg/day (maximum, 1 g/day) in two divided doses for 10 days (oral solution).

Impetigo:

3 mo–12 yr: 30 mg/kg/day (maximum, 1 g/day) in two divided doses for 10 days (oral suspension).

Parenteral**Adults**

750 mg–1.5 g IM or IV every 8 hr, depending on severity of infection, for 5–10 days.

- *Uncomplicated gonorrhea*: 1.5 g IM (at two different sites) with 1 g of oral probenecid.

- *Perioperative prophylaxis*: 1.5 g IV 30–60 min prior to initial incision; then 750 mg IV or IM every 8 hr for 24 hr after surgery.

Pediatric patients older than 3 mo

50–100 mg/kg/day IM or IV in divided doses every 6–8 hr.

- *Bacterial meningitis*: 200–240 mg/kg/day IV in divided doses every 6–8 hr.

Pediatric patients with impaired renal function

Adjust adult dosage for renal impairment by weight or age of child.

Geriatric patients or adults with impaired renal function

CrCl (mL/min)	Dosage
More than 20	750 mg–1.5 g every 8 hr
10–20	750 mg every 12 hr
Less than 10	750 mg every 24 hr

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	Immediate	18–24 hr
IM	20 min	30 min	18–24 hr
Oral	Varies	2 hr	18–24 hr

Metabolism: $T_{1/2}$: 1–2 hr

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Preparation of parenteral drug solutions and suspensions differs for different starting preparations and different brand names; check the manufacturer's directions carefully. Reconstitute parenteral drug with sterile water for injection, D₂W, 0.9% sodium chloride, or any of the following, which also may be used for further dilution: 0.9% sodium chloride, 5% or 10% dextrose injection, 5% dextrose and 0.45% or 0.9% sodium chloride injection, or 1/6 M sodium lactate injection. Stability of solutions depends on diluent and concentration: Check manufacturer's specifications.

⊗ **Warning** Do not mix with IV solutions containing aminoglycosides. Powder form, solutions, and suspensions darken during storage.

Infusion: Inject slowly over 3–5 min directly into vein for IV administration, or infuse over 30 min; may be given by continuous infusion. Give aminoglycosides and cefuroxime at different sites.

Incompatibilities: Do not mix aminoglycosides and cefuroxime in the same IV solution.

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression** (decreased WBC, decreased platelets, decreased Hct)
- **Hypersensitivity:** Ranging from rash to fever to **anaphylaxis**; serum sickness reaction
- **Local:** Pain, abscess at injection site, *phlebitis*, inflammation at IV site
- **Other:** *Superinfections, disulfiram-like reaction with alcohol*

Interactions

★ **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Risk of disulfiram-like reaction with alcohol; avoid this combination during and for 3 days after completion of therapy

★ **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

Nursing considerations

Assessment

- **History:** Hepatic and renal impairment, lactation, pregnancy
- **Physical:** Skin status, LFTs, renal function tests, culture of affected area, sensitivity tests

Interventions

- Culture infection site, and arrange for sensitivity tests before and during therapy if expected response is not seen.
- Give oral drug with food to decrease GI upset and enhance absorption.
- Give oral tablets to children who can swallow tablets; crushing the drug results in a bitter, unpleasant taste. Use solution for children who cannot swallow tablets.
- Have vitamin K available in case hypoprotrombinemia occurs.
- Discontinue if hypersensitivity reaction occurs.

Teaching points

Oral drug

- Take full course of therapy even if you are feeling better.
- This drug is specific for this infection and should not be used to self-treat other problems.
- Swallow tablets whole; do not crush them. Take the drug with food.
- Store solution in the refrigerator. Shake well before each use.
- You may experience these side effects: Stomach upset or diarrhea.
- Report severe diarrhea with blood, pus, or mucus; rash; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising; unusual itching or irritation.

Parenteral drug

- Avoid alcohol while taking this drug and for 3 days after because severe reactions often occur.
- You may experience these side effects: Stomach upset or diarrhea.
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

celecoxib*(sell ab cocks' ib)*

Celebrex

PREGNANCY CATEGORY C
(FIRST AND SECOND TRIMESTER)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Analgesic (nonopioid)

NSAID

Specific COX-2 enzyme inhibitor

Therapeutic actions

Analgesic and anti-inflammatory activities related to inhibition of the COX-2 enzyme, which is activated in inflammation to cause the signs and symptoms associated with inflammation; does not affect the COX-1 enzyme, which protects the lining of the GI tract and has blood clotting and renal functions.

Indications

- Acute and long-term treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis
- Reduction of the number of colorectal polyps in familial adenomatous polyposis (FAP)
- Management of acute pain
- Treatment of primary dysmenorrhea
- Relief of signs and symptoms of ankylosing spondylitis
- Relief of signs and symptoms of juvenile rheumatoid arthritis
- Unlabeled uses: Treatment of preterm labor; prevention of colorectal cancer; adjunctive therapy in schizophrenia

Contraindications and cautions

- Contraindicated with allergies to sulfonamides, celecoxib, NSAIDs, or aspirin; significant renal impairment; perioperative pain post CABG surgery; pregnancy (third trimester); lactation.
- Use cautiously with impaired hearing, hepatic and CV conditions.

Available forms

Capsules—50, 100, 200, 400 mg

Dosages**Adults**

Initially, 100 mg PO bid; may increase to 200 mg/day PO bid as needed.

- *Acute pain, dysmenorrhea*: 400 mg, then 200 mg PO bid.
- *FAP*: 400 mg PO bid.
- *Ankylosing spondylitis*: 200 mg/day PO; after 6 wk, a trial of 400 mg/day may be tried for 6 wk; if no effect is seen, suggest another therapy.

Pediatric patients 2 yr and older*10 kg or 25 kg or less*: 50 mg capsule PO bid.*More than 25 kg*: 100 mg capsule PO bid.**Patients with hepatic impairment**

Reduce dosage by 50%.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3 hr

Metabolism: Hepatic; $T_{1/2}$: 11 hr**Distribution**: Crosses placenta; may enter breast milk**Excretion**: Bile, urine**Adverse effects**

- **CNS**: *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **CV: MI, CVA**
- **Dermatologic**: *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI**: Nausea, abdominal pain, *dyspepsia*, flatulence, GI bleed
- **Hematologic**: Neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia,

aplastic anemia, decreased Hgb or Hct, bone marrow depression, menorrhagia

- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

Interactions

★ **Drug-drug** • Increased risk of bleeding if taken concurrently with warfarin. Monitor patient closely and reduce warfarin dose as appropriate • Increased lithium levels and toxicity • Increased risk of GI bleeding with long-term alcohol use, smoking

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Celebrex* (celecoxib), *Celexa* (citalopram), *Xanax* (alprazolam), and *Cerebyx* (fosphenytoin); use caution.

Assessment

- **History:** Renal impairment, impaired hearing, allergies, hepatic and CV conditions, lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, LFTs, renal function tests; serum electrolytes

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Establish safety measures if CNS or visual disturbances occur.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

- Provide further comfort measures to reduce pain (eg, positioning, environmental control) and to reduce inflammation (eg, warmth, positioning, rest).

Teaching points

- Take drug with food or meals if GI upset occurs.
- Take only the prescribed dosage; do not increase dosage.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or the use of dangerous machinery while taking this drug).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; chest pain, shortness of breath, slurred speech.

▷ cellulose sodium phosphate (CSP)

See Appendix U, *Less commonly used drugs*.

▷ cephalexin (*sef a lex' in*)

Apo-Cephalex (CAN), Keflex, Novo-Lexin (CAN), Nu-Cephalex (CAN)

PREGNANCY CATEGORY B

Drug classes

Antibiotic

Cephalosporin (first generation)

Therapeutic actions

Bactericidal: Inhibits synthesis of bacterial cell wall, causing cell death.

Indications

- Respiratory tract infections caused by *Streptococcus pneumoniae*, group A beta-hemolytic streptococci
- Skin and skin structure infections caused by staphylococcus, streptococcus
- Otitis media caused by *S. pneumoniae*, *Haemophilus influenzae*, streptococcus, staphylococcus, *Moraxella catarrhalis*
- Bone infections caused by staphylococcus, *Proteus mirabilis*
- GU infections caused by *Escherichia coli*, *P. mirabilis*, *Klebsiella*

Contraindications and cautions

- Contraindicated with allergy to cephalosporins or penicillins.
- Use cautiously with renal failure, lactation, pregnancy.

Available forms

Capsules—250, 333, 500, 750 mg; tablets—250, 500 mg; oral suspension—125 mg/5 mL, 250 mg/5 mL

Dosages**Adults**

1–4 g/day in divided doses; 250 mg PO every 6 hr usual dose.

- *Skin and skin structure infections*: 500 mg PO every 12 hr. Larger doses may be needed in severe cases; do not exceed 4 g/day.

Pediatric patients

25–50 mg/kg/day PO in divided doses.

- *Skin and skin structure infections*: Divide total daily dose, and give every 12 hr. Dosage may be doubled in severe cases.
- *Otitis media*: 75–100 mg/kg/day PO in four divided doses.

Pharmacokinetics

Route	Peak	Duration
Oral	60 min	8–10 hr

Metabolism: $T_{1/2}$: 50–80 min

Distribution: Crosses the placenta, enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, dizziness, lethargy, paresthesias
- **GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, flatulence*, **pseudomembranous colitis**, hepatotoxicity
- **GU:** Nephrotoxicity
- **Hematologic:** **Bone marrow depression**
- **Hypersensitivity:** *Ranging from rash to fever to anaphylaxis*; serum sickness reaction
- **Other:** *Superinfections*

Interactions

★ **Drug-drug** • Increased nephrotoxicity with aminoglycosides • Increased bleeding effects with oral anticoagulants • Disulfiram-like reaction may occur if alcohol is taken within 72 hr after cephalexin administration

★ **Drug-lab test** • Possibility of false results on tests of urine glucose using Benedict's solution, Fehling's solution, Clinitest tablets; urinary 17-ketosteroids; direct Coombs' test

■ Nursing considerations**Assessment**

- **History:** Penicillin or cephalosporin allergy, pregnancy, or lactation
- **Physical:** Renal function tests, respiratory status, skin status; culture and sensitivity tests of infected area

Interventions

- Arrange for culture and sensitivity tests of infection before and during therapy if infection does not resolve.
- Give drug with meals; arrange for small, frequent meals if GI complications occur.
- Refrigerate suspension, discard after 14 days.

Teaching points

- Take this drug with food. Refrigerate suspension; discard any drug after 14 days.
- Complete the full course of this drug even if you feel better.
- This drug is prescribed for this particular infection; do not self-treat any other infection.
- You may experience these side effects: Stomach upset, loss of appetite, nausea (take drug with food); diarrhea; headache, dizziness.
- Avoid alcohol while taking cephalexin and for 3 days after completion of therapy.
- Report severe diarrhea with blood, pus, or mucus; rash or hives; difficulty breathing; unusual tiredness, fatigue; unusual bleeding or bruising.

 **certolizumab**

See Appendix U, *Less commonly used drugs*.

cetirizine hydrochloride

(*se teer' i zeen*)

Reactine (CAN), Zyrtec Allergy, Zyrtec Children's Allergy, Zyrtec Children's Hives Relief, Zyrtec Hives Relief

PREGNANCY CATEGORY B

Drug class

Antihistamine

Therapeutic actions

Potent specific histamine (H₁) receptor antagonist; inhibits histamine release and eosinophil chemotaxis during inflammation, leading to reduced swelling and decreased inflammatory response.

Indications

- Management of seasonal and perennial allergic rhinitis, allergies, hay fever
- Treatment of chronic, idiopathic urticaria
- Unlabeled uses: To decrease wheal response and pruritus of mosquito bites; possible use in allergic asthma

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, hydroxyzine.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction (avoid use or use with caution as condition may be exacerbated by drug effects); lactation.

Available forms

Tablets—5, 10 mg; chewable tablets—5, 10 mg; syrup—1 mg/mL

Dosages

Adults and children 6 yr and older

10 mg/day PO or 5 mg PO bid; maximum dose 10 mg/day.

Pediatric patients 6–11 yr

5 or 10 mg PO daily.

Pediatric patients 2–6 yr

2.5 mg PO once daily to a maximum 5 mg/day.

Patients with hepatic or renal impairment, elderly patients

Dosage adjustment necessary; suggested dose, 5 mg PO daily.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	1 hr	24 hr

Metabolism: Hepatic; T_{1/2}: 7–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Somnolence, sedation*
- **CV:** Palpitation, edema, dizziness
- **GI:** Nausea, diarrhea, abdominal pain, constipation, dry mouth
- **Respiratory:** **Bronchospasm**, pharyngitis
- **Other:** Fever, photosensitivity, rash, myalgia, arthralgia, angioedema, fatigue

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between **Zyrtec** (cetirizine) and **Zyprexa** (olanzapine) and between **Zyrtec** (cetirizine) and **Zantac** (ranitidine); use caution.

Assessment

- **History:** Allergy to any antihistamines, hydroxyzine; narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction; lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; R, adventitious sounds; prostate palpation; renal and hepatic function tests

Interventions

- Give without regard to meals.
- Provide syrup form or chewable tablets for pediatric use if needed.
- Arrange for use of humidifier if thickening of secretions, nasal dryness become bothersome; encourage adequate intake of fluids.
- Provide skin care for urticaria.

Teaching points

- Take this drug without regard to meals.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); thickening of bronchial secretions, dry nasal mucosa (humidifier may help).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, irregular heartbeat.

 **cetorelix acetate**See Appendix U, *Less commonly used drugs*. **cetuximab**See Appendix U, *Less commonly used drugs*. **cevimeline hydrochloride**See Appendix U, *Less commonly used drugs*. **charcoal, activated**
(*char' kole*)

OTC: Actidose-Aqua, Actidose with Sorbitol, CharcoAid, CharcoAid 2000, Liqui-Char

PREGNANCY CATEGORY C

Drug class

Antidote

Therapeutic actions

Adsorbs toxic substances swallowed into the GI tract, inhibiting GI absorption; maximum amount of toxin absorbed is 100–1,000 mg/g charcoal.

Indications

- Emergency treatment in poisoning by most drugs and chemicals

Contraindications and cautions

- Contraindicated with poisoning or overdose of cyanide, mineral acids, alkalis.

- Use cautiously; not effective with ethanol, methanol, and iron salts.

Available forms

Powder—15, 30, 40, 120, 240 g; liquid—208 mg/mL, 12.5 g/60 mL, 15 g/75 mL, 15 g/120 mL, 25 g/120 mL, 30 g/120 mL, 50 g/240 mL; suspension—15, 30 g; granules—15 g

Dosages**Adults**

50–60 g or 1 g/kg PO or approximately 5–10 times the amount of poison ingested, as an oral suspension; administer as soon as possible after poisoning.

- *Gastric dialysis*: 20–40 g every 6 hr for 1–2 days for severe poisonings; for optimum effect, administer within 30 min of poisoning.

Pediatric patients 1–12 yr*Weighing more than 32 kg*: 50–60 g.*Weighing 16–32 kg*: 25–30 g.*Weighing less than 16 kg and younger than 1 yr*: Not recommended.**Pharmacokinetics**

Not absorbed systemically

Excretion: Feces**Adverse effects**

- **GI**: *Vomiting* (related to rapid ingestion of high doses), *constipation*, *diarrhea*, black stools

Interactions

* **Drug-drug** • Adsorption and inactivation of laxatives with activated charcoal • Decreased effectiveness of other medications because of adsorption by activated charcoal

* **Drug-food** • Decreased adsorptive capacity if taken with milk, ice cream, or sherbet

Nursing considerations**CLINICAL ALERT!**

Name confusion can occur between *Actidose* (charcoal) and *Actos* (pioglitazone); use caution.

Assessment

- **History:** Poisoning or overdosage of cyanide, mineral acids, alkalis, ethanol, methanol, and iron salts
- **Physical:** Stools, bowel sounds

Interventions

- Repeat dose if patient vomits shortly after administration.
- Give drug to conscious patients only.
- Take measures to prevent aspiration of charcoal powder; fatalities have occurred.
- Give drug as soon after poisoning as possible; most effective results are seen if given within 30 min.
- Prepare suspension of powder in 6–8 oz of water; taste may be gritty and disagreeable. Sorbitol is added to some preparations to improve taste; diarrhea more likely with these preparations.
- Store in closed containers; activated charcoal adsorbs gases from the air and will lose its effectiveness with prolonged exposure to air.
- Ensure that life-support equipment is readily available for poisoning and overdose.

Teaching points

- Drink 6–8 glasses of liquid per day to avoid constipation.
- You may experience these side effects: Black stools, diarrhea, constipation.

▼ chenioliol

See Appendix U, *Less commonly used drugs*.

⚠ DANGEROUS DRUG**▼ chloral hydrate**

(klor al hye' drate)

Chloral Hydrate-Odan (CAN),
Somnote **ORC**

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-IV

Drug class

Sedative-hypnotic (nonbarbiturate)

Therapeutic actions

Mechanism by which CNS is affected is not known; hypnotic dosage produces mild cerebral depression and quiet, deep sleep; does not depress REM sleep, produces less hangover than most barbiturates and benzodiazepines.

Indications

- Nocturnal sedation
- Preoperative sedation to lessen anxiety and induce sleep without depressing respiration or cough reflex
- Adjunct to opiates and analgesics in postoperative care and control of pain

Contraindications and cautions

- Contraindicated with hypersensitivity to chloral derivatives, allergy to tartrazine (in 324-mg and 648-mg suppositories marketed as *Aquachloral Supporettes*), severe cardiac disease, gastritis, gastric or duodenal ulcers; hepatic or renal impairment, lactation.
- Use cautiously with acute intermittent porphyria (may precipitate attacks).

Available forms

Capsules **ORC**—500 mg; syrup—250 mg/5 mL, 500 mg/5 mL

Dosages**Adults**

- Single doses or daily dose should not exceed 2 g.
- **Hypnotic:** 500 mg–1 g PO 15–30 min before bedtime or 30 min before surgery. It is not usually considered safe practice to give oral medication to patients who are NPO for anesthesia or surgery.
 - **Sedative:** 250 mg PO tid after meals.

Pediatric patients

- **Hypnotic:** 50 mg/kg/day PO up to 1 g per single dose; may be given in divided doses.
- **Sedative:** 25 mg/kg/day PO up to 500 mg per single dose; may be given in divided doses.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral, rectal	30–60 min	1–3 hr	4–8 hr

Metabolism: Hepatic; $T_{1/2}$: 7–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** *Somnambulism, disorientation, incoherence, paranoid behavior*; excitement, delirium, drowsiness, staggering gait, ataxia, light-headedness, vertigo, nightmares, malaise, mental confusion, headache, hallucinations
- **Dermatologic:** *Skin irritation*; allergic rashes including hives, erythema, eczematoid dermatitis, urticaria
- **GI:** Gastric irritation, nausea, vomiting, **gastric necrosis** (following intoxicating doses), flatulence, diarrhea, unpleasant taste
- **Hematologic:** Leukopenia, eosinophilia
- **Other:** Physical, psychological dependence; tolerance; withdrawal reaction; hangover

Interactions

* **Drug-drug** • Additive CNS depression with alcohol, other CNS depressants • Mutual inhibition of metabolism with alcohol • Complex effects on oral (warfarin) anticoagulants given with chloral hydrate; monitor prothrombin levels and adjust warfarin dosage whenever chloral hydrate is instituted or withdrawn from drug regimen

* **Drug-lab test** • Interference with the copper sulfate test for glycosuria, fluorometric tests for urine catecholamines, and urinary 17-hydroxycorticosteroid determinations (when using the Reddy, Jenkins, and Thorn procedure)

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to chloral derivatives, allergy to tartrazine, severe cardiac disease, gastritis, hepatic or renal impairment, acute intermittent porphyria, lactation
- **Physical:** Skin color, lesions; orientation, affect, reflexes; P, BP, perfusion; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, CBC and differential, stool guaiac test

Interventions

- Give capsules with a full glass of liquid; ensure that patient swallows capsules whole; give syrup in half glass of water, fruit juice, or ginger ale.

- Supervise dose and amount of drug prescribed for patients who are addiction prone or alcoholic; give least amount feasible to patients who are depressed or suicidal.
- Withdraw gradually over 2 wk if patient has been maintained on high doses for weeks or months; if patient has built up high tolerance, withdrawal should occur in a hospital, using supportive therapy similar to that for barbiturate withdrawal; fatal withdrawal reactions have occurred.
- Reevaluate patients with prolonged insomnia; therapy for the underlying cause (eg, pain, depression) is preferable to prolonged use of sedative-hypnotic drugs.

Teaching points

- Take this drug exactly as prescribed: Swallow capsules whole with a full glass of liquid (take syrup in half glass of water, fruit juice, or ginger ale).
- Do not discontinue the drug abruptly. Consult your health care provider if you wish to discontinue the drug.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- You may experience these side effects: Drowsiness, dizziness, light-headedness (avoid driving or performing tasks requiring alertness); GI upset (eat frequent small meals); sleepwalking, nightmares, confusion (use caution: close doors, keep medications out of reach so inadvertent overdose does not occur while confused).
- Report rash, coffee ground vomitus, black or tarry stools, severe GI upset, fever, sore throat.

DANGEROUS DRUG**▽ chlorambucil***(klor am' byoo sil)*

Leukeran

PREGNANCY CATEGORY D**Drug classes**Alkylating drug, nitrogen mustard derivative
Antineoplastic

Therapeutic actions

Cytotoxic; Alkylates cellular DNA, interfering with the replication of susceptible cells.

Indications

- Palliative treatment of chronic lymphocytic leukemia; malignant lymphomas, including lymphosarcoma; giant follicular lymphoma; and Hodgkin's lymphoma
- Unlabeled uses: Ovarian and testicular carcinoma, Waldenstrom's macroglobulinemia, non-Hodgkin's lymphoma, polycythemia vera

Contraindications and cautions

- Contraindicated with allergy to chlorambucil; cross-sensitization with melphalan, pregnancy.
- Use cautiously with radiation therapy, chemotherapy, myelosuppression, lactation.

Available forms

Tablets—2 mg

Dosages

Individualize dosage based on hematologic profile and response.

Adults

- *Initial dose and short-course therapy*: 0.1–0.2 mg/kg per day PO for 3–6 wk; single daily dose may be given.
- *Chronic lymphocytic leukemia (alternate regimen)*: 0.4 mg/kg PO every 2 wk, increasing by 0.1 mg/kg with each dose until therapeutic or toxic effect occurs.
- *Maintenance dose*: 0.03–0.1 mg/kg/day PO. Do not exceed 0.1 mg/kg/day. Short courses of therapy are safer than continuous maintenance therapy; base dosage and duration on patient response and bone marrow status.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1 hr	15–20 hr

Metabolism: Hepatic; $T_{1/2}$: 60–90 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Tremors, muscular twitching, confusion, agitation, ataxia, flaccid paresis, hallucinations, seizures
- **Dermatologic:** Rash, urticaria, *alopecia*, keratitis, **Stevens-Johnson syndrome**, **erythema multiforme**
- **GI:** *Nausea, vomiting, stomatitis*, anorexia, **hepatotoxicity**, jaundice (rare)
- **GU:** *Sterility* (especially in prepubertal or pubertal males and adult men; amenorrhea can occur in females)
- **Hematologic:** **Bone marrow depression**, hyperuricemia
- **Respiratory:** Bronchopulmonary dysplasia, pulmonary fibrosis
- **Other:** Cancer, **acute leukemia**

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Leukeran* (chlorambucil), *Myleran* (busulfan), *Alkeran* (melphalan), and leucovorin; use caution.

Assessment

- **History:** Allergy to chlorambucil, cross-sensitization with melphalan (rash), radiation therapy, chemotherapy, hematopoietic depression, pregnancy, lactation
- **Physical:** T; weight; skin color, lesions; R, adventitious sounds; liver evaluation; CBC, differential, Hgb, uric acid, LFTs

Interventions

⊗ **Black box warning** Arrange for blood tests to evaluate hematopoietic function before and weekly during therapy. Severe bone marrow suppression can occur.

⊗ **Black box warning** This drug is carcinogenic. Monitor patient regularly.

- Do not give full dosage within 4 wk after a full course of radiation therapy or chemotherapy because of risk of severe bone marrow depression.

- Ensure that patient is well hydrated before treatment.

⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy; encourage use of barrier contraceptives

because this drug is teratogenic. This drug may also cause infertility.

⊗ **Warning** Monitor uric acid levels; ensure adequate fluid intake, and prepare for appropriate treatment of hyperuricemia if it occurs.

- Divide single daily dose if nausea and vomiting occur with large single dose.

Teaching points

- Take this drug once a day and take it with food. If nausea and vomiting occur, consult health care provider about dividing the dose.
- You may experience these side effects: Nausea, vomiting, loss of appetite (dividing dose, eat frequent small meals; maintain your fluid intake and nutrition; drink at least 10–12 glasses of fluid each day); infertility (from irregular menses to complete amenorrhea; men may stop producing sperm—may be irreversible; discuss with your health care provider); severe birth defects—use barrier contraceptives; cancer—follow all suggested screening protocols.
- Report unusual bleeding or bruising, fever, chills, sore throat; cough, shortness of breath, yellow skin or eyes, flank or stomach pain.

▶ chloramphenicol

(*klor am fen' i kole*)

chloramphenicol sodium succinate

PREGNANCY CATEGORY C

Drug class

Antibiotic

Therapeutic actions

Bacteriostatic effect against susceptible bacteria; prevents cell replication.

Indications

Systemic

- Serious infections for which no other antibiotic is effective
- Acute infections caused by *Salmonella typhi*

- Serious infections caused by *Salmonella*, *Haemophilus influenzae*, rickettsiae, lymphogranuloma—psittacosis group
- Cystic fibrosis regimen

Contraindications and cautions

- Contraindicated with allergy to chloramphenicol.
- Use cautiously with renal failure, hepatic failure, G6PD deficiency, intermittent porphyria, pregnancy (may cause gray syndrome in premature infants and newborns), lactation.

Available forms

Powder for injection—100 mg/mL

Dosages

Systemic

⊗ **Black box warning** Severe and sometimes fatal blood dyscrasias (in adults) and severe and sometimes fatal gray syndrome (in newborns and premature infants) may occur. Use should be restricted to situations in which no other antibiotic is effective. Serum levels should be monitored at least weekly to minimize risk of toxicity (therapeutic concentrations: peak, 10–20 mcg/mL; trough, 5–10 mcg/mL).

Adults

50 mg/kg/day IV in divided doses every 6 hr up to 100 mg/kg/day in severe cases.

Pediatric patients

50–100 mg/kg/day IV in divided doses every 6 hr.

- **Meningitis:** 50–100 mg/kg/day IV in divided doses every 6 hr.
- **Neonates:**
 - Less than 2 kg and/or younger than 7 days: 25 mg/kg daily in divided doses at 6-hr intervals.
 - Older than 7 days and more than 2 kg: 50 mg/kg/day in divided doses every 6 hr.
- **Infants and children with immature metabolic processes:** 25 mg/kg/day IV (monitor serum concentration carefully).

Geriatric patients or patients with renal or hepatic failure

Use serum concentration of the drug to adjust dosage.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	20–30 min	1 hr	48–72 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute with 10 mL of sterile water for injection, or 5% dextrose injection.

Infusion: Administer as a 10% solution over 3–5 min, single-dose infusion over 30–60 min.

Adverse effects

Systemic

- **CNS:** Headache, mild depression, mental confusion, delirium
- **GI:** Nausea, vomiting, glossitis, stomatitis, diarrhea
- **Hematologic: Blood dyscrasias**
- **Other:** Fever, macular rashes, urticaria, **anaphylaxis; gray baby syndrome** (seen in neonates and premature infants—abdominal distention, pallid cyanosis, vasomotor collapse, irregular respirations), **superinfections**

Interactions

* **Drug-drug** • Increased serum levels and drug effects of warfarin, phenytoins, tolbutamide, glipizide, glyburide, tolazamide with chloramphenicol • Decreased hematologic response to iron salts, vitamin B₁₂ with chloramphenicol • Risk of increased bone marrow suppression if taken with other drugs that suppress bone marrow

■ Nursing considerations

Assessment

- **History:** Allergy to chloramphenicol, renal or hepatic failure, G6PD deficiency, intermittent porphyria, pregnancy, lactation
- **Physical:** Culture infection; orientation, reflexes, sensation; R, adventitious sounds; bowel sounds, output, liver evaluation; urinalysis, BUN, CBC, LFTs, renal function tests

Interventions

Systemic administration

- Culture infection site before beginning therapy.

⊗ **Warning** Do not give this drug IM because it is ineffective.

⊗ **Black box warning** Monitor hematologic data carefully, especially with long-term therapy by any route of administration. Serious and fatal blood dyscrasias have occurred.

- Reduce dosage in patients with renal or hepatic disease.
- Monitor serum levels periodically as indicated in dosage section.
- Change to another antibiotic as soon as possible.

Teaching points

- This drug can only be given IV.
- You may experience these side effects: Nausea, vomiting; diarrhea (reversible); headache (request medication); confusion (avoid driving or operating machinery); superinfections (good hygiene may help; medications are available if severe).
- Report sore throat, tiredness, unusual bleeding or bruising (even as late as several weeks after you finish the drug), numbness, tingling, pain in the extremities, pregnancy; discomfort at IV site.

▷ chlordiazepoxide (metaminodiazepoxide hydrochloride)

(*klor dye az e pox' ide*)

Apo-Chlordiazepoxide (CAN),
Librium

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Anxiolytic
Benzodiazepine

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at subcortical levels of the CNS;

main sites of action may be the limbic system and reticular formation; potentiates the effects of GABA.

Indications

- Management of anxiety disorders or for short-term relief of symptoms of anxiety
- Acute alcohol withdrawal; may be useful in symptomatic relief of acute agitation, tremor, delirium tremens, hallucinosis
- Preoperative relief of anxiety and tension

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (increased risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery ("floppy infant" syndrome reported), lactation (infants may become lethargic and lose weight).
- Use cautiously with hepatic or renal impairment, debilitation and in geriatric patients who are at increased risk for mental status changes.

Available forms

Capsules—5, 10, 25 mg; powder for injection—100 mg/ampule

Dosages

Adults

Individualize dosage; increase dosage cautiously to avoid adverse effects.

Oral

- *Anxiety disorders*: 5 or 10 mg, up to 20 or 25 mg, tid–qid, depending on severity of symptoms.
- *Preoperative apprehension*: 5–10 mg tid–qid on days preceding surgery.
- *Alcohol withdrawal*: Parenteral form usually used initially. If given orally, initial dose is 50–100 mg, followed by repeated doses as needed up to 300 mg/day; then reduce to maintenance levels.

Parenteral

- *Severe anxiety*: Initially, 50–100 mg IM or IV; then 25–50 mg tid–qid if necessary, or switch to oral dosage form.

- *Preoperative apprehension*: 50–100 mg IM 1 hr prior to surgery.
- *Alcohol withdrawal*: Initially, 50–100 mg IM or IV; repeat in 2–4 hr if necessary. Up to 300 mg may be given in 6 hr; do not exceed 300 mg/24 hr.

Pediatric patients

Oral

Younger than 6 yr: Not recommended.

Older than 6 yr: Initially, 5 mg bid–qid; may be increased in some children to 10 mg bid–tid.

Parenteral

12–18 yr: 25–50 mg IM or IV.

Geriatric patients or patients with debilitating disease

5 mg PO bid–qid; 25–50 mg IM or IV.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–4 hr	48–72 hr
IM	10–15 min	15–30 min	48–72 hr
IV	Immediate	3–30 min	48–72 hr

Metabolism: Hepatic; $T_{1/2}$: 24–48 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add 5 mL sterile physiologic saline or sterile water for injection to contents of ampule; agitate gently until drug is dissolved.

Infusion: Administer IV doses slowly over 1 min. Change patients on IV therapy to oral therapy as soon as possible.

Adverse effects

- **CNS**: *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, psychomotor retardation, extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment* (especially in psychiatric patients, aggressive children, and those with high dosage), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion

- **CV:** Bradycardia, tachycardia, CV collapse, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)
- **Dermatologic:** Urticaria, pruritus, skin rash, dermatitis
- **GI:** *Constipation, diarrhea*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, hepatic impairment, jaundice
- **GU:** *Incontinence, urinary retention, changes in libido*, menstrual irregularities
- **Hematologic:** Decreased Hct, blood dyscrasias
- **Other:** Phlebitis and thrombosis at IV injection sites, hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia, pain, burning, and redness after IM injection

Interactions

- * **Drug-drug** • Increased CNS depression with alcohol, omeprazole • Increased pharmacologic effects with cimetidine, disulfiram, hormonal contraceptives • Decreased sedative effects with theophylline, aminophylline, dypyllyline, smoking
- * **Drug-alternative therapy** • Risk of increased CNS effects with kava

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; lactation; impaired hepatic or renal function, debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- ⊗ **Warning** Do not administer intrarterially; arteriospasm or gangrene may result.

- Reconstitute solutions for IM injection only with 2 mL special diluent provided; do not use diluent if it is opalescent or hazy; prepare injection immediately before use, and discard any unused solution.
- Do not use drug solutions made with physiologic saline or sterile water for injection for IM injections because of pain.
- Give IM injection slowly into upper outer quadrant of the gluteus muscle; monitor injection sites.
- Do not use small veins (dorsum of hand or wrist) for IV injection.
- Monitor P, BP, R carefully during IV administration.
- Keep patients receiving parenteral benzodiazepines in bed for 3 hr; do not permit ambulatory patients to drive following an injection.

⊗ **Warning** Reduce dosage of opioid analgesics in patients receiving IV benzodiazepines; doses should be reduced by at least one-third or totally eliminated.

- Monitor LFTs, renal function tests, and CBC at intervals during long-term therapy.

⊗ **Warning** Taper dosage gradually after long-term therapy, especially in epileptic patients.

- Advise use of barrier contraceptives; serious fetal abnormalities have been reported.

Teaching points

- Take drug exactly as prescribed.
- Do not stop taking this drug (long-term therapy) without consulting your health care provider. Avoid alcohol, sleep-inducing, or over-the-counter drugs.
- Avoid becoming pregnant while taking this drug; serious adverse effects could occur. Using barrier contraceptives is suggested.
- You may experience these side effects: Drowsiness, dizziness (transient; avoid driving or engaging in other dangerous activities); GI upset (take drug with water); depression, dreams, emotional upset, crying.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of the extremities, visual changes, difficulty voiding, smoking (can decrease effectiveness).

chloroquine phosphate

(klo' ro kwin)

Aralen Phosphate

PREGNANCY CATEGORY NOT ESTABLISHED

Drug classes

4-aminoquinoline

Amebicide

Antimalarial

Therapeutic actions

Inhibits protozoal reproduction and protein synthesis. Mechanism of anti-inflammatory action in rheumatoid arthritis is not known.

Indications

- Treatment of extraintestinal amebiasis
- Prophylaxis and treatment of acute attacks of malaria caused by susceptible strains of *Plasmodia*
- Unlabeled uses: Treatment of rheumatoid arthritis (150 mg PO daily) and discoid lupus erythematosus

Contraindications and cautions

- Contraindicated with allergy to chloroquine and other 4-aminoquinolines.
- Use cautiously with porphyria, psoriasis, retinal disease, hepatic disease, G6PD deficiency, alcoholism, lactation, pregnancy.

Available forms

Tablets—250, 500 mg

Dosages

⊗ **Warning** Dosage is often expressed as chloroquine base.

Adults

- **Amebiasis:** 1 g (600 mg base)/day PO for 2 days; then 500 mg (300 mg base)/day for 2–3 wk.
- **Malaria:** For suppression, 300 mg base PO once a week on the same day for 2 wk before exposure and continuing until 4–8 wk after exposure. For acute attack, initially 600 mg base PO; then 300 mg 6–8 hr, 24 hr,

48 hr after the initial dose for a total dose of 1.5 g in 3 days.

Pediatric patients

- **Amebiasis:** Not recommended.
- **Malaria:** For suppression, 5 mg base/kg PO once a week on the same day for 2 wk before exposure and continuing until 6–8 wk after exposure. For acute attack, 10 mg base/kg PO initially; then 5 mg base/kg 6 hr later; then third dose 18 hr later; then last dose 24 hr after third dose. Do not exceed 10 mg base/kg/day or 300 mg/base/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	1 wk

Metabolism: Hepatic; $T_{1/2}$: 70–120 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Visual disturbances*, possibly permanent retinal changes (blurring of vision, difficulty in focusing), ototoxicity, muscle weakness
- **CV:** Hypotension, ECG changes
- **Dermatologic:** Skin eruptions, pruritus, hair loss
- **GI:** *Nausea, vomiting, diarrhea*, loss of appetite, abdominal pain
- **Hematologic:** Blood dyscrasias, hemolysis in patients with G6PD deficiency

Interactions

* **Drug-drug** • Increased effects of chloroquine with cimetidine

■ Nursing considerations Assessment

- **History:** Allergy to chloroquine and other 4-aminoquinolines, porphyria, psoriasis, retinal disease, hepatic disease, G6PD deficiency, alcoholism, lactation, pregnancy
- **Physical:** Reflexes, muscle strength, auditory and ophthalmologic screening; BP, ECG; liver palpation; CBC, G6PD in deficient patients, LFTs

Interventions

- Administer with meals if GI upset occurs.
- Schedule weekly, same-day therapy on a calendar.
- ⊗ **Warning** Double check pediatric doses; children are very susceptible to overdosage.
- Arrange for ophthalmologic examinations during long-term therapy.

Teaching points

- Take full course of drug therapy. Take drug with meals if GI upset occurs. Mark your calendar with the days you should take your drug for malarial prophylaxis.
- Arrange to have regular ophthalmologic examinations if long-term use is indicated.
- You may experience these side effects: Stomach pain, loss of appetite, nausea, vomiting, or diarrhea.
- Report blurring of vision, loss of hearing, ringing in the ears, muscle weakness, fever.

chlorothiazide

(*klor ob thye' a zide*)

Diuril

chlorothiazide sodium

Sodium Diuril

PREGNANCY CATEGORY C

Drug class

Thiazide diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, increasing the excretion of sodium, chloride, and water by the kidney.

Indications

- Adjunctive therapy in edema associated with heart failure, cirrhosis, corticosteroid, and estrogen therapy, renal impairment
- Treatment of hypertension, alone or with other antihypertensives
- Unlabeled uses: Treatment of diabetes insipidus, especially nephrogenic diabetes insipidus; reduction of incidence of osteoporosis in postmenopausal women, calcium nephrolithiasis

Contraindications and cautions

- Contraindicated with anuria, renal failure, allergy to thiazide diuretics or other sulfonamide drugs, hepatic coma.
- Use cautiously with fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorder, lactation, pregnancy.

Available forms

Tablets—250, 500 mg; oral suspension—250 mg/5 mL; powder for injection—500 mg

Dosages

Note: Dosage should be individualized according to patient response, and the lowest possible dose should be used.

Adults

- **Edema:** 0.5–2 g daily PO or IV (if patient unable to take PO), daily in one or two doses.
- **Hypertension:** 0.5–2 g/day PO as a single or divided dose; adjust dosage to BP response, giving up to 2 g/day in divided doses. IV use is not recommended.

Pediatric patients

10–20 mg/kg/day PO in a single dose or two doses.

Pediatric patients 2–12 yr

375 mg–1 g PO in two divided doses.

Pediatric patients 2 yr or younger

125–375 mg PO in two divided doses.

Pediatric patients younger than 6 mo

Up to 30 mg/kg per day PO in two doses. IV use not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2 hr	3–6 hr	6–12 hr
IV	15 min	30 min	2 hr

Metabolism: $T_{1/2}$: 45–120 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute vial for parenteral solution with 18 mL sterile water for injection. Never add less than 18 mL. Discard diluted solution after 24 hr.

Infusion: Administer slowly. Switch to oral drug as soon as possible.

Compatibilities: Compatible with dextrose and sodium chloride solutions.

Incompatibilities: Do not give parenteral solution with whole blood or blood products.

Adverse effects

- **CNS:** *Dizziness, vertigo*, paresthesias, weakness, headache, drowsiness, fatigue
- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain
- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation*, jaundice, hepatitis, pancreatitis
- **GU:** *Polyuria, nocturia, impotence*, loss of libido, renal failure
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia, fluid and electrolyte imbalances
- **Other:** Muscle cramps and muscle spasms, fever, hives, gouty attacks, flushing, weight loss, rhinorrhea, electrolyte imbalances

Interactions

- *** Drug-drug** • Increased thiazide effects and chance of acute hyperglycemia with diazoxide • Decreased absorption with cholestyramine • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Increased dosage of anti-diabetics may be needed • Possible potentiation of hypotension with alcohol, opioids • Potentiation of hypokalemia with corticosteroids
- *** Drug-lab test** • Monitor for decreased PBI levels without clinical signs of thyroid disturbances

■ Nursing considerations

Assessment

- **History:** Fluid or electrolyte imbalances, renal or liver disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, manic-depressive disorders, lactation
- **Physical:** Orientation, reflexes, muscle strength; pulses, BP, orthostatic BP, perfusion, edema, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds; CBC, serum

electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

- Administer with food or milk if GI upset occurs.
- Do not administer drug IM or subcutaneously.
- Administer early in the day, so increased urination will not disturb sleep.
- Measure and record weight to monitor fluid changes.

Teaching points

- Take drug early in the day, so your sleep will not be disturbed by increased urination.
- Weigh yourself daily, and record weights.
- Protect skin from exposure to the sun or bright lights.
- Increased urination will occur; you may want to plan activities accordingly.
- You may experience these side effects: Dizziness, drowsiness, or feeling faint (use caution).
- Report rapid weight change of more than 3 pounds a day, swelling in ankles or fingers, unusual bleeding or bruising, muscle cramps.

▽ chlorpheniramine maleate

(*klor fen ir' a meen mal' ee ate*)

Aller-Chlor; Allergy; Allergy Relief; Chlo-Amine; Chlor-Trimeton Allergy 4 hr, 8 hr, and 12 hr; ED-CHLOR-TAN **OND**; Efidac 24 **OND**; QDALL-AR **OND**

PREGNANCY CATEGORY B

Drug class

Antihistamine (alkylamine type)

Therapeutic actions

Competitively blocks the effects of histamine at H₁-receptor sites; has atropine-like, antipruritic, and sedative effects.

Indications

- Symptomatic relief of symptoms associated with perennial and seasonal allergic rhinitis; vasomotor rhinitis; common cold; allergic conjunctivitis

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, third trimester of pregnancy, lactation.
- Use cautiously in pregnancy, geriatric patients.

Available forms

Chewable tablets—2 mg; tablets—4 mg; ER tablets **onc**—8, 12, 16 mg; syrup—2 mg/5 mL; SR capsules **onc**—8, 12 mg, ER capsules **onc**—12 mg; caplets—8 mg

Dosages

Adults and children older than 12 yr

Tablets or syrup

4 mg PO every 4–6 hr; do not exceed 24 mg in 24 hr.

SR

8–12 mg PO at bedtime or every 8–12 hr during the day; do not exceed 24 mg in 24 hr.

ER (Efidac 24)

16 mg with liquid PO every 24 hr.

ER capsules

12 mg/day PO; do not exceed 24 mg/day.

Caplets

8–12 mg/day PO every 12 hr.

Pediatric patients

Tablets or syrup

Age 2–younger than 6 yr: 1 mg every 4–6 hr PO; do not exceed 4 mg in 24 hr.

6–12 yr: 2 mg every 4–6 hr PO; do not exceed 12 mg in 24 hr.

SR

Younger than 6 yr: Not recommended.

6–12 yr: 8 mg PO at bedtime or during the day.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak
Oral	0.5–6 hr	2–6 hr

Metabolism: Hepatic; $T_{1/2}$: 12–15 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, disturbed coordination*, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, hysteria, tingling, heaviness and weakness of the hands
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress*, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea, or constipation
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido, impotence
- **Hematologic:** Hemolytic anemia, aplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia
- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal stuffiness, dry mouth, dry nose, dry throat, sore throat
- **Other:** Urticaria, rash, anaphylactic shock, photosensitivity, excessive perspiration, chills

Interactions

★ **Drug-drug** • Increased depressant effects with alcohol, other CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergy to any antihistamines; narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, pregnancy, lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Administer with food if GI upset occurs.
- Caution patient not to crush or chew SR or ER preparations.
- Arrange for periodic blood tests during prolonged therapy.

Teaching points

- Take as prescribed; avoid excessive dosage. Take with food if GI upset occurs; do not cut, crush, or chew the sustained-release or extended-release preparations.
- Avoid over-the-counter drugs; many contain ingredients that could cause serious reactions if taken with this antihistamine.
- Avoid alcohol; serious sedation may occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); epigastric distress, diarrhea, or constipation (take with meals; consult your health care provider if severe); dry mouth (frequent mouth care, sucking sugarless lozenges may help); thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier).
- Report difficulty breathing; hallucinations, tremors, loss of coordination; unusual bleeding or bruising; visual disturbances; irregular heartbeat.

chlorpromazine hydrochloride

(*klor proe' ma zeen*)

Novo-Chlorpromazine (CAN)

PREGNANCY CATEGORY C

Drug classes

Antiemetic
Antipsychotic
Anxiolytic
Dopaminergic blocker
Phenothiazine

Therapeutic actions

Mechanism not fully understood; antipsychotic drugs block postsynaptic dopamine receptors in the brain; depress those parts of the brain involved with wakefulness and emesis; anti-

cholinergic, antihistaminic (H_1), and alpha-adrenergic blocking.

Indications

- Management of manifestations of psychotic disorders; control of manic phase of manic-depressive illness
- Relief of preoperative restlessness and apprehension
- Adjunct in treatment of tetanus
- Acute intermittent porphyria therapy
- Severe behavioral problems in children
- Therapy for combativeness, hyperactivity
- Control of nausea and vomiting and intractable hiccups

Contraindications and cautions

- Contraindicated with allergy to chlorpromazine, comatose or severely depressed states, bone marrow depression, circulatory collapse, subcortical brain damage, Parkinson's disease, liver damage, cerebral or coronary arteriosclerosis, severe hypotension or hypertension.
- Use cautiously with respiratory disorders; glaucoma; epilepsy or history of epilepsy; peptic ulcer or history of peptic ulcer; decreased renal function; prostate hypertrophy; breast cancer; thyrotoxicosis; myelography within 24 hr or scheduled within 48 hr; lactation; exposure to heat, phosphorous insecticides; children with chickenpox, CNS infections (makes children more susceptible to dystonias, confounding the diagnosis of Reye's syndrome or other encephalopathy; antiemetic effects of drug may mask symptoms of Reye's syndrome, encephalopathies).

Available forms

Tablets—10, 25, 50, 100, 200 mg; suppository—100 mg; injection—25 mg/mL

Dosages

Full clinical antipsychotic effects may require 6 wk to 6 mo of therapy.

Adults

- *Excessive anxiety, agitation in psychiatric patients:* 25 mg IM; may repeat in 1 hr with 25–50 mg IM. Increase dosage gradually in inpatients, up to 400 mg every 4–6 hr. Switch to oral dosage as soon as possible, 25–50 mg

PO tid for outpatients; up to 2,000 mg/day PO for inpatients. Initial oral dosage, 10 mg tid–qid PO or 25 mg PO bid–tid; increase daily dosage by 20–50 mg semiweekly until optimum dosage is reached (maximum response may require months); doses of 200–800 mg/day PO are not uncommon in discharged mental patients.

- **Surgery:** Preoperatively, 25–50 mg PO 2–3 hr before surgery or 12.5–25 mg IM 1–2 hr before surgery; intraoperatively, 12.5 mg IM, repeated in 30 min or 2 mg IV repeated every 2 min up to 25 mg total to control vomiting (if no hypotension occurs); postoperatively, 10–25 mg PO every 4–6 hr or 12.5–25 mg IM repeated in 1 hr (if no hypotension occurs).
- **Acute intermittent porphyria:** 25–50 mg PO or 25 mg IM tid–qid until patient can take oral therapy.
- **Tetanus:** 25–50 mg IM tid–qid, usually with barbiturates, or 25–50 mg IV diluted and infused at rate of 1 mg/min.
- **Antiemetic:** 10–25 mg PO every 4–6 hr; 50–100 mg rectally every 6–8 hr; 25 mg IM. If no hypotension, give 25–50 mg every 3–4 hr. Switch to oral dose when vomiting ends.
- **Intractable hiccups:** 25–50 mg PO tid–qid. If symptoms persist for 2–3 days, give 25–50 mg IM; if inadequate response, give 25–50 mg IV in 500–1,000 mL of saline with BP monitoring and administer to patient flat in bed.

Pediatric patients 6 mo–12 yr

Generally not used in children younger than 6 mo.

- **Psychiatric outpatients:** 0.5 mg/kg PO every 4–6 hr; 1 mg/kg rectally every 6–8 hr; 0.5 mg/kg IM every 6–8 hr, not to exceed 40 mg/day (up to 5 yr) or 75 mg/day (5–12 yr).
- **Surgery:** Preoperatively, 0.5 mg/kg PO 2–3 hr before surgery or 0.5 mg/kg IM 1–2 hr before surgery; intraoperatively, 0.25 mg/kg IM or 1 mg (diluted) IV, repeated at 2-min intervals up to total IM dose; postoperatively, 0.5 mg/kg PO every 4–6 hr or 0.5 mg/kg IM, repeated in 1 hr if no hypotension.
- **Psychiatric inpatients:** 50–100 mg/day PO; maximum of 40 mg/day IM for children up to 5 yr; maximum of 75 mg/day IM for children 5–12 yr.

- **Tetanus:** 0.5 mg/kg IM every 4–6 hr or 0.5 mg/min IV, not to exceed 40 mg/day for children up to 23 kg; 75 mg/day for children 23–45 kg.
- **Antiemetic:** 0.55 mg/kg PO every 4–6 hr; 1.1 mg/kg rectally every 6–8 hr or 0.55 mg/kg IM every 6–8 hr. Maximum IM dosage, 40 mg/day for children up to 5 yr or 75 mg/day for children 5–12 yr.

Geriatric patients

Start dosage at one-fourth to one-third that given in younger adults and increase more gradually.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2–4 hr	4–6 hr
IM	10–15 min	15–20 min	4–6 hr

Metabolism: Hepatic, $T_{1/2}$: 2 hr, then 30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute drug for IV injection to a concentration of 1 mg/mL or less.

Injection: Reserve IV injections for hiccups, tetanus, or use during surgery. Administer at a rate of 1 mg/min for adults, 0.5 mg/min for children.

Incompatibilities: Precipitate or discoloration may occur when mixed with morphine, meperidine, cresols.

Adverse effects

- **CNS:** *Drowsiness*, insomnia, *vertigo*, headache, weakness, tremors, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, *extrapyramidal syndromes*, **neuroleptic malignant syndrome**, tardive dyskinesia
- **CV:** *Hypotension*, *orthostatic hypotension*, hypertension, tachycardia, bradycardia, cardiac arrest, heart failure, cardiomegaly, refractory arrhythmias, pulmonary edema
- **EENT:** Nasal congestion, glaucoma, *photophobia*, *blurred vision*, miosis, mydriasis, deposits in the cornea and lens, pigmentary retinopathy

- **Endocrine:** Lactation; breast engorgement in females; galactorrhea; SIADH; amenorrhea; menstrual irregularities; gynecomastia; changes in libido; hyperglycemia; inhibition of ovulation; infertility; pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, and progestins
- **GI:** *Dry mouth, salivation, nausea, vomiting, anorexia, constipation*, paralytic ileus, incontinence
- **GU:** *Urinary retention*, polyuria, incontinence, priapism, ejaculation inhibition, male impotence, urine discolored pink to red-brown
- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia, **aplastic anemia**, hemolytic anemia, thrombocytopenic or nonthrombocytopenic purpura, pancytopenia, elevated serum cholesterol
- **Hypersensitivity:** Jaundice, *urticaria*, angioneurotic edema, laryngeal edema, photosensitivity, eczema, asthma, anaphylactoid reactions, exfoliative dermatitis, contact dermatitis
- **Respiratory:** **Bronchospasm, laryngospasm**, dyspnea, suppression of cough reflex and potential aspiration
- **Other:** Fever, heatstroke, pallor, flushed facies, sweating, *photosensitivity*

Interactions

- * **Drug-drug** • Additive anticholinergic effects and possibly decreased antipsychotic efficacy with anticholinergic drugs • Additive CNS depression, hypotension if given preoperatively with barbiturate anesthetics, alcohol, meperidine • Additive effects of both drugs if taken concurrently with beta blockers • Increased risk of tachycardia, hypotension with epinephrine, norepinephrine
- * **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used) • Increase in protein-bound iodine, not attributable to an increase in thyroxine • False positive on PKU test

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between chlorpromazine, chlorpropamide, and clomipramine; use caution.

Assessment

- **History:** Allergy to chlorpromazine; comatose or severely depressed states; bone marrow depression; circulatory collapse; subcortical brain damage, Parkinson's disease; liver damage; cerebral or coronary arteriosclerosis; severe hypotension or hypertension; respiratory disorders; glaucoma; epilepsy or history of epilepsy; peptic ulcer or history of peptic ulcer; decreased renal function; prostate hypertrophy; breast cancer; thyrotoxicosis; myelography within 24 hr or scheduled within 48 hr; lactation; exposure to heat, phosphorous insecticides; children with chickenpox; CNS infections
- **Physical:** T, weight; skin color, turgor; reflexes, orientation, IOP, ophthalmologic examination; P, BP, orthostatic BP, ECG; R, adventitious sounds; bowel sounds, normal output, liver evaluation; prostate palpation, normal urine output; CBC; urinalysis; thyroid, LFTs, renal function tests; EEG

Interventions

- Do not give by subcutaneous injection; give slowly by deep IM injection into upper outer quadrant of buttock.
- Keep patient recumbent for 30 min after injection to avoid orthostatic hypotension.
- If giving drug via continuous infusion for intractable hiccups, keep patient flat in bed during infusion and monitor BP.
- Avoid skin contact with parenteral drug solutions due to possible contact dermatitis.
- Patient or the patient's guardian should be advised about the possibility of tardive dyskinesias.
- ⊗ **Warning** Be alert to potential for aspiration because of suppressed cough reflex.
- Monitor renal function tests; discontinue if serum creatinine or BUN becomes abnormal.
- Monitor CBC; discontinue if WBC count is depressed.
- Consult with physician about dosage reduction or use of anticholinergic antiparkinsonian drugs (controversial) if extrapyramidal effects occur.
- Withdraw drug gradually after high-dose therapy; possible gastritis, nausea, dizziness,

headache, tachycardia, insomnia after abrupt withdrawal.

- Monitor elderly patients for dehydration; sedation and decreased sensation of thirst; CNS effects can lead to dehydration, hemoconcentration, and reduced pulmonary ventilation; promptly institute remedial measures.
- Avoid epinephrine as vasopressor if drug-induced hypotension occurs.

Teaching points

- Take drug exactly as prescribed. Avoid over-the-counter drugs and alcohol unless you have consulted your health care provider.
- Use caution in hot weather; risk of heatstroke; keep up fluid intake, and do not overexercise in a hot climate.
- You may experience these side effects: Drowsiness (avoid driving or operating dangerous machinery; avoid alcohol, which increases drowsiness); sensitivity to the sun (avoid prolonged sun exposure, wear protective garments or use a sunscreen); pink or reddish brown urine (expected effect); faintness, dizziness (change position slowly; use caution climbing stairs; usually transient).
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine, pale stools, yellowing of the skin and eyes.

▼ chlorproPAMIDE

See Appendix U, *Less commonly used drugs*.

▼ chlorthalidone

(*klor thal' i done*)

Apo-Chlorthalidone (CAN),
Thalitone

PREGNANCY CATEGORY B

Drug class

Thiazide-like diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, increasing excretion of sodium, chloride, and water by the kidney.

Indications

- Adjunctive therapy in edema associated with heart failure, cirrhosis, corticosteroid and estrogen therapy, renal impairment
- Hypertension, alone or with other antihypertensives

Contraindications and cautions

- Contraindicated with anuria, renal failure, allergy to any thiazides or sulfonamides, hepatic coma.
- Use cautiously with fluid or electrolyte imbalances, renal or hepatic disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, manic-depressive disorders, lactation, pregnancy.

Available forms

Tablets—15, 25, 50, 100 mg

Dosages

Adults

- *Edema*: 30–60 mg/day PO or 60 mg every other day; up to 120 mg/day.
- *Hypertension*: Initiate with 15 mg/day; if response is insufficient, increase to 30 mg/day, then 45–50 mg/day PO. Add a second antihypertensive if additional control is needed based on patient response. Increases in serum uric acid and decreases in serum potassium are dose-related over the 15- to 50-mg/day range and beyond.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2–3 hr	2–6 hr	24–72 hr

Metabolism: Eliminated primarily as unchanged drug; $T_{1/2}$: 40–60 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, vertigo*, paresthesias, weakness, headache, drowsiness, fatigue
- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain

- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis
- **GI:** *Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation*, jaundice, hepatitis, pancreatitis
- **GU:** *Polyuria, nocturia, impotence*, loss of libido
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia, fluid and electrolyte imbalances
- **Other:** Muscle cramps and muscle spasms, fever, hives, gouty attacks, flushing, weight loss

Interactions

- * **Drug-drug** • Increased thiazide effects and chance of acute hyperglycemia with diazoxide • Decreased absorption with cholestyramine, colestipol • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Increased dosage of antidiabetics may be needed
- * **Drug-lab test** • Decreased PBI levels without clinical signs of thyroid disturbances

■ Nursing considerations

Assessment

- **History:** Fluid or electrolyte imbalances, renal or hepatic disease, gout, SLE, glucose tolerance abnormalities, hyperparathyroidism, bipolar disorder, lactation, allergy to thiazides or sulfonamides, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, muscle strength; pulses, BP, orthostatic BP, perfusion, edema, baseline ECG; R, adventitious sounds; liver evaluation, bowel sounds; CBC, serum electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

- ⊗ **Warning** Differentiate between *Thalitone* and other preparations; dosage varies.
- Give with food or milk if GI upset occurs.
- Administer early in the day, so increased urination will not disturb sleep.
- Mark calendars or other reminders of drug days for outpatients on every other day or 3-to 5-day/wk therapy.
- Measure and record weight to monitor fluid changes.

Teaching points

- Take drug early in the day, so your sleep will not be disturbed by increased urination.
- Weigh yourself daily, and record weights.
- Protect skin from exposure to the sun or bright lights.
- Increased urination will occur.
- You may experience these side effects: Dizziness, drowsiness, feeling faint (use caution).
- Report rapid weight change, swelling in ankles or fingers, unusual bleeding or bruising, muscle cramps.

▼ chlorzoxazone

(*klor zox' a zone*)

Paraflex, Parafon Forte DSC, Remular-S

PREGNANCY CATEGORY C

Drug class

Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Precise mechanism not known; has sedative properties; acts at spinal and supraspinal levels of the CNS to depress reflex arcs involved in producing and maintaining skeletal muscle spasm.

Indications

- Relief of discomfort associated with acute, painful musculoskeletal conditions, adjunct to rest, physical therapy, and other measures

Contraindications and cautions

- Contraindicated with allergic or idiosyncratic reactions to chlorzoxazone.
- Use cautiously with history of allergies or allergic drug reactions, lactation, pregnancy.

Available forms

Tablets—250, 500 mg

Dosages

Adults

Usual dose, 250 mg PO tid–qid; painful conditions may require 500 mg PO tid–qid; may

increase to 750 mg tid–qid; reduce dosage as improvement occurs.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1–2 hr	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: 60 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, light-headedness, drowsiness*, malaise, overstimulation
- **GI:** *GI disturbances*, GI bleeding (rare)
- **GU:** Urine discoloration (orange to purple-red)
- **Hypersensitivity:** Rashes, petechiae, ecchymoses, angioneurotic edema, **anaphylaxis** (rare)

Interactions

★ **Drug-drug** • Additive CNS effects with alcohol, other CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergic or idiosyncratic reactions to chlorzoxazone; history of allergies or allergic drug reactions; lactation, pregnancy
- **Physical:** Skin color, lesions; orientation; liver evaluation; LFTs

Interventions

⊗ **Warning** Discontinue if signs or symptoms of hepatic impairment or allergic reaction (urticaria, redness, or itching) occur.

- Institute rest, physical therapy, and other measures to relieve discomfort.

Teaching points

- Take this drug exactly as prescribed; do not take a higher dosage.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- You may experience these side effects: Drowsiness, dizziness, light-headedness (avoid driving or engaging in activities that require

alertness); nausea (take with food and eat frequent small meals); discolored urine (expected effect).

- Report rash, severe nausea, coffee-ground vomitus, black or tarry stools, pale stools, yellow skin or eyes, difficulty breathing.

▽ cholestyramine (*koe less' tir a meen*)

Cholestyramine Light,
PMS-Cholestyramine (CAN), Prevalite,
Questran, Questran Light

PREGNANCY CATEGORY C

Drug classes

Antihyperlipidemic
Bile acid sequestrant

Therapeutic actions

Binds bile acids in the intestine, allowing excretion in the feces; as a result, cholesterol is oxidized in the liver to replace the bile acids lost; serum cholesterol and LDL are lowered.

Indications

- Adjunctive therapy: Reduction of elevated serum cholesterol in patients with primary hypercholesterolemia (elevated LDL)
- Pruritus associated with partial biliary obstruction
- Unlabeled uses: Antibiotic-induced pseudomembranous colitis, treatment of thyroid hormone overdose, treatment of digitalis toxicity, treatment of certain diarrheas including *Clostridium difficile* (binds to toxins in the intestine), hyperoxaluria

Contraindications and cautions

- Contraindicated with allergy to bile acid sequestrants, tartrazine (tartrazine sensitivity occurs often with allergies to aspirin); complete biliary obstruction.
- Use cautiously with abnormal intestinal function, pregnancy, lactation.

Available forms

Powder for suspension—4 g/5.5, 5.7, 6.4, or 9 g powder

Dosages**Adults**

Initially, 4 g one to two times per day PO. In patients with constipation, start with 4 g once/day. Individualize dose based on response. For maintenance, 8–16 g/day divided into two doses. Increase dose gradually with periodic assessment of lipid/lipoprotein levels at intervals of at least 4 wk. Maximum dose 6 packets or scoopfuls. May be administered 1–6 doses/day. Dosage may be as high as 36 g every day.

Pediatric patients

240 mg/kg/day in 2–3 divided doses, not to exceed 8 g/day. Dose is based on anhydrous cholestyramine resin. Optimal dose schedule has not been established.

Pharmacokinetics

Not absorbed systemically

Excretion: Feces

Adverse effects

- **CNS:** Headache, anxiety, vertigo, dizziness, fatigue, syncope, drowsiness
- **Dermatologic:** Rash and irritation of skin, tongue, perianal area
- **GI:** *Constipation to fecal impaction, exacerbation of hemorrhoids*, abdominal cramps, pain, flatulence, anorexia, heartburn, nausea, vomiting, steatorrhea
- **GU:** Hematuria, dysuria, diuresis
- **Hematologic:** *Increased bleeding tendencies related to vitamin K malabsorption*, vitamins A and D deficiencies, reduced serum and red cell folate, hyperchloremic acidosis
- **Other:** Osteoporosis, backache, muscle and joint pain, arthritis, fever

Interactions

★ **Drug-drug** • Decreased or delayed absorption with warfarin, thiazide diuretics, digitalis preparations, thyroid, corticosteroids

- Malabsorption of fat-soluble vitamins with cholestyramine

■ Nursing considerations**Assessment**

- **History:** Allergy to bile acid sequestrants, tartrazine; complete biliary obstruction; abnormal intestinal function; lactation, pregnancy

- **Physical:** Skin lesions, color, T; orientation, affect, reflexes; P; auscultation, baseline ECG, peripheral perfusion; liver evaluation, bowel sounds; lipid studies, LFTs, clotting profile

Interventions

- Mix contents of one packet or one level scoop of powder with 2–6 fluid oz of beverage (water, milk, fruit juices, noncarbonates), highly fluid soup, pulpy fruits (applesauce, pineapple); do not give drug in dry form.
- Administer drug before meals.
- ⊗ **Warning** Monitor intake of other oral drugs due to risk of binding in the intestine and delayed or decreased absorption, give oral medications 1 hr before or 4–6 hr after the cholestyramine.
- Alert patient about potentially high cost of drug.

Teaching points

- Take drug before meals; do not take the powder in the dry form; mix one packet or one scoop with 2–6 ounces of fluid—water, milk, juice, noncarbonated drinks, highly fluid soups, cereals, pulpy fruits such as applesauce or pineapple.
- Take other medications 1 hour before or 4–6 hours after cholestyramine.
- You may experience these side effects: Constipation (ask about measures that may help); nausea, heartburn, loss of appetite (eat frequent small meals); dizziness, drowsiness, vertigo, fainting (avoid driving and operating dangerous machinery); headache, muscle and joint aches and pains (may lessen with time).
- Report unusual bleeding or bruising, severe constipation, severe GI upset, chest pain, difficulty breathing, rash, fever.

choline magnesium trisalicylate

See Appendix U, *Less commonly used drugs.*

▷ chorionic gonadotropin (human chorionic gonadotropin, HCG)

(kor e awn ick
goe nad' ob troe pin)

Choron 10, Gonic, Novarel, Pregnyl, Profasi

PREGNANCY CATEGORY X

Drug class

Hormone

Therapeutic actions

A human placental hormone with actions identical to pituitary LH; stimulates production of testosterone and progesterone.

Indications

- Prepubertal cryptorchidism not due to anatomic obstruction
- Treatment of selected cases of hypogonadotropic hypogonadism in males
- Induction of ovulation in the anovulatory, infertile woman in whom the cause of anovulation is secondary and not due to primary ovarian failure and who has been pretreated with human menopausal gonadotropin

Contraindications and cautions

- Contraindicated with known sensitivity to chorionic gonadotropin, precocious puberty, prostatic carcinoma or androgen-dependent neoplasm, pregnancy.
- Use cautiously with epilepsy, migraine, asthma, cardiac or renal disease, lactation.

Available forms

Powder for injection—5,000, 10,000, 20,000 units/vial with 10 mL diluent

Dosages

Patients older than 4 yr

For IM use only; individualize dosage; the following dosage regimens are suggested:

- *Prepubertal cryptorchidism not due to anatomic obstruction*: 4,000 USP units IM, three times per week for 3 wk; 5,000 USP units IM, every second day for 4 injections;

15 injections of 500–1,000 USP units over 6 wk; 500 USP units three times per week for 4–6 wk; if not successful, start another course 1 mo later, giving 1,000 USP units/injection.

- *Hypogonadotropic hypogonadism in males*: 500–1,000 USP units, IM three times per week for 3 wk; followed by the same dose twice a week for 3 wk; 1,000–2,000 USP units IM three times per week; 4,000 USP units three times per week for 6–9 mo; reduce dosage to 2,000 USP units three times per week for an additional 3 mo.
- *Induction of ovulation and pregnancy*: 5,000–10,000 units IM, 1 day following the last dose of menopausal gonadotropin.

Pediatric patients

Safety and efficacy in children younger than 4 yr have not been established.

Pharmacokinetics

Route	Onset	Peak
IM	2 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 23 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, irritability, restlessness, depression, fatigue
- **CV:** Edema, arterial thromboembolism
- **Endocrine:** Precocious puberty, gynecomastia, ovarian hyperstimulation (sudden ovarian enlargement, ascites, rupture of ovarian cysts, multiple births)
- **Other:** Pain at injection site, ovarian malignancy

■ Nursing considerations

Assessment

- **History:** Sensitivity to chorionic gonadotropin, precocious puberty, prostatic carcinoma or androgen-dependent neoplasm, epilepsy, migraine, asthma, cardiac or renal disease, lactation, pregnancy
- **Physical:** Skin texture, edema; prostate examination; injection site; sexual development; orientation, affect, reflexes; R, adventitious sounds; P, auscultation, BP, peripheral edema; liver evaluation; renal function tests

Interventions

⊗ **Black box warning** Be aware that this drug has no known effect on fat metabolism and is not for treatment of obesity.

- Prepare solution for injection using manufacturer's instructions; brand and concentrations vary.

⊗ **Warning** Discontinue at any sign of ovarian overstimulation, and have patient admitted to the hospital for observation and supportive measures.

- Provide comfort measures for CNS effects, pain at injection site.

Teaching points

- This drug can only be given IM. Prepare a calendar with a treatment schedule.
- You may experience these side effects: Headache, irritability, restlessness, depression, fatigue (reversible; if uncomfortable, consult your health care provider).
- Report pain at injection site, severe headache, restlessness, swelling of ankles or fingers, difficulty breathing, severe abdominal pain.

▷ chorionic gonadotropin alfa

See Appendix U, *Less commonly used drugs*.

▷ cidofovir

See Appendix U, *Less commonly used drugs*.

▷ cilostazol (sill *abs'* tab zoll)

Pletal

PREGNANCY CATEGORY C

Drug class

Antiplatelet

Therapeutic actions

Reversibly inhibits platelet aggregation induced by a variety of stimuli including ADP, thrombin, collagen, shear stress, epinephrine,

and arachidonic acid by inhibiting cAMP phosphodiesterase III; produces vascular dilation in vascular beds with a specificity for femoral beds; seems to have no effect on renal arteries.

Indications

- Reduction of symptoms of intermittent claudication allowing increased walking distance

Contraindications and cautions

- Contraindicated with allergy to cilostazol, heart failure of any severity (decreased survival rates have occurred), active bleeding, hemostatic disorders.
- Use cautiously with pregnancy, lactation, renal dysfunction.

Available forms

Tablets—50, 100 mg

Dosages

Adults

100 mg PO bid taken at least 30 min before or 2 hr after breakfast and dinner. Response may not be noted for 2–4 wk and may take up to 12 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Gradual	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 11–13 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, headaches*
- **CV:** Heart failure, tachycardia, *palpitations*
- **GI:** *Diarrhea, nausea, flatulence, dyspepsia*
- **Respiratory:** Cough, pharyngitis, *rhinitis*
- **Other:** Peripheral edema, infection, back pain

Interactions

* **Drug-drug** • Increased serum levels and risk of toxic effects of cilostazol if combined

with macrolide antibiotics, diltiazem, azole antifungals (itraconazole, ketoconazole), or omeprazole; if this combination is used, consider decreasing cimetidazole dose to 50 mg bid and monitor patient closely • Smoking decreased cimetidazole exposure by 20%

• **Drug-food** • Increased absorption if taken with high-fat meal; administer drug at least 30 min before or 2 hr after meals • Increased serum levels and risk of adverse effects if combined with grapefruit juice; avoid grapefruit juice if taking this drug

■ Nursing considerations

Assessment

- **History:** Allergy to cimetidazole, heart failure, lactation, CV disorders, pregnancy
- **Physical:** Skin color, lesions; orientation; bowel sounds, normal output; P, BP; R, adventitious sounds; CBC, LFTs, renal function tests

Interventions

⊗ **Black box warning** Do not administer to patients with heart failure; decreased survival has been reported.

- Administer drug on an empty stomach, at least 30 min before or 2 hr after breakfast and dinner.
- Encourage patient to avoid the use of grapefruit juice.
- Establish baseline walking distance to monitor drug effectiveness.

⊗ **Warning** Establish safety precautions to prevent injury and bleeding (eg, tell patient to use an electric razor, avoid contact sports).

- Advise patient to use barrier contraceptives while receiving this drug; potentially, it could harm the fetus.
- Encourage patient to continue therapy; results may not be seen for 2–4 wk and in some cases may take up to 12 wk.
- Advise patient that the CV risks associated with this drug are not known; potentially serious CV effects have occurred in laboratory animals but drug has been successfully used in patients with CAD.

Teaching points

- Take drug on an empty stomach at least 30 minutes before or 2 hours after breakfast and dinner.

- Avoid drinking grapefruit juice while you are taking this drug.
- The therapeutic effects of this drug may not be seen for 2–4 weeks and may take up to 12 weeks.
- Avoid pregnancy while taking this drug; it could potentially harm the fetus. Use barrier contraceptives; notify your health care provider immediately if you think you are pregnant.
- You may experience these side effects: Upset stomach, nausea, diarrhea, loss of appetite (eat frequent small meals).
- Report fever, chills, sore throat, palpitations, chest pain, edema or swelling, difficulty breathing, fatigue, bleeding, or bruising.

▷ cimetidine

(*sye met' i deen*)

Apo-Cimetidine (CAN), Gen-Cimetidine (CAN), Nu-Cimet (CAN), Tagamet, Tagamet HB, Tagamet HB Suspension

PREGNANCY CATEGORY B

Drug class

Histamine₂ (H₂) antagonist

Therapeutic actions

Inhibits the action of histamine at the H₂ receptors of the stomach, inhibiting gastric acid secretion and reducing total pepsin output.

Indications

- Short-term treatment and maintenance of active duodenal ulcer
- Short-term treatment of benign gastric ulcer
- Treatment of pathologic hypersecretory conditions (Zollinger-Ellison syndrome)
- Prophylaxis of stress-induced ulcers and acute upper GI bleeding in critical patients
- Treatment of erosive GERD
- OTC use: Relief of symptoms of heartburn, acid indigestion, sour stomach
- Unlabeled uses: Part of multidrug regimen for *Helicobacter pylori*; urticaria, warts, interstitial cystitis

Contraindications and cautions

- Contraindicated with allergy to cimetidine.
- Use cautiously with impaired renal or hepatic function, lactation, pregnancy.

Available forms

Tablets—200, 300, 400, 800 mg; liquid—300 mg/5 mL; injection—150 mg/mL; injection premixed—300 mg/50 mL

Dosages**Adults**

- *Active duodenal ulcer*: 800 mg PO at bedtime or 300 mg PO qid with meals and at bedtime or 400 mg PO bid; continue for 4–6 wk unless healing is demonstrated by endoscopy. For intractable ulcers, 300 mg IM or IV every 6–8 hr.
- *Maintenance therapy for duodenal ulcer*: 400 mg PO at bedtime.
- *Active benign gastric ulcer*: 300 mg PO qid with meals and at bedtime or 800 mg at bedtime. Treat for 8 wk.
- *Pathologic hypersecretory syndrome*: 300 mg PO qid with meals and at bedtime, or 300 mg IV or IM every 6 hr. Individualize doses as needed; do not exceed 2,400 mg/day.
- *Erosive GERD*: 1,600 mg PO in divided doses bid–qid for 12 wk.
- *Prevention of upper GI bleeding*: Continuous IV infusion of 50 mg/hr. Do not treat beyond 7 days.
- *Heartburn, acid indigestion*: 200 mg as symptoms occur; up to 4 tablets/24 hr. Do not take maximum dose for more than 2 wk.

Pediatric patients

Not recommended for children younger than 12 yr.

Geriatric patients or patients with impaired renal function

Accumulation may occur. Use lowest dose possible, 300 mg PO or IV every 12 hr; may be increased to every 8 hr if patient tolerates it and levels are monitored; if creatinine clearance is less than 30 mL/min, give 25 mg/hr IV for prevention of upper GI bleed.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–1.5 hr
IV, IM	Rapid	1–1.5 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: For IV injections, dilute in 0.9% sodium chloride injection, 5% or 10% dextrose injection, lactated Ringer's solution, 5% sodium bicarbonate injection to a volume of 20 mL. Solution is stable for 48 hr at room temperature. For IV infusions, dilute 300 mg in at least 50 mL of 5% dextrose injection or one of above listed solutions.

Infusion: Inject by direct injection over not less than 5 min; by infusion, slowly over 15–20 min.

Incompatibilities: Incompatible with aminophylline, barbiturate in IV solutions; pentobarbital sodium and pentobarbital sodium and atropine in the same syringe.

Adverse effects

- **CNS**: *Dizziness, somnolence, headache, confusion, hallucinations*, peripheral neuropathy; symptoms of brain stem dysfunction (dysarthria, ataxia, diplopia)
- **CV**: Cardiac arrhythmias, **cardiac arrest**, hypotension (IV use)
- **GI**: *Diarrhea*
- **Hematologic**: Increases in plasma creatinine, serum samnaminase
- **Other**: *Impotence* (reversible), gynecomastia (in long-term treatment), rash, vasculitis, pain at IM injection site

Interactions

★ **Drug-drug** • Increased risk of decreased white blood cell counts with antimetabolites, alkylating agents, other drugs known to cause neutropenia • Increased serum levels and risk of toxicity of warfarin-type anticoagulants, phenytoin, beta-adrenergic blocking agents, alcohol, quinidine, lidocaine, theophylline, chloroquine, certain benzodiazepines (alpra-

zolam, chlordiazepoxide, diazepam, flurazepam, triazolam), nifedipine, pentoxifylline, TCAs, procainamide, carbamazepine when taken with cimetidine

■ Nursing considerations

Assessment

- **History:** Allergy to cimetidine, impaired renal or hepatic function, lactation
- **Physical:** Skin lesions; orientation, affect; pulse, baseline ECG (continuous with IV use); liver evaluation, abdominal examination, normal output; CBC, LFTs, renal function tests

Interventions

- Give drug with meals and at bedtime.
- Decrease doses in patients with renal and hepatic impairment.
- Administer IM dose undiluted deep into large muscle group.
- Arrange for regular follow-up, including blood tests to evaluate effects.

Teaching points

- Take drug with meals and at bedtime; therapy may continue for 4–6 weeks or longer.
- Take antacids as prescribed and at recommended times.
- Inform your health care provider about your cigarette smoking habits. Cigarette smoking decreases the drug's effectiveness.
- Have regular medical follow-up care to evaluate your response to drug.
- Tell your health care providers about all medications, over-the-counter drugs, or herbs you take; this drug may interact with many of these.
- Report sore throat, fever, unusual bruising or bleeding, tarry stools, confusion, hallucinations, dizziness, muscle or joint pain.

cinacalcet hydrochloride

(*sin ab kal' set*)

Sensipar OND

PREGNANCY CATEGORY C

Drug classes

Calcimimetic

Calcium-lowering drug

Therapeutic actions

Increases the sensitivity to extracellular calcium of the calcium-sensing receptors on the surface of the chief cell of the parathyroid gland, resulting in a decrease in parathyroid hormone secretion. The drop in parathyroid hormone level leads to a decrease in serum calcium levels.

Indications

- Secondary hyperparathyroidism in patients receiving dialysis for chronic renal disease
- Treatment of hypercalcemia in patients with parathyroid carcinoma

Contraindications and cautions

- Contraindicated with allergy to any component of the drug, lactation.
- Use cautiously with a history of seizure disorders, moderate to severe hepatic impairment, pregnancy.

Available forms

Tablets OND—30, 60, 90 mg

Dosages

Adults

- *Secondary hyperparathyroidism:* 30 mg/day PO; monitor serum calcium and phosphorous levels within 1 wk after starting therapy and intact parathyroid hormone levels within 1–4 wk of starting therapy to adjust dosage to therapeutic level. May increase dose 30 mg every 2–4 wk to a maximum dose of 180 mg/day. May be combined with vitamin D and phosphate binders.
- *Hypercalcemia associated with parathyroid carcinoma:* Initially 30 mg PO bid to maintain calcium levels within a normal range; may adjust dosage every 2–4 wk in sequential dosages of 60 mg bid, then 90 mg bid to a maximum dosage of 90 mg tid to qid.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–6 hr

Metabolism: Hepatic; $T_{1/2}$: 30–40 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine

Adverse effects

- **CNS:** Asthenia, *dizziness*, **seizures**
- **CV:** Chest pain, hypertension
- **GI:** Anorexia, diarrhea, *nausea*, *vomiting*
- **Other:** Adynamic bone disease, hypocalcemia, *myalgia*

Interactions

★ **Drug-drug** • Risk of increased amitriptyline levels if used concomitantly; monitor patient • Risk of increased serum levels of flecainide, vinblastine, thioridazine, TCAs; if this combination is used, monitor patient and adjust dosage accordingly • Risk of increased serum levels of cinacalcet and resulting hypocalcemia if combined with ketoconazole, erythromycin, itraconazole; monitor serum calcium levels carefully and adjust dosage accordingly

■ Nursing considerations**Assessment**

- **History:** Allergy to any component of the drug, pregnancy, lactation, history of seizure disorders, moderate to severe hepatic impairment
- **Physical:** Orientation, reflexes; BP; abdominal examination; LFTs, renal function tests; serum calcium, phosphorous levels, intact parathyroid hormone levels

Interventions

- Monitor serum calcium levels before and regularly during therapy.
- Administer with food or shortly after a meal; ensure that patient does not cut, crush or chew the tablet.
- Suggest alternate method of feeding the baby if patient is lactating; it is not known if this drug passes into breast milk, but it does cross in animal studies.
- Monitor patient's nutritional status as nausea, vomiting, and diarrhea are common.

Teaching points

- Take this drug with food or shortly after a meal.
- Do not cut, crush, or chew this tablet; it must be swallowed whole.
- If you miss a dose, take the dose as soon as you remember. Take the next dose the next day; do not make up or double doses.
- If you are taking this drug with hemodialysis, you will also be taking vitamin D and phosphate binders.
- If you are nursing a baby, choose a different method of feeding the baby while you are on this drug.
- You will need to have regular follow-ups, including blood tests to monitor your calcium levels while you are on this drug.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or use of dangerous machinery while on this drug); nausea, vomiting, loss of appetite (it is important to try to maintain your nutrition and fluid intake; if this becomes a problem, consult your health care provider); confusion, hallucinations (it might help to know that this is a drug effect; consult your health care provider if this becomes a problem).
- Report muscle cramping, tingling, pain; fever, flu-like symptoms.

▽ ciprofloxacin

(*si proe flox' a sin*)

Apo-Ciprofloxacin (CAN), Ciloxan, Cipro, Cipro HC Otic, Cipro I.V., Co Ciprofloxacin (CAN), Gen-Ciprofloxacin (CAN), PMS-Ciprofloxacin (CAN), Proquin XR **OND**, ratio-Ciprofloxacin (CAN)

PREGNANCY CATEGORY C

Drug classes

Antibacterial
Fluoroquinolone

Therapeutic actions

Bactericidal; interferes with DNA replication in susceptible bacteria preventing cell reproduction.

Indications

- For the treatment of infections caused by susceptible gram-negative bacteria, including *Escherichia coli*, *Proteus mirabilis*, *Klebsiella pneumoniae*, *Enterobacter cloacae*, *Proteus vulgaris*, *Proteus rettgeri*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Citrobacter freundii*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, group D streptococci, *Serratia marcescens*
- Treatment of uncomplicated UTIs caused by *E. coli*, *K. pneumoniae* as a one-time dose in patients at low risk of nausea, diarrhea (*Proquin XR*)
- Otic: Treatment of acute otitis externa
- Treatment of chronic bacterial prostatitis
- IV: Treatment of nosocomial pneumonia caused by *Haemophilus influenzae*, *K. pneumoniae*
- Oral: Typhoid fever
- Oral: STDs caused by *Neisseria gonorrhoeae*
- Prevention of anthrax following exposure to anthrax bacilla (prophylactic use in regions suspected of using germ warfare)
- Acute sinusitis: Caused by *H. influenzae*, *Streptococcus pneumoniae*, or *Moraxella catarrhalis*
- Lower respiratory tract infections: Caused by *E. coli*, *Klebsiella*, *Enterobacter species*, *P. mirabilis*, *P. aeruginosa*, *H. influenzae*, *Haemophilus parainfluenzae*, *S. pneumoniae*
- Unlabeled use: Cystic fibrosis in patients who have pulmonary exacerbations, gastroenteritis in children, mycobacterial infection, traveler's diarrhea

Contraindications and cautions

- Contraindicated with allergy to ciprofloxacin, norfloxacin or other fluoroquinolones, pregnancy, lactation.
- Use cautiously with renal impairment, seizures, tendinitis or tendon rupture associated with fluoroquinolone use.

Available forms

Tablets—100, 250, 500, 750 mg; ER tablets **CINC**—500, 1,000 mg; injection—200, 400 mg; microcapsules for suspension—250, 500 mg; ophthalmic ointment—3.33 mg/g;

ophthalmic solution—3.5 mg/mL; otic suspension—2 mg/mL; otic single-use container—0.25 mL

Dosages

Adults

- *Uncomplicated UTIs*: 250 mg PO every 12 hr for 3 days or 500 mg PO daily (ER tablets) for 3 days. *Proquin XR*—500 mg PO once a day for 3 days.
- *Mild to moderate UTIs*: 250 mg every 12 hr PO for 7–14 days or 200 mg IV every 12 hr for 7–14 days.
- *Complicated UTIs*: 500 mg every 12 hr PO for 7–14 days or 400 mg IV every 12 hr or 1,000 mg (ER tablets) PO daily every 7–14 days.
- *Chronic bacterial prostatitis*: 500 mg PO every 12 hr for 28 days or 400 mg IV every 12 hr for 28 days.
- *Infectious diarrhea*: 500 mg every 12 hr PO for 5–7 days.
- *Anthrax postexposure*: 500 mg PO every 12 hr for 60 days or 400 mg IV every 12 hr for 60 days.
- *Respiratory infections*: 500–750 mg PO every 12 hr or 400 mg IV every 8–12 hr for 7–14 days.
- *Acute sinusitis*: 500 mg PO every 12 hr or 400 mg IV every 12 hr for 10 days.
- *Acute uncomplicated pyelonephritis*: 1,000 mg ER tablets PO daily every 7–14 days.
- *Bone, joint, skin infections*: 500–750 mg PO every 12 hr or 400 mg IV every 8–12 hr for 4–6 wk.
- *Nosocomial pneumonia*: 400 mg IV every 8 hr for 10–14 days.
- *Ophthalmic infections caused by susceptible organisms not responsive to other therapy*: 1 or 2 drops every 2 hr while awake for 2 days or every 4 hr for 5 days, or ½ inch ribbon of ointment into conjunctival sac tid on first 2 days, then apply ½ inch ribbon bid for next 5 days.
- *Acute otitis externa*: 4 drops in infected ear, tid–qid, or 1 single-use container (0.25 mL) in infected ear bid for 7 days.

Pediatric patients

⊗ **Warning** Drug produced lesions of joint cartilage in immature experimental animals.

Inhalational anthrax: 15 mg/kg/dose PO every 12 hr for 60 days or 10 mg/kg/dose IV every 12 hr for 60 days; do not exceed 500 mg/dose PO or 400 mg/dose IV.

Patients with impaired renal function

For creatinine clearance of 30–50 mL/min, give 250–500 mg PO every 12 hr. For creatinine clearance of 5–29 mL/min, give 250–500 mg PO every 18 hr or 200–400 mg IV every 18–24 hr. For patients on hemodialysis, give 250–500 mg every 24 hr, after dialysis.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	60–90 min	4–5 hr
IV	10 min	30 min	4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 3.5–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute to a final concentration of 1–2 mg/mL with 0.9% sodium chloride injection or 5% dextrose injection. Stable up to 14 days refrigerated or at room temperature.

Infusion: Administer slowly over 60 min.

Incompatibilities: Discontinue the administration of any other solutions during ciprofloxacin infusion. Incompatible with aminophylline, amoxicillin, clindamycin, heparin in solution.

Adverse effects

- **CNS:** *Headache*, dizziness, insomnia, fatigue, somnolence, depression, blurred vision, hallucinations, ataxia, nightmares
- **CV:** Arrhythmias, hypotension, angina
- **EENT:** Dry eye, eye pain, keratopathy
- **GI:** *Nausea*, vomiting, dry mouth, *diarrhea*, abdominal pain
- **GU:** Renal failure
- **Hematologic:** Elevated BUN, AST, ALT, serum creatinine and alkaline phosphatase; decreased WBC count, neutrophil count, Hct
- **Other:** Fever, rash

Interactions

• **Drug-drug** • Decreased therapeutic effect with iron salts, sucralfate • Decreased absorption with antacids, didanosine • Increased serum levels and toxic effects of theophyllines if taken concurrently with ciprofloxacin • Increased effects of coumarin or its derivatives • Increased risk of seizures with fosfarnet

• **Drug-alternative therapy** • Increased risk of severe photosensitivity reactions if combined with St. John's wort

Nursing considerations Assessment

- **History:** Allergy to ciprofloxacin, norfloxacin or other quinolones; renal impairment; seizures; lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; mucous membranes, bowel sounds; LFTs, renal function tests

Interventions

⊗ **Black box warning** Risk of tendonitis and tendon rupture exists; risk is higher in patients older than 60 yr; those on steroids; and those with renal, heart, or lung transplant.

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy for 2 days after signs and symptoms of infection are gone.
- Be aware that *Proquin XR* is not interchangeable with other forms.
- Ensure that patient swallows ER tablets whole; do not cut, crush, or chew.
- Ensure that patient is well hydrated.
- Give antacids at least 2 hr after dosing.
- Monitor clinical response; if no improvement is seen or a relapse occurs, repeat culture and sensitivity.
- Encourage patient to complete full course of therapy.

Teaching points

- If an antacid is needed, take it at least 2 hours before or after dose. Swallow ER tablets whole; do not cut, crush, or chew them.
- Take *Proquin XR* with the main meal of the day.

- Do not touch tip of eye ointment or solution as this may contaminate the product.
- Drink plenty of fluids while you are taking this drug.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation; drowsiness, blurring of vision, dizziness (use caution if driving or using dangerous equipment).
- Report rash, visual changes, severe GI problems, weakness, tremors.

DANGEROUS DRUG

▷ cisplatin (CDDP)
(sis' pla tin)

PREGNANCY CATEGORY D

Drug classes

Alkylating drug
Antineoplastic
Platinum agent

Therapeutic actions

Cytotoxic; Heavy metal that inhibits cell replication by alkylating DNA; cell cycle nonspecific.

Indications

- Metastatic testicular tumors: Combination therapy with bleomycin sulfate and vinblastine sulfate after surgery or radiotherapy
- Metastatic ovarian tumors: As single therapy in resistant patients or in combination therapy with doxorubicin or cyclophosphamide after surgery or radiotherapy
- Advanced bladder cancer: Single agent for transitional cell bladder cancer no longer amenable to surgery or radiotherapy
- Unlabeled uses: Lung cancer; endometrial cancer; osteogenic sarcoma; liver cancer; breast cancer; squamous cell carcinoma of the head, neck, cervix; brain tumor; esophageal cancer; carcinoma of adrenal cortex

Contraindications and cautions

- Contraindicated with allergy to cisplatin, platinum-containing products; hematopoi-

etic depression; impaired renal function; hearing impairment; pregnancy; lactation.

- Use cautiously with hepatic impairment, peripheral vascular disease.

Available forms

Injection—1 mg/mL

Dosages

Dose is often given in combination with another chemotherapeutic drug.

Adults

- *Metastatic testicular tumor:*
Remission induction: Cisplatin, 20 mg/m² per day IV for 5 consecutive days (days 1–5) every 3 wk for three courses of therapy; bleomycin, 30 units IV weekly (day 2 of each wk) for 12 consecutive doses; vinblastine, 0.15–0.2 mg/kg IV twice weekly (days 1 and 2) every 3 wk for four courses.
Maintenance: Vinblastine, 0.3 mg/kg IV every 4 wk for 2 yr.
- *Metastatic ovarian tumors:* 75–100 mg/m² IV once every 4 wk. For combination therapy, administer sequentially: Cisplatin, 50–100 mg/m² IV once every 3–4 wk; cyclophosphamide, 600 mg/m² IV once every 4 wk.
- *Advanced bladder cancer:* 50–70 mg/m² IV once every 3–4 wk; in heavily pretreated (radiotherapy or chemotherapy) patients, give an initial dose of 50 mg/m² repeated every 4 wk. Do not give repeated courses until serum creatinine is lower than 1.5 mg/dL or BUN is lower than 25 mg/dL or until platelets exceed 100,000/mm³ and WBCs exceed 4,000/mm³. Do not give subsequent doses until audiometry indicates hearing is within normal range.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	8–10 hr	18–23 days	30–35 days

Metabolism: Hepatic; T_{1/2}: 25–49 min, then 58–73 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Available solution contains 1 mg/mL cisplatin; stable for 28 days protected from light or 7 days under room light at room temperature—do not refrigerate. Dilute drug in 1–2 L of 5% dextrose in one-half or one-third normal saline containing 37.5 g mannitol.

Infusion: Hydrate patient with 1–2 L of fluid infused for 8–12 hr before drug therapy; infuse dilute drug over 6–8 hr.

Adverse effects

- **CNS:** *Ototoxicity*, peripheral neuropathies, seizures, loss of taste
- **GI:** *Nausea, vomiting, anorexia*, liver impairment
- **GU:** *Nephrotoxicity*, dose limiting
- **Hematologic:** *Leukopenia, thrombocytopenia, anemia*, hypomagnesemia, hypocalcemia, hypokalemia, hypophosphatemia, hyperuricemia
- **Hypersensitivity: Anaphylactic-like reactions**, facial edema, bronchoconstriction, tachycardia, hypotension (treat with epinephrine, corticosteroids, antihistamines)

Interactions

* **Drug-drug** • Additive ototoxicity with furosemide, bumetanide, ethacrynic acid • Decreased serum levels of phenytoins with cisplatin • Additive nephrotoxicity with aminoglycosides

Nursing considerations

Assessment

- **History:** Allergy to cisplatin, platinum-containing products; hematopoietic depression; impaired renal function; hearing impairment; pregnancy, lactation
- **Physical:** Weight; eighth cranial nerve evaluation; reflexes; sensation; CBC, differential; renal function tests; serum electrolytes; serum uric acid; audiogram

Interventions

⊗ **Warning** Arrange for tests to evaluate serum creatinine, BUN, creatinine clearance, magnesium, calcium, and potassium levels

before initiating therapy and before each sub-course of therapy. Do not give if there is evidence of nephrotoxicity.

⊗ **Black box warning** Arrange for audiometric testing before beginning therapy and prior to subsequent doses. Do not give dose if audiometric acuity is outside normal limits.

⊗ **Black box warning** Monitor renal function; severe toxicity related to dose is possible.

⊗ **Black box warning** Have epinephrine and corticosteroids available in case the patient has anaphylaxis-like reactions.

⊗ **Warning** Do not use needles of IV sets containing aluminum parts; can cause precipitate and loss of drug potency. Use gloves while preparing drug to prevent contact with the skin or mucosa; contact can cause skin reactions. If contact occurs, wash area immediately with soap and water.

- Maintain adequate hydration and urinary output for the 24 hr following drug therapy.
- Use of prophylactic antiemetics is required (ondansetron).
- Monitor uric acid levels; if markedly increased, allopurinol may be ordered.
- Monitor electrolytes and maintain by supplements.

Teaching points

- This drug can only be given IV. Prepare a calendar of treatment days.
- Use birth control; drug may cause birth defects or miscarriages.
- Have frequent, regular medical follow-up care, including frequent blood tests, to monitor drug effects.
- You may experience these side effects: Nausea, vomiting (medication may be ordered; eat frequent small meals); numbness, tingling, loss of taste, ringing in the ears, dizziness, loss of hearing (reversible).
- Report loss of hearing, dizziness; unusual bleeding or bruising, fever, chills, sore throat, leg cramps, muscle twitching, changes in voiding patterns.

Citalopram (CAN) **ONC**, ratio-
Citalopram (CAN) **ONC**

PREGNANCY CATEGORY C

Drug classes

Antidepressant
SSRI

Therapeutic actions

Potentiates serotonergic activity in the CNS by inhibiting neuronal reuptake of serotonin, resulting in antidepressant effect, with little effect on norepinephrine or dopamine reuptake.

Indications

- Treatment of depression, particularly effective in major depressive disorders
- Unlabeled uses: OCD, panic disorder, PMDD, social phobia, trichotillomania, PTSD

Contraindications and cautions

- Contraindicated with MAOI use; allergy to drug or any component of the drug or other SSRIs; concomitant use of pimozone.
- Use cautiously with renal or hepatic impairment, pregnancy, and lactation, and in patients who are elderly or suicidal.

Available forms

Tablets **ONC**—10, 20, 40 mg; oral solution—2 mg/mL

Dosages

Adults

Initially, 20 mg/day PO as a single daily dose. May be increased to 40 mg/day if needed no less than an interval of 1 wk.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal or hepatic impairment

20 mg/day PO as a single dose; increase to 40 mg/day only if clearly needed and patient is not responding.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 35 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, dizziness, insomnia, tremor,* nervousness, headache, anxiety, paresthesia, blurred vision
- **CV:** Palpitations, vasodilation, orthostatic hypotension, hypertension
- **Dermatologic:** *Sweating,* rash, redness
- **GI:** *Nausea, dry mouth,* constipation, diarrhea, anorexia, flatulence, vomiting
- **GU:** *Ejaculatory disorders*
- **Respiratory:** Sinusitis, URI, cough, rhinitis

Interactions

★ **Drug-drug** • Increased citalopram levels and toxicity if taken with MAOIs; ensure that patient has been off the MAOI for at least 14 days before administering citalopram • Increased citalopram levels with azole antifungals, macrolides • Possible severe adverse effects if combined with TCAs, erythromycin; use caution • Possible increased effects of beta blockers; monitor patient and reduce beta blocker dose as needed • Possible increased bleeding with warfarin; monitor patient carefully • Risk of prolonged QT interval and potentially fatal cardiac arrhythmias if combined with pimozone; avoid this combination • Risk of serotonin syndrome with linezolid • Increased citalopram levels with cimetidine

★ **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Celexa* (citalopram), *Celebrex* (celecoxib), *Xanax* (alprazolam), and *Cerebyx* (fosphenytoin); use caution.

Assessment

- **History:** MAOI use; allergy to drug or any component of the drug; renal or hepatic impairment, the elderly, pregnancy, lactation, suicidal tendencies
- **Physical:** Orientation, reflexes; P, BP, perfusion; bowel sounds, normal output; urinary output; liver evaluation; LFTs, renal function tests

Interventions

⊗ **Black box warning** Be aware of increased risk of suicidality in children, adolescents, and young adults; monitor accordingly.

- Administer once a day, in the morning; may be taken with food if desired.
- Encourage patient to continue use for 4–6 wk, as directed, to ensure adequate levels to affect depression.
- Limit amount of drug given in prescription to potentially suicidal patients.
- Establish appropriate safety precautions if patient experiences adverse CNS effects.
- Institute appropriate therapy for patient suffering from depression.

Teaching points

- Take this drug exactly as directed, and as long as directed; it may take a few weeks to realize the benefits of the drug. The drug may be taken with food if desired. Do not cut, crush, or chew tablets.
- This drug should not be taken during pregnancy or when nursing a baby; use of barrier contraceptives is suggested.
- You may experience these side effects: Drowsiness, dizziness, tremor (use caution and avoid driving a car or performing other tasks that require alertness if you experience daytime drowsiness); GI upset (eat frequent small meals, perform frequent mouth care); alterations in sexual function (it may help

to know that this is a drug effect, and will pass when drug therapy is ended).

- Report severe nausea, vomiting; palpitations; blurred vision; excessive sweating; thoughts of suicide.

DANGEROUS DRUG

▷ cladribine (CdA, 2-chlorodeoxyadenosine)

(*kla' dri been*)

Leustatin

PREGNANCY CATEGORY D

Drug classes

Antimetabolite
Antineoplastic
Purine analogue

Therapeutic actions

Blocks DNA synthesis and repair, causing cell death in active and resting lymphocytes and monocytes.

Indications

- Treatment of active hairy cell leukemia
- Unlabeled uses: Advanced cutaneous T-cell lymphomas, chronic lymphocytic leukemia, non-Hodgkin's lymphomas, acute myeloid leukemia, autoimmune hemolytic anemia, mycosis fungoides, Sézary syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to cladribine or any components, pregnancy, lactation.
- Use cautiously with active infection, myelosuppression, debilitating illness, renal or hepatic impairment.

Available forms

IV solution—1 mg/mL

Dosages

Adults

Single course given by continuous IV infusion of 0.09–0.1 mg/kg/day for 7 days.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	8–10 hr

Metabolism: Hepatic; $T_{1/2}$: 5.4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare daily dose by adding calculated dose to 500-mL bag of 0.9% sodium chloride injection. Stable for 24 hr at room temperature. Prepare 7-day infusion using aseptic technique, and add calculated dose to 100 mL bacteriostatic, 0.9% sodium chloride injection (0.9% benzyl alcohol preserved) through a sterile 0.22- μ m filter. Store unopened vials in refrigerator; protect from light. Vials are single-use only, discard after use.

Infusion: Infuse daily dose slowly over 24 hr. 7-day dose should be infused continuously over the 7-day period. Stable for 7 days in CADD medication cassettes.

Incompatibilities: Do not mix with any other solutions, drugs, or additives. Do not infuse through IV line with any other drug or additive.

Adverse effects

- **CNS:** *Fatigue, headache*, dizziness, insomnia, **neurotoxicity**
- **CV:** Tachycardia, edema
- **Dermatologic:** *Rash*, pruritus, pain, erythema, petechiae, purpura
- **GI:** *Nausea, anorexia, vomiting, diarrhea, constipation*, abdominal pain
- **GU:** **Nephrotoxicity**
- **Hematologic:** *Neutropenia, myelosuppression*, anemia, thrombocytopenia, *lymphopenia*
- **Local:** *Injection site redness, swelling, pain*; thrombosis, phlebitis
- **Respiratory:** *Cough, abnormal breath sounds*, shortness of breath
- **Other:** *Fever, chills*, asthenia, diaphoresis, myalgia, arthralgia, **infection**, cancer

■ Nursing considerations**Assessment**

- **History:** Allergy to clarithromycin or any component, renal or hepatic impairment,

myelosuppression, infection, pregnancy, lactation

- **Physical:** Weight, skin condition, neurologic status, abdominal examination, P, respiratory status, LFTs, renal function tests, CBC, uric acid levels

Interventions

⊗ **Warning** Use disposable gloves and protective garments when handling clarithromycin. If drug contacts skin or mucous membranes, wash immediately with copious amounts of water.

- Ensure continuous infusion of drug over 7 days.
- Alert patients of childbearing age to drug's severe effects on fetus; advise using birth control during and for several weeks after treatment.

⊗ **Black box warning** Monitor complete hematologic profile and LFTs and renal function tests before and frequently during treatment. Consult with physician at first sign of toxicity; consider delaying or discontinuing dose if neurotoxicity or renal toxicity occurs.

Teaching points

- This drug must be given continuously for 7 days.
- Frequent monitoring of blood tests is needed during the treatment and for several weeks thereafter to assess the drug's effect.
- Using barrier contraceptives is advised during therapy and for several weeks following therapy.
- You may experience these side effects: Fever, headache, rash, nausea, vomiting, fatigue, pain at injection site.
- Report numbness or tingling, severe headache, nausea, rash, extreme fatigue, edema, pain or swelling at injection site.

▷ clarithromycin

(*klar itb' ro my sin*)

Biaxin, Biaxin XL ORAC

PREGNANCY CATEGORY C

Drug class

Macrolide antibiotic

Therapeutic actions

Inhibits protein synthesis in susceptible bacteria, causing cell death.

Indications

- Treatment of URIs caused by *Streptococcus pyogenes*, *Streptococcus pneumoniae*
- Treatment of lower respiratory infections caused by *Mycoplasma pneumoniae*, *S. pneumoniae*, *Haemophilus influenzae*, *Moraxella catarrhalis*, *Haemophilus parainfluenzae*
- Treatment of skin and skin structure infections caused by *Staphylococcus aureus*, *S. pyogenes*
- Treatment and prevention of disseminated mycobacterial infections due to *Mycobacterium avium* and *Mycobacterium intracellulare*
- Treatment of active duodenal ulcer associated with *Helicobacter pylori* in combination with proton pump inhibitor
- Treatment of acute otitis media, acute maxillary sinusitis due to *H. influenzae*, *M. catarrhalis*, *S. pneumoniae*
- Treatment of mild to moderate community-acquired pneumonia

Contraindications and cautions

- Contraindicated with hypersensitivity to clarithromycin, erythromycin, or any macrolide antibiotic.
- Use cautiously with colitis, hepatic or renal impairment, pregnancy, lactation.

Available forms

Tablets—250, 500 mg; granules for suspension—125, 250 mg/5 mL; ER tablets —500 mg

Dosages**Adults**

- *Pharyngitis, tonsillitis; pneumonia due to S. pneumoniae, M. pneumoniae; skin or skin structure infections; lower respiratory infections due to S. pneumoniae, M. catarrhalis*: 250 mg PO every 12 hr for 7–14 days.
- *Acute maxillary sinusitis, acute otitis media, lower respiratory infections caused*

by H. influenzae: 500 mg PO every 12 hr for 7–14 days.

- *Mycobacterial infections*: 500 mg PO bid.
- *Duodenal ulcers*: 500 mg PO tid plus omeprazole 40 mg PO every AM for 14 days, then omeprazole 20 mg PO every AM for 14 days.
- *Community-acquired pneumonia*: 250 mg PO every 12 hr for 7–14 days or 1,000 mg PO of ER tablets every 24 hr for 7 days.

Pediatric patients

Usual dosage, 15 mg/kg/day PO divided every 12 hr for 10 days.

- *Mycobacterial infections*: 7.5 mg/kg PO bid, up to 500 mg PO bid.

Geriatric patients or patients with impaired renal function

Decrease dosage or prolong dosing intervals as appropriate. If creatinine clearance is less than 30 mL/min, halve the dose or double the interval.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2 hr

Metabolism: Hepatic; $T_{1/2}$: 3–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, headache, vertigo, somnolence, fatigue
- **GI:** *Diarrhea, abdominal pain, nausea, dyspepsia, flatulence, vomiting, melena, pseudomembranous colitis, abnormal taste*
- **Other:** *Superinfections*, increased PT, decreased WBC count

Interactions

- **Drug-drug** • Increased serum levels and effects of carbamazepine, theophylline, lovastatin, phenytoin
- **Drug-food** • Food decreases the rate of absorption of clarithromycin but does not alter effectiveness • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to clarithromycin, erythromycin, or any macrolide antibiotic; pseudomembranous colitis, hepatic or renal impairment, lactation, pregnancy
- **Physical:** Site of infection; skin color, lesions; orientation, GI output, bowel sounds, liver evaluation; culture and sensitivity tests of infection, urinalysis, LFTs, renal function tests

Interventions

- Culture infection site before therapy.
- Do not cut or crush, and ensure that patient does not chew ER tablets.
- Monitor patient for anticipated response.
- Administer without regard to meals; administer with food if GI effects occur.

Teaching points

- Take drug with food if GI effects occur. Take the full course of therapy. Do not drink grapefruit juice while taking this drug.
- Shake suspension before use; do not refrigerate; do not cut, crush, or chew extended-release tablets; swallow them whole.
- You may experience these side effects: Stomach cramping, discomfort, diarrhea; fatigue, headache (medication may be ordered); additional infections in the mouth or vagina (consult your health care provider for treatment).
- Report severe or watery diarrhea, severe nausea or vomiting, rash or itching, mouth sores, vaginal sores.

▽ clemastine fumarate (*klem'* as teen)

Dayhist-1, Tavist Allergy

PREGNANCY CATEGORY B

Drug class

Antihistamine

Therapeutic actions

Blocks the effects of histamine at H₁-receptor sites; has atropine-like, antipruritic, and sedative effects.

Indications

- Symptomatic relief of symptoms associated with perennial and seasonal allergic rhinitis; vasomotor rhinitis; allergic conjunctivitis
- Mild, uncomplicated urticaria and angioedema

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, third trimester of pregnancy, lactation.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction.

Available forms

Tablets—1.34, 2.68 mg; syrup—0.67 mg/5 mL

Dosages

Adults and children older than 12 yr

- *Allergic rhinitis:* 1.34 mg PO bid. Do not exceed 8.04 mg/day (syrup); 2.68 mg/day (tablets).
- *Urticaria or angioedema:* 2.68 mg PO daily—tid. Do not exceed 8.04 mg/day.

Pediatric patients 6–12 yr

- *Allergic rhinitis (syrup only):* 0.67 mg PO as syrup bid. Do not exceed 4.02 mg/day.
- *Urticaria or angioedema (syrup only):* 1.34 mg PO as syrup bid. Do not exceed 4.02 mg/day.

Pediatric patients younger than 6 yr

Safety and efficacy not established.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	1–2 hr	12 hr

Metabolism: Hepatic; T_{1/2}: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, disturbed coordination*, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, hysteria, tingling, heaviness and weakness of the hands
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress*, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea or constipation
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido, impotence
- **Hematologic:** Hemolytic anemia, aplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia
- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal stuffiness, dry mouth, dry nose, dry throat, sore throat
- **Other:** Urticaria, rash, **anaphylactic shock**, photosensitivity, excessive perspiration, chills

Interactions

* **Drug-drug** • Increased depressant effects with alcohol, other CNS depressants • Increased and prolonged anticholinergic (drying) effects with MAOIs; avoid this combination

■ Nursing considerations**Assessment**

- **History:** Allergy to any antihistamines; narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction; lactation, pregnancy
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Administer with food if GI upset occurs.
- Administer syrup form if patient is unable to take tablets; children 6–12 yr should receive only syrup form.

- Encourage patient to drink plenty of fluids (unless contraindicated); use a humidifier if dry mucosa is an issue.
- Monitor patient response, adjust to lowest possible effective dose.

Teaching points

- Take drug as prescribed; avoid excessive dosage.
- Take with food if GI upset occurs.
- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); epigastric distress, diarrhea, or constipation (take with meals; consult your health care provider as needed); dry mouth (frequent mouth care, sucking sugarless lozenges may help); thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

▽ clevipidine butyrate*(klev id' ih peen)*

Cleviprex

PREGNANCY CATEGORY C**Drug classes**

Calcium channel blocker

Antihypertensive

Therapeutic actions

Blocks the influx of calcium in the arterial smooth muscle, leading to arterial muscle relaxation and decreased vascular resistance, which lowers BP; does not affect preload or cardiac filling pressure, showing no effect on venous vessels.

Indications

- BP reduction when oral therapy is not possible or is not desirable

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug, soy, or egg products; defective lipid metabolism; acute pancreatitis; severe aortic stenosis.
- Use cautiously with heart failure, pregnancy, lactation.

Available forms

Single-use vials—0.5 mg/mL

Dosages

Adults

- Initially, give IV infusion of 1–2 mg/hr; titrate quickly by doubling the dose every 90 sec to achieve desired BP. Maintenance dose is usually 4–6 mg/hr. Maximum dose, 21 mg/hr per 24-hr period.

Pediatric patients

- Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: Blood and tissues; $T_{1/2}$: 15 min

Distribution: May cross placenta; may enter breast milk

Excretion: Blood and tissues

IV FACTS

Preparation: Maintain strict sterile technique; product contains phospholipids, which can support microbial growth. Administer within 4 hr of puncturing the stopper; discard any unused drug. Invert vial several times to dispense drug. Drug should appear milky; inspect for any particulate matter, which indicates a contaminated product. Do not dilute. May be administered with water for injection, sodium chloride (0.9%) injection, 5% dextrose injection, 5% dextrose in 0.9% sodium chloride, 5% dextrose in lactated Ringer's solution, lactated Ringer's injection, 10% amino acids.

Infusion: Monitor patient's BP and cardiac status continuously. Infuse using a controlled infusing device that allows for calibrated titration.

Incompatibilities: Do not administer in the same line as any other medications.

Adverse effects

- **CNS:** *Headache*
- **CV:** **Hypotension**, reflex tachycardia, hypertension, heart failure
- **GI:** *Nausea, vomiting*

Nursing considerations

Assessment

- **History:** Known hypersensitivity to any component of the drug, soy, or egg products; defective lipid metabolism; acute pancreatitis; severe aortic stenosis; heart failure; pregnancy; lactation
- **Physical:** Orientation, affect; BP, P, peripheral perfusion, auscultation

Interventions

- Continuously monitor BP and cardiac status during administration; titrate drug accordingly to achieve desired BP.
- Be aware that drug does not protect from rebound effect of beta blocker discontinuation; if patient has been maintained on a beta blocker, drug should be tapered to avoid rebound tachycardia and hypertension.
- Patient should be switched to an oral antihypertensive as appropriate to maintain BP control. If patient is not started on an oral antihypertensive, be prepared for effects of rebound hypertension for at least 8 hr after discontinuation of clevidipine.
- Be aware that drug should be handled using strict sterile technique because drug contains phospholipids that can support microbial growth.
- Use drug within 4 hr of puncturing the stopper.

Teaching points

- This drug must be given IV to regulate your high blood pressure. You will be continuously monitored and the dosage will be adjusted to achieve the desired blood pressure.
- You will need to have regular medical follow-up appointments with your health care provider to monitor your hypertension. Oral medications may be ordered to maintain a safe blood pressure.
- You may experience these side effects: Headache (medications may be available to help); nausea and vomiting (frequent small meals

may help, medication may be available to relieve these symptoms).

- Report changes in vision, swelling of the ankles or legs, changes in orientation or alertness, difficulty breathing, fast heart rate.

clindamycin

(*klin da mye' sin*)

clindamycin hydrochloride

Oral: Cleocin, Dalacin C (CAN)

clindamycin palmitate hydrochloride

Oral: Cleocin Pediatric, Dalacin C Flavored Granules (CAN)

clindamycin phosphate

Oral, parenteral, topical dermatologic solution for acne, vaginal preparation: Cleocin T, Cleocin Vaginal Ovules, ClindaDerm (CAN), Clindagel, ClindaMax, Clindesse, Clindets, Dalacin C Phosphate (CAN), Dalacin Vaginal Cream (CAN), Dalacin T (CAN), Evoclin

PREGNANCY CATEGORY B

Drug class

Lincosamide antibiotic

Therapeutic actions

Inhibits protein synthesis in susceptible bacteria, causing cell death.

Indications

- Systemic administration: Serious infections caused by susceptible strains of anaerobes, streptococci, staphylococci, pneumococci; reserve use for penicillin-allergic patients or when penicillin is inappropriate; less toxic antibiotics (erythromycin) should be considered
- Parenteral: Treatment of septicemia caused by staphylococci, streptococci; acute hematogenous osteomyelitis; adjunct to surgical

treatment of chronic bone and joint infections due to susceptible organisms; do not use to treat meningitis; does not cross the blood–brain barrier.

- Topical dermatologic solution: Treatment of acne vulgaris
- Vaginal preparation: Treatment of bacterial vaginosis

Contraindications and cautions

Systemic administration

- Contraindicated with allergy to clindamycin, lactation.
- Use cautiously in newborns and infants due to benzyl alcohol content (associated with gasping syndrome) and in patients with tartrazine sensitivity or hepatic or renal impairment.

Topical dermatologic solution, vaginal preparation

- Contraindicated with allergy to clindamycin or lincomycin.
- Use caution with history of regional enteritis or ulcerative colitis; history of antibiotic-associated colitis.

Available forms

Capsules—75, 150, 300 mg; granules for oral solution—75 mg/5 mL; injection—150 mg/mL, 300 mg/12 mL, 600 mg/14 mL, 900 mg/16 mL, 300, 600, 900 mg/50 mL; topical gel—1%; topical lotion—1%; topical suspension—1%; vaginal cream—2%; vaginal suppository—100 mg

Dosages

Adults

Oral

150–300 mg every 6 hr, up to 300–450 mg every 6 hr in more severe infections.

Parenteral

600–2,700 mg/day in two to four equal doses; up to 4.8 g/day IV or IM may be used for life-threatening situations.

Vaginal

One applicator (100 mg clindamycin phosphate) intravaginally, preferably at bedtime for 7 consecutive days; or insert vaginal suppository, preferably at bedtime for 3 days for *Cleocin Vaginal Ovules*.

Topical

Apply a thin film to affected area bid.

Pediatric patients**Oral**

For clindamycin hydrochloride, 8–16 mg/kg/day (serious infections) or 16–20 mg/kg/day (more serious infections) in three or four equal doses. For clindamycin palmitate hydrochloride, 8–25 mg/kg/day in three or four equal doses; for children weighing less than 10 kg, use 37.5 mg tid as the minimum dose.

Parenteral

Neonates: 15–20 mg/kg/day in three or four equal doses.

Older than 1 mo: 20–40 mg/kg/day in three or four equal doses or 350 mg/m²/day to 450 mg/m²/day.

Patients with renal failure

Reduce dose, and monitor patient carefully.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	8–12 hr
IM	20–30 min	1–3 hr	8–12 hr
IV	Immediate	Minutes	8–12 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Topical: Minimal systemic absorption

IV FACTS

Preparation: Store unconstituted product at room temperature. Reconstitute by adding 75 mL of water to 100-mL bottle of palmitate in two portions. Shake well; do not refrigerate reconstituted solution. Reconstituted solution is stable for 2 wk at room temperature. Dilute reconstituted solution to a concentration of 300 mg/50 mL or more of diluent using 0.9% sodium chloride injection, 5% dextrose injection, or lactated Ringer's solution. Do not exceed 18 mg/mL. Solution is stable for 16 days at room temperature.

Infusion: ⓧ **Warning** Do not administer more than 1,200 mg in a single 1-hr infusion. Infusion rates: 300 mg in 50 mL diluent, 10 min; 600 mg in 50 mL diluent, 20 min; 900 mg in 50–100 mL diluent, 30 min;

1,200 mg in 100 mL diluent, 40 min. Do not infuse faster than 30 mg/min; rapid infusion can cause cardiac arrest.

Incompatibilities: Do not mix with calcium gluconate, ampicillin, phenytoin, barbiturates, aminophylline, and magnesium sulfate. May be mixed with sodium chloride, dextrose, calcium, potassium, vitamin B complex, kanamycin, gentamicin, penicillin, carbenicillin. Incompatible in syringe with tobramycin.

Adverse effects**Systemic administration**

- **CV:** Hypotension, **cardiac arrest** (with rapid IV infusion)
- **GI:** Severe colitis, including **pseudomembranous colitis**, *nausea, vomiting, diarrhea, abdominal pain, esophagitis, anorexia*, jaundice, hepatic function changes
- **Hematologic:** Neutropenia, leukopenia, agranulocytosis, eosinophilia
- **Hypersensitivity:** *Rashes*, urticaria to anaphylactoid reactions
- **Local:** *Pain following injection*, induration and sterile abscess after IM injection, thrombophlebitis after IV use

Topical dermatologic solution

- **CNS:** Fatigue, headache
 - **Dermatologic:** *Contact dermatitis, dryness*, gram-negative folliculitis
 - **GI:** Pseudomembranous colitis, diarrhea, bloody diarrhea; abdominal pain, sore throat
 - **GU:** Urinary frequency
- Vaginal preparation**
- **GU:** Cervicitis, vaginitis, vulvar irritation

Interactions**Systemic administration**

- **Drug-drug** • Increased neuromuscular blockade with neuromuscular blocking agents
- Decreased GI absorption with kaolin, aluminum salts

■ Nursing considerations**Assessment**

- **History:** Allergy to clindamycin, history of asthma or other allergies, allergy to tartrazine (in 75- and 150-mg capsules); hepatic or renal impairment; lactation; history of regional enteritis or ulcerative colitis; history of antibiotic-associated colitis

- **Physical:** Site of infection or acne; skin color, lesions; BP; R, adventitious sounds; bowel sounds, output, liver evaluation; complete blood count, LFTs, renal function tests

Interventions

Systemic administration

- Culture infection site before therapy.
- Administer oral drug with a full glass of water or with food to prevent esophageal irritation.
- Do not give IM injections of more than 600 mg; inject deep into large muscle to avoid serious problems.
- Do not use for minor bacterial or viral infections.

⊗ **Black box warning** Be aware that serious to fatal colitis can occur up to several wk after completion of therapy; reserve use, and monitor patient closely.

- Monitor LFTs and renal function tests, and blood counts with prolonged therapy.

Topical dermatologic administration

- Keep solution away from eyes, mouth, and abraded skin or mucous membranes; alcohol base will cause stinging. Shake well before use.
- Keep cool tap water available to bathe eye, mucous membranes, abraded skin inadvertently contacted by drug solution.

Vaginal preparation

- Give intravaginally, preferably at bedtime.

Teaching points

Systemic administration

- Take oral drug with a full glass of water or with food.
- Take full prescribed course of oral drug. Do not stop taking without notifying your health care provider.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); superinfections in the mouth, vagina (use frequent hygiene measures, request treatment if severe).
- Report severe or watery diarrhea, abdominal pain, inflamed mouth or vagina, skin rash or lesions.

Topical dermatologic administration

- Apply thin film of acne solution to affected area twice daily, being careful to avoid eyes, mucous membranes, abraded skin; if solution contacts one of these areas, flush with lots of cool water.
- Report abdominal pain, diarrhea.

Vaginal preparation

- Use vaginal preparation for 7 or 3 consecutive days, preferably at bedtime. Refrain from sexual intercourse during treatment with this product.
- Report vaginal irritation, itching; diarrhea, no improvement in complaint being treated.

▷ clofarabine

See Appendix U, *Less commonly used drugs*.

▷ clomiPHENE citrate (kloe' mi feen)

Clomid, Milophene, Serophene

PREGNANCY CATEGORY X

Drug classes

Fertility drug
Hormone

Therapeutic actions

Binds to estrogen receptors, decreasing the number of available estrogen receptors, which gives the hypothalamus and pituitary the false signal to increase FSH and LH secretion, resulting in ovarian stimulation.

Indications

- Treatment of ovulatory failure in patients with normal liver function and normal endogenous estrogen levels, whose partners are fertile and potent
- Unlabeled use: Treatment of male infertility

Contraindications and cautions

- Contraindicated with known sensitivity to clomiphene, liver disease, uterine fibroids, abnormal vaginal bleeding of undetermined origin, ovarian cyst, uncontrolled thyroid or

adrenal dysfunction, organic intracranial lesions, pregnancy.

- Use cautiously with lactation.

Available forms

Tablets—50 mg

Dosages

Adults

- *Treatment of ovulatory failure:*

Initial therapy: 50 mg/day PO for 5 days started anytime there has been no recent uterine bleeding or about the fifth day of the cycle if uterine bleeding does occur.

Second course: If ovulation does not occur after the first course, administer 100 mg/day PO for 5 days; start this course as early as 30 days after the previous one.

Third course: Repeat second course regimen; if patient does not respond to three courses of treatment, further treatment is not recommended.

- *Male infertility:* 25–50 mg/day PO for 3–12 mo (controversial).

Pharmacokinetics

Route	Onset	Duration
Oral	5–8 days	6 wk

Metabolism: Hepatic; $T_{1/2}$: 5 days

Distribution: Crosses placenta

Excretion: Feces

Adverse effects

- **CNS:** Visual symptoms (blurring, spots, flashes), nervousness, insomnia, dizziness, light-headedness, photophobia, diplopia
- **CV:** *Vasomotor flushing*
- **GI:** *Abdominal discomfort, distention, bloating, nausea, vomiting*
- **GU:** Uterine bleeding, *ovarian enlargement*, **ovarian overstimulation**, birth defects in resulting pregnancies
- **Other:** *Breast tenderness*

Interactions

- *** Drug-lab test •** Increased levels of serum thyroxine, thyroxine-binding globulin

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Serophene* (clomiphene) and *Sarafem* (fluoxetine); use caution.

C

Assessment

- **History:** Sensitivity to clomiphene, liver disease, uterine fibroids, abnormal vaginal bleeding of undetermined origin, ovarian cyst, pregnancy, thyroid or adrenal dysfunction, intracranial lesions
- **Physical:** Skin color, T; affect, orientation, ophthalmologic examination; abdominal examination, pelvic examination, liver evaluation; urinary estrogens and estriol levels (women); LFTs

Interventions

- Complete a pelvic examination before each treatment to rule out ovarian enlargement, pregnancy, and other uterine difficulties.
- Check urine estrogen and estriol levels before therapy; normal levels indicate appropriate patient selection.
- Refer patient for complete ophthalmic examination; if visual symptoms occur, discontinue drug.

- **⊗ Warning** Discontinue drug at any sign of ovarian overstimulation, admit patient to hospital for observation and supportive measures.
- Provide women with calendar of treatment days and explanations about signs of estrogen and progesterone activity; caution patient that 24-hr urine collections will be needed periodically; timing of intercourse is important for achieving pregnancy.
- Alert patient to risks and hazards of multiple births.
- Explain failure to respond after three courses of therapy probably means drug will not help, and treatment will be discontinued.

Teaching points

- Prepare a calendar showing the treatment schedule, plotting ovulation.
- There is an increased incidence of multiple births in women using this drug.
- You may experience these side effects: Abdominal distention; flushing; breast tenderness; dizziness, drowsiness, light-headed-

ness, visual disturbances (use caution driving or performing tasks that require alertness).

- Report bloating, stomach pain, blurred vision, yellow skin or eyes, unusual bleeding or bruising, fever, chills, visual changes.

clomiPRAMINE hydrochloride

(kloe *mi'* pra meen)

Anafranil, Apo-Clomipramine (CAN), Co Clomipramine (CAN), Gen-Clomipramine (CAN)

PREGNANCY CATEGORY C

Drug class

TCA (tertiary amine)

Therapeutic actions

Mechanism unknown; inhibits the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors.

Indications

- Treatment of obsessions and compulsions in patients with OCD, whose obsessions or compulsions cause marked distress, are time-consuming, or interfere with social or occupational functioning
- Unlabeled uses: Panic disorders, PMS, prevention of migraine, stuttering

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, patients in the acute recovery phase following MI, myelography within previous 24 hr or scheduled within 48 hr, lactation.
- Use cautiously with allergy to dibenzazepines, ECT, preexisting CV disorders (eg, severe coronary heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may ex-

hibit a worsening of psychosis with TCA therapy); patients with bipolar disorder; elective surgery; pregnancy; lactation.

Available forms

Capsules—25, 50, 75 mg

Dosages

Adults

- *Initial treatment:* 25 mg PO daily; gradually increase as tolerated to approximately 100 mg during the first 2 wk. Then increase gradually over the next several weeks to a maximum dose of 250 mg/day. At maximum dose, give once a day at bedtime to minimize sedation.
- *Maintenance therapy:* Adjust to maintain the lowest effective dosage, and periodically assess need for treatment. Effectiveness after 10 wk has not been documented.

Pediatric patients

- *Initial treatment:* 25 mg PO daily; gradually increase as tolerated during the first 2 wk to a maximum of 3 mg/kg or 100 mg, whichever is smaller. Administer in divided doses with meals to reduce GI side effects. Then increase dosage to a daily maximum of 3 mg/kg or 200 mg, whichever is smaller. At maximum, give once a day at bedtime to minimize sedation.
- *Maintenance therapy:* Adjust dosage to maintain lowest effective dosage, and periodically assess patient to determine the need for treatment. Effectiveness after 10 wk has not been documented.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	1–6 wk

Metabolism: Hepatic; $T_{1/2}$: 19–37 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects; confusion* (especially in elderly), *disturbed concentration, dizziness, tremor*; hallucinations, disorientation, decreased memory, feelings of unreality, delu-

sions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, *asthenia*, aggressive reaction

- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure, CVA
- **Endocrine:** Hyperglycemia or hypoglycemia; elevated prolactin levels; inappropriate ADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, parotid swelling, abdominal cramps, black tongue, *eructation*
- **GU:** Urinary retention, delayed or frequent micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, *menstrual irregularity* and galactorrhea in women; increased or decreased libido; *impotence*, painful ejaculation
- **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia, purpura, thrombocytopenia, leukopenia, anemia
- **Hypersensitivity:** Skin rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized, facial, tongue), drug fever
- **Withdrawal:** Symptoms on abrupt discontinuation of prolonged therapy—nausea, headache, vertigo, nightmares, malaise
- **Other:** *Nasal congestion, laryngitis*, excessive appetite, weight change; sweating hyperthermia, flushing, chills

Interactions

• **Drug-drug** • Increased TCA levels and pharmacologic effects with cimetidine • Increased TCA levels with fluoxetine, methylphenidate, phenothiazines, hormonal contraceptives, disulfiram • Hyperpyretic crises, severe seizures, hypertensive episodes and deaths when MAOIs, furazolidone, clonidine are given with TCAs; don't give within 14 days before or after an MAOI • Increased antidepressant response and cardiac arrhythmias when given with thyroid medication • Increased anticholinergic effects of anticholinergic drugs when given with TCAs • Increased response to alcohol, barbiturates, benzodiazepines, other CNS depressants

with TCAs • Decreased effects of indirect-acting sympathomimetic drugs (ephedrine) with TCAs • Risk of arrhythmias if combined with fluoroquinolones • Decreased levels with drugs that induce CYP450 (such as rifampin, phenytoin) • **Drug-alternative therapy** • Clomipramine levels reduced with St. John's wort

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between clomipramine and chlorpromazine; use caution.

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; myelography within previous 24 hr or scheduled within 48 hr; lactation; ECT; preexisting CV disorders; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism, impaired hepatic, renal function; psychiatric patients; elective surgery, pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

⊗ **Black box warning** Increased risk of suicidal thinking and behavior in children, adolescents, and young adults; use caution, and monitor patient.

- Limit depressed and potentially suicidal patients' access to drug.
- Administer in divided doses with meals to reduce GI side effects while increasing dosage to therapeutic levels.
- Give maintenance dose once daily at bedtime to decrease daytime sedation.
- Reduce dose if minor side effects develop; discontinue drug if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other signs of infection.

Teaching points

- Take this drug as prescribed; do not stop taking abruptly or without consulting your health care provider.
- Avoid alcohol, sleep-inducing drugs, and over-the-counter drugs.
- Avoid prolonged exposure to sun or sunlamps; use a sunscreen or protective garments if exposure to sun is unavoidable.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; take safety measures if severe; avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals; practice frequent mouth care; and suck sugarless candies); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty urinating, excessive sedation.

clonazepam

(kloe na' ze pam)

Apo-Clonazepam (CAN),
CO Clonazepam (CAN), Gen-
Clonazepam (CAN), Klonopin,
Klonopin Wafers, PMS-
Clonazepam (CAN), ratio-
Clonazepam (CAN), Rivotril (CAN)

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Antiepileptic
Benzodiazepine

Therapeutic actions

Exact mechanisms not understood; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter.

Indications

- Used alone or as adjunct in treatment of Lennox-Gastaut syndrome (petit mal variant), akinetic and myoclonic seizures; may be useful in patients with absence (petit mal) seizures

who have not responded to succinimides; up to 30% of patients show loss of anticonvulsant activity of drug, often within 3 mo of therapy (may respond to dosage adjustment)

- Treatment of panic disorder with or without agoraphobia
- Unlabeled uses: Periodic leg movements during sleep; hypokinetic dysarthria; acute manic episodes; multifocal tic disorders; neuralgias; adjunct in managing schizophrenia

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs; pregnancy (risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery ("floppy infant" syndrome), lactation (infants become lethargic and lose weight).
- Use cautiously with hepatic or renal impairment, debilitation; elderly patients.

Available forms

Tablets—0.5, 1, 2 mg; orally disintegrating tablets—0.125, 0.25, 0.5, 1, 2 mg

Dosages

Individualize dosage; increase dosage gradually to avoid adverse effects; drug is available only in oral dosage forms.

Adults

Seizure disorders: Initial dose should not exceed 1.5 mg/day PO divided into three doses; increase in increments of 0.5–1 mg PO every 3 days until seizures are adequately controlled or until side effects preclude further increases. Maximum recommended dosage is 20 mg/day.

Panic disorders: Initial dose 0.25 mg PO bid; gradually increase to a target dose of 1 mg/day.

Pediatric patients at least 10 yr or 30 kg

Initially, 0.01–0.03 mg/kg/day PO; do not exceed 0.05 mg/kg/day PO, given in two or three doses. Increase dosage by not more than 0.25–0.5 mg every third day until a daily maintenance dose of 0.1–0.2 mg/kg has been reached, unless seizures are controlled by lower dosage or side effects preclude increases. Whenever possible, divide daily dose into three equal doses, or give largest dose at bedtime.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–2 hr	Weeks

Metabolism: Hepatic; $T_{1/2}$: 18–50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, anger, hostility*; episodes of mania and hypomania, restlessness, confusion, crying, delirium, suicidal ideation, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; *mild paradoxical excitatory reactions during first 2 wk of treatment*
- **CV:** Bradycardia, tachycardia, **CV collapse**, hypertension and hypotension, palpitations, edema
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **EENT:** Visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **GI:** *Constipation, diarrhea, dry mouth*, salivation, *nausea*, anorexia, vomiting, difficulty in swallowing, gastric disorders, encopresis
- **GU:** Incontinence, urinary retention, changes in libido, menstrual irregularities
- **Hematologic:** Elevations of blood enzymes—LDH, alkaline phosphatase, AST, ALT; blood dyscrasias: agranulocytosis, leukopenia
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia. Drug dependence with withdrawal syndrome when drug is discontinued; more common with abrupt discontinuation of higher dosage used for longer than 4 mo

Interactions

* **Drug-drug** • Increased CNS depression with alcohol and other CNS depressants • Increased effect with cimetidine, disulfiram, omeprazole, hormonal contraceptives • Decreased effect with

theophylline • Risk of increased digoxin levels and toxicity; monitor patient carefully

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Klonopin* (clonazepam) and clonidine; use caution.

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; lactation; hepatic or renal impairment, debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P; BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Monitor addiction-prone patients carefully because of their predisposition to habituation and drug dependence.
- Monitor patient for suicidal ideation.
- Monitor liver function and blood counts periodically in patients on long-term therapy.
- **⊗ Warning** Taper dosage gradually after long-term therapy, especially in patients with epilepsy; substitute another antiepileptic.
- Monitor patient for therapeutic drug levels: 20–80 nanograms/mL.
- If patient has epilepsy, arrange for patient to wear medical alert identification indicating patient has epilepsy and is receiving drug therapy.

Teaching points

- Take drug exactly as prescribed; do not stop taking drug (long-term therapy) without consulting your health care provider.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs.
- Avoid pregnancy; serious adverse effects can occur. Using barrier contraceptives is advised while taking this drug.
- It is advisable to wear or carry a medical alert identification indicating your diagnosis and drug therapy.

- You may experience these side effects: Drowsiness, dizziness (may become less pronounced; avoid driving or engaging in other dangerous activities); GI upset (take drug with food); fatigue; dreams; crying; nervousness; depression, emotional changes; bed-wetting, urinary incontinence.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, difficulty voiding, palpitations, swelling in the extremities, thoughts of suicide.

clonidine hydrochloride

(kloe' ni deen)

Oral: Apo-Clonidine (CAN), Catapres, Clonidine ER Suspension, Clonidine ER Tablets, Jenloga

Transdermal preparations: Catapres-TTS-1, Catapres-TTS-2, Catapres-TTS-3, Dixarit (CAN), Duraclon

Analgesic: Duraclon

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Central analgesic
Sympatholytic (centrally acting)

Therapeutic actions

Stimulates CNS α_2 -adrenergic receptors, inhibits sympathetic cardioaccelerator and vasoconstrictor centers, and decreases sympathetic outflow from the CNS.

Indications

- Hypertension, used alone or as part of combination therapy
- Treatment of severe pain in cancer patients in combination with opiates; epidural more effective with neuropathic pain (*Duraclon*)
- Unlabeled uses: Tourette syndrome; migraine, decreases severity and frequency; menopausal flushing, decreases severity and frequency of episodes; chronic methadone detoxification; rapid opiate detoxification (in doses up to 17 mcg/kg/day); alcohol and

benzodiazepine withdrawal treatment; management of hypertensive “urgencies” (oral clonidine “loading” is used; initial dose of 0.2 mg then 0.1 mg every hour until a dose of 0.7 mg is reached or until BP is controlled); atrial fibrillation; attention deficit hyperactivity disorder; post-herpetic neuralgia, smoking cessation (transdermal), hot flashes, hyperhidrosis, ulcerative colitis, diabetic diarrhea

Contraindications and cautions

- Contraindicated with hypersensitivity to clonidine or any adhesive layer components of the transdermal system.
- Use cautiously with severe coronary insufficiency, recent MI, cerebrovascular disease; chronic renal failure; pregnancy, lactation.

Available forms

Tablets—0.1, 0.2, 0.3 mg; ER tablets—0.17, 0.26 mg; moderate-release tablets—0.1 mg; ER suspension—0.09 mg/mL; transdermal—0.1, 0.2, 0.3 mg/24 hr; epidural injection—100 mcg/mL

Dosages

Adults

Oral therapy

Individualize dosage. Initial dose is 0.1 mg bid; for maintenance dosage, increase in increments of 0.1 or 0.2 mg to reach desired response. Common range is 0.2–0.6 mg/day, in divided doses or once daily if using extended-release form; maximum dose is 2.4 mg/day. Minimize sedation by slowly increasing daily dosage; giving majority of daily dose at bedtime. Moderate-release tablets use same dosage, but are not interchangeable with other forms; dosage adjustment may be needed if switching between forms.

Transdermal system

Apply to a hairless area of intact skin of upper arm or torso once every 7 days. Change skin site for each application. If system loosens while wearing, apply adhesive overlay directly over the system to ensure adhesion. Start with the 0.1-mg system (releases 0.1 mg/24 hr); if, after 1–2 wk, desired BP reduction is not achieved, add another 0.1-mg system, or use a larger system. Dosage of more than two 0.3-mg systems does

not improve efficacy. Antihypertensive effect may only begin 2–3 days after application; therefore, when substituting transdermal systems, a gradual reduction of prior dosage is advised. Remove old system before applying new one. Previous antihypertensive medication may have to be continued, particularly with severe hypertension.

Epidural

- **Pain management:** 30 mcg/hr by continuous epidural infusion.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	3–5 hr	24 hr
Transdermal	Slow	2–3 days	7 days
Epidural	Rapid	19 min	Variable

Metabolism: Hepatic; $T_{1/2}$: 12–16 hr, 19 hr (transdermal system); 48 hr (epidural)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness*, headache, fatigue that tend to diminish within 4–6 wk, dreams, nightmares, insomnia, hallucinations, delirium, nervousness, restlessness, anxiety, depression, retinal degeneration
- **CV:** Heart failure, orthostatic hypotension, palpitations, tachycardia, bradycardia, Raynaud's phenomenon, ECG abnormalities manifested as Wenckebach period or ventricular trigeminy
- **Dermatologic:** Rash, angioneurotic edema, hives, urticaria, hair thinning and alopecia, pruritus, dryness, itching or burning of the eyes, pallor
- **GI:** *Dry mouth, constipation*, anorexia, malaise, nausea, vomiting, parotid pain, parotitis, mild transient abnormalities in LFTs
- **GU:** Impotence, sexual dysfunction, nocturia, difficulty in micturition, urinary retention
- **Other:** Weight gain, transient hyperglycemia or elevated serum creatine phosphokinase level, gynecomastia, weakness, muscle or joint pain, cramps of the lower limbs, dryness of the nasal mucosa, fever

Transdermal system

- **CNS:** Drowsiness, fatigue, headache, lethargy, sedation, insomnia, nervousness
- **GI:** *Dry mouth*, constipation, nausea, change in taste, dry throat
- **GU:** Impotence, sexual dysfunction
- **Local:** *Transient localized skin reactions*, pruritus, erythema, allergic contact sensitization and contact dermatitis, localized vesiculation, hyperpigmentation, edema, excoriation, burning, papules, throbbing, blanching, generalized macular rash

Interactions

★ **Drug-drug** • Decreased antihypertensive effects with TCAs (imipramine) • Paradoxical hypertension with propranolol; also greater withdrawal hypertension when abruptly discontinued and patient is taking beta-adrenergic blocking agents • Additive sedation with CNS depressants, alcohol

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between clonidine and *Klonopin* (clonazepam); use caution.

Assessment

- **History:** Hypersensitivity to clonidine or adhesive layer components of the transdermal system; severe coronary insufficiency, recent MI, cerebrovascular disease; chronic renal failure; lactation, pregnancy
- **Physical:** Body weight; T; skin color, lesions, T; mucous membranes color, lesions; breast examination; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, perfusion, edema, auscultation; bowel sounds, normal output, liver evaluation, palpation of salivary glands; normal urinary output, voiding pattern; LFTs, ECG

Interventions

⊗ **Warning** Do not discontinue use abruptly; discontinue therapy by reducing the dosage gradually over 2–4 days to avoid rebound hypertension, tachycardia, flushing, nausea, vomiting, cardiac arrhythmias (hypertensive encephalopathy and death have occurred after abrupt cessation of clonidine).

- Do not discontinue transdermal therapy prior to surgery; monitor BP carefully during surgery; have other BP-controlling drugs readily available.
- Continue oral clonidine therapy to within 4 hr of surgery then resume as soon as possible thereafter.

⊗ **Black box warning** Epidural route is not recommended for obstetric, postpartum, or perioperative pain because of the risk of hemodynamic instability.

- Store epidural injection at room temperature; discard any unused portions.
- Reevaluate therapy if clonidine tolerance occurs; giving concomitant diuretic increases the antihypertensive efficacy of clonidine.
- Monitor BP carefully when discontinuing clonidine; hypertension usually returns within 48 hr.

⊗ **Warning** Remove transdermal patch before defibrillation to prevent arcing. Remove system if patient is having an MRI.

- Assess compliance with drug regimen in a supportive manner with pill counts, or other methods.

Teaching points

- Take this drug exactly as prescribed. Do not miss doses. Do not discontinue the drug unless instructed by your health care provider. Do not discontinue abruptly; life-threatening adverse effects may occur. If you travel, take an adequate supply of drug.
- Use the transdermal system as prescribed; refer to directions in package insert, or contact your health care provider with questions. Be sure to remove old systems before applying new ones. System must be removed if you are going to have an MRI; inform technician that you are using this system.
- Attempt lifestyle changes that will reduce your blood pressure: Stop smoking and using alcohol; lose weight; restrict intake of salt; exercise regularly.
- Use caution with alcohol. Your sensitivity may increase while using this drug.
- You may experience these side effects: Drowsiness, dizziness, light-headedness, headache, weakness (often transient; observe caution driving or performing other tasks that require alertness or physical dexterity); dry mouth (suck-

ing on sugarless lozenges or ice chips may help); GI upset (eat frequent small meals); dreams, nightmares (reversible); dizziness, light-headedness when you change position (get up slowly; use caution climbing stairs); impotence, other sexual dysfunction, decreased libido (discuss with your health care provider); breast enlargement, sore breasts; palpitations.

- Report urinary retention, changes in vision, blanching of fingers, rash.

▽ clopidogrel bisulfate

(*clœ pid' oh grel*)

Plavix

PREGNANCY CATEGORY B

Drug classes

Adenosine diphosphate (ADP) receptor antagonist
Antiplatelet

Therapeutic actions

Inhibits platelet aggregation by blocking ADP receptors on platelets, preventing clumping of platelets.

Indications

- Treatment of patients at risk for ischemic events—recent MI, recent ischemic CVA, peripheral artery disease
- Treatment of patients with acute coronary syndrome
- Unlabeled use: As loading dose with aspirin to prevent adverse cardiac events in coronary stent implantation

Contraindications and cautions

- Contraindicated with allergy to clopidogrel, active pathological bleeding such as peptic ulcer or intracranial hemorrhage, lactation.
- Use cautiously with bleeding disorders, recent surgery, hepatic impairment, pregnancy.

Available forms

Tablets—75, 300 mg

Dosages

Adults

- *Recent MI, CVA, or established peripheral arterial disease:* 75 mg PO daily.
- *Acute coronary syndrome:* 300 mg PO loading dose, then 75 mg/day PO with aspirin, given at a dose from 75–325 mg once daily.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1 hr	2 hr

Metabolism: Hepatic; $T_{1/2}$: 8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, weakness, syncope, flushing
- **CV:** Hypertension, edema
- **Dermatologic:** *Rash*, pruritus
- **GI:** Nausea, GI distress, constipation, diarrhea, **GI bleed**
- **Other:** Increased bleeding risk

Interactions

- *** Drug-drug** • Increased risk of GI bleeding with NSAIDs, monitor patient carefully
- Increased risk of bleeding with warfarin; monitor carefully

■ Nursing considerations

Assessment

- **History:** Allergy to clopidogrel, pregnancy, lactation, bleeding disorders, recent surgery, hepatic impairment, peptic ulcer
- **Physical:** Skin color, T, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; R, adventitious sounds

Interventions

⊗ **Black box warning** Slow metabolizers may experience less effects, as drug is activated in the liver by CYP2C19. Genotype testing for poor metabolizers is suggested before beginning drug.

- Provide frequent small meals if GI upset occurs (not as common as with aspirin).
- Provide comfort measures and arrange for analgesics if headache occurs.

- Monitor patient for increased bleeding; limit invasive procedures.

Teaching points

- Take daily as prescribed. May be taken with meals.
- You may experience these side effects: Dizziness, light-headedness (this may pass as you adjust to the drug); headache (lie down in a cool environment and rest; over-the-counter preparations may help); nausea, gastric distress (eat frequent small meals); prolonged bleeding (alert dentists and health care providers of this drug use).
- Report rash, chest pain, fainting, severe headache, abnormal bleeding or bruising.

▽ clorazepate dipotassium

(*klor az' e pate*)

Apo-Clorazepate (CAN),
Tranxene-T-tab

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Antiepileptic
Anxiolytic
Benzodiazepine

Therapeutic actions

Exact mechanisms not understood; benzodiazepines potentiate the effects of GABA, an inhibitory neurotransmitter; anxiolytic effects occur at doses well below those necessary to cause sedation, ataxia.

Indications

- Management of anxiety disorders or for short-term relief of symptoms of anxiety
- Symptomatic relief of acute alcohol withdrawal
- Adjunctive therapy for partial seizures

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication with depression of vital signs; preg-

nancy (risk of congenital malformations, neonatal withdrawal syndrome); labor and delivery (“floppy infant” syndrome); lactation (infants tend to become lethargic and lose weight).

- Use cautiously with impaired liver or renal function, debilitation; elderly patients.

Available forms

Tablets—3.75, 7.5, 15 mg

Dosages

Individualize dosage; increase dosage gradually to avoid adverse effects. Drug is available only in oral forms.

Adults

- **Anxiety:** Usual dose is 30 mg/day PO in divided doses tid; adjust gradually within the range of 15–60 mg/day; also may be given as a single daily dose at bedtime with a maximum starting dose of 15 mg. For maintenance, give the 22.5-mg PO tablet in a single daily dose as an alternate form for patients stabilized on 7.5 mg PO tid; do not use to initiate therapy.
- **Adjunct to antiepileptic medication:** Maximum initial dose is 7.5 mg PO tid. Increase dosage by no more than 7.5 mg every wk, do not exceed 90 mg/day.
- **Acute alcohol withdrawal:** Day 1: 30 mg PO initially, then 30–60 mg in divided doses. Day 2: 45–90 mg PO in divided doses. Day 3: 22.5–45 mg PO in divided doses. Day 4: 15–30 mg PO in divided doses. Thereafter, gradually reduce dose to 7.5–15 mg/day PO, and stop as soon as condition is stable.

Pediatric patients

- **Adjunct to antiepileptic medication:**
Older than 12 yr: Use adult dosage.
9–12 yr: Maximum initial dose is 7.5 mg PO bid; increase dosage by no more than 7.5 mg every wk, and do not exceed 60 mg/day.
Younger than 9 yr: Not recommended.

Geriatric patients or patients with debilitating disease

- **Anxiety:** Initially, 7.5–15 mg/day PO in divided doses. Adjust as needed and tolerated.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Fast	1–2 hr	Days

Metabolism: Hepatic; $T_{1/2}$: 40–50 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, anger, hostility*, episodes of mania and hypomania, restlessness, confusion, crying, delirium, *headache*, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; *mild paradoxical excitatory reactions during first 2 wk of treatment*
- **CV:** Bradycardia, tachycardia, **CV collapse**, hypertension and hypotension, palpitations, edema
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **EENT:** Visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion
- **GI:** *Constipation, diarrhea, dry mouth*, salivation, *nausea*, anorexia, vomiting, difficulty in swallowing, gastric disorders, hepatic impairment, encopresis
- **GU:** Incontinence, urinary retention, changes in libido, menstrual irregularities
- **Hematologic:** Elevations of blood enzymes—LDH, alkaline phosphatase, AST, ALT; blood dyscrasias—agranulocytosis, leukopenia
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia; drug dependence with withdrawal syndrome is common with abrupt discontinuation of higher dosage used for longer than 4 mo

Interactions

- **Drug-drug** • Increased CNS depression with alcohol and other CNS depressants • Increased effect with cimetidine, disulfiram,

omeprazole, hormonal contraceptives • Decreased effect with theophylline • Risk of increased digoxin levels and toxicity; monitor patient carefully

★ **Drug-alternative therapy** • Increased CNS effects with kava

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between clorazepate and clofibrate; use caution.

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; lactation; renal or hepatic impairment; debilitation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- ⊗ **Warning** Taper dosage gradually after long-term therapy, especially in epileptics.
- Arrange for patients with epilepsy to wear medical alert identification, indicating disease and medication usage.
- Because of increased risk of suicide, monitor patient for suicidal ideation.

Teaching points

- Take drug exactly as prescribed; do not stop taking drug (long-term therapy) without consulting your health care provider.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs.
- Avoid pregnancy while taking this drug; use of barrier contraceptives is advised. If you become pregnant, do not stop the drug; contact your health care provider.
- You may experience these side effects: Drowsiness, dizziness (may be transient; avoid driving a car or engaging in other dangerous activities); GI upset (take with food); fatigue; depression; dreams; crying; nervousness; depression, emotional changes; bed-wetting, urinary incontinence.

- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, difficulty voiding, palpitations, swelling in the extremities, thoughts of suicide.

▷ clotrimazole

(kloe trim' a zole)

Oral, Topical use only: Mycelex Troche

Vaginal preparations: Canesten Vaginal (CAN), Gyne-Lotrimin 3, Gyne-Lotrimin 3 Combination Pack, Mycelex-7, Mycelex-7 Combination Pack

Topical preparations: Canesten Topical (CAN), Clotrimaderm (CAN), Cruex, Desenex, Fungoid, Lotrimin AF, Lotrimin Ultra

PREGNANCY CATEGORY B
(TOPICAL, VAGINAL FORMS)

PREGNANCY CATEGORY C
(ORAL TROCHE)

Drug class

Antifungal

Therapeutic actions

Fungicidal and fungistatic: Binds to fungal cell membrane with a resultant change in membrane permeability, allowing leakage of intracellular components, causing cell death.

Indications

- Troche: Treatment of oropharyngeal candidiasis; prevention of oropharyngeal candidiasis in immunocompromised patients receiving radiation, chemotherapy, or steroid therapy
- Vaginal preparations: Local treatment of vulvovaginal candidiasis (moniliasis)
- Topical preparations: Topical treatment of tinea pedis, tinea cruris, tinea corporis due to *Trichophyton rubrum*, *Trichophyton mentagrophytes*, *Epidermophyton floccosum*, *Microsporium canis*; candidiasis due to *Candida albicans*; tinea versicolor due to *Malassezia furfur*

Contraindications and cautions

- Contraindicated with allergy to clotrimazole or components used in preparation. Vaginal products contraindicated in girls younger than 12 yr.
- Use vaginal and topical preparations cautiously with pregnancy, lactation.
- Use oral troche only when benefits to mother outweigh risk to fetus.

Available forms

Vaginal suppositories—100, 200 mg; vaginal cream, solution, lotion—1%, 2%; topical cream, solution, lotion—1%; oral troche—10 mg

Dosages

Adults and children 2 yr and older

Oral troche

For treatment, dissolve slowly in the mouth five times daily for 14 days. For prevention, tid for the duration of chemotherapy or radiation therapy or until steroids are reduced to maintenance levels.

Topical

Gently massage into affected and surrounding skin areas bid in the morning and evening for 14 days. Relief is usually noted during first week of therapy; therapy 2–4 wk.

Vaginal suppository

100-mg suppository intravaginally at bedtime for 7 consecutive nights; 200-mg suppository for 3 consecutive nights.

Vaginal preparation, cream

One applicator (5 g/day), preferably at bedtime for 3–7 consecutive days.

Pharmacokinetics

Action is primarily local; pharmacokinetics are not known.

Adverse effects

Troche

- **GI:** *Nausea, vomiting, abnormal LFTs*

Vaginal

- **Dermatologic:** Rash
- **GI:** *Lower abdominal cramps, bloating (elevated AST), unpleasant mouth sensations*
- **GU:** *Slight urinary frequency; burning or irritation in the sexual partner*

Topical

- **Local:** Erythema, stinging, blistering, peeling, edema, pruritus, urticaria, general skin irritation

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between clotrimazole and co-trimoxazole; use caution.

Assessment

- **History:** Allergy to clotrimazole or components used in preparation, pregnancy, lactation
- **Physical:** Skin color, lesions, area around lesions; bowel sounds; culture of area involved, LFTs

Interventions

- Culture fungus involved before therapy.
- Have patient dissolve troche slowly in mouth.
- Insert vaginal suppository into vagina at bedtime for 3–7 consecutive nights. Provide sanitary napkin to protect clothing from stains.
- Administer vaginal cream high into vagina using the applicator supplied with the product. Administer for 3–7 consecutive nights, even during menstrual period.
- Cleanse affected area before topical application. Do not apply to eyes or near eyes.
- Monitor response to drug therapy. If no response is noted, arrange for more cultures to determine causative organism.
- Ensure that patient receives full course of therapy to eradicate the fungus and prevent recurrence.
- Discontinue topical or vaginal administration if rash or sensitivity occurs.
- Supervise children younger than 12 yr using topical products.

Teaching points

- Take the full course of drug therapy, even if symptoms improve. Continue during menstrual period if vaginal route is being used. Long-term use of the drug may be needed; beneficial effects may not be seen for several weeks. Vaginal creams should be inserted high into the vagina. Troche preparation

should be allowed to dissolve slowly in the mouth. Apply topical preparation by gently massaging into the affected area.

- Use hygiene measures to prevent reinfection or spread of infection.
- With vaginal use, refrain from sexual intercourse, or advise partner to use a condom to avoid reinfection. Use a sanitary napkin to prevent staining of clothing.
- You may experience these side effects: Nausea, vomiting, diarrhea (oral use); irritation, burning, stinging (local).
- Report worsening of the condition being treated, local irritation, burning (topical), rash, irritation, pelvic pain (vaginal), nausea, GI distress (oral administration).

clozapine

(kloe' za peen)

Apo-Clozapine (CAN), Clozaril, FazaClo, Gen-Clozapine (CAN)

PREGNANCY CATEGORY B

Drug classes

Antipsychotic
Dopaminergic blocker

Therapeutic actions

Mechanism not fully understood: Blocks dopamine receptors in the brain, depresses the RAS; anticholinergic, antihistaminic (H₁), and alpha-adrenergic blocking activity may contribute to some of its therapeutic (and adverse) actions. Clozapine produces fewer extrapyramidal effects than other antipsychotics.

Indications

- Management of severely ill schizophrenics who are unresponsive to standard antipsychotic drugs
- Reduction of the risk of recurrent suicidal behavior in patients with schizophrenia or schizoaffective disorder (not orally disintegrating tablet)

Contraindications and cautions

- Contraindicated with allergy to clozapine, myeloproliferative disorders, history of clozapine-induced agranulocytosis or severe

granulocytopenia, severe CNS depression, comatose states, history of seizure disorders, lactation, therapy with other drugs that cause bone marrow suppression.

- Use cautiously with CV disease, narrow-angle glaucoma, pregnancy.

Available forms

Tablets—25, 100 mg; orally disintegrating tablets—12.5, 25, 50, 100 mg

Dosages

Adults

- **Initial therapy:** 12.5 mg PO once or twice daily. If using orally disintegrating tablets, begin with one half (12.5 mg) of a 25-mg tablet and destroy the remaining half. Continue to 25 mg PO daily or bid; then gradually increase with daily increments of 25–50 mg/day, if tolerated, to a dose of 300–450 mg/day by the end of second week. Adjust later dosage no more often than twice weekly in increments of less than 100 mg. Do not exceed 900 mg/day.
- **Maintenance:** Maintain at the lowest effective dose for remission of symptoms.
- **Discontinuation of therapy:** Gradual reduction over a 2-wk period is preferred. If abrupt discontinuation is required, carefully monitor patient for signs of acute psychotic symptoms.
- **Reinitiation of treatment:** Follow initial dosage guidelines, use extreme care; increased risk of severe adverse effects with re-exposure.

Pediatric patients

Safety and efficacy in patients younger than 16 yr not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–6 hr	Weeks

Metabolism: Hepatic; T_{1/2}: 4–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Drowsiness, sedation, seizures, dizziness, syncope, headache, tremor, disturbed sleep, nightmares, restlessness, agitation, in-

creased salivation, sweating, tardive dyskinesia, neuroleptic malignant syndrome

- **CV:** *Tachycardia, hypotension*, hypertension, ECG changes, **potentially fatal myocarditis**
- **GI:** *Nausea, vomiting, constipation*, abdominal discomfort, dry mouth
- **GU:** Urinary abnormalities
- **Hematologic:** Leukopenia, **agranulocytosis**
- **Other:** *Fever*, weight gain, rash, development of diabetes mellitus

Interactions

★ **Drug-drug** • Increased therapeutic and toxic effects with cimetidine, caffeine, other CYP450 inhibitors • Decreased therapeutic effect with phenytoin, ethotoin, other CYP450 inducers

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred with *Clozaril* (clozapine) and *Colazal* (balsalazide); dangerous effects could occur. Use caution.

Assessment

- **History:** Allergy to clozapine, myeloproliferative disorders, history of clozapine-induced agranulocytosis or severe granulocytopenia, severe CNS depression, comatose states, history of seizure disorders, CV disease, narrow-angle glaucoma, lactation, pregnancy
- **Physical:** T, weight; reflexes, orientation, IOP, ophthalmologic examination; P, BP, orthostatic BP, ECG; R, adventitious sounds; bowel sounds, normal output, liver evaluation; prostate palpation, normal urine output; CBC, urinalysis, LFTs, renal function tests, EEG

Interventions

⊗ **Black box warning** Use only when unresponsive to conventional antipsychotic drugs; risk of serious CV and respiratory effects, including myocarditis.

- Obtain clozapine through the *Clozaril* Patient Assistance Program. For more information, call 1-800-448-5938.
- Dispense only 1 wk supply at a time.

- Monitor WBC count carefully prior to first dose.

⊗ **Black box warning** Monitor WBC count weekly during treatment and for 4 wk thereafter. Dosage must be adjusted based on WBC count. Potentially fatal agranulocytosis has been reported.

⊗ **Black box warning** Elderly patients with dementia-related psychosis are at increased risk for death; drug is not approved for these patients.

- Monitor T. If fever occurs, rule out underlying infection, and consult physician for comfort measures.
- ⊗ **Black box warning** Monitor for seizures; with history of seizures, risk increases as dose increases.
- Monitor elderly patients for dehydration. Institute remedial measures promptly; sedation and decreased thirst related to CNS effects can lead to dehydration.
- Monitor patient regularly for signs and symptoms of diabetes mellitus.
- Encourage voiding before taking drug to decrease anticholinergic effects of urinary retention.
- Follow guidelines for discontinuation or re-institution of the drug.
- Educate patient on seriousness of potential agranulocytosis.

Teaching points

- Weekly blood tests will be taken to determine safe dosage; dosage will be increased gradually to achieve most effective dose. Only 1 week of medication can be dispensed at a time and will depend on your white blood cell count. Do not take more than your prescribed dosage. Do not make up missed doses; instead contact your health care provider. Do not stop taking this drug suddenly; gradual reduction of dosage is needed to prevent side effects.
- If you think you are pregnant or wish to become pregnant, contact your health care provider.
- You may experience these side effects: Drowsiness, dizziness, sedation, seizures (avoid driving or performing tasks that require concentration); dizziness, faintness on arising (change positions slowly); increased saliva-

tion (reversible); constipation (consult your health care provider for correctives); fast heart rate (rest, take your time).

- Report lethargy, weakness, fever, sore throat, malaise, mouth ulcers, and flulike symptoms.

▷ coagulation factor VIIa (recombinant)

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ codeine phosphate (*koe' deen*)

PREGNANCY CATEGORY C
(DURING PREGNANCY)

PREGNANCY CATEGORY D
(DURING LABOR)

CONTROLLED SUBSTANCE C-II

Drug classes

Antitussive

Opioid agonist analgesic

Therapeutic actions

Acts at opioid receptors in the CNS to produce analgesia, euphoria, sedation; acts in the medullary cough center to depress cough reflex.

Indications

- Relief of mild to moderate pain in adults and children
- Suppression of coughing induced by chemical or mechanical irritation of the respiratory system

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, physical dependence on an opioid analgesic (drug may precipitate withdrawal).
- Use cautiously with pregnancy, labor, lactation, bronchial asthma, COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, renal or hepatic impairment.

Available forms

Tablets—15, 30, 60 mg; oral solution—15 mg/5 mL; injection—15, 30 mg/mL

Dosages

Adults

Analgesic

15–60 mg PO, IM, IV or subcutaneously every 4–6 hr; do not exceed 360 mg/24 hr.

Antitussive

10–20 mg PO every 4–6 hr; do not exceed 120 mg/24 hr.

Pediatric patients

Contraindicated in premature infants.

Analgesic

1 yr and older: 0.5 mg/kg or 15 mg/m² IM or subcutaneously every 4–6 hr.

Antitussive

2–6 yr: 2.5–5 mg PO every 4–6 hr; do not exceed 12–18 mg/day based on age.

6–12 yr: 5–10 mg PO every 4–6 hr; do not exceed 60 mg/24 hr.

Geriatric patients or impaired adults

Use caution; respiratory depression may occur in elderly, the very ill, or those with respiratory problems. Reduced dosage may be necessary.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral, IM, IV	10–30 min	30–60 min	4–6 hr

Metabolism: Hepatic; T_{1/2}: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Protect vials from light.

Infusion: Administer slowly over 5 min by direct injection or into running IV tubing.

Adverse effects

- **CNS:** Sedation, clamminess, sweating, headache, vertigo, floating feeling, dizziness, lethargy, confusion, light-headedness, nervousness, unusual dreams, agitation, euphoria, hallucinations, delirium, insomnia, anxiety, fear, disorientation,

impaired mental and physical performance, coma, mood changes, weakness, tremor, seizures

- **CV:** Palpitation, increase or decrease in BP, circulatory depression, **cardiac arrest, shock**, tachycardia, bradycardia, arrhythmia
- **Dermatologic:** Rash, hives, pruritus, flushing, warmth, sensitivity to cold
- **EENT:** Diplopia, blurred vision
- **GI:** *Nausea, vomiting*, dry mouth, anorexia, *constipation*, biliary tract spasm
- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Phlebitis following IV injection, pain at injection site; tissue irritation and induration (subcutaneous injection)
- **Respiratory:** Slow, shallow respiration; apnea; suppression of cough reflex; **laryngospasm; bronchospasm**
- **Other:** Physical tolerance and dependence, psychological dependence

Interactions

* **Drug-drug** • Additive CNS effects when given with CNS depressants • Potentiation of effects of codeine with barbiturate anesthetics; decrease dose of codeine when coadministering

* **Drug-lab test** • Elevated biliary tract pressure may increase plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between codeine and *Cardene* (nicardipine); use caution.

Assessment

- **History:** Hypersensitivity to codeine, physical dependence on an opioid analgesic, pregnancy, labor, lactation, bronchial asthma, COPD, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, renal or hepatic impairment

- **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; pulse, auscultation, BP; R, adventitious sounds; bowel sounds, normal output; LFTs, renal function tests

Interventions

- Give to nursing women 4–6 hr before scheduled feeding to minimize drug in milk.
- Use the smallest effective dose for the shortest period.

⊗ **Warning** Nursing mothers should monitor infants for evidence of overdose (increased sleepiness, difficulty breathing, limpness) and seek medical help immediately if it occurs.

⊗ **Warning** During parenteral administration, ensure that opioid antagonist and facilities for assisted or controlled respirations are readily available.

- Use caution when injecting subcutaneously into chilled body areas or in patients with hypotension or in shock; impaired perfusion may delay absorption; with repeated doses, an excessive amount may be absorbed when circulation is restored.

⊗ **Warning** Do not use IV in children.

- Instruct postoperative patients in pulmonary toilet; drug suppresses cough reflex.
- Monitor bowel function, arrange for stimulant laxatives to be given regularly, and initiate bowel training program if severe constipation occurs.

Teaching points

- Take drug exactly as prescribed.
- Do not take any leftover drug for other disorders, and do not let anyone else take it.
- If you are nursing a baby, take drug 4 to 6 hours before scheduled feeding. Monitor baby for increased sleepiness or difficulty breathing.
- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (avoid driving and performing other tasks that require alertness); nausea, loss of appetite (lie quietly, eat frequent small meals); constipation (use a laxative).
- Report severe nausea, vomiting, palpitations, constipation, shortness of breath or difficulty breathing.

colchicine

(kol' chib seen)

Colcryst

PREGNANCY CATEGORY C

Drug class

Antigout drug

Therapeutic actions

Exact mechanism of action unknown; decreases deposition of uric acid, inhibits kinin formation and phagocytosis, and decreases inflammatory reaction to urate crystal deposition.

Indications

- Treatment of acute gout flares in adults
- Treatment of familial Mediterranean fever in adults and children 4 yr and older

Contraindications and cautions

- Contraindicated with hypersensitivity to colchicine, concurrent use of cyclosporine, ranolazine, or strong to moderate CYP3A4 inhibitors in presence of hepatic or renal impairment.
- Use cautiously with hepatic or renal impairment, pregnancy, lactation, and in elderly patients.

Available forms

Tablets—0.6 mg

Dosages

Adults

Acute gout flares: 1.2 mg PO at first sign of gout flare, followed by 0.6 mg 1 hour later. Maximum recommended dosage is 1.8 mg over a 1-hour period.

Familial Mediterranean fever: 1.2–2.4 mg/day PO in one or two divided doses; increase or decrease in 0.3-mg increments as needed.

Pediatric patients

Treatment and prophylaxis of acute gout flares: Safety and efficacy not established.

Familial Mediterranean fever: 4–6 yr: 0.3–1.8 mg/day PO; 6–12 yr: 0.9–1.8 mg/day PO; older than 12 yr: use adult dosage. May be given as one dose or in two divided doses.

Patients with hepatic impairment

Acute gout flares: For mild to moderate impairment, no dosage adjustment is needed. For severe impairment, dosage should be the same but should not be repeated more often than once every 2 wk.

Familial Mediterranean fever: Monitor patient closely. Consider dosage reduction with careful monitoring.

Patients with renal impairment

Acute gout flares: For mild to moderate impairment, no dosage adjustment is needed. For severe impairment (CrCl less than 30 mL/min), dosage adjustment is not needed, but do not repeat more than once every 2 wk. For patient on dialysis, give 0.6 mg as a single dose; do not repeat more than once every 2 wk.

Familial Mediterranean fever: For mild to moderate impairment, consider dosage reduction; monitor patient closely. For severe impairment, start with 0.3 mg/day and increase with careful monitoring. Patients on dialysis should receive a total dose of 0.3 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1-2 hr

Metabolism: Hepatic; $T_{1/2}$: 26–31 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine, bile

Adverse effects

- **CNS:** Peripheral neuropathy
- **Dermatologic:** Alopecia, rash, purpura, dermatoses
- **GI:** Nausea, diarrhea, vomiting, abdominal pain, dyspepsia
- **GU:** Azoospermia, oligospermia
- **Hematologic:** Bone marrow suppression, elevated AST and ALT, aplastic anemia
- **Other:** Myopathy, muscle pain, weakness, rhabdomyolysis

Interactions

★ **Drug-drug** • Increased risk of serious toxic effects, including fatalities if combined with cyclosporine, ranolazine; this combination is contraindicated but if combination must be

used, monitor patient closely and limit dose to maximum of 0.6 mg/day • Significant increase in serum colchicine level and toxicity if combined with atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin; this combination is contraindicated but if combination must be used, monitor patient closely and limit dose to 0.6 mg followed by 0.3 mg in 1 hour (for gout), repeat no earlier than every 3 days; 0.6 mg/day (for familial Mediterranean fever); avoid this combination in patients with renal or hepatic impairment • Risk of significant increase in colchicine plasma level and toxicity with amprenavir, aprepitant, diltiazem, erythromycin, fluconazole, foramprenavir, verapamil; these combinations are contraindicated, but if combination must be used, limit dose to 1.2 mg (for gout), repeat no earlier than every 3 days; 1.2 mg/day (for familial Mediterranean fever) • Risk of altered pharmacokinetics or pharmacodynamics if combined with atorvastatin, digoxin, fibrates, fluvastatin, gemfibrozil, pravastatin, simvastatin; weigh benefit versus risk in use of these combinations and carefully monitor patient for muscle pain or weakness

★ **Drug-food** • Risk of serious adverse effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug; blood dyscrasias; serious GI, hepatic or renal disorders; pregnancy; lactation
- **Physical:** T; skin color, lesions; orientation, reflexes; P, BP; liver evaluation, normal bowel output; normal urine output; CBC, LFTs, renal function tests, urinalysis

Interventions

- Obtain baseline and periodic liver and renal function tests, serum uric acid levels, CBC.
- Administer drug as prescribed. Do not make up missed doses.
- Encourage patient to avoid grapefruit juice.
- Check patient's complete drug list and ensure that interacting drugs are not being

used, and that appropriate dosage adjustments have been considered.

- Monitor patient for relief of pain and signs and symptoms of acute gout flare. Begin therapy at first sign of acute flare for best therapeutic effect.
- Monitor GI effects; antidiarrheal medication may be needed.
- Fatal overdoses have occurred; keep out of reach of children.

Teaching points

- Take this drug exactly as prescribed. If taking this drug for gout, take it at the first sign of an acute flare; then take the second dose 1 hour later.
- If you are taking this drug for familial Mediterranean fever and forget a dose, take the next dose at the regular time. Do not attempt to make up or double doses.
- Do not drink grapefruit juice while you are taking drug; serious adverse effects could occur.
- Continue to take this drug as prescribed; do not discontinue this drug without consulting your health care provider.
- Keep a record of all drugs, herbs, and over-the-counter medications you are taking and review it with your health care provider. This drug interacts with many of these drugs and serious complications could occur. Your health care provider may need to adjust the dosages of these drugs for your safety.
- This drug can suppress the activity of your bone marrow, resulting in lower than normal red blood cells (you may feel fatigued), platelets (you may bleed more than normal), and white blood cells (you may have increased susceptibility to infections).
- You may experience these side effects: Nausea, vomiting, diarrhea, abdominal pain (small, frequent meals may help; consult your health care provider if abdominal pain becomes too uncomfortable), loss of hair (which is reversible), rash
- You will need periodic medical exams and blood tests to evaluate the effects of this drug.
- Report severe diarrhea, muscle pain or weakness, tingling or numbness in the fingers or toes, persistent gout attacks, extreme fatigue,

unusual bleeding or bruising, fever and chills, signs of infection.

colesevelam hydrochloride

(*koe leh seve' eh lam*)

WelChol

PREGNANCY CATEGORY B

Drug classes

Antihyperlipidemic
Bile acid sequestrant

Therapeutic actions

Binds bile acids in the intestine allowing excretion in the feces; as a result, cholesterol is oxidized in the liver to replace the bile acids lost; serum cholesterol and LDLs are lowered.

Indications

- Reduction of elevated LDLs as adjunct to diet and exercise in patients with primary hypercholesterolemia; used alone or in conjunction with an HMG-CoA reductase inhibitor
- As adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes
- Adjunct to diet and exercise to reduce LDL in boys and postmenarchal girls ages 10–17 yr with familial hypercholesterolemia not responsive to diet alone

Contraindications and cautions

- Contraindicated with allergy to bile acid sequestrants; complete biliary obstruction; intestinal obstruction; lactation.
- Use cautiously with difficulty swallowing; GI motility disorders; major GI tract surgery; patients susceptible to fat-soluble vitamin deficiency, pregnancy.

Available forms

Tablets—625 mg; oral suspension—1.875-, 3.75-g packets

Dosages

Adults

- *Monotherapy for hyperlipidemia:* 3 tablets bid PO with meals or 6 tablets daily PO with a meal; do not exceed 7 tablets/day.
- *Combination therapy with an HMG-CoA inhibitor:* 3 tablets PO bid with meals or 6 tablets once a day PO with a meal; do not exceed 6 tablets/day.
- *Type 2 diabetes:* 6 tablets/day PO or 3 tablets PO bid.

Pediatric patients 10–17 yr

- *Familial hypercholesterolemia:* 1.8 g PO bid or 3.7 g/day PO oral suspension

Pharmacokinetics

Not absorbed systemically

Excretion: Feces

Adverse effects

- **CNS:** Headache, anxiety, vertigo, dizziness, fatigue, syncope, drowsiness
- **GI:** *Constipation to fecal impaction*, exacerbation of hemorrhoids, abdominal cramps, pain, flatulence, nausea, vomiting, diarrhea, heartburn
- **GU:** Hematuria, dysuria, diuresis
- **Hematologic:** Increased bleeding tendencies related to vitamin K malabsorption, vitamin A and D deficiencies, reduced serum and red cell folate, hyperchloremic acidosis
- **Other:** Osteoporosis, backache, muscle and joint pain, arthritis, fever, pharyngitis

Interactions

★ **Drug-drug** • Malabsorption of fat-soluble vitamins if taken concurrently with cholestyramine • Decreased absorption of oral drugs; take other oral drugs 1 hr before or 4–6 hr after colesevelam • Decreased bioavailability of SR verapamil

■ Nursing considerations

Assessment

- **History:** Allergy to bile acid sequestrants; complete biliary obstruction; intestinal obstruction; pregnancy; lactation; difficulty

swallowing, GI motility disorders; major GI tract surgery; susceptibility to fat-soluble vitamin deficiency

- **Physical:** Skin lesions, color, T; orientation, affect, reflexes; P; auscultation, baseline ECG, peripheral perfusion; liver evaluation, bowel sounds; lipid studies, LFTs, clotting profile

Interventions

- Monitor serum cholesterol, LDLs, triglycerides, and serum glucose before starting treatment and periodically during treatment.
- For hyperlipidemia, administer drug with meals. For type 2 diabetes, administer once or twice a day.
- Store at room temperature; protect from moisture.
- Mix oral suspension packet with 4–8 oz of water; do not use dry. Administer with meals.
- Establish bowel program to deal with constipation.
- Monitor nutritional status and arrange for consults if needed.
- Consult with dietitian regarding low-cholesterol diets and provide information regarding exercise programs.
- Ensure that patients with type 2 diabetes follow diet and exercise regimen.
- Arrange for regular follow-up during long-term therapy.

Teaching points

- If this drug was prescribed for hyperlipidemia, take drug with meals. If drug was prescribed for type 2 diabetes, take drug once or twice per day.
- Take this drug at least 1 hour before or 4–6 hours after other drugs.
- Continue to follow your low-fat or diabetic diet and participate in an exercise program.
- If using the oral solution, mix entire content of packet with 4–8 ounces of water. Take with meals. Do not use dry.
- Plan to return for periodic blood tests to evaluate the effectiveness of this drug.
- You may experience these side effects: Constipation (this may resolve, or other measures may need to be taken to alleviate this problem); nausea, heartburn, loss of appetite

(eat frequent small meals); dizziness, drowsiness, vertigo, fainting (avoid driving and operating dangerous machinery until you know how this drug affects you); headache, muscle and joint aches and pains (this may decrease over time; if it becomes bothersome, consult your health care provider).

- Report unusual bleeding or bruising, severe constipation, severe GI upset, chest pain, difficulty breathing, rash, fever.

colestipol hydrochloride

(*koe les' ti pole*)

Colestid

PREGNANCY CATEGORY C

Drug classes

Antihyperlipidemic
Bile acid sequestrant

Therapeutic actions

Binds bile acids in the intestine to form a complex that is excreted in the feces; as a result, cholesterol is lost, oxidized in the liver, and serum cholesterol and LDL are lowered.

Indications

- Adjunctive therapy: Reduction of elevated serum cholesterol in patients with primary hypercholesterolemia (elevated LDL)
- Unlabeled uses: Digitalis toxicity, hyperoxaluria, relief of pruritus associated with biliary obstruction, adjunctive treatment of hyperthyroidism, binding of *Clostridium difficile* toxin

Contraindications and cautions

- Contraindicated with allergy to bile acid sequestrants, complete biliary obstruction.
- Use cautiously with abnormal intestinal function, pregnancy, lactation.

Available forms

Tablets—1 g; granules—5-g packets, 5 g/7.5 g powder

Dosages

Adults

- For suspension, 5–30 g/day PO once or in divided doses two to four times/day. Start with 5 g daily or bid PO, and increase in 5-g/day increments at 1- to 2-mo intervals. For tablets, 2–16 g/day PO in 1–2 divided doses; initially, 2 g once or twice daily; increasing in 2-g increments at 1- to 2-mo intervals.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Not absorbed systemically

Excretion: Feces

Adverse effects

- **CNS:** *Headache*, anxiety, vertigo, dizziness, fatigue, syncope, drowsiness
- **Dermatologic:** Rash and irritation of skin, tongue, perianal area
- **GI:** *Constipation* to fecal impaction, *exacerbation of hemorrhoids*, abdominal cramps, *abdominal pain*, flatulence, anorexia, heartburn, nausea, vomiting, steatorrhea
- **GU:** Hematuria, dysuria, diuresis
- **Hematologic:** Increased bleeding tendencies related to vitamin K malabsorption, vitamin A and D deficiencies, hyperchloremic acidosis
- **Other:** Osteoporosis, chest pain, backache, muscle and joint pain, arthritis, fever

Interactions

* **Drug-drug** • Decreased serum levels or delayed absorption of thiazide diuretics, digitalis preparations • Malabsorption of fat-soluble vitamins • Decreased absorption of oral drugs; administer 1 hr before or 4–6 hr after colestipol

■ Nursing considerations

Assessment

- **History:** Allergy to bile acid sequestrant, complete biliary obstruction, abnormal intestinal function, pregnancy, lactation
- **Physical:** Skin lesions, color, T; orientation, affect, reflexes; P, auscultation, baseline ECG, peripheral perfusion; liver evaluation, bowel sounds; lipid studies, LFTs, clotting profile

Interventions

- Do not administer drug in dry form. Mix in liquids, soups, cereals, or pulpy fruits; add the prescribed amount to a glassful (90 mL) of liquid; stir until completely mixed. The granules will not dissolve. May be mixed with carbonated beverages, slowly stirred in a large glass. Rinse the glass with a small amount of additional beverage to ensure that the entire dose has been taken.
- Make sure that patient swallows tablets whole; do not cut, crush, or chew them. Tablets should be taken with plenty of fluids.
- Administer drug before meals.
- ⊗ **Warning** Monitor administration of other oral drugs for binding in the intestine and delayed or decreased absorption. Give them 1 hr before or 4–6 hr after the colestipol.
- Arrange for regular follow-up care during long-term therapy.
- Alert patient and concerned others about the high cost of drug.

Teaching points

- Take drug before meals. Do not take the powder in the dry form. Mix in liquids, soups, cereals, or pulpy fruit; add the prescribed amount to a glassful of the liquid; stir until completely mixed. The granules will not dissolve; rinse the glass with a small amount of additional liquid to ensure that you receive the entire dose of the drug. Or, carbonated beverages may be used; mix by slowly stirring in a large glass. If taking tablet form, swallow tablet whole with plenty of fluids; do not cut, crush, or chew it.
- This drug may interfere with the absorption of other oral medications. Take other oral medications 1 hour before or 4–6 hours after colestipol.
- You may experience these side effects: Constipation (transient, if it persists, request correctives); nausea, heartburn, loss of appetite (eat frequent small meals); dizziness, drowsiness, vertigo, fainting (avoid driving and operating dangerous machinery); headache, muscle and joint aches and pains (may decrease with time).
- Report unusual bleeding or bruising, severe constipation, severe GI upset, chest pain, difficulty breathing, rash, fever.

▶ collagenase clostridium histolyticum

See Appendix U, *Less commonly used drugs*.

▶ corticotropin (ACTH, adrenocorticotropin, corticotrophin)

(kor ti koe troe' pin)

Repository injection: H.P. Acthar Gel

PREGNANCY CATEGORY C

Drug classes

Anterior pituitary hormone
Diagnostic agent

Therapeutic actions

Stimulates the adrenal cortex to synthesize and secrete adrenocortical hormones.

Indications

- Allergic states unresponsive to conventional treatments
- Therapy of some glucocorticoid-sensitive disorders
- Nonsuppurative thyroiditis
- Hypercalcemia associated with cancer
- Acute exacerbations of MS
- Tuberculous meningitis with subarachnoid block
- Trichinosis with neurologic or myocardial involvement
- Rheumatic, collagen, dermatologic, allergic, ophthalmologic, respiratory, hematologic, edematous, and GI diseases
- Palliative management of leukemias, lymphomas
- Unlabeled use: Treatment of infantile spasms

Contraindications and cautions

- Contraindicated with adrenocortical insufficiency or hyperfunction; infections, especially systemic fungal infections, ocular herpes simplex; scleroderma, osteoporosis; recent surgery; heart failure, hypertension; allergy to pork or pork products (corticotropin is isolated from porcine pituitaries); liver dis-

ease; ulcerative colitis with impending perforation; recent GI surgery; active or latent peptic ulcer; inflammatory bowel disease; hypothyroidism; pregnancy, lactation.

- Use cautiously with mental disturbances, diabetes, diverticulitis, renal impairment, myasthenia gravis.

Available forms

Repository injection—80 units/mL

Dosages

Adults

- **Therapy:** 40–80 units IM or subcutaneously every 24–72 hr; when indicated, gradually reduce dosage by increasing intervals between injections or decreasing the dose injected, or both.
- **Acute exacerbations of MS:** 80–120 units/day IM for 2–3 wk.

Pediatric patients

Use only if necessary, and only intermittently and with careful observation. Prolonged use will inhibit skeletal growth.

- **Infantile spasms:** 20–40 units/day or 80 units every other day IM for 3 mo or 1 mo after cessation of seizures.

Pharmacokinetics

Route	Onset	Peak	Duration
IM, Subcut.	Rapid	1 hr	2–4 hr

Metabolism: T_{1/2}: 15 min

Distribution: Does not cross placenta; may enter breast milk

Adverse effects

- **CNS:** Seizures, vertigo, *headaches*, pseudotumor cerebri, *euphoria*, *insomnia*, *mood swings*, *depression*, psychosis, intracerebral hemorrhage, reversible cerebral atrophy in infants, cataracts, increased IOP, glaucoma
- **CV:** *Hypertension*, heart failure, necrotizing angitis
- **Endocrine:** Growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state, *secondary adrenocortical and pituitary unresponsiveness*
- **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention
- **GU:** *Amenorrhea*, *irregular menses*

- **Hematologic:** *Fluid and electrolyte disturbances*, negative nitrogen balance
- **Hypersensitivity:** **Anaphylactoid** or hypersensitivity reactions
- **Musculoskeletal:** *Muscle weakness*, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures
- **Other:** *Impaired wound healing, petechiae, ecchymoses, increased sweating, thin and fragile skin, acne, immunosuppression and masking of signs of infection*, activation of latent infections, including tuberculosis, fungal, and viral eye infections, pneumonia, abscess, septic infection, GI and GU infections

Interactions

★ **Drug-drug** ● Decreased effects with barbiturates ● Decreased effects of anticholinesterases with corticotropin; profound muscular depression is possible ● Decreased effectiveness of insulin, antidiabetics; monitor patient closely and increase dosage as needed

★ **Drug-lab test** ● Suppression of skin test reactions

■ Nursing considerations

Assessment

- **History:** Adrenocortical insufficiency or hyperfunction; infections, ocular herpes simplex; scleroderma, osteoporosis; recent surgery; heart failure, hypertension; allergy to pork or pork products; liver disease: cirrhosis; ulcerative colitis; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease, lactation; diabetes mellitus; hypothyroidism, pregnancy
- **Physical:** Weight, T; skin color, integrity; reflexes, bilateral grip strength, ophthalmologic examination, affect, orientation; P, BP, auscultation, peripheral perfusion, status of veins; R, adventitious sounds, chest X-ray; upper GI X-ray (peptic ulcer symptoms), liver palpation; CBC, serum electrolytes, 2-hr postprandial blood glucose, thyroid function tests, urinalysis

Interventions

- Verify adrenal responsiveness (increased urinary and plasma corticosteroid levels) to corticotropin before therapy; use the administrative route proposed for treatment.

- Administer only by IM or subcutaneous injection.
- Use minimal doses for minimal duration to minimize adverse effects.
- Taper doses when discontinuing high-dose or long-term therapy.
- Administer a rapidly acting corticosteroid before, during, and after stress when patients are on long-term therapy.
- Do not give patients receiving corticotropins live virus vaccines.

Teaching points

- Avoid immunizations with live vaccines.
- Diabetics may require an increased dosage of insulin or oral hypoglycemic drug; consult your health care provider.
- Take antacids between meals to reduce heartburn.
- Avoid exposure to people with contagious diseases. This drug masks signs of infection and decreases resistance to infection; wash hands carefully after touching contaminated surfaces.
- Report unusual weight gain, swelling of lower extremities, muscle weakness, abdominal pain, seizures, headache, fever, prolonged sore throat, cold or other infection, worsening of symptoms for which drug is being taken.

▷ cosyntropin

See Appendix U, *Less commonly used drugs*.

▷ cromolyn sodium

See Appendix U, *Less commonly used drugs*.

▷ cyanocobalamin, intranasal

(*sigh' an oh cob ball' a min*)

CaloMist Nasal Spray, Nascobal

PREGNANCY CATEGORY C

Drug class

Synthetic vitamin

Therapeutic actions

Intranasal gel that allows absorption of vitamin B₁₂, which is essential to cell growth and reproduction, hematopoiesis, and nucleoprotein and myelin synthesis, and has been associated with fat and carbohydrate metabolism and protein synthesis.

Indications

- Maintenance of patients in hematologic remission after IM vitamin B₁₂ therapy for pernicious anemia, inadequate secretion of intrinsic factor, dietary deficiency, malabsorption, competition by intestinal bacteria or parasites, or inadequate utilization of vitamin B₁₂
- Maintenance of effective therapeutic levels of vitamin B₁₂ in patients with HIV, AIDS, MS, and Crohn's disease

Contraindications and cautions

- Contraindicated with hypersensitivity to cobalt, vitamin B₁₂, or any component of drug.
- Use cautiously with pregnancy or lactation, Leber's disease, nasal lesions, or URIs.

Available forms

Spray—25 mcg/0.1 mL, 500 mcg/0.1 mL

Dosages

Adults

One spray (500 mcg) in one nostril, once per wk (*Nascobal*). One spray (25 mcg) in each nostril once per day for a total of 50 mcg; may be increased to bid if needed (*CaloMist Nasal Spray*).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Nasal	Slow	1–2 hr

Metabolism: T_{1/2}: Unknown

Distribution: May cross placenta, may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **Hematologic:** Bone marrow suppression
- **Local:** *Rhinitis, nasal congestion*
- **Other:** Fever, pain, local irritation

Interactions

- **Drug-drug:** Decreased effectiveness may be seen with antibiotics, methotrexate, colchicine, para-aminosalicylic acid, excessive alcohol use

Nursing considerations

Assessment

- **History:** Pregnancy or lactation, Leber's disease, nasal lesions or URIs; history of pernicious anemia, vitamin B₁₂ deficiency, dates of IM cyanocobalamin therapy
- **Physical:** State of nasal mucous membranes; serum vitamin B₁₂ levels, CBC, potassium level

Interventions

- Confirm diagnosis before administering; ensure that patient is hemodynamically stable after IM therapy.
- Monitor serum vitamin B₁₂ levels before starting, 1 mo after starting, and every 3–6 mo during therapy.
- Do not administer if nasal congestion, rhinitis, or URI is present.
- Evaluate patient response and consider need for folate or iron replacement.

Teaching points

- Take drug as prescribed, one spray in one nostril once a week (*Nascobal*) or one spray in each nostril once a day (*CaloMist*).
- Periodic blood tests will be needed to monitor your response to this drug.
- Take drug 1 hour before or 1 hour after ingestion of hot foods or liquids because hot foods can cause nasal secretions and interfere with absorption.
- Do not administer if you have nasal congestion, rhinitis, or upper respiratory tract infection; consult your health care provider.
- You may experience these side effects: Headache (analgesics may help), nausea (eat frequent small meals).

- Report nasal pain, nasal sores, fatigue, weakness, easy bruising.

cyclizine

(*syeh' kli zeen*)

Marezine

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Antiemetic
Antihistamine
Anti-motion-sickness drug

Therapeutic actions

Reduces sensitivity of the labyrinthine apparatus; peripheral anticholinergic effects may contribute to efficacy.

Indications

- Prevention and treatment of nausea, vomiting, dizziness associated with motion sickness

Contraindications and cautions

- Contraindicated with allergy to cyclizine.
- Use cautiously with pregnancy, lactation, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias; postoperative patients (hypotensive effects may be confusing and dangerous).

Available forms

Tablets—50 mg

Dosages

Adults

50 mg PO 30 min before exposure to motion; repeat every 4–6 hr. Do not exceed 200 mg in 24 hr.

Pediatric patients 6–12 yr

25 mg PO up to three times a day.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	60–90 min	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

Adverse effects

- **CNS:** *Drowsiness, confusion*, euphoria, nervousness, restlessness, insomnia and excitement, seizures, vertigo, tinnitus, blurred vision, diplopia, auditory and visual hallucinations
- **CV:** Hypotension, palpitations, tachycardia
- **Dermatologic:** Urticaria, drug rash
- **GI:** *Dry mouth, anorexia, nausea*, vomiting, diarrhea or constipation, cholestatic jaundice
- **GU:** *Urinary frequency, difficult urination*, urinary retention
- **Respiratory:** Respiratory depression, dry nose and throat

Interactions

★ **Drug-drug** • Increased depressant effects with alcohol, other CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergy to cyclizine, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias, recent surgery, lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC

Interventions

- Monitor elderly patients carefully for adverse effects.

Teaching points

- Take drug as prescribed; avoid excessive dosage.
- Use before motion sickness occurs; anti-motion sickness drugs work best if used prophylactically.

- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); epigastric distress, diarrhea or constipation (take drug with food); dry mouth (practice frequent mouth care, suck sugarless lozenges); thickening of bronchial secretions, dryness of nasal mucosa (consider another type of motion sickness remedy).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

cyclobenzaprine hydrochloride

(*sye kloë ben' za preen*)

Amrix, Apo-Cyclobenzaprine (CAN), Flexeril, Gen-Cyclobenzaprine (CAN), PMS-Cyclobenzaprine (CAN), ratio-Cyclobenzaprine (CAN)

PREGNANCY CATEGORY B

Drug class

Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Precise mechanism not known; does not directly relax tense skeletal muscles but appears to act mainly at brain stem levels or in the spinal cord.

Indications

- Relief of discomfort associated with acute, painful musculoskeletal conditions, as adjunct to rest, physical therapy
- Unlabeled use: Adjunct in the management of fibrositis syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to cyclobenzaprine, acute recovery phase of MI, arrhythmias, heart block or conduction disturbances, heart failure, hyperthyroidism.
- Use cautiously with urinary retention, angle-closure glaucoma, increased IOP, lactation, mild hepatic impairment.

Available forms

Tablets—5, 7.5, 10 mg; ER capsules—15, 30 mg

Dosages

Adults

5 mg PO tid, up to 10 mg PO tid. Do not exceed 30 mg/day; do not use longer than 2 or 3 wk. For ER capsules, 15 mg once/day; some patients need 30 mg/day.

Pediatric patients

Safety and efficacy in patients younger than 15 yr not established.

Geriatric patients

Initiate at 5 mg/day PO; titrate slowly while monitoring patient. Do not use capsules.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	4–6 hr	12–24 hr

Metabolism: Hepatic; $T_{1/2}$: 1–3 days, 18 hr (range 8–37 hr)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, dizziness*, fatigue, asthenia, blurred vision, headache, nervousness, confusion
- **CV:** Arrhythmias, **MI**
- **GI:** *Dry mouth*, nausea, constipation, dyspepsia, unpleasant taste, liver toxicity
- **GU:** Frequency, urinary retention

Interactions

★ **Drug-drug** • Additive CNS effects with alcohol, barbiturates, other CNS depressants, MAOIs, TCAs; avoid concomitant use • Risk of hyperpyretic crisis and seizures if given within 14 days of MAOIs • Increased risk of seizures with tramadol

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to cyclobenzaprine, acute recovery phase of MI, arrhythmias, heart failure, hyperthyroidism, urinary retention, angle-closure glaucoma, increased IOP, lactation

- **Physical:** Orientation, affect, ophthalmic examination (tonometry); bowel sounds, normal GI output; prostate palpation, normal voiding pattern; thyroid function tests

Interventions

- Arrange for analgesics if headache occurs.

Teaching points

- Take this drug exactly as prescribed. Do not take a higher dosage.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these may cause dangerous effects.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving or engaging in activities that require alertness); dyspepsia (take drug with food, eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips).
- Report urinary retention or difficulty voiding, pale stools, yellow skin or eyes.

DANGEROUS DRUG

cyclophosphamide

(*syé kloé foss' fa mide*)

Procytox (CAN)

PREGNANCY CATEGORY D

Drug classes

Alkylating drug

Antineoplastic

Nitrogen mustard derivative

Therapeutic actions

Cytotoxic: Interferes with the replication of susceptible cells. Not specific to cell cycle.

Immunosuppressive: Lymphocytes are especially sensitive to drug effects.

Indications

- Treatment of malignant lymphomas, multiple myeloma, leukemias, mycosis fungoides, neuroblastoma, adenocarcinoma of the ovary, retinoblastoma, carcinoma of the breast; used concurrently or sequentially with other antineoplastic drugs
- Treatment of minimal change nephrotic syndrome in children

- Unlabeled uses: Severe rheumatologic conditions, Wegener's granulomatosis, steroid-resistant vasculitis, SLE

Contraindications and cautions

- Contraindicated with allergy to cyclophosphamide, pregnancy, lactation.
- Use cautiously with radiation therapy; tumor cell infiltration of the bone marrow; adrenalectomy with steroid therapy; infections, especially varicella-zoster; hematopoietic depression, impaired hepatic or renal function.

Available forms

Tablets—25, 50 mg; injection—500 mg, 1 g, 2 g

Dosages

Consult current chemotherapeutic reference for appropriate protocol, and individualize dosage based on hematologic profile and response.

Adults

- *Induction therapy:* 40–50 mg/kg IV given in divided doses over 2–5 days or 1–5 mg/kg/day PO.
- *Alternative dosing:* 1–5 mg/kg/day PO, 10–15 mg/kg IV every 7–10 days, or 3–5 mg/kg IV twice weekly.

Pediatric patients

- *Minimal change nephrotic syndrome:* 2.5–3 mg/day PO for 60–90 days.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1 hr
IV	Rapid	15–30 min

Metabolism: Hepatic; $T_{1/2}$: 3–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add sterile water for injection or bacteriostatic water for injection to the vial, and shake gently. Use 25 mL for 500-mg vial, 50 mL for 1-g vial, 100 mL for 2-g vial. Prepared solutions may be injected IV, IM, intraperitoneally, intrapleurally. Use within

24 hr if stored at room temperature or within 6 days if refrigerated. If bacteriostatic water for injection is not used, use within 6 hr.

Infusion: Infuse in 5% dextrose injection, 5% dextrose and 0.9% sodium chloride injection; infuse over 15 min or longer (infusion can be painful).

Adverse effects

- **CV:** Cardiotoxicity
- **Dermatologic:** *Alopecia*, darkening of skin and fingernails
- **GI:** *Anorexia, nausea, vomiting, diarrhea, stomatitis*
- **GU:** *Hemorrhagic cystitis*, bladder fibrosis, hematuria to potentially fatal **hemorrhagic cystitis**, increased urine uric acid levels, infertility
- **Hematologic:** *Leukopenia*, thrombocytopenia, anemia
- **Respiratory:** Interstitial pulmonary fibrosis
- **Other:** SIADH, immunosuppression secondary to malignancy

Interactions

* **Drug-drug** • Prolonged apnea with succinylcholine: Metabolism is inhibited by cyclophosphamide • Decreased serum levels and therapeutic activity of digoxin • Myelosuppressive effects are enhanced with coadministration of allopurinol • Increased anticoagulant effects with anticoagulants • Increased cardiac effects with doxorubicin • Reduced activity of cyclophosphamide with chloramphenicol

* **Drug-food** • Decreased metabolism and risk of toxic effects if combined with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to cyclophosphamide, radiation therapy, chemotherapy, tumor cell infiltration of the bone marrow, adrenalectomy with steroid therapy, infections, hematopoietic depression, impaired hepatic or renal function, pregnancy, lactation
- **Physical:** T; weight; skin color; lesions; hair; P; auscultation, baseline ECG; R, adventitious sounds; mucous membranes, liver eval-

uation; CBC, differential; urinalysis; LFTs, renal function tests

Interventions

- Arrange for blood tests to evaluate hematopoietic function before therapy and weekly during therapy.
- ⊗ **Warning** Do not give full dosage within 4 wk after a full course of radiation therapy due to the risk of severe bone marrow depression; reduced dosage may be needed.
- Arrange for reduced dosage in patients with impaired renal or hepatic function.
- ⊗ **Warning** Ensure that patient is well hydrated before treatment to reduce risk of cystitis.
- Prepare oral solution by dissolving injectable cyclophosphamide in aromatic elixir. Refrigerate in a glass container and use within 14 days.
- Give tablets on an empty stomach. If severe GI upset occurs, tablet may be given with food.
- Counsel male patients not to father a child during or immediately after therapy; infant cardiac and limb abnormalities have occurred.
- Make sure that antiemetics have been ordered before each dose.

Teaching points

- Take drug on an empty stomach. If severe GI upset occurs, the tablet may be taken with food. Do not drink grapefruit juice while taking this drug.
- Try to maintain your fluid intake and nutrition (drink at least 10–12 glasses of fluid each day).
- Both men and women should use birth control during and after drug use; this drug can cause severe birth defects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (take drug with food, eat frequent small meals); darkening of the skin and fingernails; loss of hair (obtain a wig or other head covering prior to hair loss; head must be covered in extremes of temperature).
- Report unusual bleeding or bruising, fever, chills, sore throat, cough, shortness of breath, blood in the urine, painful urination, rapid heartbeat, swelling of the feet or hands, stomach or flank pain.

cycloSERINE

(sye kloer ser' een)

Seromycin Pulvules

PREGNANCY CATEGORY C

Drug classes

Antibiotic

Antituberculous (third line)

Therapeutic actions

Inhibits cell wall synthesis in susceptible strains of gram-positive and gram-negative bacteria and in *Mycobacterium tuberculosis*, causing cell death.

Indications

- Treatment of active pulmonary and extrapulmonary (including renal) TB that is not responsive to first-line antituberculous in conjunction with other antituberculous
- UTIs caused by susceptible bacteria

Contraindications and cautions

- Contraindicated with allergy to cycloserine, epilepsy, depression, severe anxiety or psychosis, severe renal insufficiency, excessive concurrent use of alcohol, lactation.
- Use cautiously with pregnancy.

Available forms

Capsules—250 mg

Dosages**Adults**

Initial dose, 250 mg bid PO at 12-hr intervals for first 2 wk; monitor serum levels (above 30 mcg/mL is generally toxic). Maintenance dose, 500 mg–1 g/day PO in divided doses monitored by blood levels. Do not exceed 1 g/day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	4–8 hr	48–72 hr

Metabolism: $T_{1/2}$: 10 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Feces, urine**Adverse effects**

- **CNS:** Drowsiness, somnolence, headache, tremor, vertigo, confusion, disorientation, loss of memory, psychoses (possibly with suicidal tendencies), hyperirritability, aggression, paresis, hyperreflexia, paresthesias, seizures, coma
- **Dermatologic:** Rash
- **Hematologic:** Elevated serum transaminase levels

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred among cycloserine, cyclosporine, and cyclophosphamide; use caution.

Assessment

- **History:** Allergy to cycloserine, epilepsy, depression, severe anxiety or psychosis, severe renal insufficiency, excessive concurrent use of alcohol, lactation, pregnancy
- **Physical:** Skin color, lesions; orientation, reflexes, affect, EEG; liver evaluation; LFTs

Interventions

- Arrange for culture and sensitivity studies before use.
- Give this drug only when other therapy has failed, and only in conjunction with other antituberculous, when treating TB.
- Arrange for follow-up of LFTs, renal function tests, hematologic tests, and serum drug levels.
- Consult with physician regarding the use of antiepileptics, sedatives, or pyridoxine if CNS effects become severe.
- Discontinue drug, and notify physician if rash or severe CNS reactions occur.

Teaching points

- Avoid excessive alcohol consumption while on this drug.
- Take this drug regularly; avoid missing doses. Do not discontinue this drug without first consulting your health care provider.
- Avoid taking with a high-fat meal.
- Have regular, periodic medical checkups, including blood tests to evaluate the drug's effects.

- You may experience these side effects: Drowsiness, tremor, disorientation (use caution operating a car or dangerous machinery); depression, personality change, numbness, tingling.
- If you experience trouble breathing or if signs or symptoms of heart failure occur, notify your health care provider immediately, especially if you are receiving more than 1 to 1.5 g per day.
- Report rash, headache, tremors, shaking, confusion, dizziness.

(*sye' kloe spor een*)

Gengraf, Neoral, Sandimmune

PREGNANCY CATEGORY C

Drug class

Immunosuppressant

Therapeutic actions

Exact mechanism of immunosuppressant is not known; specifically and reversibly inhibits immunocompetent lymphocytes in the G0 or G1 phase of the cell cycle; inhibits T-helper and T-suppressor cells, lymphokine production, and release of interleukin-2 and T-cell growth factor.

Indications

- Prophylaxis for organ rejection in kidney, liver, and heart transplants in conjunction with adrenal corticosteroids
- Treatment of chronic rejection in patients previously treated with other immunosuppressive agents (*Sandimmune*)
- *Neoral, Gengraf*: Alone, or in combination with methotrexate for treatment of patients with severe active rheumatoid arthritis
- *Neoral, Gengraf*: Treatment of recalcitrant, plaque psoriasis in non-immune-compromised adults
- Unlabeled uses: Aplastic anemia; resistant leukemias; other procedures, including pancreas, bone marrow, lung transplants; Crohn's disease, SLE, MS

Contraindications and cautions

- Contraindicated with allergy to cyclosporine or polyoxyethylated castor oil, lactation.
- Use cautiously with impaired renal function, malabsorption, pregnancy, uncontrolled hypertension.

Available forms

Capsules—25, 100 mg; soft gel capsules for microemulsion—25, 100 mg; oral solution—100 mg/mL; IV solution—50 mg/mL

Dosages

Adults and pediatric patients

Neoral, Gengraf, and Sandimmune are not bioequivalent—do not interchange. Concentrations should be monitored when switching because of variable bioavailability.

Oral

- *Organ rejection*: 15 mg/kg/day PO (*Sandimmune*) initially given 4–12 hr prior to transplantation; continue dose postoperatively for 1–2 wk, then taper by 5% per wk to a maintenance level of 5–10 mg/kg/day.
- *Rheumatoid arthritis*: 2.5 mg/kg/day (*Neoral, Gengraf*) PO in divided doses bid; may increase up to 4 mg/kg/day. If no benefit after 16 wks, discontinue drug.
- *Psoriasis*: 2.5 mg/kg/day (*Neoral, Gengraf*) PO divided bid for 4 wk, then may increase up to 4 mg/kg/day. If no satisfactory response after 6 wk at 4 mg/kg/day, discontinue drug.

Parenteral

Patients unable to take oral solution preoperatively or postoperatively may be given IV infusion (*Sandimmune*) at one-third the oral dose (ie, 5–6 mg/kg/day given 4–12 hr prior to transplantation, administered as a slow infusion over 2–6 hr). Continue this daily dose postoperatively. Switch to oral drug as soon as possible.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3.5 hr
IV	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 10–27 hr (*Sandimmune*), 5–18 hr (*Neoral, Gengraf*)

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute IV solution immediately before use. Dilute 1 mL concentrate in 20–100 mL of 0.9% sodium chloride injection or 5% dextrose injection. Discard unused infusion solutions after 24 hr.

Infusion: Give in a slow IV infusion over 2–6 hr.

Incompatibility: Do not mix with magnesium sulfate.

Adverse effects

- **CNS:** Tremor, seizures, headache, paresthesias
- **CV:** Hypertension
- **GI:** Hepatotoxicity, gum hyperplasia, diarrhea, nausea, vomiting, anorexia
- **GU:** Renal impairment, nephrotoxicity
- **Hematologic:** Leukopenia, hyperkalemia, hypomagnesemia, hyperuricemia
- **Other:** Hirsutism, acne, lymphomas, infections, elevated serum creatinine and BUN

Interactions

• **Drug-drug** • Increased risk of nephrotoxicity with other nephrotoxic agents (amino glycosides, amphotericin B, acyclovir) • Increased risk of digoxin toxicity • Risk of severe myopathy or rhabdomyolysis with HMG-CoA reductase inhibitors • Increased risk of toxicity if taken with SSRIs, diltiazem, metoclopramide, nicardipine, amiodarone, androgens, azole antifungals, colchicine, hormonal contraceptives, foscarnet, macrolides, metoclopramide • Increased plasma concentration of cyclosporine with ketoconazole • Decreased therapeutic effect with hydantoins, rifampin, phenobarbital, carbamazepine, orlistat

• **Drug-food** • Increased serum levels and adverse effects if combined with grapefruit juice • Decreased absorption of *Neoral* if taken with a high-fat meal

• **Drug-alternate therapy** • Decreased cyclosporine levels with use of St. John's wort

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been associated with cyclosporine, cycloserine, and cyclophosphamide; use caution.

Assessment

- **History:** Allergy to cyclosporine or polyoxyethylated castor oil, impaired renal function, malabsorption, lactation
- **Physical:** T; skin color, lesions; BP, peripheral perfusion; liver evaluation, bowel sounds, gum evaluation; LFTs, renal function tests, CBC

Interventions

- Mix oral solution with milk, chocolate milk, or orange juice at room temperature. Stir well, and administer at once. Do not allow mixture to stand before drinking. Use a glass container, and rinse with more diluent to ensure that the total dose is taken.
- Use parenteral administration only if patient is unable to take the oral solution; transfer to oral solution as soon as possible. *Sandimmune* must be taken with corticosteroids.
- Do not refrigerate oral solution; store at room temperature and use within 2 mo after opening.

⊗ **Black box warning** Monitor patient for infections, malignancies; risks are increased.

⊗ **Black box warning** Monitor LFTs and renal function tests prior to and during therapy; marked decreases in function may require dosage adjustment or discontinuation.

⊗ **Black box warning** Monitor BP; heart transplant patients may require concomitant antihypertensive therapy.

Teaching points

- Dilute solution with milk, chocolate milk, or orange juice at room temperature; drink immediately after mixing. Rinse the glass with the solution to ensure that all of the dose is taken. Store solution at room temperature. Use solution within 2 months of opening the bottle.
- Do not drink grapefruit juice while taking this drug.
- Do not take with high-fat meals or within 30 minutes of high-fat meals.
- Avoid infection; avoid crowds or people who have infections. Notify your health care provider at once if you injure yourself.
- This drug should not be taken during pregnancy. Use of barrier contraceptives is advised. If you think that you are pregnant or

you want to become pregnant, discuss this with your health care provider.

- Have periodic blood tests to monitor your response to drug effects.
- Do not discontinue this medication without your health care provider's advice.
- You may experience these side effects: Nausea, vomiting (take the drug with food); diarrhea; rash; mouth sores (practice frequent mouth care).
- Report unusual bleeding or bruising, fever, sore throat, mouth sores, tiredness.

ciproheptadine hydrochloride

(*si proe hep' ta deen*)

PREGNANCY CATEGORY B

Drug class

Antihistamine (piperidine type)

Therapeutic actions

Blocks the effects of histamine at H₁ receptor sites; has atropine-like, antiserotonin, antipruritic, sedative, and appetite-stimulating effects.

Indications

- Relief of symptoms associated with perennial and seasonal allergic rhinitis; vasomotor rhinitis; allergic conjunctivitis; mild, uncomplicated urticaria and angioedema; amelioration of allergic reactions to blood or plasma; dermatographism; adjunctive therapy in anaphylactic reactions
- Treatment of cold urticaria
- Unlabeled uses: Treatment of vascular cluster headaches, appetite stimulation, treatment of nightmares associated with PTSD, prevention of vascular headaches such as migraines

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, third trimester of pregnancy, newborns, premature infants.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder

neck obstruction, pyloroduodenal obstruction, lactation.

Available forms

Tablets—4 mg; syrup—2 mg/5 mL

Dosages

Adults

For initial therapy, 4 mg tid PO. For maintenance therapy, 4–20 mg/day in three divided doses PO; do not exceed 0.5 mg/kg/day.

Pediatric patients

0.25 mg/kg/day PO or 8 mg/m².

Pediatric patients 2–6 yr

2 mg PO bid or tid; do not exceed 12 mg/day.

Pediatric patients 7–14 yr

4 mg PO bid or tid; do not exceed 16 mg/day.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	1–2 hr	4–6 hr

Metabolism: Hepatic; T_{1/2}: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, disturbed coordination*, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, hysteria, tingling, heaviness and weakness of the hands
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress*, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea or constipation
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido, impotence
- **Hematologic:** Hemolytic anemia, hypoplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia
- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal

stuffiness, dry mouth, dry nose, dry throat, sore throat

- **Other:** Urticaria, rash, **anaphylactic shock**, photosensitivity, excessive perspiration, chills

Interactions

- **Drug-drug** • Subnormal pituitary-adrenal response to metyrapone • Decreased effects of fluoxetine • Increased and prolonged anticholinergic (drying) effects if taken with MAOIs • Increased sedation with alcohol, CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergy to any antihistamines; narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction; lactation, pregnancy
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Administer with food if GI upset occurs.
- Give syrup form if unable to take tablets.
- Monitor patient response, and adjust dosage to lowest possible effective dose.

Teaching points

- Take as prescribed; avoid excessive dosage.
- Take drug with food if GI upset occurs.
- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); epigastric distress, diarrhea, or constipation (take drug with meals); dry mouth (practice frequent mouth care, suck sugarless lozenges); thickening of bronchial secretions, dryness of nasal mucosa (use humidifier).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

DANGEROUS DRUG

cytarabine **(cytosine arabinoside)**

(*syə tare' a been*)

DepoCyt, Tarabine PFS

PREGNANCY CATEGORY D

C

Drug classes

Antimetabolite
Antineoplastic

Therapeutic actions

Inhibits DNA polymerase; cell cycle phase specific—S phase (stage of DNA synthesis); also blocks progression of cells from G1 to S.

Indications

- Induction and maintenance of remission in AML (higher response rate in children than in adults)
- Treatment of acute lymphocytic leukemia in adults and children; treatment of chronic myelocytic leukemia and erythroleukemia
- Intrathecal use: Treatment of meningeal leukemia
- Liposomal: Treatment of lymphomatous meningitis
- In combination therapy: Treatment of non-Hodgkin's lymphoma in children
- Unlabeled uses: Hodgkin's lymphoma, bone marrow transplantation

Contraindications and cautions

- Contraindicated with allergy to cytarabine, active meningeal infection (liposomal).
- Use cautiously with hematopoietic depression secondary to radiation or chemotherapy; hepatic impairment, pregnancy, lactation, premature infants.

Available forms

Powder for injection—100, 500 mg, 1, 2 g; injection—20 mg/mL, 100 mg/mL, 10 mg/mL (liposomal)

Dosages

Doses vary based on protocol; consult a current chemotherapy reference.

Adults

- **AML induction of remission:** 100–200 mg/m² per day by continuous infusion for 5 days for a total dose of 1,000 mg/m²; repeat every 2 wk. Individualize dosage based on hematologic response.
- **Maintenance of AML:** Use same dosage and schedule as induction; often a longer rest period is allowed.
- **ALL:** Dosage similar to AML.
- **Intrathecal use for meningeal leukemia:** 5 mg/m² to 75 mg/m² once daily for 4 days or once every 4 days. Most common dose is 30 mg/m² every 4 days until CSF is normal, followed by one more treatment.
- **Treatment of lymphomatous meningitis:** 50 mg liposomal cytarabine intrathecal every 14 days for two doses; then every 14 days for three doses; repeat every 28 days for four doses.
- **Refractory acute leukemia:** 3 g/m² IV over 2 hr every 12 hr for 4–12 doses (repeated at 2- to 3-wk intervals).

Pediatric patients

- **Remission induction and maintenance of AML:** Calculate dose by body weight or surface area.
- **ALL:** Same dosage as AML.

Intrathecal

(Has been used as treatment of meningeal leukemia and prophylaxis in newly diagnosed patients): Cytarabine, 30 mg/m² every 4 days until CSF is normal; hydrocortisone sodium succinate, 15 mg/m²; methotrexate, 15 mg/m².

Combination therapies

For persistent leukemias, give at 2- to 4-wk intervals.

Cytarabine: 100 mg/m²/day by continuous IV infusion, days 1–10. *Doxorubicin:* 30 g/m²/day by IV infusion over 30 min, days 1–3.

Cytarabine: 100 mg/m²/day by IV infusion over 30 min every 12 hr, days 1–7. *Thioguanine:* 100 mg/m² PO every 12 hr, days 1–7. *Daunorubicin:* 60 mg/m²/day by IV infusion, days 5–7.

Cytarabine: 100 mg/m²/day by continuous infusion, days 1–7. *Doxorubicin:* 30 mg/m²/day by IV infusion, days 1–3. *Vincristine:* 1.5 mg/m²/day by IV infusion, days 1 and 5.

Prednisone: 40 mg/m²/day by IV infusion every 12 hr, days 1–5.

Cytarabine: 100 mg/m²/day by continuous infusion, days 1–7. *Daunorubicin:* 45 mg/m²/day by IV push, days 1–3.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	20–60 min	12–18 hr

Metabolism: Hepatic; T_{1/2} in plasma: 1–3 hr; T_{1/2} in CSF: 2 hr:

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute 100-mg vial with 5 mL of bacteriostatic water for injection with benzyl alcohol 0.9%; resultant solution contains 20 mg/mL cytarabine. Reconstitute 500-mg vial with 10 mL of the above; resultant solution contains 50 mg/mL cytarabine. Reconstitute 1 g vial and 2 g vial with 10 mL, 20 mL of the above respectively; resultant solution contains 100 mg/mL cytarabine. Store at room temperature for up to 48 hr. Discard solution if a slight haze appears. Can be further diluted with water for injection, D₅W, or sodium chloride injection; stable for 8 days.

Infusion: Administer by IV infusion over at least 30 min, IV injection over 1–3 min for each 100 mg, or subcutaneously; patients can usually tolerate higher doses when given by rapid IV injection. There is no clinical advantage to any particular route.

Incompatibilities: Do not mix with insulin, heparin, penicillin G, oxacillin, nafcillin, 5-FU.

Adverse effects

- **CNS:** Neuritis, neural toxicity
- **Dermatologic:** Fever, rash, urticaria, freckling, skin ulceration, pruritus, conjunctivitis, alopecia
- **GI:** Anorexia, nausea, vomiting, diarrhea, oral and anal inflammation or ulceration; esophageal ulcerations, esophagitis, abdominal pain, hepatic impairment (jaundice), acute pancreatitis

- **GU:** Renal impairment, urine retention
- **Hematologic:** Bone marrow depression, hyperuricemia, *leukopenia*, *thrombocytopenia*, anemia
- **Local:** *Thrombophlebitis*, cellulitis at injection site
- **Other:** Cytarabine syndrome (fever, myalgia, bone pain, occasional chest pain, maculopapular rash, conjunctivitis, malaise, which is sometimes responsive to corticosteroids), *fever*, *rash*, arachnoiditis (liposomal preparation)

Interactions

★ **Drug-drug** • Decreased therapeutic action of digoxin if taken with cytarabine

■ Nursing considerations

Assessment

- **History:** Allergy to cytarabine, hematopoietic depression, impaired liver function, lactation, pregnancy
- **Physical:** Weight; T; skin lesions, color; hair; orientation, reflexes; R, adventitious sounds; mucous membranes, liver evaluation, abdominal exam; CBC, differential; LFTs, renal function tests; urinalysis

Interventions

- Evaluate hematopoietic status before and frequently during therapy.
- ⊗ **Warning** Discontinue drug therapy if platelet count is less than 50,000/mm³ or neutrophil count is less than 1,000/mm³; consult physician for dosage adjustment.
- Use Elliott's B solution for diluent, similar to CSF, for intrathecal use. Administer within 4 hr after withdrawal from vial; contains no preservatives. Do not use in-line filters; inject directly into CSF.
- Use caution to avoid skin contact with liposomal form; use liposomal form within 4 hr of withdrawing from vial.
- Make sure antiemetics are ordered before each dose.
- Give comfort measures for anal inflammation, headache, other pain associated with cytarabine syndrome.

Teaching points

- Prepare a calendar of treatment days. Drug must be given IV, subcutaneously, or intrathecally.

- Use birth control; this drug may cause birth defects or miscarriages.
- Have frequent, regular medical follow-up care, including blood tests to assess drug's effects.
- You may experience these side effects: Nausea, vomiting, loss of appetite (medication may be ordered; eat frequent small meals; maintain nutrition); malaise, weakness, lethargy (reversible; avoid driving or operating dangerous machinery); mouth sores (practice frequent mouth care); diarrhea; loss of hair (obtain a wig or other head covering; keep the head covered in extreme temperatures); anal inflammation (use comfort measures).
- Report black, tarry stools; fever; chills; sore throat; unusual bleeding or bruising; shortness of breath; chest pain; difficulty swallowing.

⚠ DANGEROUS DRUG

▷ **dacarbazine** (DTIC, imidazole carboxamide)

(*da kar' ba zeen*)

DTIC-Dome

PREGNANCY CATEGORY C

Drug class

Antineoplastic

Therapeutic actions

Cytotoxic: Exact mechanism of action unknown; inhibits DNA and RNA synthesis, causing cell death; cell cycle nonspecific.

Indications

- Metastatic malignant melanoma
- Hodgkin's disease—second-line therapy in combination with other drugs
- Unlabeled uses: Malignant pheochromocytoma with cyclophosphamide and vincristine; metastatic soft tissue sarcoma; alone or in combination therapy for Kaposi's sarcoma; alone or in combination for the treatment of neuroblastomas, fibrosarcoma, rhabdomyosarcoma, islet-

cell carcinoma, medullary carcinoma of the thyroid

Contraindications and cautions

- Contraindicated with allergy to dacarbazine, lactation.
- Use cautiously with impaired hepatic function, bone marrow depression, pregnancy, lactation; choose another method of feeding a baby.

Available forms

Powder for injection—100, 200, 500 mg

Dosages

- *Adult and pediatric malignant melanoma:* 2–4.5 mg/kg/day IV for 10 days, repeated at 4-wk intervals or 250 mg/m² per day IV for 5 days, repeated every 3 wk.
- *Adult Hodgkin's disease:* 150 mg/m² per day for 5 days in combination with other drugs, repeated every 4 wk or 375 mg/m² on day 1 in combination with other drugs, repeated every 15 days.

Pharmacokinetics

Route	Onset	Duration
IV	15–20 min	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 19 min then 5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute 100-mg vials with 9.9 mL and the 200-mg vials with 19.7 mL of sterile water for injection; the resulting solution contains 10 mg/mL of dacarbazine. Reconstituted solution may be further diluted with 5% dextrose injection or 0.9% sodium chloride injection and administered as an IV infusion. Reconstituted solution is stable for 72 hr if refrigerated, 8 hr at room temperature. If further diluted, solution is stable for 24 hr if refrigerated or 8 hr at room temperature. Protect reconstituted solution from light.

Infusion: Infuse slowly over 30–60 min; avoid extravasation.

Incompatibility: Do not combine with hydrocortisone sodium succinate.

Adverse effects

- **Dermatologic:** *Photosensitivity*, erythematous and urticarial rashes, alopecia
- **GI:** *Anorexia, nausea, vomiting*, hepatotoxicity, **hepatic necrosis**
- **Hematologic:** **Leukopenia, thrombocytopenia**
- **Hypersensitivity:** **Anaphylaxis**
- **Local:** *Local tissue damage and pain if extravasation occurs*
- **Other:** Facial flushing and paresthesias, flulike symptoms, cancer

Nursing considerations

Assessment

- **History:** Allergy to dacarbazine, impaired hepatic function, bone marrow depression, lactation, pregnancy
- **Physical:** Weight; T; skin color, lesions; hair; mucous membranes, liver evaluation; CBC, LFTs, renal function tests

Interventions

⊗ **Black box warning** Arrange for lab tests (liver function; WBC, RBC, platelet counts) before and frequently during therapy; serious bone marrow suppression, hepatotoxicity may occur.

⊗ **Black box warning** Drug is carcinogenic in animals; monitor patient accordingly.

⊗ **Warning** Give IV only; avoid extravasation into the subcutaneous tissues during administration because tissue damage and severe pain may occur.

- Apply hot packs to relieve pain locally if extravasation occurs.
- Restrict oral intake of fluid and foods for 4–6 hr before therapy to alleviate nausea and vomiting.
- Consult with physician for antiemetic if severe nausea and vomiting occur. Phenobarbital and prochlorperazine may be used. Assure patient that nausea usually subsides after 1–2 days.

Teaching points

- Prepare a calendar for treatment days and additional therapy.
- Have regular blood tests to monitor drug's effects.
- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, eat frequent small meals; maintain good nutrition; consult a dietitian; antiemetic available); rash; loss of hair (reversible; obtain a wig or other suitable head covering; keep head covered in extreme temperature); sensitivity to UV light (use a sun-screen and protective clothing); increased risk of infection (avoid crowded areas, people with known infections).
- Report fever, chills, sore throat, unusual bleeding or bruising, yellow skin or eyes, light-colored stools, dark urine, pain or burning at IV injection site.

⚠ DANGEROUS DRUG

▷ dactinomycin (actinomycin D, ACT)

(*dak ti noe mye' sin*)

Cosmegen

PREGNANCY CATEGORY D

Drug classes

Antibiotic
Antineoplastic

Therapeutic actions

Cytotoxic: Inhibits synthesis of messenger RNA, causing cell death; cell cycle nonspecific.

Indications

- Wilms' tumor, rhabdomyosarcoma, Ewing's sarcoma, in combination therapy
- Testicular cancer (metastatic nonseminomatous) in combination
- Gestational trophoblastic neoplasia, as monotherapy or in combination
- Palliative treatment or adjunct to tumor resection via isolation-perfusion technique for solid malignancies

- **NEW INDICATION:** Unlabeled uses: Osteosarcoma, malignant melanoma, Paget's disease

Contraindications and cautions

- Contraindicated with allergy to dactinomycin; chickenpox, herpes zoster (severe, generalized disease and death could result); pregnancy; lactation.
- Use cautiously with bone marrow suppression, radiation therapy, and patients with reduced renal and hepatic function.

Available forms

Powder for injection—500 mcg

Dosages

⊗ **Warning** Individualize dosage. Toxic reactions are frequent, limiting the amount of the drug that can be given. Give drug in short courses.

Adults

Do not exceed 15 mcg/kg/day or 400–600 mcg/m² per day for 5 days. Calculate dosage for obese or edematous patients on the basis of surface area as an attempt to relate dosage to lean body mass.

- *Nonseminomatous testicular carcinoma:* 1,000 mcg/m² IV on day 1 of a combination regimen.
- *Gestational trophoblastic neoplasia:* 12 mcg/kg/day IV for 5 days when used as monotherapy. When used as part of a combination regimen, can give 500 mcg IV on days 1 and 2.
- *Isolation-perfusion technique:* 50 mcg/kg for lower extremity or pelvis; 35 mcg/kg for upper extremity. Use lower dose for obese patients or when previous chemotherapy or radiation therapy has been used.

Pediatric patients

Do not give to children younger than 6 mo. 15 mcg/kg/day IV for 5 days; do not exceed 15 mcg/kg/day or 400–600 mcg/m²/day for 5 days.

Pharmacokinetics

Route	Onset	Duration
IV	Rapid	9 days

Metabolism: Hepatic; $T_{1/2}$: 36 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute by adding 1.1 mL of sterile water for injection (without preservatives) to vial, creating a 500 mcg/mL concentration solution. Discard any unused portion. Highly toxic—handle and administer cautiously. Avoid inhalation of dust or vapors and contact with mucous membranes, especially the eyes. Protective equipment should be worn when handling.

Infusion: Add to IV infusions of 5% dextrose or to sodium chloride, or inject into IV tubing of a running IV infusion. Direct drug injection without infusion requires two needles, one sterile needle to remove drug from vial and another for the direct IV injection. Do not inject into IV lines with cellulose ester membrane filters; drug may be partially removed by filter. Inject over 2–3 min; infuse slowly over 20–30 min. Protect from light.

Adverse effects

- **Dermatologic:** *Alopecia, skin eruptions, acne, erythema, increased pigmentation of previously irradiated skin*
- **GI:** *Cheilitis, dysphagia, esophagitis, ulcerative stomatitis, pharyngitis, anorexia, abdominal pain, diarrhea, GI ulceration, proctitis, nausea, vomiting, hepatotoxicity*
- **GU:** Renal abnormalities
- **Hematologic:** *Anemia, aplastic anemia, agranulocytosis, leukopenia, thrombocytopenia, pancytopenia, reticulopenia*
- **Local:** *Tissue necrosis at sites of extravasation*
- **Other:** *Malaise, fever, fatigue, lethargy, myalgia, hypocalcemia, death, increased incidence of second primary tumors with radiation*

Interactions

* **Drug-lab test** • Inaccurate bioassay procedure results for determination of antibacterial drug levels

Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between dactinomycin and daptomycin. Use extreme caution.

Assessment

- **History:** Allergy to dactinomycin; chickenpox, herpes zoster; bone marrow suppression, prior chemotherapy, radiation therapy; pregnancy, lactation
- **Physical:** T; skin color, lesions; weight; hair; local injection site; mucous membranes, abdominal examination; CBC, LFTs, renal function tests, urinalysis

Interventions

⊗ **Black box warning** Use strict handling procedures; drug is extremely toxic to skin and eyes.

- Do not give IM or subcutaneously; severe local reaction and tissue necrosis occur; IV use only.

⊗ **Black box warning** Monitor injection site for extravasation, burning, or stinging. Discontinue infusion immediately, apply cold compresses to the area, and restart in another vein. Local infiltration with injectable corticosteroid and flushing with saline may lessen reaction.

- Monitor response, including CBC, often at start of therapy; adverse effects may require a decrease in dose or discontinuation of the drug; consult physician.
- Adverse effects may not occur immediately, may be worst 1–2 wk after therapy.

Teaching points

- Prepare a calendar for therapy days.
- Have regular medical follow-up, including blood tests to monitor the drug's effects.
- Adverse effects of the drug may not occur immediately; may be 1 week after therapy before maximal effects.
- You may experience these side effects: Rash, skin lesions, loss of hair (obtain a wig; use skin care); loss of appetite, nausea, mouth sores (frequent mouth care, eat frequent small meals; maintain good nutrition; consult a dietitian; antiemetic may be ordered).

- Report severe GI upset, diarrhea, vomiting, fever, burning or pain at injection site, unusual bleeding or bruising, severe mouth sores, sore throat, GI lesions.

▷ dalfampridine

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ dalteparin sodium

(*dahl' tep ab rin*)

Fragmin

PREGNANCY CATEGORY B

Drug classes

Anticoagulant

Antithrombotic

Low–molecular-weight heparin

Therapeutic actions

Low–molecular-weight heparin that inhibits thrombus and clot formation by blocking factor Xa, factor IIa, preventing the formation of clots.

Indications

- Treatment of unstable angina and non–Q-wave MI for the prevention of complications in patients on aspirin or standard therapy
- Prevention of DVT, which may lead to pulmonary embolism, following abdominal or hip replacement surgery
- Extended treatment of symptomatic venous thromboembolism, DVT, or pulmonary embolism to reduce the recurrence of venous thromboembolism in patients with cancer
- Unlabeled use: Systemic anticoagulation in venous and arterial thromboembolic complications; prophylaxis of DVT in situations that may lead to PE

Contraindications and cautions

- Contraindicated with hypersensitivity to dalteparin, heparin, pork products, or benzyl alcohol; severe thrombocytopenia; uncontrolled bleeding; use of unstable angina dosage in patients undergoing regional anesthesia; pregnancy.

- Use cautiously with lactation; history of GI bleed; severe hepatic or renal impairment; recent childbirth or surgery; history of heparin-induced thrombocytopenia; severe and uncontrolled hypertension, spinal tap, spinal/epidural anesthesia.

Available forms

Injection (prefilled syringes)—2,500 international units/0.2 mL, 5,000 international units/0.2 mL, 7,500 international units/0.3 mL, 10,000 international units/mL, 12,500 international units/0.5 mL, 15,000 international units/0.6 mL, 18,000 international units/0.72 mL.

Dosages

Adults

- *Unstable angina*: 120 international units/kg subcutaneously every 12 hr with aspirin therapy for 5–8 days; not to exceed 10,000 international units every 12 hr.
- *DVT prophylaxis, abdominal surgery*: 2,500 international units subcutaneously given 1–2 hr before surgery and repeated once daily for 5–10 days after surgery; high-risk patients, 5,000 international units subcutaneously starting the evening before surgery; then daily for 5–10 days.
- *Hip replacement surgery*: 5,000 international units subcutaneously the evening before surgery or 2,500 international units within 2 hr before surgery or 2,500 international units 4–8 hr after surgery; then, 5,000 international units subcutaneously each day for 5–10 days or up to 14 days.
- *Extended treatment of venous thromboembolism*:
Month 1: 200 international units/kg/day subcutaneously; do not exceed 18,000 international units/day
Months 2–6: 150 international units/kg/day subcutaneously; do not exceed 18,000 international units/day.

Pediatric patients

Safety and efficacy not established.

Patients with thrombocytopenia on extended treatment

Reduce daily dose by 2,500 international units until platelet count exceeds 100,000/mm³. If platelet count is less than 50,000/mm³, discontinue drug.

Patients with renal insufficiency on extended treatment

If creatinine clearance is less than 30 mL/min, target anti-Xa range is 0.5–1.5 international units/mL; after at least 3–4 doses have been given, draw blood 4–6 hr after dose

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	20–60 min	3–5 hr	2–12 hr

Metabolism: $T_{1/2}$: 4.5 hr

Distribution: May cross placenta, may enter breast milk

Excretion: Urine

Adverse effects

- **Hematologic:** Hemorrhage, bruising, thrombocytopenia
- **Hepatic:** Elevated concentrations of AST, ALT
- **Hypersensitivity:** Chills, fever, urticaria, asthma
- **Other:** Fever; pain; local irritation, hematoma, erythema at site of injection; risk of spinal or epidural hematoma if used with spinal/epidural anesthesia or spinal tap, skin necrosis

Interactions

- * **Drug-drug** • Increased bleeding tendencies with oral anticoagulants or platelet inhibitors; clopidogrel, ticlopidine, salicylates
- Risk of severe bleeding with heparin; avoid this combination
- * **Drug-lab test** • Increased AST, ALT levels
- * **Drug-alternative therapy** • Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo, and ginseng therapy, high-dose vitamin E

■ Nursing considerations Assessment

- **History:** Recent surgery or injury; sensitivity to heparin, pork products, either low-molecular-weight heparins or enoxaparin, tinzaparin, benzyl alcohol; lactation, pregnancy; history of GI bleed; renal or hepatic impairment

- **Physical:** Peripheral perfusion, R, stool guaiac test, PTT or other tests of blood coagulation, platelet count, LFTs, renal function tests

Interventions

⊗ **Black box warning** Carefully monitor patients with spinal epidural anesthesia; risk of spinal hematoma and paralysis.

- Give 1–2 hr before abdominal surgery.
- Do not give dalteparin by IM injection.
- Administer by deep subcutaneous injection; patient should be lying down; alternate administration between the left and right anterolateral and left and right posterolateral abdominal wall. Introduce the whole length of the needle into a skin fold at a 45 degree and 90 degree angle held between the thumb and forefinger; hold the skin fold throughout the injection.
- Cannot be used interchangeably (unit for unit) with other low-molecular-weight heparin or unfractionated heparin.
- Apply pressure to all injection sites after needle is withdrawn; inspect injection sites for signs of hematoma.
- Do not massage injection sites.
- Do not mix with other injections or infusions.
- Store at room temperature; fluid should be clear, colorless to pale yellow.
- Alert all health care providers that patient is on dalteparin.
- If thromboembolic episode should occur despite therapy, discontinue and initiate appropriate therapy.
- ⊗ **Warning** Keep protamine sulfate (dalteparin antidote) readily available in case of overdose.
- Treatment of overdose: Protamine sulfate (1% solution). Administer 1 mg of protamine per 100 antifactor Xa international units of dalteparin. Give very slowly IV over 10 min.

Teaching points

- This drug must be given by a parenteral route (not orally). You or your caregiver need to learn to administer the drug subcutaneously, and to safely dispose of syringes.
- Periodic blood tests are needed to monitor response.

- Avoid injury while using this drug—use an electric razor, avoid potentially injurious activities.
- Report nose bleed, bleeding of the gums, unusual bruising, black or tarry stools, cloudy or dark urine, abdominal or lower back pain, severe headache, light-headedness, or dizziness.

dantrolene sodium

(dan' troe leen)

Dantrium, Dantrium Intravenous

PREGNANCY CATEGORY C

Drug class

Skeletal muscle relaxant (direct acting)

Therapeutic actions

Relaxes skeletal muscle within the skeletal muscle fiber, probably by interfering with the release of calcium from the sarcoplasmic reticulum; does not interfere with neuromuscular transmission or affect the surface membrane of skeletal muscle.

Indications

- Oral: Control of clinical spasticity resulting from upper motor neuron disorders, such as spinal cord injury, CVA, cerebral palsy, or MS; not indicated for relief of skeletal muscle spasm resulting from rheumatic disorders; continued long-term administration is justified if use significantly reduces painful or disabling spasticity (clonus); significantly reduces the intensity or degree of nursing care required; rids the patient of problematic manifestation of spasticity
- Oral: Preoperatively to prevent or attenuate the development of malignant hyperthermia in susceptible patients who must undergo surgery or anesthesia; after a malignant hyperthermia crisis to prevent recurrence
- Parenteral (IV): Management of the fulminant hypermetabolism of skeletal muscle characteristic of malignant hyperthermia crisis; preoperative prevention of malignant hyperthermia
- Unlabeled uses: Exercise-induced muscle pain, neuroleptic malignant syndrome

Contraindications and cautions

- Contraindicated with active hepatic disease; spasticity used to sustain upright posture, balance in locomotion or to gain or retain increased function; lactation.
- Use cautiously with female patients and patients older than 35 yr (increased risk for potentially fatal, hepatocellular disease); impaired pulmonary function; severely impaired cardiac function due to myocardial disease; history of previous liver disease or impairment.
- Malignant hyperthermia is a medical emergency that would override contraindications and cautions.

Available forms

Capsules—25, 50, 100 mg; powder for injection—20 mg/vial

Dosages

Adults

Oral

- *Chronic spasticity*: Titrate and individualize dosage; establish a therapeutic goal before therapy, and increase dosage until maximum performance compatible with the dysfunction is achieved. Initially, 25 mg daily; increase to 25 mg tid for 7 days; then increase to 50 mg tid and to 100 mg tid if necessary. Most patients will respond to 400 mg/day or less; maintain each dosage level for 4–7 days to evaluate response. Discontinue drug after 45 days if benefits are not evident.
- *Preoperative prophylaxis of malignant hyperthermia*: 4–8 mg/kg/day PO in three to four divided doses for 1–2 days prior to surgery; give last dose about 3–4 hr before scheduled surgery with a minimum of water. Adjust dosage to the recommended range to prevent incapacitation due to drowsiness and excessive GI irritation.
- *Postcrisis follow-up*: 4–8 mg/kg/day PO in four divided doses for 1–3 days to prevent recurrence.

Parenteral

- *Treatment of malignant hyperthermia*: Discontinue all anesthetics as soon as problem is recognized. Give dantrolene by continuous rapid IV push beginning at a minimum dose of 1 mg/kg and continuing until

symptoms subside or a maximum cumulative dose of 10 mg/kg has been given. If physiologic and metabolic abnormalities reappear, repeat regimen. Give continuously until symptoms subside.

- **Preoperative prophylaxis of malignant hyperthermia:** 2.5 mg/kg IV 1¼ hr before surgery infused over 1 hr.

Pediatric patients

Safety for use in children younger than 5 yr not established. Since adverse effects may appear only after many years, weigh benefits and risks of long-term use carefully.

Oral

- **Chronic spasticity:** Use an approach similar to that for the adult. Initially, 0.5 mg/kg once daily for 7 days, followed by 0.5 mg/kg tid for 7 days; then 1 mg/kg tid for 7 days; then 2 mg/kg tid if necessary. Do not exceed dosage of 100 mg qid.
- **Malignant hyperthermia:** Dosage orally and IV is same as adult.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	4–6 hr	8–10 hr
IV	Rapid	5 hr	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 9 hr (oral), 4–8 hr (IV)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Add 60 mL of sterile water for injection (without bacteriostatics) to each vial; shake until solution is clear. Use within 6 hr; store at room temperature and protect from light.

Infusion: Administer by rapid continuous IV push. Administer continuously until symptoms subside; prophylactic doses infused over 1 hr.

Incompatibilities: Dantrolene sodium is not compatible with 5% dextrose or 0.9% sodium chloride or bacteriostatic water for injection.

Adverse effects

Oral

- **CNS:** *Drowsiness, dizziness, weakness, general malaise, fatigue*, speech disturbance, seizure, headache, light-headedness, visual disturbance, diplopia, alteration of taste, insomnia, mental depression, mental confusion, increased nervousness
- **CV:** Tachycardia, erratic BP, phlebitis, heart failure
- **Dermatologic:** Abnormal hair growth, acnelike rash, pruritus, urticaria, eczematoid eruption, sweating, photosensitivity
- **GI:** *Diarrhea*, constipation, GI bleeding, anorexia, dysphagia, gastric irritation, abdominal cramps, **hepatitis**
- **GU:** Increased urinary frequency, hematuria, crystalluria, difficult erection, urinary incontinence, nocturia, dysuria, urinary retention
- **Hematologic:** Aplastic anemia, leukopenia, thrombocytopenia
- **Other:** Myalgia, backache, chills and fever, feeling of suffocation, respiratory depression

Parenteral

- None of the above reactions with short-term IV therapy for malignant hyperthermia

Interactions

• **Drug-drug** • Risk of hyperkalemia, myocardial depression if combined with verapamil

Nursing considerations Assessment

- **History:** Active hepatic disease; spasticity used to sustain upright posture and balance in locomotion or to gain and retain increased function; female patient and patients older than 35 yr; impaired pulmonary function; severely impaired cardiac function; history of previous liver disease; lactation, pregnancy
- **Physical:** T; skin color, lesions; orientation, affect, reflexes, bilateral grip strength, vision; P, BP, auscultation; adventitious sounds; bowel sounds, normal GI output; prostate palpation, normal output, voiding pattern; urinalysis, LFTs

Interventions

⊗ **Warning** Monitor IV injection sites, and ensure that extravasation does not

occur—drug is very alkaline and irritating to tissues.

⊗ **Warning** Ensure that all appropriate measures are used to treat malignant hyperthermia: Discontinue triggering drugs, monitor and provide for increased oxygen requirements, manage metabolic acidosis and electrolyte imbalance, use cooling measures if necessary.

- Establish a therapeutic goal before beginning long-term oral therapy to gain or enhance ability to engage in therapeutic exercise program, use of braces, transfer maneuvers.
- Withdraw oral drug for 2–4 days to confirm therapeutic benefits; clinical impression of exacerbation of spasticity would justify use of this potentially dangerous drug.
- Discontinue if diarrhea is severe; it may be possible to reinstitute drug at a lower dose.

⊗ **Black box warning** Have liver function tests done periodically; arrange to discontinue at first sign of abnormality; early detection of liver abnormalities may permit reversion to normal function. Hepatotoxicity is possible.

Teaching points

Preoperative prophylaxis of malignant hyperthermia

- Call for assistance if you wish to get up; do not move about alone; this drug can cause drowsiness.
- Report GI upset; a dosage change is possible; eat frequent small meals.

Long-term oral therapy for spasticity

- Take this drug exactly as prescribed; do not take a higher dosage.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs; these could cause dangerous effects.
- You may experience these side effects: Drowsiness, dizziness, blurred vision (avoid driving or engaging in activities that require alertness); diarrhea; nausea (take with food, eat frequent small meals); difficulty urinating, increased urinary frequency, urinary incontinence (empty bladder just before taking medication); headache, malaise (an analgesic may be allowed); photosensitivity (avoid sun and ultraviolet light or use sunscreens, protective clothing).

- Report rash, itching, bloody or black tarry stools, pale stools, yellowish discoloration of the skin or eyes, severe diarrhea.

▷ dapsone

See Appendix U, *Less commonly used drugs*.

▷ daptomycin

(*dap toe mye' sin*)

Cubicin

PREGNANCY CATEGORY B

Drug class

Cyclic lipopeptide antibiotic

Therapeutic actions

Binds to bacterial cell membranes, causing a rapid depolarization of membrane potential. The loss of membrane potential leads to the inhibition of protein, DNA, and RNA synthesis, which results in bacterial cell death.

Indications

- Treatment of complicated skin and skin structure infections caused by susceptible strains of the following gram-positive bacteria: *Staphylococcus aureus* (including methicillin-resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus dysgalactiae*, and *Enterococcus faecalis* (vancomycin-susceptible strains only)
- Treatment of *S. aureus* bloodstream infections, including right-sided endocarditis caused by methicillin-susceptible and methicillin-resistant *S. aureus*

Contraindications and cautions

- Contraindicated with known allergy to daptomycin.
- Use cautiously with pregnancy, lactation, renal impairment.

Available forms

Powder for injection—500 mg/vial

Dosages**Adults**

Skin and skin structure infections: 4 mg/kg IV given over 30 min in 0.9% sodium chloride injection every 24 hr for 7–14 days.

Bacteremia: 6 mg/kg/day IV over 30 min for 2–6 wk or longer.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

For patients with creatinine clearance less than 30 mL/min or for those on dialysis, give 4 mg/kg IV once every 48 hr (6 mg/kg for *S. aureus* bloodstream infections).

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	30 min

Metabolism: Hepatic; $T_{1/2}$: 8–9 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute with 10 mL (500-mg vial) 0.9% sodium chloride injection; further dilute with 0.9% sodium chloride injection for infusion. Final concentration should not exceed 20 mg/mL. Reconstituted and diluted solution is stable for 12 hr at room temperature, up to 48 hr if refrigerated; date bag to ensure that solution is discarded after that time; solution should be clear and free of particulate matter.

Infusion: Infuse over 30 min.

Compatibilities: Compatible with 0.9% sodium chloride injection, lactated Ringer's.

Incompatibilities: Do not mix with dextrose solutions; do not mix in solution with any other drugs, if a line is used for several drugs, flush the line with compatible fluids between drugs.

Adverse effects

- **CNS:** *Headache, insomnia*, dizziness
- **CV:** Hypotension, hypertension
- **GI:** *Constipation, nausea, diarrhea, vomiting*, dyspepsia, **pseudomembranous colitis**

- **Respiratory:** Dyspnea

- **Other:** *Injection site reactions*, fever, rash, pruritus, arthralgia, limb pain, **myopathy**, *superinfections*, anemia

Interactions

• **Drug-drug** • Potential for increased effects of oral anticoagulants if combined; monitor patient closely and adjust dosage as needed • Risk of altered effects of both drugs if combined with tobramycin; if this combination is used, monitor patient very closely • Increased risk of myopathy if combined with HMG-CoA inhibitors; consider discontinuing the HMG-CoA inhibitor while daptomycin is being used

Nursing considerations**CLINICAL ALERT!**

Name confusion has been reported between dactinomycin and daptomycin. Use extreme caution.

Assessment

- **History:** Allergy to daptomycin, renal impairment, pregnancy, lactation
- **Physical:** Site of infection, skin color, lesions; orientation, affect; GI output, bowel sounds; orientation, affect; culture and sensitivity tests of infection, renal function tests

Interventions

- Culture site of infection before beginning therapy.
- Monitor CPK levels weekly to assess for myopathy.
- ⊗ **Warning** Discontinue drug and provide supportive care for any patient developing signs of pseudomembranous colitis.
- ⊗ **Warning** Discontinue drug with any unexplained signs of myopathy (muscle pain or weakness) or with increasing levels of CPK. Consider discontinuing any other drugs that are associated with myopathy (HMG-CoA inhibitors) while daptomycin is being used.
- Monitor renal function in patients before beginning therapy.
- Institute appropriate hygiene measures and arrange treatment if superinfections occur.

- If GI upset occurs, provide small, frequent meals; encourage patient to maintain fluid intake and nutrition.
- Establish safety measures (eg, accompany patient, use side rails) if CNS changes occur.

Teaching points

- This drug will be given IV over 30 minutes once a day for 7–14 days or longer.
- You may experience these side effects: Nausea, diarrhea, discomfort (eat frequent small meals); headache (analgesics may be available to help; consult your health care provider); dizziness (ask for help when you are walking); reaction at the injection site (if this becomes painful, notify your health care provider).
- Report severe or watery diarrhea, skin rash, muscle pain or weakness.

darbepoetin alfa (dar bab poe e' tin)

Aranesp

PREGNANCY CATEGORY C

Drug class

Erythropoiesis-stimulating hormone

Therapeutic actions

An erythropoietin-like glycoprotein hormone produced by recombinant DNA technology; stimulates RBC production in the bone marrow in the same manner as naturally occurring erythropoietin, a hormone released into the bloodstream in response to renal hypoxia.

Indications

- Treatment of anemia associated with chronic renal failure, including during dialysis
- Treatment of chemotherapy-induced anemia in patients with nonmyeloid malignancies
- Unlabeled use: Anemia associated with malignancy

Contraindications and cautions

- Contraindicated with uncontrolled hypertension or hypersensitivity to any component of the drug.

- Use cautiously with hypertension, pregnancy, lactation.

Available forms

Polysorbate solution for injection—25, 40, 60, 100, 200, 300, 500 mcg/mL; 40 mcg/0.4 mL; 60 mcg/0.3 mL; 100 mcg/0.5 mL; 150 mcg/0.3 or 0.75 mL; 200 mcg/0.4 mL; 300 mcg/0.6 mL

Dosages

Adults

- *Starting dose:* 0.45 mcg/kg IV or subcutaneously once per wk. Dosage may be adjusted no more frequently than once per mo. Target Hgb level is 12 g/dL. Adjust dosage by 25% at a time to achieve that level. Avoid rapid increase in Hgb.
- *Switching from epoetin alfa:*

Epoetin Alfa Dose in Units/wk	Darbepoetin Alfa Dose in mcg/wk
Less than 2,500	6.25
2,500–4,999	12.5
5,000–10,999	25
11,000–17,999	40
18,000–33,999	60
34,000–89,999	100
90,000 or more	200

Patients who were receiving epoetin two to three times per week should receive darbepoetin once per wk. Patients who were receiving epoetin once per wk should receive darbepoetin once every 2 wk.

- *Chemotherapy-induced anemia:* 2.25 mcg/kg subcutaneously once per wk; adjust to maintain acceptable Hgb levels. Or 500 mcg by subcutaneous injection once every 3 wk; adjust dosage to maintain Hgb level at 12 g/dL.

Pediatric patients

Safety and efficacy not established.

Patients with chronic renal failure

Start with single subcutaneous injection every 2 wk. Dosage should start slowly and be increased based on Hgb levels; check Hgb levels weekly until stable, then monthly.

Pharmacokinetics

Route	Peak	Duration
Subcut.	34 hr	24–72 hr
IV	14 hr	24–72 hr

Metabolism: Serum; $T_{1/2}$: 21 hr (IV), 49 hr (subcutaneously)

Distribution: May cross placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Administer as provided; no additional preparation needed. Enter vial only once; discard any unused solution. Refrigerate. Do not shake vial. Inspect for any discoloring or precipitates before use.

Infusion: Administer by direct IV injection or into tubing of running IV.

Incompatibilities: Do not mix with any other drug solution.

Adverse effects

- **CNS:** *Headache, fatigue, asthenia*, dizziness, **seizure**, TIA, **CVA**
- **CV:** *Hypertension, edema, hypotension*, chest pain, arrhythmias, chest pain, **MI**
- **GI:** *Nausea, vomiting, diarrhea, abdominal pain*
- **Respiratory:** *URI, dyspnea, cough*
- **Other:** *Arthralgias, myalgias*, limb pain, clotting of access line, pain at injection site, **development of anti-erythropoietin antibodies with subsequent pure red cell aplasia and extreme anemia**

■ Nursing considerations

Assessment

- **History:** Hypertension; hypersensitivity to any component of product, pregnancy, lactation
- **Physical:** Reflexes, affect, BP, P, R, adventitious sounds, urinary output, renal function tests, CBC, hemoglobin, Hct, iron levels, electrolytes

Interventions

⊗ **Warning** Ensure chronic, renal nature of anemia or response to chemotherapy. Darbepoetin is not intended as a treatment of severe anemia and is not a substitute for emergency transfusion.

⊗ **Black box warning** Risk of death and serious CV events increases if hemoglobin target exceeds 12 g/dL. Use lowest level of any

drug needed to increase hemoglobin to lowest level needed to avoid transfusion.

⊗ **Black box warning** Risk of DVT is higher in patients who receive erythropoietin-stimulating agents preoperatively to decrease need for transfusion; note that darbepoetin is not approved for this use.

⊗ **Black box warning** Risk of death or tumor progression increases when drug is used in cancer patients with Hgb target range exceeding 12 g/dL. Monitor Hgb closely in these patients.

- Prepare solution by gently mixing. Do not shake; shaking may denature the glycoprotein. Use only one dose per vial; do not reenter the vial. Discard unused portions.
- Patients with chronic renal failure on hemodialysis should receive this drug IV, not by subcutaneous injection, to decrease the risk of developing anti-erythropoietin antibodies.
- Do not administer with any other drug solution.
- Administer dose once weekly. If administered independent of dialysis, administer into venous access line. If patient is not on dialysis, administer IV or subcutaneously.
- Evaluate chemotherapy patients for once-every-3-wk treatment program.
- Monitor access lines for signs of clotting.
- Arrange for Hct or Hgb reading before administration of each dose to determine appropriate dosage. Do not exceed Hgb target of 12 g/dL. If patient fails to respond within 4 wk of therapy, evaluate patient for other causes of the problem.
- Evaluate iron stores before and periodically during therapy. Supplemental iron may be needed.
- Monitor patient for sudden loss of response and severe anemia with low reticulocyte count; hold drug and check patient for anti-erythropoietin antibodies. If antibodies are present, discontinue drug permanently and do not switch to any other erythropoietic agent; cross-sensitivity can occur.
- Monitor diet and assess nutrition; arrange for nutritional consult as necessary.
- Establish safety precautions (eg, siderails, environmental control, lighting) if CNS effects occur.

- Maintain seizure precautions during administration.
- Provide additional comfort measures, as necessary, to alleviate discomfort from GI effects, headache.
- Offer support and encouragement to deal with chronic disease and need for prolonged therapy and testing.

Teaching points

- The drug will need to be given once a week or once every 3 wk, as prescribed, and can only be given IV or subcutaneously or into a dialysis access line. Prepare a schedule of administration dates. You and a significant other should learn to administer subcutaneous injections. Dispose of needles and syringes properly.
- Keep appointments for blood tests; frequent blood tests will be needed to determine the effects of the drug on your blood count and to determine the appropriate dosage needed.
- Maintain all of the usual activities and restrictions that apply to your chronic renal failure. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headache, fatigue, joint pain (consult your health care provider if these become bothersome; medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important; consult with your dietitian to maintain nutrition and ensure ready access to bathroom facilities); upper respiratory infection, cough (consult your health care provider if this occurs).
- Report difficulty breathing, numbness or tingling, chest pain, seizures, severe headache.

darifenacin hydrobromide

(*da ree fen' ab sin*
high drob brob' myde)

Enablex 

PREGNANCY CATEGORY C

Drug classes

Muscarinic receptor antagonist
Urinary antispasmodic

Therapeutic actions

Counteracts smooth muscle spasm of the urinary tract by relaxing the detrusor and other smooth muscles through action at the muscarinic parasympathetic receptors.

Indications

- Treatment of overactive bladder with symptoms of urge urinary incontinence, urgency and urinary frequency

Contraindications and cautions

- Contraindicated with allergy to drug or any component of the drug, urinary retention, gastric retention, uncontrolled narrow-angle glaucoma.
- Use cautiously with bladder outflow obstruction, GI obstructive disorders, decreased GI motility, controlled narrow-angle glaucoma, reduced hepatic function, pregnancy, lactation.

Available forms

ER tablets —7.5, 15 mg

Dosages

Adults

7.5 mg/day PO taken with liquid and swallowed whole. May be increased to 15 mg/day PO as early as week 2, if needed for patient response.

Pediatric patients

Safety and efficacy not established.

Patients with moderate hepatic impairment

Do not exceed 7.5 mg/day PO.

Patients with severe hepatic impairment

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	6.5–7.5 hr

Metabolism: Hepatic; $T_{1/2}$: 13–19 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, asthenia, headache
- **EENT:** Dry eyes, blurred vision
- **GI:** *Dry mouth, constipation*, nausea, dyspepsia, abdominal pain, diarrhea
- **GU:** UTI, urinary retention
- **Other:** Flulike symptoms

Interactions

- *** Drug-drug** • Risk of increased serum levels and toxic effects if combined with clarithromycin, ketoconazole, itraconazole, ritonavir, nelfinavir, clarithromycin, nefazadone; if this combination is used, monitor patient and do not exceed 7.5 mg/day darifenacin
- Risk of increased toxic effects of flecainide, thioridazine, TCAs; monitor patient closely and use caution if this combination is used
- Risk of increased anticholinergic adverse effects (dry mouth, constipation, blurred vision) if combined with anticholinergic drugs; monitor patient carefully if this combination is used

■ Nursing considerations**Assessment**

- **History:** Allergy to drug or any component of the drug; urinary retention, gastric retention, uncontrolled narrow-angle glaucoma, bladder outflow obstruction, GI obstructive disorders, decreased GI motility, reduced renal or hepatic function, pregnancy, lactation
- **Physical:** Orientation, affect, reflexes, ophthalmic examination, ocular pressure measurement; P; bowel sounds, oral mucous membranes; LFTs

Interventions

- Arrange for definitive treatment of underlying medical conditions that may be causing overactive bladder.
- Ensure that patient swallows tablet whole; do not cut, crush, or allow patient to chew tablet.
- Provide sugarless lozenges for patient to suck and frequent mouth care if dry mouth is a serious problem.
- Provide small, frequent meals if GI upset occurs.
- Establish bowel program if constipation is a problem.

- Arrange for ophthalmic examination before beginning therapy and periodically during therapy.
- Establish safety precautions if CNS effects occur.

Teaching points

- Take drug once a day with water. Swallow whole, do not cut, crush, or chew tablet. Take with or without food.
- Be aware that this drug is meant to relieve the symptoms you are experiencing; other medications may be used to treat the cause of the symptoms.
- You may not be able to sweat normally while on this drug, use caution in any situation that could lead to overheating.
- Consult your health care provider if you become pregnant or wish to become pregnant, it is not known if this drug affects the fetus.
- If you are nursing a baby, another method of feeding the baby should be used while you are on this drug.
- You may experience these side effects: Dry mouth, GI upset (sucking on sugarless lozenges and frequent mouth care may help); drowsiness, blurred vision (avoid driving or performing tasks that require alertness while on this drug); constipation (medication may be available to help).
- Report inability to void, fever, blurring of vision, severe constipation.

PREGNANCY CATEGORY C

Drug classes

Antiviral

Nonnucleoside reverse transcriptase inhibitor

Therapeutic actions

Nonnucleoside inhibitor of HIV reverse transcriptase; binds directly to HIV's reverse transcriptase and blocks RNA-dependent and DNA-dependent DNA polymerase activities.

Indications

- Treatment of HIV-1 infection in combination with other appropriate retroviral drugs when therapy is warranted; not intended as a monotherapy because resistant virus emerges rapidly

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component.
- Use cautiously with compromised or impaired liver function, pregnancy, lactation.

Available forms

Tablets—100, 200 mg

Dosages

Adults and patients older than 16 yr

400 mg PO tid used in combination with appropriate antiretroviral drugs.

Pediatric patients

Not recommended for patients younger than 16 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 2–11 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** *Headache*, insomnia, myalgia, *asthenia*, malaise, dizziness, paresthesia, somnolence, fatigue
- **GI:** *Nausea*, GI pain, *diarrhea*, anorexia, vomiting, dyspepsia, increased liver enzymes
- **Skin:** *Rash*, pruritus, maculopapular rash, nodules, urticaria
- **Other:** Anemia, arthralgia, breast enlargement, fat redistribution

Interactions

★ **Drug-drug** ☒ **Warning** Potentially serious or life-threatening adverse effects may occur in combination with antiarrhythmics, clarithromycin, dapsone, rifabutin, benzodiazepines, calcium channel blockers, ergot derivatives, indinavir, saquinavir, quinidine or warfarin; avoid these combinations if at all possible; if the combination cannot be avoided, monitor patient very closely and decrease dosage as appropriate.

★ **Drug-alternative therapy** • Possible loss of antiviral response with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Life-threatening allergy to any component, impaired liver function, pregnancy, lactation
- **Physical:** Skin rashes, lesions, texture; T; affect, reflexes, peripheral sensation; bowel sounds, LFTs, CBC and differential

Interventions

- Arrange to monitor hematologic indices and liver function periodically during therapy.

- Monitor patient for signs of opportunistic infections that will need to be treated appropriately.

⊗ **Black box warning** Administer the drug concurrently with appropriate antiretroviral drugs; not for monotherapy.

- Disperse tablets in water before administration; add four 100-mg tablets to at least 3 oz water; allow to stand for a few minutes, stir until a uniform dispersion occurs; have patient drink immediately. Rinse glass and have patient drink rinse; the 200-mg tablets are not readily soluble in water.
- Offer support and encouragement to deal with the diagnosis; explain that this drug must be taken in combination with other drugs and that the long-term effects of the use of this drug are not known.

Teaching points

- Take drug as prescribed; take with other prescribed drugs; do not change dose or alter routine without consulting your health care provider. If also taking antacids, take at least 1 hour apart.
- Disperse four 100-mg tablets in 3 ounces of water; let stand, then stir and drink immediately, rinse glass with water and drink rinse; the 200-mg tablets are not readily soluble in water.
- These drugs are not a cure for AIDS or AIDS-related complex; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- Frequent blood tests are needed during the course of treatment; results of blood counts may indicate a need for decreased dosage or discontinuation of the drug for a specific time.
- This drug may interact with several other drugs; alert any health care provider that you are on this drug. If you are taking antacids, take them at least 1 hour apart from delavirdine.
- Delavirdine does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination; use appropriate precautions.
- You may experience these side effects: Nausea, loss of appetite, change in taste (eat frequent small meals); headache, fever, muscle aches (an analgesic may help; consult

your health care provider); rash (skin care will be important).

- Report use of any prescription or over-the-counter drugs or dietary supplements to your physician or pharmacist.
- Report rash, severe headache, severe nausea, vomiting, changes in color of urine or stool, fatigue.

▷ demeclocycline hydrochloride (demethylchlortetracycline hydrochloride)

(dem e kloe sye' kleen)

Declomycin

PREGNANCY CATEGORY D

Drug classes

Antibiotic

Tetracycline antibiotic

Therapeutic actions

Bacteriostatic: Inhibits protein synthesis of susceptible bacteria, preventing cell reproduction.

Indications

- Infections caused by susceptible strains of rickettsiae; *Mycoplasma pneumoniae*; agents of psittacosis, ornithosis, lymphogranuloma venereum, and granuloma inguinale; *Borrelia recurrentis*; *Haemophilus ducreyi*; *Pasteurella pestis*; *P. tularensis*; *Bartonella bacilliformis*; *Bacteroides*; *Vibrio cholerae*; *Vibrio comma*; *Vibrio fetus*; *Brucella*; *Escherichia coli*; *Enterobacter aerogenes*; *Shigella*; *Acinetobacter calcoaceticus*; *Haemophilus influenzae*; *Klebsiella*; *Diplococcus pneumoniae*; *Staphylococcus aureus*; *Streptococcus pyogenes*; *Streptococcus pneumoniae*; *Mycoplasma bacteria*, *Francisella tularensis*, *Lersinia pestis*
- When penicillin is contraindicated, infections caused by *Neisseria gonorrhoeae*, *Treponema pallidum*, *T. pertenuis*, *Listeria monocytogenes*, *Clostridium*, *Bacillus anthracis*, *Fusobacterium fusiforme*, *Actinomyces*, *Neisseria meningitidis*

- As an adjunct to amebicides in acute intestinal amebiasis
- Treatment of acne or uncomplicated urethral, endocervical, or rectal infections in adults caused by *Chlamydia trachomatis*

Contraindications and cautions

- Contraindicated with allergy to tetracyclines; pregnancy, lactation; in children during tooth-forming years.
- Use cautiously with renal or hepatic impairment.

Available forms

Tablets—150, 300 mg

Dosages

Adults

- *General guidelines:* 150 mg PO qid or 300 mg PO bid.
- *Gonococcal infection:* 600 mg PO then 300 mg every 12 hr for 4 days to a total of 3 g.
- *Streptococcal infections:* Treat for at least 10 days.

Pediatric patients 8 yr and older

3–6 mg/lb/day (6.6–13.2 mg/kg/day) PO in two to four divided doses.

Pediatric patients younger than 8 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	3–4 hr	18–20 hr

Metabolism: Hepatic; $T_{1/2}$: 12–16 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **Dental:** *Discoloring and inadequate calcification of primary teeth of fetus if used by pregnant women, discoloring and inadequate calcification of permanent teeth if used during period of dental development*
- **Dermatologic:** *Phototoxic reactions, rash, exfoliative dermatitis (especially frequent and severe with this tetracycline)*

- **GI:** *Fatty liver, liver failure, anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, esophageal ulcer*
- **Hematologic:** **Hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia, leukocytosis, leukopenia**
- **Other:** *Superinfections, nephrogenic diabetes insipidus syndrome (polyuria, polydipsia, weakness) in patients being treated for SIADH*

Interactions

- *** Drug-drug** • Decreased absorption with antacids, iron, alkali, magnesium • Increased digoxin toxicity • Decreased activity of penicillin • Possibly decreased effectiveness of hormonal contraceptives
- *** Drug-food** • Decreased effectiveness of demeclocycline if taken with food, dairy products
- *** Drug-lab test** • Interference with culture studies for several days following therapy

Nursing considerations

Assessment

- **History:** Allergy to tetracyclines, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin status, R and adventitious sounds, GI function and liver evaluation, urinary output and concentration, urinalysis and BUN, LFTs, renal function tests; culture infected area before beginning therapy

Interventions

- Give on an empty stomach; if severe GI upset occurs, give with food. Avoid combination with dairy products, antacids.
- Give with a full 8-oz glass of water.
- Discontinue drug if diabetes insipidus occurs in SIADH patients.
- Recommend the use of barrier contraceptives while on this drug; fetal abnormalities can occur.

Teaching points

- Take drug throughout the day for best results; take on an empty stomach, 1 hour before or 2 hours after meals, unless GI upset occurs; then it can be taken with food. Avoid combining with dairy products or antacids.
- Use of contraceptive measures is advised while on this drug. Hormonal contraceptives may not be effective; fetal harm has been reported.

- You may experience these side effects: Sensitivity to sunlight (use protective clothing and sunscreen), diarrhea.
- Report rash, itching; difficulty breathing; dark urine or light-colored stools; severe cramps; increased thirst, increased urination, weakness (SIADH patients).

denileukin diftitox

See Appendix U, *Less commonly used drugs*.

denosumab

(den os you mab)

Prolia

PREGNANCY CATEGORY C

Drug class

Nuclear factor kappa B (RANK) ligand inhibitor

Therapeutic actions

Human monoclonal antibody that prevents the activation of RANK ligand, a protein essential for the formation and function of osteoclasts, which are responsible for bone resorption. This action inhibits osteoclast formation and survival, decreasing bone resorption and increasing bone mass and strength.

Indications

- Treatment of postmenopausal women with osteoporosis who are at high risk for fracture (history of osteoporotic fractures, failure on or intolerant to other osteoporosis therapy)

Contraindications and cautions

- Contraindicated with known hypersensitivity to components of drug; lactation, hypocalcemia.
- Use cautiously with current infections, pregnancy.

Available forms

Single-use vial—60 mg/mL; prefilled syringe—60 mg/mL

Dosages

Adults

60 mg by subcutaneous injection in upper arm, thigh, or abdomen every 6 mo.

Pediatric patients younger than 18 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	10 days

Metabolism: Unknown; T_{1/2}: 25.4 days

Distribution: May cross placenta; may enter breast milk

Excretion: Tissue

Adverse effects

- **CNS:** *Vertigo*
- **CV:** Angina, atrial fibrillation, peripheral edema
- **Dermatologic:** Dermatitis, eczema, rash
- **GI:** Abdominal pain, flatulence, GERD, **constipation**
- **GU:** *Cystitis*
- **Respiratory:** URI, pneumonia, pharyngitis
- **Other:** *Hypocalcemia*, **serious to life-threatening infection, cancer, osteonecrosis of jaw**, suppression of bone remodeling resulting in fractures and delayed fracture healing, *back pain, extremity pain, musculoskeletal pain, hypercholesterolemia*

Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug; lactation, pregnancy, hypocalcemia
- **Physical:** Reflexes; skin color, lesions; baseline ECG; R, adventitious sounds; serum calcium levels; cholesterol levels

Interventions

- Obtain baseline serum calcium level before beginning therapy; do not administer if patient has hypocalcemia.
- Assess patient for underlying infections before beginning therapy; encourage patient to have dental follow-up and use good oral hygiene during therapy.

- Ensure that patient is also taking calcium 1,000 mg/day and at least 400 international units of vitamin D.
- Administer by subcutaneous injection into abdomen, upper thigh, or upper arm; rotate injection sites. Injections should be given every 6 mo.
- Ensure that patient has regular cancer screening while on drug.
- Stop drug if signs and symptoms of serious infection, serious dermatologic reaction, or osteonecrosis of the jaw occurs.

Teaching points

- This drug can only be given by subcutaneous injection; it will be given by your health care provider every 6 months. Mark your calendar for return dates for the injection.
- If you miss an injection, arrange to have your next injection as soon as possible.
- You will need to take calcium and vitamin D while on this drug.
- This drug should not be taken during pregnancy; it can have serious effects on the fetus. Women of childbearing age will need to have a serum pregnancy test before beginning therapy. Use of contraceptive measures is advised.
- If you are nursing a baby, you should use another method of feeding the baby while you are on this drug; this drug could cause serious adverse effects on the baby.
- You will need to have blood tests to monitor the effects of this drug on your calcium level.
- This drug affects your immune system and you may be at increased risk for infections and cancer development. Be alert for signs and symptoms of infection (fever, severe abdominal pain, red or swollen areas, frequency or burning on urination) and report these to your health care provider immediately. Take precautions to avoid exposure to infections. Make sure you have all appropriate cancer screening tests.
- This drug could cause problems with your jaw. Make sure you see your dentist regularly and that you brush and floss your teeth daily.
- You may experience these side effects: Dizziness (use caution when moving about; change position slowly); rash (notify your

health care provider if you experience redness, itching, bumps, blisters, or skin peeling); low calcium level (report spasms, twitching, or muscle cramps; make sure you take your calcium and vitamin D daily); constipation (medications may be available if this becomes a problem).

- Report numbness or tingling in extremities or around the mouth, signs and symptoms of infection, jaw pain, severe rash.

desipramine hydrochloride

(*dess ip' ra meen*)

Alti-Desipramine (CAN),
Apo-Desipramine (CAN), Norpramin,
Nu-Desipramine (CAN),
PMS-Desipramine (CAN),
ratio-Desipramine (CAN)

PREGNANCY CATEGORY C

Drug classes

Antidepressant
TCA (secondary amine)

Therapeutic actions

Mechanism of action unknown; inhibits the presynaptic reuptake of the neurotransmitters norepinephrine and serotonin; anticholinergic at CNS and peripheral receptors; sedating.

Indications

- Relief of symptoms of depression (endogenous depression most responsive)
- Unlabeled uses: Treatment of eating disorders, chronic urticaria, diabetic neuropathy, ADHD, enuresis, alcohol dependence, postherpetic neuralgia, traumatic brain injury, Tourette syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug, concomitant therapy with an MAOI, recent MI, myelography within previous 24 hr or scheduled within 48 hr.
- Use cautiously with ECT; preexisting CV disorders (eg, severe coronary heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia; possibly increased

risk of serious CVS toxicity with TCAs); family history of sudden death or rhythm disturbances; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm (anticholinergic effects of TCAs may exacerbate these conditions); seizure disorders (TCAs lower the seizure threshold); hyperthyroidism (predisposes to CVS toxicity, including renal cardiac arrhythmias); impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis with TCA therapy); manic-depressive patients (may shift to hypomanic or manic phase); elective surgery (TCAs should be discontinued as long as possible before surgery), pregnancy, lactation.

Available forms

Tablets—10, 25, 50, 75, 100, 150 mg

Dosages

Adults

- **Depression:** 100–200 mg/day PO as single dose or in divided doses initially. May gradually increase to 300 mg/day. Do not exceed 300 mg/day. Patients requiring 300 mg/day should generally have treatment initiated in a hospital. Continue a reduced maintenance dosage for at least 2 mo after a satisfactory response has been achieved.

Pediatric patients

Not recommended in children younger than 12 yr.

Geriatric patients and adolescents

Initially, 25–100 mg/day PO; dosages more than 100–150 mg are not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2–4 hr	3–4 days

Metabolism: Hepatic; $T_{1/2}$: 12–24 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Sedation and anticholinergic effects, confusion* (especially in elderly), *disturbed*

concentration, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy, extrapyramidal symptoms, *seizures*, speech blockage, dysarthria, tinnitus, altered EEG, **stroke**, seizures

- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure
- **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; SIADH secretion
- **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue
- **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling in men; breast enlargement, menstrual irregularity and galactorrhea in women; increased or decreased libido; impotence
- **Hematologic: Bone marrow depression**
- **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized or of face and tongue), drug fever
- **Withdrawal:** Symptoms on abrupt discontinuation of prolonged therapy—nausea, headache, vertigo, nightmares, malaise
- **Other:** Nasal congestion, excessive appetite, weight gain or loss; sweating (paradoxical effect in a drug with prominent anticholinergic effects), alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

- * **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine • Increased serum levels and risk of bleeding with oral anti-

coagulants • Altered response, including arrhythmias and hypertension with sympathomimetics, quinolones • Risk of severe hypertension with clonidine • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths when MAOIs are given with TCAs

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; ECT; preexisting CV disorders; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients; elective surgery; pregnancy, lactation
- **Physical:** Body weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P; BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG, serum glucose levels in diabetics

Interventions

⊗ **Black box warning** Risk of suicidality in children, adolescents, and young adults; monitor patient, and inform caregivers.

⊗ **Warning** For depressed and potentially suicidal patients, limit access to drug.

- Give major portion of dose at bedtime if drowsiness or severe anticholinergic effects occur.
- Reduce dosage if minor side effects develop; contact health care provider if serious side effects occur.
- Monitor elderly patients for possibly increased adverse effects.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection.

Teaching points

- Take drug exactly as prescribed; do not stop taking this drug abruptly or without consulting your health care provider.
- Avoid alcohol and other sleep-inducing and over-the-counter drugs while taking this drug.

- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments with prolonged exposure to sunlight.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; if severe, avoid driving or performing tasks that require alertness); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals, frequent mouth care, and sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function.
- Report dry mouth, difficulty in urination, excessive sedation, suicidal thoughts.

▷ desirudin

See Appendix U, *Less commonly used drugs*.

▷ desloratadine

(*dess lor at' a deen*)

Clarinet, Clarinet Reditabs

PREGNANCY CATEGORY C

Drug class

Antihistamine (non-sedating type)

Therapeutic actions

Competitively blocks the effects of histamine at peripheral H₁-receptor sites.

Indications

- Relief of nasal and non-nasal symptoms of seasonal allergic rhinitis in patients 2 yr and older
- Treatment of chronic idiopathic urticaria and perennial allergies caused by indoor and outdoor allergens in patients 6 mo and older

Contraindications and cautions

- Contraindicated with allergy to desloratadine, loratadine, or any components of the product; lactation.
- Use cautiously with hepatic or renal impairment or pregnancy.

Available forms

Tablets—5 mg; rapidly disintegrating tablets—2.5, 5 mg; syrup—2.5 mg/5 mL

Dosages**Adults and children 12 yr and older**

5 mg/day PO or 2 tsp (5 mg/10 mL) syrup PO once daily.

Pediatric patients 6–11 yr

1 tsp syrup (2.5 mg/5 mL) PO once daily, or 2.5-mg rapidly disintegrating tablet PO once daily.

Pediatric patients 12 mo–5 yr

1/2 tsp syrup (1.25 mg/2.5 mL) PO once daily.

Pediatric patients 6–11 mo

2 mL syrup (1 mg) PO once daily.

Patients with hepatic or renal impairment

5 mg PO every other day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	3 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 27 hr

Distribution: May cross placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Somnolence, nervousness, dizziness, fatigue
- **CV:** Tachycardia
- **GI:** *Dry mouth*, nausea
- **Respiratory:** Bronchospasm, pharyngitis, dry throat
- **Other:** Flulike symptoms, hypersensitivity

■ Nursing considerations**Assessment**

- **History:** Allergy to desloratadine, loratadine, other antihistamines; hepatic or renal impairment; pregnancy; lactation
- **Physical:** T, orientation, reflexes, affect, R, adventitious sounds, LFTs, renal function tests

Interventions

- Administer without regard to meals.
- Arrange for use of humidifier if thickening of secretions, throat dryness become bothersome; encourage adequate intake of fluids.
- Provide sugarless lozenges to suck and regular mouth care if dry mouth is a problem.
- Provide safety measures if CNS effects occur.

Teaching points

- Take this drug exactly as prescribed, with or without food. *Clarinox Reditabs* contain phenylalanine; use caution if you have phenylketonuria.
- Place rapidly disintegrating tablets on tongue immediately after opening blister pack; administer with or without water.
- You may experience these side effects: Dizziness, fatigue (use caution if driving or performing tasks that require alertness); dry throat, thickening of bronchial secretions, dryness of nasal mucosa (use of a humidifier may help if this becomes a problem); dry mouth (sucking on sugarless lozenges and frequent mouth care may help).
- Report difficulty breathing, tremors, palpitations.

desmopressin acetate (1-deamino-8-D-arginine vasopressin)

(*des moe press' in*)

Apo-Desmopressin (CAN), DDAVP, Octostim (CAN), Stimite, Stimite Nasal Spray

PREGNANCY CATEGORY B

Drug class

Hormone

Therapeutic actions

Synthetic analogue of human ADH; promotes resorption of water in the renal tubule; increases levels of clotting factor VIII.

Indications

- *DDAVP*: Neurogenic diabetes insipidus (not nephrogenic in origin; intranasal and parenteral); hemophilia A (with factor VIII levels exceeding 5%; parenteral); von Willebrand's disease (type I; parenteral or intranasal)
- *Stimite*: Treatment of hemophilia A (with factor VIII levels exceeding 5%), von Willebrand's disease (type I)
- Unlabeled use (intranasal): Treatment of chronic autonomic failure

Contraindications and cautions

- Contraindicated with allergy to desmopressin acetate; type II von Willebrand's disease; severe renal impairment
- Use cautiously with vascular disease or hypertension, lactation, water intoxication, fluid and electrolyte imbalance, pregnancy.

Available forms

Tablets—0.1, 0.2 mg; nasal solution—0.1 mg/mL, 1.5 mg/mL; injection—4 mcg/mL

Dosages

Adults

- *Diabetes insipidus*: 0.1–0.4 mL/day intranasally as a single dose or divided into two to three doses; 0.5–1 mL/day subcutaneously or IV, divided into two doses, adjusted to achieve a diurnal water turnover pattern, or 0.05 mg PO bid—adjust according to water turnover pattern.
- *Hemophilia A or von Willebrand's disease*: 0.3 mcg/kg diluted in 50 mL sterile physiologic saline; infuse IV slowly over 15–30 min. If needed preoperatively, infuse 30 min before the procedure. Determine need for repeated administration based on patient response. Intranasal—1 spray per nostril, 2 hr preoperatively for a total dose of 300 mcg.

Pediatric patients

- *Diabetes insipidus*: For patients 3 mo–12 yr, 0.05–0.3 mL/day intranasally as a single dose or divided into two doses; or 0.05 mg PO daily—adjust according to water turnover pattern.
- *Hemophilia A or von Willebrand's disease*: For patients weighing 10 kg or less, 0.3 mcg/kg diluted in 10 mL of sterile physiologic saline; 50 mL normal saline if weighing more than 10 kg. Infuse IV slowly over 15–30 min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	4–7 hr	7 hr
IV, Subcut.	30 min	90–120 min	Varies
Nasal	15–60 min	1–5 hr	5–21 hr

Metabolism: $T_{1/2}$: 7.8 min then 75.5 min (IV); 1.5–2.5 hr (oral); 3.3–3.5 hr (nasal)

Distribution: May cross placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: Use drug as provided; refrigerate vial.

Infusion: Administer by direct IV injection over 1 min; infuse for hemophilia A or von Willebrand's disease over 15–30 min. May dilute in normal saline solution.

Adverse effects

- **CNS:** Transient headache
- **CV:** Slight elevation of BP, facial flushing (with high doses)
- **GI:** Nausea, mild abdominal cramps
- **GU:** Vulval pain
- **Local:** *Local erythema, swelling, burning pain* (parenteral injection)
- **Other:** Fluid retention, water intoxication, hyponatremia (rare)

Interactions

★ **Drug-drug** • Risk of increased antidiuretic effects if combined with carbamazepine, chlorpropamide • Increased risk of hyponatremia related to increased fluid intake if used with TCAs or SSRIs; monitor patient closely and limit fluid intake

Nursing considerations

Assessment

- **History:** Allergy to desmopressin acetate; type II von Willebrand's disease; vascular disease or hypertension; lactation, pregnancy
- **Physical:** Nasal mucous membranes; skin color; P, BP, edema; R, adventitious sounds; bowel sounds, abdominal examination; urine volume and osmolality, plasma osmolality; factor VIII coagulant activity, skin bleeding times, factor VIII coagulant levels, factor VIII antigen and ristocetin cofactor levels (as appropriate)

Interventions

- Refrigerate nasal solution and injection; *Stimate* will remain stable for up to 3 wk at room temperature.
- Administer intranasally by drawing solution into the rhinal tube or flexible calibrated plastic tube supplied with preparation. Insert one end of tube into nostril; blow on the other end to deposit solution deep into nasal cavity. Administer to infants, young children, or obtunded adults by using an air-filled

syringe attached to the plastic tube. Spray form also available.

- Monitor condition of nasal passages during long-term therapy; inappropriate administration can lead to nasal ulcerations.

⊗ **Warning** Monitor patients with CV diseases carefully for cardiac reactions.

⊗ **Warning** Monitor patient for signs of hyponatremia, which could lead to seizures. Hold drug when patient has fluid or electrolyte disturbances. If using tablets, limit fluid intake 1 hr before and up to 8 hr after dosing.

- Arrange to individualize dosage to establish a diurnal pattern of water turnover; estimate response by adequate duration of sleep and adequate, not excessive, water turnover.
- Monitor P and BP during infusion for hemophilia A or von Willebrand's disease. Monitor clinical response and lab reports to determine effectiveness of therapy and need for more desmopressin or use of blood products.

Teaching points

- *Stimate* pump must be primed before first use; prime pump by pressing down on pump four times. Discard after 25 doses. Administer intranasally by drawing solution into the rhinal tube or flexible calibrated plastic tube supplied with preparation. Insert one end of tube into nostril; blow on the other end to deposit solution deep into nasal cavity. Review proper administration technique for nasal use. Do not use intranasal route if you are experiencing nasal congestion or blockage.
- You may experience these side effects: GI cramping, facial flushing, headache, nasal irritation (proper administration may decrease these problems).
- Report drowsiness, listlessness, headache, shortness of breath, heartburn, abdominal cramps, vulval pain, severe nasal congestion or irritation.

desvenlafaxine succinate

(des ven la fax' een)

Pristiq 

PREGNANCY CATEGORY C

Drug classes

Serotonin-norepinephrine reuptake inhibitor
Antidepressant

Therapeutic actions

Potentiates the neurotransmitter activity in the CNS; inhibits serotonin and norepinephrine reuptake at the nerve synapse, leading to prolonged stimulation at the neuroreceptor; this action is thought to decrease the signs and symptoms of depression.

Indications

- Treatment of major depressive disorder in adults

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug or venlafaxine, with use of an MAOI, or within 14 days of stopping a MAOI.
- Use cautiously with hypertension, glaucoma, abnormal bleeding, use of drugs that alter coagulation, vascular disease, lipid disorders, renal impairment, lung disease, pregnancy, lactation.

Available forms

ER tablets —50, 100 mg

Dosages

Adults

50 mg/day PO with or without food; range, 50–400 mg/day.

Pediatric patients

Safety and efficacy not established.

Patients with severe renal dysfunction

50 mg PO every other day. Do not administer supplemental dose after dialysis.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	7.5 hr

Metabolism: Hepatic; $T_{1/2}$: 11 hr

Distribution: May cross placenta, enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness, headache*, somnolence, tremor, paresthesia, *insomnia*, anxiety, nervousness, irritability, abnormal dreams, **suicidal ideation**, vision impairment, tinnitus, glaucoma, activation of bipolar symptoms
- **CV:** Palpitations, increased BP, tachycardia
- **GI:** *Nausea, dry mouth, diarrhea, constipation, vomiting, decreased appetite*
- **Respiratory: Interstitial lung disease, eosinophilic pneumonia**
- **Other:** *Fatigue, hyperhidrosis*, rash, yawning, increased bleeding, increased cholesterol and triglyceride levels, sexual function disorders (males)

Interactions

- *** Drug-drug** • Risk of serious adverse reactions if combined with MAOIs; wait 14 days after stopping MAOI before beginning desvenlafaxine, allow 7 days from stopping desvenlafaxine before beginning MAOI • Risk of serotonin syndrome if combined with other drugs that increase serotonin levels; monitor patient closely
 - Increased risk of bleeding if combined with other drugs that affect coagulation (NSAIDs, aspirin, warfarin); monitor patient closely and adjust dosage as needed
 - Potential for increased impairment of mental ability if combined with alcohol or other CNS drugs; monitor patient closely
 - Risk of increased toxicity if combined with venlafaxine; avoid this combination
- *** Drug-alternative therapy** • Increased risk of serotonin syndrome if combined with St. John's Wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug or venlafaxine, current use of an MAOI or use of an MAOI within 14 days, hypertension, glaucoma, abnormal bleeding or the use of drugs that alter coagulation, vascular disease, lipid disorders, renal impairment, lung disease, pregnancy, lactation
- **Physical:** T; skin—color; lesions; orientation, affect, sensory examination, eye pressure; P, BP; abdominal examination; R, adventitious sounds

Interventions

⊗ **Black box warning** Monitor patient for suicidal ideation, especially when beginning therapy or changing dosage; high risk in children, adolescents, and young adults. Drug is not approved for use in pediatric patients.

- Limit amount of drug available to patient because of increased risk of suicidal ideation.
- Give with food if GI upset occurs.
- Instruct patient to swallow tablet whole; do not cut, crush, or chew.
- Do not administer with an MAOI or within 14 days of stopping an MAOI; allow 7 days after stopping desvenlafaxine before starting an MAOI.
- Monitor patients with glaucoma, hypertension, CV disease, SIADH for potential exacerbation of these problems.
- Inform patient that it may take several weeks to see the effects of this drug.
- Avoid suddenly stopping drug; taper gradually.
- Tell patient that the matrix of the drug may be seen in the stool; assure patient that the active drug has been absorbed.
- Advise women of childbearing age to use contraception.
- Encourage nursing mothers to find a different method of feeding the baby while on this drug.

Teaching points

- Take this drug about the same time each day; swallow the tablet whole; do not cut, crush or chew the tablets.
- If you miss a dose, take it as soon as you remember. If it is almost time for the next dose, just skip the missed dose. Do not make up doses. Do not take more than one dose a day.
- Do not stop taking this drug suddenly; if you are running low on tablets, contact your health care provider about a refill. Your health care provider will reduce the dose over time if the drug is to be stopped.
- It may take several weeks before you see the effects of this drug; keep taking the drug as prescribed.
- You may notice something in your stool that looks like your tablet. This is the empty shell of the tablet; the medicine has already been absorbed into your system.

- Do not use St. John's wort while on this drug; serious adverse effects could occur.
- Do not drive or operate dangerous machinery until you know how this drug affects you.
- Avoid drinking alcohol while on this drug.
- It is not known whether this drug affects an unborn baby. Use contraceptive measures while on this drug. If you wish to become pregnant, discuss this with your health care provider. If you become pregnant while taking this drug, consult with your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for adverse effects on an infant, another method of feeding the baby should be used while you are on this drug.
- Your health care provider may monitor your eye pressure, blood pressure, and various blood tests while you are on this drug.
- There is a risk of suicidal thoughts, especially when starting the drug or adjusting the dose. Be alert for these thoughts. Call your health care provider if you have any suicidal thoughts or increased depression or anxiety.
- You may experience these side effects: Dry mouth, nausea (eating frequent small meals and sucking sugarless lozenges may help); dizziness, tremor, changes in ability to concentrate (do not drive a car or operate dangerous machinery until you know how this drug will affect you); constipation (medication may be available to help).
- Report suicidal thoughts, behavioral changes, difficulty breathing, increased bleeding, hallucinations, fever.

dexamethasone

(*dex a meth' a sone*)

dexamethasone

Oral, topical dermatologic aerosol and gel, ophthalmic suspension: Aeroseb-Dex, Apo-Dexamethasone (CAN), Decadron, Decaspray, Dexasol, DexPak TaperPak, Maxidex Ophthalmic, ratio-Dexamethasone (CAN)

dexamethasone sodium phosphate

IV, IM, intra-articular, intralesional injection; respiratory inhalant; intranasal steroid; ophthalmic solution and ointment; topical dermatologic cream: Cortastat, Dalalone, Decadron Phosphate, Decaject, Dexasone, Hexadrol Phosphate, PMS-Dexamethasone (CAN)

PREGNANCY CATEGORY C

Drug classes

Corticosteroid
Glucocorticoid
Hormone

Therapeutic actions

Enters target cells and binds to specific receptors, initiating many complex reactions that are responsible for its anti-inflammatory and immunosuppressive effects.

Indications

- Hypercalcemia associated with cancer
- Cancer chemotherapy–induced nausea and vomiting
- Short-term management of various inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (SLE), dermatologic diseases (pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders: Thrombocytopenic purpura, erythroblastopenia
- Trichinosis with neurologic or myocardial involvement
- Ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas
- Cerebral edema associated with brain tumor, craniotomy, or head injury
- Testing adrenocortical hyperfunction
- Unlabeled uses: Antiemetic for cisplatin-induced vomiting, diagnosis of depression
- Intra-articular or soft-tissue administration: Arthritis, psoriatic plaques

- Respiratory inhalant: Control of bronchial asthma requiring corticosteroids in conjunction with other therapy
- Intranasal: Relief of symptoms of seasonal or perennial rhinitis that responds poorly to other treatments
- Dermatologic preparations: Relief of inflammatory and pruritic manifestations of dermatoses that are steroid-responsive
- Ophthalmic preparations: Inflammation of the lid, conjunctiva, cornea, and globe

Contraindications and cautions

- Contraindicated with infections, especially tuberculosis, fungal infections, amebiasis, vaccinia and varicella, and antibiotic-resistant infections, allergy to any component of the preparation used.
- Use cautiously with renal or hepatic disease; hypothyroidism, ulcerative colitis with impending perforation; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease; heart failure, hypertension, thromboembolic disorders; osteoporosis; seizure disorders; diabetes mellitus; lactation.

Available forms

Tablets—0.25, 0.5, 0.75, 1, 1.5, 2, 4, 6 mg; elixir—0.5 mg/5 mL; oral solution concentrate—0.5 mg/0.5 mL; injection—4 mg/mL, 8 mg/mL, 10 mg/mL, 16 mg/mL, 20 mg/mL, 24 mg/mL; aerosol—84 mcg/actuation; ophthalmic solution—0.1%; ophthalmic suspension—0.1%; ophthalmic ointment—0.05%; topical ointment—0.05%; topical cream—0.05%, 0.1%; topical aerosol—0.01%, 0.04%

Dosages

Adults

Systemic administration

Individualize dosage based on severity of condition and response. Give daily dose before 9 AM to minimize adrenal suppression. If long-term therapy is needed, alternate-day therapy with a short-acting steroid should be considered. After long-term therapy, withdraw drug slowly to avoid adrenal insufficiency. For maintenance therapy, reduce initial dose in small increments at intervals until the lowest clinically satisfactory dose is reached.

Oral (dexamethasone)

0.75–9 mg/day.

- *Suppression test for Cushing's syndrome:* 1 mg at 11 PM; assay plasma cortisol at 8 AM the next day. For greater accuracy, give 0.5 mg every 6 hr for 48 hr, and collect 24-hr urine to determine 17-hydroxycorticosteroid (17-OHCS) excretion.
- *Suppression test to distinguish Cushing's syndrome due to ACTH excess from that resulting from other causes:* 2 mg every 6 hr for 48 hr. Collect 24-hr urine to determine 17-OHCS excretion.

IV or IM (dexamethasone sodium phosphate)

0.5–9 mg/day.

- *Cerebral edema:* 10 mg IV and then 4 mg IM every 6 hr until cerebral edema symptoms subside; change to oral therapy, 1–3 mg tid, as soon as possible and taper over 5–7 days.

Pediatric patients

Individualize dosage based on severity of condition and response, rather than by strict adherence to formulas that correct adult doses for age or body weight. Carefully observe growth and development in infants and children on long-term therapy.

IV

- *Unresponsive shock:* 1–6 mg/kg as a single IV injection (as much as 40 mg initially followed by repeated injections every 2–6 hr has been reported).

(dexamethasone sodium phosphate)

0.4–6 mg (depending on joint or soft-tissue injection site).

Respiratory inhalant

(dexamethasone sodium phosphate)

84 mcg released with each actuation.

Adults

3 inhalations tid–qid, not to exceed 12 inhalations/day.

Pediatric patients

2 inhalations tid–qid, not to exceed 8 inhalations/day.

Intranasal (dexamethasone sodium phosphate)

Each spray delivers 84 mcg dexamethasone.

Adults

2 sprays (168 mcg) into each nostril bid–tid, not to exceed 12 sprays (1,008 mcg)/day.

Pediatric patients

1 or 2 sprays (84–168 mcg) into each nostril bid, depending on age, not to exceed 8 sprays (672 mcg). Arrange to reduce dose and discontinue therapy as soon as possible.

Topical dermatologic preparations**Adults and pediatric patients**

Apply sparingly to affected area bid–qid.

Ophthalmic solutions, suspensions**Adults and pediatric patients**

Instill 1 or 2 drops into the conjunctival sac every 1 hr during the day and every 2 hr during the night; after a favorable response, reduce dose to 1 drop every 4 hr and then 1 drop tid–qid.

Ophthalmic ointment**Adults and pediatric patients**

Apply a thin coating in the lower conjunctival sac tid–qid; reduce dosage to bid and then qid after improvement.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	1–2 hr	2–3 days
IM	Rapid	30–60 min	2–3 days
IV	Rapid	30–60 min	2–3 days

Metabolism: Hepatic; $T_{1/2}$: 110–210 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: No preparation required.

Infusion: Administer by slow, direct IV injection over 1 min.

Incompatibilities: Do not combine with daunorubicin, doxorubicin, metaraminol, vancomycin.

Adverse effects

Adverse effects depend on dose, route, and duration of therapy.

Systemic administration

• **CNS:** Seizures, vertigo, headaches, pseudotumor cerebri, euphoria, insomnia, mood swings, depression, psychosis, in-

tracerebral hemorrhage, reversible cerebral atrophy in infants, cataracts, IOP, glaucoma

- **CV:** Hypertension, heart failure, necrotizing angitis
- **Endocrine:** Growth retardation, decreased carbohydrate tolerance, diabetes mellitus, cushingoid state, secondary adrenocortical and pituitary unresponsiveness
- **GI:** Peptic or esophageal ulcer, pancreatitis, abdominal distention
- **GU:** Amenorrhea, irregular menses
- **Hematologic:** Fluid and electrolyte disturbances, negative nitrogen balance, increased blood sugar, glycosuria, increased serum cholesterol, decreased serum T_3 and T_4 levels
- **Hypersensitivity:** Anaphylactoid or hypersensitivity reactions
- **Musculoskeletal:** Muscle weakness, steroid myopathy, loss of muscle mass, osteoporosis, spontaneous fractures
- **Other:** Impaired wound healing; petechiae; ecchymoses; increased sweating; thin and fragile skin; acne; immunosuppression and masking of signs of infection; activation of latent infections, including TB, fungal, and viral eye infections; pneumonia; abscess; septic infection; GI and GU infections

Intra-articular

• **Musculoskeletal:** Osteonecrosis, tendon rupture, infection

Intralesional therapy

• **CNS:** Blindness (when used on face and head—rare)

Respiratory inhaled

- **Endocrine:** Suppression of HPA function due to systemic absorption
- **Respiratory:** Oral, laryngeal, pharyngeal irritation
- **Other:** Fungal infections

Intranasal

- **CNS:** Headache
- **Dermatologic:** Urticaria
- **Endocrine:** Suppression of HPA function due to systemic absorption
- **GI:** Nausea
- **Respiratory:** Nasal irritation, fungal infections, epistaxis, rebound congestion, perforation of the nasal septum, anosmia

Topical dermatologic ointments, creams, sprays

- **Endocrine:** Suppression of HPA function due to systemic absorption, growth retardation in children (children may be at special risk for systemic absorption because of their large skin surface area to body weight ratio)
- **Local:** Local burning, irritation, acneiform lesions, striae, skin atrophy

Ophthalmic preparations

- **Endocrine:** Suppression of HPA function due to systemic absorption; more common with long-term use
- **Local:** Infections, especially fungal; glaucoma, cataracts with long-term use

Interactions

• **Drug-drug** • Decreased effects of anticholinesterases with corticotropin; profound muscular depression is possible • Decreased steroid blood levels with phenytoin, phenobarbital, rifampin • Decreased serum levels of salicylates with dexamethasone and increased risk of gastric ulceration

• **Drug-lab test** • False-negative nitroblue-tetrazolium test for bacterial infection • Suppression of skin test reactions

■ Nursing considerations

Assessment

- **History for systemic administration:** Active infections; renal or hepatic disease; hypothyroidism, ulcerative colitis; diverticulitis; active or latent peptic ulcer; inflammatory bowel disease; heart failure, hypertension, thromboembolic disorders; osteoporosis; seizure disorders; diabetes mellitus; lactation
- **History for ophthalmic preparations:** Acute superficial herpes simplex keratitis, fungal infections of ocular structures; vaccinia, varicella, and other viral diseases of the cornea and conjunctiva; ocular TB
- **Physical for systemic administration:** Baseline body weight, T; reflexes, and grip strength, affect, and orientation; P, BP, peripheral perfusion, prominence of superficial veins; R and adventitious sounds; serum electrolytes, blood glucose
- **Physical for topical dermatologic preparations:** Affected area for infections, skin injury

Interventions

- For systemic administration, do not give drug to nursing mothers; drug may be secreted in breast milk.
- ⊗ **Warning** Give daily doses before 9 AM to mimic normal peak corticosteroid blood levels.
- Increase dosage when patient is subject to stress.
- Monitor blood glucose levels; dietary restrictions may be needed.
- Taper doses when discontinuing high-dose or long-term therapy.
- Do not give live virus vaccines with immunosuppressive doses of corticosteroids.
- For respiratory inhalant, intranasal preparation, do not use respiratory inhalant during an acute asthmatic attack or to manage status asthmaticus.
- Do not use intranasal product with untreated local nasal infections, epistaxis, nasal trauma, septal ulcers, or recent nasal surgery.
- ⊗ **Warning** Taper systemic steroids carefully during transfer to inhaled steroids; adrenal insufficiency deaths have occurred.
- For topical dermatologic preparations, use caution when occlusive dressings, tight diapers cover affected area; these can increase systemic absorption.
- Avoid prolonged use near the eyes, in genital and rectal areas, and in skin creases.

Teaching points

Systemic administration

- Do not stop taking the oral drug without consulting your health care provider.
- Avoid exposure to infection.
- Report unusual weight gain, swelling of the extremities, muscle weakness, black or tarry stools, fever, prolonged sore throat, colds or other infections, worsening of this disorder.

Intra-articular administration

- Do not overuse joint after therapy, even if pain is gone.

Respiratory inhalant, intranasal preparation

- Do not use more often than prescribed.
- Do not stop using this drug without consulting your health care provider.
- Use the inhalational bronchodilator drug before using the oral inhalant product when using both.

- Administer decongestant nose drops first if nasal passages are blocked.

Topical

- Apply the drug sparingly.
- Avoid contact with eyes or skin around eyes.
- Report any irritation or infection at the site of application.

Ophthalmic

- Administer as follows: Lie down or tilt head backward and look at ceiling. Warm tube of ointment in hand for several minutes. Apply one-fourth to one-half inch of ointment, or drop suspension inside lower eyelid while looking up. After applying ointment, close eyelids and roll eyeball in all directions. After instilling eye drops, release lower lid, but do not blink for at least 30 seconds; apply gentle pressure to the inside corner of the eye for 1 minute. Do not close eyes tightly, and try not to blink more often than usual; do not touch ointment tube or dropper to eye, fingers, or any surface.
- Wait at least 10 minutes before using any other eye preparations.
- Eyes will become more sensitive to light (use sunglasses).
- Report worsening of the condition, pain, itching, swelling of the eye, failure of the condition to improve after 1 week.

dexchlorpheniramine maleate ORIG

(dex klor fen ir' a meen)

PREGNANCY CATEGORY B

Drug class

Antihistamine (alkylamine type)

Therapeutic actions

Blocks the effects of histamine at H₁-receptor sites, has atropine-like, antipruritic, and sedative effects.

Indications

- Relief of symptoms associated with perennial and seasonal allergic rhinitis; vasomotor rhinitis; allergic conjunctivitis; mild, uncomplicated urticaria and angioedema; amelioration of allergic reactions to blood

or plasma; dermatographism; adjunctive therapy in anaphylactic reactions

Contraindications and cautions

- Contraindicated with allergy to antihistamines, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, MAOI use, third trimester of pregnancy, lactation.
- Use cautiously with pregnancy, COPD.

Available forms

ER tablets ORIG—4, 6 mg; syrup—2 mg/5 mL

Dosages

Adults and children older than 12 yr

4–6 mg at bedtime PO or every 8–10 hr PO during the day.

Pediatric patients 6–12 yr

4 mg PO once daily at bedtime (syrup only).

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak
Oral	15–30 min	3 hr

Metabolism: Hepatic; T_{1/2}: 12–15 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, disturbed coordination, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, hysteria, tingling, heaviness and weakness of the hands*
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea or constipation*
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido

- **Hematologic:** Hemolytic anemia, hypoplastic anemia, **thrombocytopenia, leukopenia, agranulocytosis, pancytopenia**
- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal stuffiness, dry mouth, dry nose, dry throat, sore throat
- **Other:** Urticaria, rash, **anaphylactic shock**, photosensitivity, excessive perspiration

Interactions

★ **Drug-drug** • Increased depressant effects with alcohol, other CNS depressants

■ Nursing considerations

Assessment

- **History:** Allergy to any antihistamines; narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, pregnancy, lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Administer with food if GI upset occurs.
- Have patient swallow tablets whole—do not cut, crush, or chew.
- Monitor patient response, and adjust dosage to lowest possible effective dose.

Teaching points

- Take as prescribed; avoid excessive dosage. Take with food if GI upset occurs; do not crush or chew the tablets; swallow whole.
- Avoid alcohol; serious sedation can occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution driving or performing tasks that require alertness); epigastric distress, diarrhea, or constipation (take with meals); dry mouth (frequent mouth care, sucking sugarless lozenges may help); thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier).
- Report difficulty breathing; hallucinations, tremors, loss of coordination; unusual bleeding or bruising; visual disturbances; irregular heartbeat.

dexlansoprazole

(*decks' lan sob' pray zol*)

Dexilant OND

PREGNANCY CATEGORY B

D

Drug classes

Antisecretory drug
Proton pump inhibitor

Therapeutic actions

Gastric acid pump inhibitor that suppresses gastric acid secretion by specific inhibition of the hydrogen-potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step in acid production.

Indications

- Healing of all grades of erosive esophagitis
- Maintenance of healing of erosive esophagitis
- Treatment of heartburn associated with nonerosive gastroesophageal reflux disease (GERD)

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, lactation.
- Use cautiously with pregnancy.
- Possible increased risk for *C. difficile* infection.

Available forms

DR capsules OND—30, 60 mg

Dosages

Adults

Healing of erosive esophagitis: 60 mg/day PO for up to 8 wk.

Maintenance of healing of erosive esophagitis: 30 mg/day PO.

GERD: 30 mg/day PO for up to 4 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr, then 4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine and feces

Adverse effects

- **CNS:** Headache, dizziness, insomnia, taste changes
- **GI:** Nausea, *diarrhea*, vomiting, abdominal pain
- **Respiratory:** URI
- **Other:** Fatigue

Interactions

★ **Drug-drug** • Decreased absorption of atazanavir with resultant loss of effectiveness; avoid this combination • Potential interference with absorption of drugs that require acidic gastric fluids (ampicillin, digoxin, iron salts, ketoconazole); monitor patient accordingly • Potential increased effects of warfarin when taken with proton pump inhibitors; if this combination is used, monitor INR regularly and adjust warfarin dosage as needed

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug; pregnancy, lactation
- **Physical:** Orientation, affect; abdominal exam; respiratory auscultation

Interventions

- Administer without regard to food.
- Capsule should be swallowed whole. Do not cut, crush, or allow patient to chew capsule. If patient cannot swallow capsule, it can be opened and the contents sprinkled over 1 tablespoon of applesauce and swallowed immediately.
- Advise patient to select another method of feeding the baby if nursing.

Teaching points

- Take this drug once a day, with or without food.
- Capsule should be swallowed whole. Do not cut, crush, or chew capsule. If you cannot swallow the capsule, it can be opened and the contents sprinkled over 1 tablespoon of applesauce and swallowed immediately.

- If you miss a dose, take the next dose as soon as you remember.
- It is not known how this drug affects a fetus. If you should become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for serious adverse effects in an infant, another method of feeding the baby should be used while you are taking this drug.
- You may experience these side effects: Dizziness, headache (do not drive a car or engage in activities that require alertness if these effects occur); diarrhea, nausea, vomiting, abdominal pain (these effects may lessen over time; consult your health care provider if they are too uncomfortable).
- Report persistent or increasing pain, severe diarrhea or vomiting.

▷ dexametomidine hydrochloride

See Appendix U, *Less commonly used drugs*.

▷ dexamethylphenidate hydrochloride

(*decks meth ill fen' i date*)

Focalin, Focalin XR **ORC**

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

CNS stimulant

Therapeutic actions

Mild cortical stimulant with CNS actions similar to those of the amphetamines; is thought to block the reuptake of norepinephrine and dopamine, increasing their concentration in the synaptic cleft; mechanism of effectiveness in hyperkinetic syndromes is not understood.

Indications

- Treatment of ADHD in patients 6 yr and older as part of a total treatment program

Contraindications and cautions

- Contraindicated with hypersensitivity to dexamethylphenidate or methylphenidate; marked anxiety, tension, and agitation; glaucoma; motor tics, family history or diagnosis of Tourette syndrome; use of MAOIs within the past 14 days.
- Use cautiously with psychosis, seizure disorders; heart failure, recent MI, hyperthyroidism; drug dependence, alcoholism, severe depression of endogenous or exogenous origin; as treatment of normal fatigue states; pregnancy, lactation.

Available forms

Tablets—2.5, 5, 10 mg; ER capsules **OND**—5, 10, 15, 20, 30 mg

Dosages

Adults and children 6 yr and older

Individualize dosage. Administer orally twice a day, at least 4 hr apart, without regard to meals. Starting dose, 2.5 mg PO bid; may increase as needed in 2.5- to 5-mg increments to a maximum dose of 10 mg PO bid. ER capsules, initially 5 mg/day for children; increase in 5-mg increments to 20 mg/day; start adults at 10 mg/day; increase in 10-mg increments to 20 mg/day.

- *Patients already on methylphenidate:* Start dose at one-half the methylphenidate dose with a maximum dose of 10 mg PO bid.

Pediatric patients younger than 6 yr
Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–1.5 hr

Metabolism: Hepatic; $T_{1/2}$: 2.2 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Nervousness, insomnia*, dizziness, headache, dyskinesia, chorea, drowsiness, Tourette's syndrome, toxic psychosis, blurred vision, accommodation difficulties
- **CV:** Increased or decreased pulse and blood pressure; *tachycardia*, angina, arrhythmias, palpitations

- **Dermatologic:** Skin rash, loss of scalp hair
- **GI:** *Anorexia, nausea, abdominal pain*; weight loss, abnormal liver function
- **Hematologic:** Leukopenia, anemia
- **Other:** Fever, tolerance, psychological dependence, abnormal behavior with abuse

Interactions

★ **Drug-drug** ☒ **Warning** Risk of severe hypertensive crisis if combined with MAOIs; do not administer dexamethylphenidate with or within 14 days of an MAOI.

- Possible increased serum levels of warfarin, phenobarbital, phenytoin, primidone, TCAs, some SSRIs; if any of these drugs are used with dexamethylphenidate, monitor the patient closely and decrease dose of the other drugs as needed
- Risk of adverse effects if combined with pressor drugs (dopamine, epinephrine) or antihypertensives; monitor patients closely

Nursing considerations

Assessment

- **History:** Hypersensitivity to dexamethylphenidate or methylphenidate; marked anxiety, tension, and agitation; glaucoma; motor tics, family history or diagnosis of Tourette's syndrome; severe depression of endogenous or exogenous origin; seizure disorders; hypertension; drug dependence, alcoholism, emotional instability; pregnancy, lactation
- **Physical:** Body weight, height, T, skin color, lesions, orientation, affect, ophthalmic examination (tonometry), P, BP, auscultation, R, adventitious sounds, bowel sounds, normal output, CBC with differential, platelet count, baseline ECG (as indicated)

Interventions

- Ensure proper diagnosis before administering to children for behavioral syndromes. Drug should not be used until other causes and concomitants of abnormal behavior (learning disability, EEG abnormalities, neurologic deficits) are ruled out.

☒ **Black box warning** Use caution with history of substance dependence or alcoholism; dependence, severe depression, psychotic reactions possible with withdrawal.

- Arrange to interrupt drug dosage periodically in children being treated for behavioral

disorders to determine if symptoms recur at an intensity that warrants continued drug therapy.

- Monitor growth of children on long-term dexmethylphenidate therapy.
- ⊗ **Warning** Arrange to dispense the least feasible amount of drug at any one time to minimize risk of overdose.
- Administer drug before 6 PM to prevent insomnia if that is a problem.
- Ensure that ER capsules are swallowed whole or contents are sprinkled over a spoonful of applesauce and taken immediately.
- Arrange to monitor CBC and platelet counts periodically in patients on long-term therapy.
- Monitor BP frequently early in treatment.
- Arrange for consult with school nurse of school-age patients receiving this drug.

Teaching points

- Take this drug exactly as prescribed. Take immediate-release tablets two times a day, at least 4 hours apart.
- Take immediate-release tablets before 6 PM to avoid nighttime sleep disturbance.
- Take extended-release capsules once a day, in the morning.
- Swallow extended-release capsules whole; do not cut, crush, or chew. Capsules can be opened and contents sprinkled over applesauce and taken immediately.
- This drug is a controlled substance and should be stored securely and safely out of the reach of children.
- Avoid the use of alcohol and over-the-counter drugs, including nose drops and cold remedies, while taking this drug; some over-the-counter drugs could cause dangerous effects. If you feel that you need one of these preparations, consult your health care provider.
- You may experience these side effects: Nervousness, restlessness, dizziness, insomnia, impaired thinking (these effects may become less pronounced after a few days, avoid driving a car or engaging in activities that require alertness if these occur, notify your health care provider if these are pronounced or bothersome); headache, loss of appetite, dry mouth.
- Report nervousness, insomnia, palpitations, vomiting, skin rash, depression, chest pain,

shortness of breath, fainting, marked changes in behavior or vision.

▷ dexpanthenol (dextro-pantothenyl alcohol)

(*dex pan' the nol*)

llopan

PREGNANCY CATEGORY C

Drug class

GI stimulant

Therapeutic actions

Mechanism is unknown; is the alcohol analog of pantothenic acid, a cofactor in the synthesis of the neurotransmitter acetylcholine; acetylcholine is the transmitter released by parasympathetic postganglionic nerves; the parasympathetic nervous system provides stimulation to maintain intestinal function.

Indications

- Prophylactic use immediately after major abdominal surgery to minimize paralytic ileus, intestinal atony causing abdominal distention
- Treatment of intestinal atony causing abdominal distention; postoperative or postpartum retention of flatus; postoperative or postpartum (if not breast-feeding) delay in resumption of intestinal motility; paralytic ileus
- Topical treatment of mild eczema, dermatosis, bee stings, diaper rash, chafing

Contraindications and cautions

- Contraindicated with allergy to dexpanthenol, hemophilia, ileus due to mechanical obstruction.
- Use cautiously in pregnancy, lactation.

Available forms

Injection—250 mg/mL; topical cream—2%

Dosages**Adults****IM**

- **Prevention of postoperative adynamic ileus:** 250–500 mg IM; repeat in 2 hr, then every 6 hr until danger of adynamic ileus has passed.
- **Treatment of adynamic ileus:** 500 mg IM; repeat in 2 hr, then every 6 hr as needed.

IV

500 mg diluted in IV solutions.

Topical

Apply once or twice daily to affected areas.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IM	Rapid	4 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Dilute with bulk solutions of glucose or lactated Ringer's.

Infusion: Infuse slowly over 3–6 hr. Do not administer by direct IV injection.

Adverse effects

- **CV:** Slight drop in BP
- **Dermatologic:** Itching, tingling, red patches of skin, generalized dermatitis, urticaria
- **GI:** Intestinal colic (30 min after administration), nausea, vomiting; diarrhea
- **Respiratory:** Dyspnea

■ Nursing considerations**Assessment**

- **History:** Allergy to dexpanthenol, hemophilia, ileus due to mechanical obstruction, lactation
- **Physical:** Skin color, lesions, texture; P, BP; bowel sounds, normal output

Interventions

- Monitor BP carefully during IV administration.

Teaching points

Teaching about this drug should be incorporated into the overall postoperative or postpartum teaching. Intestinal colic may occur within 30 minutes of administration.

- You may experience these side effects: Nausea, vomiting, diarrhea, itching, rash.
- Report difficulty breathing, severe itching, or rash.

▷ dexrazoxane

See Appendix U, *Less commonly used drugs*.

▷ dextran, high-molecular-weight

(dex' tran)

Dextran 70, Dextran 75,
Gentran 70, Macrodex

PREGNANCY CATEGORY C

Drug class

Plasma volume expander (nonbacteriostatic)

Therapeutic actions

Synthetic polysaccharide used to approximate the colloidal properties of albumin.

Indications

- Adjunctive therapy for treatment of shock or impending shock due to hemorrhage, burns, surgery, or trauma; to be used only in emergency situations when blood or blood products are not available

Contraindications and cautions

- Contraindicated with allergy to dextran (dextran 1 can be used prophylactically in patients known to be allergic to clinical dextran); marked hemostatic defects (risk for increased bleeding effects); severe cardiac congestion; renal failure, anuria, or oliguria.
- Use cautiously in pregnancy and lactation, thrombocytopenia, renal impairment.

Available forms

Injection—6% dextran 75 in 0.9% sodium chloride, 6% dextran 70 in 0.9% sodium

chloride, 6% dextran 75 in 5% dextrose, 6% dextran 70 in 5% dextrose

Dosages

Adults

500–1,000 mL, given at a rate of 20–40 mL/min IV as an emergency procedure. Do not exceed 20 mL/kg the first 24 hr of treatment.

Pediatric patients

Determine dosage by body weight or surface area of the patient. Do not exceed 20 mL/kg IV total dose.

Patients with renal impairment

Decrease dose for creatinine clearance less than 30 mL/min.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Minutes	Minutes	12–24 hr

Metabolism: Hepatic; $T_{1/2}$: 24 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Administer in unit provided. Discard any partially used containers. Do not use unless the solution is clear.

Infusion: Infuse at rate of 20–40 mL/min.

Adverse effects

- **GI:** Nausea, vomiting
- **Hematologic:** *Hypervolemia, coagulation problems*
- **Hypersensitivity:** Urticaria, nasal congestion, wheezing, tightness of chest, mild hypotension (antihistamines may be helpful in relieving these symptoms), anaphylactoid reaction
- **Local:** Infection at injection site, extravasation
- **Other:** Fever, joint pains

Interactions

* **Drug-lab test** • Falsely elevated blood glucose assays • Interference with bilirubin assays in which alcohol is used, with total protein assays using biuret reagent • Blood typing and cross-matching procedures using enzyme tech-

niques may give unreliable readings; draw blood samples before giving infusion of dextran

Nursing considerations

Assessment

- **History:** Allergy to dextran; marked hemostatic defects; severe cardiac congestion; renal failure or anuria; pregnancy
- **Physical:** T; skin color, lesions; P, BP, peripheral edema; R, adventitious sounds; urinalysis, LFTs, renal function tests, clotting times, PT, PTT, Hgb, Hct, urine output

Interventions

- Administer by IV infusion only; monitor rates based on patient response.
- Do not give more than recommended dose.
- Use only clear solutions. Discard partially used containers; solution contains no bacteriostat.
- ⊗ **Warning** Monitor patients carefully for any sign of hypervolemia or the development of heart failure; supportive measures may be needed.

Teaching points

- Report difficulty breathing, rash, unusual bleeding or bruising, pain at IV site.

▷ dextran, low-molecular-weight (dex' tran)

Dextran 40, Gentran 40, 10% LMD, Rheomacrodex

PREGNANCY CATEGORY C

Drug class

Plasma volume expander (nonbacteriostatic)

Therapeutic actions

Synthetic polysaccharide used to approximate the colloidal properties of albumin.

Indications

- Adjunctive therapy for treatment of shock or impending shock due to hemorrhage, burns, surgery, or trauma when blood or blood products are not available

- Priming fluid in pump oxygenators during extracorporeal circulation
- Prophylaxis against DVT and PE in patients undergoing procedures known to be associated with a high incidence of thromboembolic complications, such as hip surgery

Contraindications and cautions

- Contraindicated with allergy to dextran (dextran 1 can be used prophylactically in patients known to be allergic to clinical dextran); marked hemostatic defects; severe cardiac congestion; renal failure, anuria, or oliguria.
- Use cautiously with pregnancy, lactation.

Available forms

Injection—10% *Dextran 40* in 0.9% sodium chloride, 10% *Dextran 40* in 5% dextrose

Dosages

Adults

- *Adjunctive therapy in shock*: Total dosage of 20 mL/kg IV in first 24 hr. The first 10 mL/kg should be infused rapidly, and the remaining dose administered slowly. Beyond 24 hr, total daily dosage should not exceed 10 mL/kg. Do not continue therapy for more than 5 days.
- *Hemodiluent in extracorporeal circulation*: Generally 10–20 mL/kg are added to perfusion circuit. Do not exceed a total dosage of 20 mL/kg.
- *Prophylaxis therapy for DVT, PE*: 500–1,000 mL IV on day of surgery, continue treatment at dose of 500 mL/day for an additional 2–3 days. Thereafter, based on procedure and risk, 500 mL may be administered every second to third day for up to 2 wk.

Pediatric patients

Total dose should not exceed 20 mL/kg.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	Minutes	12 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Protect from freezing. Use in units provided; no further preparation necessary.

Infusion: Administer first 10 mL/kg rapidly, remainder of solution slowly over 8–24 hr, monitoring patient response.

Adverse effects

- **CV:** Hypotension, anaphylactoid shock, *hypervolemia*
- **GI:** Nausea, vomiting
- **Hypersensitivity:** Ranging from mild cutaneous eruptions to generalized urticaria
- **Local:** Infection at site of injection, extravasation, venous thrombosis or phlebitis
- **Other:** Headache, fever, wheezing

Interactions

★ **Drug-lab test** • Falsely elevated blood glucose assays • Interference with bilirubin assays in which alcohol is used, with total protein assays using biuret reagent • Blood typing and cross-matching procedures using enzyme techniques may give unreliable readings; draw blood samples before giving infusion of dextran

Nursing considerations

Assessment

- **History:** Allergy to dextran; marked hemostatic defects; severe cardiac congestion; renal failure or anuria; lactation, pregnancy
- **Physical:** T; skin color, lesions; P, BP, peripheral edema; R, adventitious sounds; urinalysis, LFTs, renal function tests, clotting times, PT, PTT, Hgb, Hct, urine output

Interventions

- Administer by IV infusion only; monitor rates based on patient response. Do not administer more than recommended dose.
- Monitor urinary output carefully; if no increase in output is noted after 500 mL of dextran, discontinue drug until diuresis can be induced by other means.

⊗ **Warning** Monitor patient for hypervolemia or development of heart failure; slow rate or discontinue drug if rapid CVP increase occurs.

Teaching points

- Report difficulty breathing, rash, unusual bleeding or bruising, pain at IV site.

dextroamphetamine sulfate

(*dex troe am fet' a meen*)

Dexedrine Spansule ,
DextroStat

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug classes

Amphetamine
CNS stimulant

Therapeutic actions

Acts in the CNS to release norepinephrine from nerve terminals; in higher doses also releases dopamine; suppresses appetite; increases alertness, elevates mood; often improves physical performance, especially when fatigue and sleep deprivation have caused impairment; efficacy in hyperkinetic syndrome, ADHD in children appears paradoxical and is not understood.

Indications

- Narcolepsy
- Adjunct therapy for abnormal behavioral syndrome in children (ADHD, hyperkinetic syndrome) that includes psychological, social, educational measures
- **NEW INDICATION:** Unlabeled uses: Cocaine-dependence treatment, autism, traumatic brain injury

Contraindications and cautions

- Contraindicated with hypersensitivity to sympathomimetic amines, tartrazine (*Dextro-Stat*); advanced arteriosclerosis, symptomatic CV disease, moderate to severe hypertension, hyperthyroidism, glaucoma, agitated states.
- Use cautiously with history of drug abuse; pregnancy; lactation.

Available forms

Tablets—5, 10 mg; ER capsules —5, 10, 15 mg

Dosages

Adults

- **Narcolepsy:** Start with 10 mg/day PO in divided doses; increase in increments of 10 mg/day at weekly intervals. If insomnia or anorexia occurs, reduce dose. Usual dosage is 5–60 mg/day PO in divided doses. Give first dose on awakening, additional doses (one or two) every 4–6 hr; long-acting forms can be given once a day.

Pediatric patients

- **Narcolepsy:**
6–12 yr: Condition is rare in children younger than 12 yr; when it does occur, initial dose is 5 mg/day PO. Increase in increments of 5 mg at weekly intervals until optimal response is obtained.
12 yr and older: Use adult dosage.
- **ADHD:**
Younger than 3 yr: Not recommended.
3–5 yr: 2.5 mg/day PO. Increase in increments of 2.5 mg/day at weekly intervals until optimal response is obtained.
6 yr and older: 5 mg PO daily–bid. Increase in increments of 5 mg/day at weekly intervals until optimal response is obtained. Dosage will rarely exceed 40 mg/day. Give first dose on awakening, additional doses (one or two) every 4–6 hr. Long-acting forms may be used once a day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	1–5 hr	8–10 hr

Metabolism: Hepatic; $T_{1/2}$: 12 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Overstimulation, restlessness, dizziness, insomnia, dyskinesia, euphoria, dysphoria, tremor, headache, psychotic episodes*
- **CV:** *Palpitations, tachycardia, hypertension*
- **Dermatologic:** Urticaria
- **Endocrine:** Reversible elevations in serum thyroxine with heavy use
- **GI:** *Dry mouth, unpleasant taste, diarrhea, constipation, anorexia and weight loss*

- **GU:** Impotence, changes in libido
- **Other:** Tolerance, psychological dependence, social disability with abuse

Interactions

• *** Drug-drug** ☒ **Warning** Hypertensive crisis and increased CNS effects if given within 14 days of MAOIs; do not give dextroamphetamine to patients who are taking or who have recently taken MAOIs.

- Decreased duration of effects if taken with urinary alkalinizers (acetazolamide, sodium bicarbonate), furazolidone
- Decreased effects if taken with urinary acidifiers
- Decreased efficacy of antihypertensive drugs given with amphetamines

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to sympathomimetic amines, tartrazine; advanced arteriosclerosis, symptomatic CV disease, moderate to severe hypertension, hyperthyroidism, glaucoma, agitated states, history of drug abuse; lactation, pregnancy, use of MAOI in the last 14 days
- **Physical:** Weight; T; skin color, lesions; orientation, affect, ophthalmic examination (tonometry); P, BP, auscultation; R, adventitious sounds; bowel sounds, normal output; thyroid function tests, blood and urine glucose, baseline ECG

Interventions

- Ensure proper diagnosis before administering to children for behavioral syndromes: Drug should not be used until other causes (learning disability, EEG abnormalities, neurologic deficits) are ruled out.

☒ **Black box warning** Be aware that drug has a high abuse potential; avoid prolonged use, and prescribe sparingly.

☒ **Black box warning** Misuse may cause sudden death or serious CV events; increased risk with heart problems or structural heart anomalies.

- Interrupt drug dosage periodically in children being treated for behavioral disorders to determine if symptomatic response still validates drug therapy.
- Monitor growth of children on long-term amphetamine therapy.

- Dispense the lowest feasible dose to minimize risk of overdosage; drug should be stored in a light-resistant container.
- Ensure that patient swallows ER capsules whole; do not cut, crush, or allow patient to chew them.
- Give drug early in the day to prevent insomnia.
- Monitor BP frequently early in therapy.

Teaching points

- Take this drug exactly as prescribed. Do not increase the dosage without consulting your health care provider. If the drug appears ineffective, consult your health care provider.
- Do not crush or chew extended-release or long-acting capsules.
- Take drug (especially sustained-release forms) early in the day to avoid insomnia.
- This drug is a controlled substance; store it in a secure location and safely out of the reach of children.
- Avoid pregnancy while taking this drug. This drug can cause harm to the fetus.
- You may experience these side effects: Nervousness, restlessness, dizziness, insomnia, impaired thinking (may diminish in a few days; avoid driving or engaging in activities that require alertness); headache, loss of appetite, dry mouth.
- Report nervousness, insomnia, dizziness, palpitations, anorexia, GI disturbances.

▷ dextromethorphan hydrobromide

(*dex troe meth or' fan*)

Aerotuss 12, Balminil DM (CAN), Buckley's Cough Mixture, Creomulsion, Creo-Terpin, Delsym, DexAlone, Hold DM, Koffex (CAN), Novahistex DM (CAN), PediaCare Infants Long-Acting Cough, Robitussin Childrens (CAN), Robitussin CoughGels, Theraflu Thin Strips Long-Acting Cough, Triaminic Thin Strips Long-Acting Cough, Trocal, Vicks 44 Cough Relief

PREGNANCY CATEGORY C

Drug class

Nonopioid antitussive

Therapeutic actions

Lacks analgesic and addictive properties; controls cough spasms by depressing the cough center in the medulla; analogue of codeine.

Indications

- Control of nonproductive cough

Contraindications and cautions

- Contraindicated with hypersensitivity to any component (check label of products for flavorings, vehicles); sensitivity to bromides; cough that persists for more than 1 wk, tends to recur, is accompanied by excessive secretions, high fever, rash, nausea, vomiting, or persistent headache (dextromethorphan should not be used; patient should consult a physician).
- Use cautiously with lactation, pregnancy.

Available forms

Gelcaps—15, 30 mg; lozenges—7.5, 10 mg; liquid—5 mg/5 mL, 10 mg/15 mL, 15 mg/5 mL, 30 mg/5 mL; syrup—5 mg/5 mL, 7.5 mg/5 mL, 10 mg/5 mL, 20 mg/5 mL; sustained-action liquid—30 mg/5 mL; oral disintegrating strips—7.5, 15 mg; freezer pops—7.5 mg/pop

Dosages**Adults and children 12 yr and older****Gelcaps**

30 mg every 6–8 hr. Do not exceed 120 mg/day.

Lozenges

5–15 mg every 1–4 hr up to 120 mg/day.

Liquid, syrup, strips

10–20 mg every 4 hr or 30 mg every 6–8 hr up to 120 mg/day.

ER suspension

60 mg every 12 hr up to 120 mg/day.

Pediatric patients (6–11 yr)**Lozenges**

5–10 mg every 1–4 hr up to 60 mg/day. Do not give to children younger than 6 yr unless directed by a physician.

Liquid, syrup, strips

15 mg every 6–8 hr up to 60 mg/day.

Freezer pop

2 pops every 6–8 hr.

Pediatric patients (2–6 yr)**Liquid, syrup, strips**

7.5 mg every 6–8 hr up to 30 mg/day.

Freezer pop

1 pop every 6–8 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	2 hr	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr**Distribution:** May cross placenta; enters breast milk**Excretion:** Urine**Adverse effects**

- **Respiratory:** Respiratory depression (with overdose)

Interactions

★ **Drug-drug** • Concomitant MAOI use may cause hypotension, fever, nausea, myoclonic jerks, and coma; avoid this combination

■ Nursing considerations Assessment

- **History:** Hypersensitivity to any component; sensitivity to bromides; cough that persists for more than 1 wk or is accompanied by excessive secretions, high fever, rash, nausea, vomiting, or persistent headache; lactation, pregnancy
- **Physical:** T, R, adventitious sounds

Interventions

- Ensure drug is used only as recommended. Coughs may be symptomatic of a serious underlying disorder that should be diagnosed and properly treated; drug may mask symptoms of serious disease.

Teaching points

- Take this drug exactly as prescribed. Do not take more than recommended or for longer than recommended.
- Be cautious when using over-the-counter products; may contain the same ingredients and overdose can occur.

- Report continued or recurring cough, cough accompanied by fever, rash, persistent headache, nausea, vomiting.

▷ diazepam

(dye az' e pam)

Apo-Diazepam (CAN), Diastat AcuDial, Diazemuls (CAN), Diazepam Intensol, Valium

PREGNANCY CATEGORY D

CONTROLLED SUBSTANCE C-IV

Drug classes

Antiepileptic
Anxiolytic
Benzodiazepine
Skeletal muscle relaxant (centrally acting)

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at the limbic system and reticular formation; may act in spinal cord and at supraspinal sites to produce skeletal muscle relaxation; potentiates the effects of GABA, an inhibitory neurotransmitter; anxiolytic effects occur at doses well below those necessary to cause sedation, ataxia; has little effect on cortical function.

Indications

- Management of anxiety disorders or for short-term relief of symptoms of anxiety
- Acute alcohol withdrawal; may be useful in symptomatic relief of acute agitation, tremor, delirium tremens, hallucinosis
- Muscle relaxant: Adjunct for relief of reflex skeletal muscle spasm due to local pathology (inflammation of muscles or joints) or secondary to trauma; spasticity caused by upper motoneuron disorders (cerebral palsy and paraplegia); athetosis, stiff-man syndrome
- Parenteral: Treatment of tetanus
- Antiepileptic: Adjunct in status epilepticus and severe recurrent convulsive seizures (parenteral); adjunct in seizure disorders (oral)
- Preoperative (parenteral): Relief of anxiety and tension and to lessen recall in patients prior to surgical procedures, cardioversion, and endoscopic procedures

- Rectal: Management of selected, refractory patients with epilepsy who require intermittent use to control bouts of increased seizure activity
- Unlabeled use: Treatment of night terrors

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines; psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication; pregnancy (cleft lip or palate, inguinal hernia, cardiac defects, microcephaly, pyloric stenosis when used in first trimester; neonatal withdrawal syndrome reported in newborns); lactation.
- Use cautiously with elderly or debilitated patients; impaired liver or renal function; and in patients with history of substance abuse.

Available forms

Tablets—2, 5, 10 mg; oral solution—1 mg/mL, 5 mg/mL; rectal pediatric gel—2.5, 5, 10 mg; injection—5 mg/mL

Dosages

Individualize dosage; increase dosage cautiously to avoid adverse effects.

Adults

Oral

- *Anxiety disorders, skeletal muscle spasm, seizure disorders:* 2–10 mg bid–qid.
- *Alcohol withdrawal:* 10 mg tid–qid first 24 hr; reduce to 5 mg tid–qid, as needed.

Rectal

0.2 mg/kg; treat no more than one episode every 5 days. May give a second dose in 4–12 hr.

Parenteral

Usual dose is 2–20 mg IM or IV. Larger doses may be required for some indications (tetanus). Injection may be repeated in 1 hr.

- *Anxiety:* 2–10 mg IM or IV; repeat in 3–4 hr if necessary.
- *Alcohol withdrawal:* 10 mg IM or IV initially, then 5–10 mg in 3–4 hr if necessary.
- *Endoscopic procedures:* 10 mg or less, up to 20 mg IV just before procedure or 5–10 mg IM 30 min prior to procedure. Reduce or omit dosage of opioids.
- *Muscle spasm:* 5–10 mg IM or IV initially, then 5–10 mg in 3–4 hr if necessary.
- *Status epilepticus:* 5–10 mg, preferably by slow IV. May repeat every 5–10 min up to

total dose of 30 mg. If necessary, repeat therapy in 2–4 hr; other drugs are preferable for long-term control.

- *Preoperative*: 10 mg IM.
- *Cardioversion*: 5–15 mg IV 5–10 min before procedure.

Pediatric patients

Oral

Older than 6 mo: 1–2.5 mg PO tid–qid initially. Gradually increase as needed and tolerated. Can be given rectally if needed.

Rectal

Younger than 2 yr: Not recommended.

2–5 yr: 0.5 mg/kg.

6–11 yr: 0.3 mg/kg.

Older than 12 yr: 0.2 mg/kg; may give a second dose in 4–12 hr.

Parenteral

Maximum dose of 0.25 mg/kg IV administered over 3 min; may repeat after 15–30 min. If no relief of symptoms after three doses, adjunctive therapy is recommended.

- *Tetanus (older than 1 mo)*: 1–2 mg IM or IV slowly every 3–4 hr as necessary.
- *Tetanus (5 yr and older)*: 5–10 mg IV every 3–4 hr.
- *Status epilepticus (older than 1 mo–younger than 5 yr)*: 0.2–0.5 mg slowly IV every 2–5 min up to a maximum of 5 mg.
- *Status epilepticus (5 yr and older)*: 1 mg IV every 2–5 min up to a maximum of 10 mg; repeat in 2–4 hr if necessary.

Geriatric patients or patients with debilitating disease

2–2.5 mg PO daily–bid or 2–5 mg parenteral initially; reduce rectal dose. Gradually increase as needed and tolerated; use cautiously.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	1–2 hr	3 hr
IM	15–30 min	30–45 min	3 hr
IV	1–5 min	30 min	15–60 min
Rectal	Rapid	1.5 hr	3 hr

Metabolism: Hepatic; $T_{1/2}$: 20–80 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Do not mix with other solutions; do not mix in plastic bags or tubing.

Infusion: Inject slowly into large vein, 1 mL/min at most; for children, give over at least 3 min; do not inject intra-arterially; if injected into IV tubing, inject as close to vein insertion site as possible.

Incompatibilities: Do not mix with other solutions; do not mix with any other drugs.

Y-site incompatibilities: Atracurium, heparin, foscarnet, pancuronium, potassium, vecuronium.

Adverse effects

- **CNS**: *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment, visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion*
- **CV**: *Bradycardia, tachycardia, CV collapse, hypertension and hypotension, palpitations, edema*
- **Dependence**: *Drug dependence with withdrawal syndrome* when drug is discontinued (common with abrupt discontinuation of higher dosage used for longer than 4 mo); IV diazepam: 1.7% incidence of fatalities; oral benzodiazepines ingested alone; no well-documented fatal overdoses
- **Dermatologic**: *Urticaria, pruritus, skin rash, dermatitis*
- **GI**: *Constipation; diarrhea, dry mouth; salivation; nausea; anorexia; vomiting; difficulty in swallowing; gastric disorders; elevations of blood enzymes—LDH, alkaline phosphatase, AST, ALT; hepatic impairment; jaundice*
- **GU**: *Incontinence, urinary retention, changes in libido, menstrual irregularities*
- **Hematologic**: *Decreased Hct, blood dyscrasias*
- **Other**: *Phlebitis and thrombosis at IV injection sites, hiccups, fever, diaphoresis,*

paresthesias, muscular disturbances, gynecomastia; pain, burning, and redness after IM injection

Interactions

• *** Drug-drug** • Increased CNS depression with alcohol, omeprazole • Increased pharmacologic effects of diazepam if combined with cimetidine, disulfiram, hormonal contraceptives • Decreased effects of diazepam with theophyllines, ranitidine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication; elderly or debilitated patients; impaired liver or renal function; pregnancy, lactation
- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes, sensory nerve function, ophthalmologic examination; P, BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; normal output; LFTs, renal function tests, CBC

Interventions

⊗ **Warning** Do not administer intrarterially; may produce arteriospasm, gangrene.

- Change from IV therapy to oral therapy as soon as possible.
- Do not use small veins (dorsum of hand or wrist) for IV injection.
- Reduce dose of opioid analgesics with IV diazepam; dose should be reduced by at least one-third or eliminated.
- Carefully monitor P, BP, respiration during IV administration.

⊗ **Warning** Maintain patients receiving parenteral benzodiazepines in bed for 3 hr; do not permit ambulatory patients to operate a vehicle following an injection.

- Monitor EEG in patients treated for status epilepticus; seizures may recur after initial control, presumably because of short duration of drug effect.
- Monitor liver and renal function, CBC during long-term therapy.
- Taper dosage gradually after long-term therapy, especially in epileptic patients.

- Arrange for epileptic patients to wear medical alert ID indicating that they are epileptics taking this medication.
- Discuss risk of fetal abnormalities with patients desiring to become pregnant.

Teaching points

- Take this drug exactly as prescribed. Do not stop taking this drug (long-term therapy, antiepileptic therapy) without consulting your health care provider.
- Caregiver should learn to assess seizures, administer rectal form, and monitor patient.
- Use of barrier contraceptives is advised while on this drug; if you become or wish to become pregnant, consult your health care provider.
- It is advisable to wear a medical alert ID indicating your diagnosis and treatment (as antiepileptic).
- You may experience these side effects: Drowsiness, dizziness (may lessen; avoid driving or engaging in other dangerous activities); GI upset (take drug with food); dreams, difficulty concentrating, fatigue, nervousness, crying (reversible).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of the ankles, visual or hearing disturbances, difficulty voiding.

▷ diazoxide

(di az ok' side)

Proglycem

PREGNANCY CATEGORY C

Drug classes

Glucose-elevating drug

Therapeutic actions

Increases blood glucose by decreasing insulin release and decreasing glucose.

Indications

- Management of hypoglycemia due to hyperinsulinism in infants and children and to inoperable pancreatic islet cell malignancies

Contraindications and cautions

- Contraindicated with allergy to thiazides or other sulfonamide derivatives; pregnancy, lactation, functional hypoglycemia.
- Use extreme caution with decreased cardiac reserve, decreased renal function, gout, or hyperuricemia.

Available forms

Capsules—50 mg; oral suspension—50 mg/mL

Dosages**Adults**

3–8 mg/kg/day PO in two to three divided doses every 8–12 hr. Starting dose, 3 mg/kg/day in three equal doses every 8 hr.

Pediatric patients

Infants and newborns: 8–15 mg/kg/day PO in two to three doses every 8–12 hr. Starting dose, 10 mg/kg/day in three equal doses every 8 hr.

Children: 3–8 mg/kg/day PO in two to three doses every 8–12 hr. Starting dose, 3 mg/kg/day in three equal doses every 8 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	8 hr	N/A

Metabolism: Hepatic; $T_{1/2}$: 21–45 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Anxiety, dizziness, extrapyramidal symptoms, headache, hearing loss, blurred vision, apprehension
- **CV:** *Hypotension* (managed by Trendelenburg position or sympathomimetics), *heart failure secondary to fluid and sodium retention*
- **Dermatologic:** Hirsutism, rash
- **GI:** *Nausea, vomiting*, anorexia, constipation, diarrhea, elevated liver enzymes
- **GU:** Renal toxicity, azotemia, reversible nephrotic syndrome
- **Hematologic:** **Thrombocytopenia**, decreased Hgb, decreased Hct

- **Metabolic:** Hyperglycemia, glycosuria, ketoacidosis, nonketotic hyperosmolar coma, hyperuricemia
- **Respiratory:** Dyspnea, choking sensation
- **Other:** Gout, advanced bone age

Interactions

- **Drug-drug** • Increased therapeutic and toxic effects of diazoxide if taken concurrently with thiazides • Increased risk of hyperglycemia if taken concurrently with chlorpropamide, glipizide, glyburide, tolazamide, tolbutamide
- Decreased serum levels and effectiveness of hydantoins taken concurrently with diazoxide
- **Drug-lab test** • Hyperglycemic and hyperuricemic effects of diazoxide prevent testing for disorders of glucose and xanthine metabolism • False-negative insulin response to glucagon

Nursing considerations
Assessment

- **History:** Allergy to thiazides or other sulfonamide derivatives; pregnancy; lactation; functional hypoglycemia, decreased cardiac reserve, decreased renal function, gout or hyperuricemia
- **Physical:** Body weight, skin integrity, swelling or limited motion in joints, earlobes; P, BP, edema, peripheral perfusion; R, pattern, adventitious sounds; intake and output; CBC, blood glucose, serum electrolytes and uric acid, urinalysis, urine glucose and ketones, LFTs, renal function tests

Interventions

- Monitor intake and output and weigh patient daily at the same time to check for fluid retention.
- Check urine or serum glucose and ketones daily.
- **⊗ Warning** Have insulin and oral hypoglycemic agents readily available in case hyperglycemic reaction occurs.
- Decrease dose in renal disease.
- Protect oral drug suspensions from light.
- Reassure patient that hirsutism will resolve when drug is discontinued.

Teaching points

- Check urine or blood daily for glucose and ketones; report elevated levels.
- Weigh yourself daily at the same time and with the same clothes, and record the results.
- Excessive hair growth may appear on your forehead, back, or limbs; growth will end after drug is stopped.
- Report weight gain of more than 5 pounds in 2–3 days, increased thirst, nausea, vomiting, confusion, fruity odor on breath, abdominal pain, swelling of extremities, difficulty breathing, bruising, bleeding.

PREGNANCY CATEGORY C

(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D

(THIRD TRIMESTER)

Drug classes

Analgesic (nonopioid)
Anti-inflammatory
Antipyretic
NSAID

Therapeutic actions

Inhibits prostaglandin synthetase to cause antipyretic and anti-inflammatory effects; the exact mechanism is unknown.

Indications

- Acute or long-term treatment of mild to moderate pain, including dysmenorrhea
- Rheumatoid arthritis
- Acute treatment of migraine headache with or without aura (*Cambia*)
- Osteoarthritis
- Ankylosing spondylitis
- Treatment of actinic keratosis in conjunction with sun avoidance (topical only)
- Topical treatment of acute pain due to minor strains, sprains, contusions (*Flector*)
- Ophthalmic: Postoperative inflammation from cataract extraction

Contraindications and cautions

- Contraindicated with allergy to NSAIDs, significant renal impairment, pregnancy, lactation.
- Use cautiously with impaired hearing, allergies, hepatic, CV, GI conditions, and in elderly patients.

Available forms

Tablets—50 mg; DR tablets **ONC**—25, 50, 75 mg; ER tablets **ONC**—100 mg; liquid-filled capsules—25 mg; packet for oral solution—50 mg; topical gel—1%, 3%; topical solution—1.5%; ophthalmic solution—0.1%; transdermal patch—180 mg

Dosages

Adults

Oral

- *Pain, including dysmenorrhea*: 50 mg tid PO; initial dose of 100 mg may help some patients (*Cataflam*).
- *Osteoarthritis*: 100–150 mg/day PO in divided doses (*Voltaren*); 50 mg bid–tid PO (*Cataflam*).
- *Rheumatoid arthritis*: 150–200 mg/day PO in divided doses (*Voltaren*); 50 mg bid–tid PO (*Cataflam*).
- *Ankylosing spondylitis*: 100–125 mg/day PO. Give as 25 mg qid, with an extra 25-mg dose at bedtime (*Voltaren*); 25 mg qid PO with an additional 25 mg at bedtime if needed (*Cataflam*).
- *Acute migraine*: 50-mg packet mixed in 30–60 mL water as single dose at onset of headache (*Cambia*).

- *Treatment of mild to moderate pain:* 25 mg liquid-filled capsule PO qid (*Zipsor*). *Not interchangeable with other forms of diclofenac.*

Topical

- *Actinic keratosis:* Cover lesion with gel and smooth into skin; do not cover with dressings or cosmetics (*Solaraze*).
- *Osteoarthritis:* Upper extremities, apply gel (2 g) to affected area qid; lower extremities, apply gel (4 g) to affected area qid (*Voltaren*).

Transdermal patch

1 patch applied to most painful area bid. Use lowest effective dose for shortest time; do not apply to damaged or broken skin (*Flector*).

Ophthalmic

1 drop to affected eye qid starting 24 hr after surgery for 2 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral (sodium)	Varies	2–3 hr	12–15 hr
Oral (potassium)	Rapid	20–120 min	12–15 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness*, somnolence, insomnia, fatigue, tiredness, tinnitus, ophthalmic effects
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, *constipation*, flatulence, GI bleed
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses
- **Other:** Peripheral edema, **anaphylactoid reactions to fatal anaphylactic shock**

Interactions

- * **Drug-drug** • Increased serum levels and increased risk of lithium toxicity • Increased

risk of bleeding with anticoagulants; monitor patient closely

Nursing considerations

Assessment

- **History:** Renal impairment; impaired hearing; allergies; hepatic, CV, and GI conditions; lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, renal function tests, LFTs; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleed, renal insufficiency; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs. Ensure that patient does not cut, crush, or chew ER or DR tablets. Mix packets for oral suspension in 30–60 mL water.
- Ensure that correct topical gel is being used for indication being treated; gels are not interchangeable.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** Institute emergency procedures if overdose occurs (gastric lavage, induction of emesis, supportive therapy).

⊗ **Warning** Liquid-filled capsules (*Zipsor*) are not interchangeable with other forms of diclofenac.

Teaching points

- Take drug with food or meals if GI upset occurs. Do not cut, crush, or chew delayed-release or extended-release tablets.
- Apply topical gel as indicated; avoid sun exposure and sun lamps.
- Apply transdermal patch to intact skin. Remove old patch before applying new one.
- Mix packets for oral solution in 30 to 60 mL water. Take at first sign of a migraine.
- Take only the prescribed dosage.
- You may experience these side effects: Dizziness or drowsiness (avoid driving or using dangerous machinery while using this drug).

- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision; black, tarry stools.

dicyclomine hydrochloride

(*dye sye' kloe meen*)

Bentyl, Bentytol (CAN), Byclomine, Dibent, Dilomine, Or-Tyl

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Antimuscarinic
Antispasmodic
Parasympatholytic

Therapeutic actions

Direct GI smooth muscle relaxant; competitively blocks the effects of acetylcholine at muscarinic cholinergic receptors that mediate the effects of parasympathetic postganglionic impulses, thus relaxing the GI tract.

Indications

- Treatment of functional bowel or IBS (irritable colon, spastic colon, mucous colitis)

Contraindications and cautions

- Contraindicated with glaucoma; adhesions between iris and lens, stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, bronchial asthma, COPD, cardiac arrhythmias, tachycardia, myocardial ischemia; impaired metabolic, liver, or renal function, myasthenia gravis; lactation, pregnancy.
- Use cautiously with Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism.

Available forms

Capsules—10, 20 mg; tablets—20 mg; syrup—10 mg/5 mL; injection—10 mg/mL

Dosages

Adults

Oral

The only effective dose is 160 mg/day PO divided into four equal doses; however, begin with 80 mg/day divided into four equal doses; increase to 160 mg/day unless side effects limit dosage.

Parenteral

80 mg/day IM in four divided doses; do not give IV.

Pediatric patients

Not recommended.

Geriatric patients

Use caution; more prone to side effects.

Pharmacokinetics

Route	Onset	Duration
Oral	1–2 hr	4 hr

Metabolism: Hepatic; $T_{1/2}$: 9–10 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Blurred vision*, mydriasis, cycloplegia, photophobia, increased IOP
- **CV:** Palpitations, tachycardia
- **GI:** *Dry mouth*, *altered taste perception*, *nausea*, *vomiting*, *dysphagia*, heartburn, constipation, bloated feeling, paralytic ileus, gastroesophageal reflux
- **GU:** *Urinary hesitancy and retention*, impotence
- **Local:** *Irritation at site of IM injection*
- **Other:** Decreased sweating and predisposition to heat prostration, suppression of lactation

Interactions

★ **Drug-drug** • Decreased effectiveness of all antipsychotic medications when used in combination with dicyclomine • Increased anticholinergic effects when administered with TCAs, amantadine • Possible increased effect of atenolol and digoxin

■ Nursing considerations

Assessment

- **History:** Glaucoma; adhesions between iris and lens, stenosing peptic ulcer, pyloroduo-

denal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, bronchial asthma, COPD, cardiac arrhythmias, myocardial ischemia; impaired metabolic, liver, or renal function, myasthenia gravis; Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism; lactation, pregnancy

- **Physical:** Bowel sounds, normal output; normal urinary output, prostate palpation; R, adventitious sounds; pulse, BP; IOP, vision; bilateral grip strength, reflexes; liver palpation, LFTs, renal function tests; skin color, lesions, texture

Interventions

- IM use is temporary; switch to oral form as soon as feasible.
- Ensure adequate hydration; control environmental temperature to prevent hyperpyrexia.
- Have patient void before each drug dose if urinary retention is a problem.
- Monitor lighting to minimize discomfort of photophobia.
- Do not give IV.

Teaching points

- Take drug exactly as prescribed.
- Avoid hot environments while taking this drug (heat intolerance may lead to dangerous reactions).
- You may experience these side effects: Constipation (ensure adequate fluid intake, proper diet); dry mouth (sugarless lozenges, frequent mouth care may help; may lessen with time); blurred vision, sensitivity to light (transient effects; avoid tasks that require acute vision; wear sunglasses); impotence (reversible); difficulty in urination (empty bladder immediately before taking drug).
- Report rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, palpitations, headache, abdominal distention, hallucinations, severe or persistent dry mouth, difficulty swallowing, difficulty in urination, severe constipation, sensitivity to light.

▽ didanosine (ddl, dideoxyinosine)

(*dye dan' oh seen*)

Videx, Videx EC ONC

PREGNANCY CATEGORY B

Drug class

Antiviral

Therapeutic actions

A synthetic nucleoside that inhibits replication of HIV, leading to viral death.

Indications

- Treatment of patients with HIV infection in combination with other antiretroviral drugs

Contraindications and cautions

- Contraindicated with allergy to any component of the formulation, lactation.
- Use cautiously with impaired hepatic or renal function; history of alcohol abuse; pregnancy.

Available forms

DR capsules ONC—125, 200, 250, 400 mg; powder for oral solution—2, 4 g

Dosages

Adults

DR capsules

- 60 kg or greater: 400 mg/day PO.
- 25–60 kg: 250 mg/day PO.
- 20–25 kg: 200 mg/day PO.

Powder for oral solution

- 60 kg or greater: 200 mg PO bid or 400 mg/day PO.
- Less than 60 kg: 125 mg PO bid or 250 mg/day PO.

Pediatric patients

Older than 8 mo: 120 mg/m² bid using buffered formulation or pediatric powder.

2 wk–8 mo: 100 mg/m² bid.

DR capsule can be used following adult dosage, based on weight.

Patients with renal impairment

For creatinine clearance of 60 mL/min or more, usual dose. For creatinine clearance of

30–59 mL/min, 125–200 mg/day or 75 mg PO bid or 150 mg suspension/day PO. For creatinine clearance of 10–29 mL/min, 100–150 mg/day or 100 mg/day PO oral suspension. For creatinine clearance less than 10 mL/min, 75–100 mg/day or 75 mg/day PO oral suspension.

Pharmacokinetics

Route	Peak	Onset
Oral	15–90 min	Varies

Metabolism: Hepatic; $T_{1/2}$: 1.6 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, pain, anxiety, confusion, nervousness, twitching, depression, peripheral neuropathy
- **Dermatologic:** Rash, pruritus
- **GI:** *Nausea, vomiting, hepatotoxicity, abdominal pain, diarrhea, pancreatitis, stomatitis, oral thrush, melena, dry mouth, elevated bilirubin*
- **Hematologic:** *Hemopoietic depression*
- **Other:** Chills, fever, infections, dyspnea, myopathy, elevated uric acid, **lactic acidosis**

Interactions

- *** Drug-drug** • Decreased effectiveness of tetracycline, fluoroquinolone antibiotics • Increased effect of *Videx* when combined with allopurinol • Changed concentrations for either drug when combined with ganciclovir • Decreased effect of *Videx* when combined with methadone • Decreased effect of azole antifungals
- *** Drug-food** • Decreased absorption and effectiveness of didanosine if taken with food

■ Nursing considerations

Assessment

- **History:** Allergy to any components of formulation, impaired hepatic or renal function, lactation, history of alcohol abuse, pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, reflexes, muscle strength, affect; abdominal examination; CBC, pancreatic enzymes, LFTs, renal function tests

Interventions

- Arrange for lab tests (CBC, SMA-12) before and frequently during therapy; monitor for bone marrow depression.
- Administer drug on an empty stomach, 1 hr before or 2 hr after meals.
- Ensure patient swallows *Videx EC* whole; do not cut, crush, or chew.

⊗ **Black box warning** Monitor patient for signs of pancreatitis—abdominal pain, elevated enzymes, nausea, vomiting. Stop drug, resume only if pancreatitis has been ruled out.

⊗ **Black box warning** Monitor patients with hepatic impairment; decreased doses may be needed if toxicity occurs. Fatal liver toxicity with lactic acidosis has been reported. Non-cirrhotic portal hypertension, sometimes fatal, has occurred.

Teaching points

- Take drug on an empty stomach, 1 hour before or 2 hours after meals.
- Pediatric solution should be reconstituted by the pharmacy. Shake admixture thoroughly. Store tightly closed in the refrigerator. If taking a delayed-release capsule, it must be swallowed whole; do not cut, crush, or chew it.
- Have regular blood tests and physical examinations to monitor drug's effects and progress of disease.
- You may experience these side effects: Loss of appetite, nausea, vomiting (frequent mouth care, frequent small meals may help); rash; chills, fever; headache.
- Report abdominal pain, nausea, vomiting, cough, sore throat, change in color of urine or stools.

 **diflunisal** OTC

(*dye floo' ni sal*)

Apo-Diflunisal (CAN) OTC

PREGNANCY CATEGORY C

Drug classes

Analgesic (nonopioid)
Anti-inflammatory
Antipyretic
NSAID

Therapeutic actions

Exact mechanism of action not known: Inhibition of prostaglandin synthetase, the enzyme that breaks down prostaglandins, may account for its antipyretic and anti-inflammatory effects.

Indications

- Acute or long-term treatment of mild to moderate pain
- Rheumatoid arthritis
- Osteoarthritis

Contraindications and cautions

- Contraindicated with allergy to diflunisal, salicylates or other NSAIDs; with pregnancy, lactation; for treatment of perioperative pain following coronary artery bypass graft (CABG) surgery.
- Use cautiously with CV dysfunction, peptic ulceration, GI bleeding, impaired hepatic or renal function, and in elderly patients.

Available forms

Tablets —500 mg

Dosages

Adults

- *Mild to moderate pain:* 1,000 mg PO initially, followed by 500 mg every 8–12 hr PO.
- *Osteoarthritis or rheumatoid arthritis:* 500–1,000 mg/day PO in two divided doses; maintenance dosage should not exceed 1,500 mg/day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2–3 hr	12 hr

Metabolism: Hepatic; $T_{1/2}$: 8–12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects

- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, constipation, flatulence
- **GU:** Dysuria, renal impairment
- **Hematologic:** Bleeding, platelet inhibition with higher doses
- **Other:** Peripheral edema, **anaphylactoid reactions to anaphylactic shock**

Interactions

- **Drug-drug** • Decreased absorption with antacids (especially aluminum salts) • Decreased serum diflunisal levels with multiple doses of aspirin • Possible increased acetaminophen levels if combined

Nursing considerations

Assessment

- **History:** Allergy to diflunisal, salicylates or other NSAIDs, CV dysfunction, peptic ulceration, GI bleeding, impaired hepatic or renal function, lactation, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, ophthalmologic evaluation; P, BP, edema; R, adventitious sounds; liver evaluation, bowel sounds; CBC, clotting times, urinalysis, LFTs, renal function tests

Interventions

 **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor accordingly.

- Give drug with food or after meals if GI upset occurs.
- Do not crush, and ensure that patient does not chew tablets.

 **Warning** Institute emergency procedures if overdose occurs—gastric lavage, induction of emesis, supportive therapy.

 **Black box warning** Do not use drug to treat perioperative pain following CABG surgery.

- Arrange for ophthalmologic examination if patient offers any eye complaints.

Teaching points

- Take the drug only as recommended to avoid overdose.

- Take the drug with food or after meals if GI upset occurs. Swallow the tablet whole; do not cut, chew, or crush it.
- You may experience these side effects: Nausea, GI upset, dyspepsia (take drug with food); diarrhea or constipation; dizziness, vertigo, insomnia (use caution if driving or operating dangerous machinery).
- Report eye changes, unusual bleeding or bruising, swelling of the feet or hands, difficulty breathing, severe GI pain.

DANGEROUS DRUG

Lanoxin

PREGNANCY CATEGORY C

Drug classesCardiac glycoside
Cardiotonic**Therapeutic actions**

Increases intracellular calcium and allows more calcium to enter the myocardial cell during depolarization via a sodium–potassium pump mechanism; this increases force of contraction (positive inotropic effect), increases renal perfusion (seen as diuretic effect in patients with heart failure), decreases heart rate (negative chronotropic effect), and decreases AV node conduction velocity.

Indications

- Heart failure
- Atrial fibrillation

Contraindications and cautions

- Contraindicated with allergy to cardiac glycosides, ventricular tachycardia, ventricular fibrillation, heart block, sick sinus syndrome, IHSS, acute MI, renal insufficiency and electrolyte abnormalities (decreased K^+ , decreased Mg^{2+} , increased Ca^{2+}).
- Use cautiously with pregnancy and lactation.

Available forms

Tablets—0.125, 0.25 mg; injection—0.25 mg/mL; pediatric injection—0.1 mg/mL

Dosages

Patient response is quite variable. Evaluate patient carefully to determine the appropriate dose.

Adults

Loading dose, 0.75–1.25 mg PO or 0.125–0.25 mg IV. Maintenance dose, 0.125–0.5 mg/day PO.

Pediatric patients

Loading dose:

	Oral (mcg/kg)	IV (mcg/kg)
Premature	20	15–25
Neonate	30	20–30
1–24 mo	40–50	30–50
2–10 yr	30–40	25–35
Older than 10 yr	10–15	8–12

Maintenance dose, 20%–30% of loading dose in divided daily doses. Usually 0.125–0.5 mg/day PO; 20%–30% for premature infants.

Geriatric patients with impaired renal function

For creatinine clearance of 10–50 mL/min, give 25%–75% normal dose every 36 hr. For creatinine clearance of less than 10 mL/min and for patients on hemodialysis, give 10%–25% normal dose, or usual dosage every 48 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–120 min	2–6 hr	6–8 days
IV	5–30 min	1–5 hr	4–5 days

Metabolism: Some hepatic; $T_{1/2}$: 30–40 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Give undiluted or diluted in fourfold or greater volume of sterile water for injection, 0.9% sodium chloride injection, 5% dextrose injection. Use diluted product promptly. Do not use if solution contains precipitates.

Infusion: Inject slowly over 5 min or longer.

Incompatibility: Do not mix with dobutamine.

Adverse effects

- **CNS:** Headache, weakness, drowsiness, visual disturbances, mental status change

- **CV:** *Arrhythmias*
- **GI:** *GI upset, anorexia*

Interactions

• **Drug-drug** • Increased therapeutic and toxic effects of digoxin with thioamides, verapamil, amiodarone, quinidine, erythromycin, cyclosporine (a decrease in digoxin dosage may be necessary to prevent toxicity; when the interacting drug is discontinued, an increase in the digoxin dosage may be necessary) • Increased incidence of cardiac arrhythmias with potassium-losing (loop and thiazide) diuretics • Increased absorption or increased bioavailability of oral digoxin, leading to increased effects with tetracyclines, erythromycin • Decreased therapeutic effects with thyroid hormones, metoclopramide, penicillamine • Decreased absorption of oral digoxin if taken with cholestyramine, charcoal, colestipol, anti-neoplastics (bleomycin, cyclophosphamide, methotrexate) • Increased or decreased effects of oral digoxin (adjust the dose of digoxin during concomitant therapy) with oral aminoglycosides

• **Drug-alternative therapy** • Increased risk of digoxin toxicity if taken with ginseng, hawthorn, or licorice therapy • Decreased absorption with psyllium • Decreased serum levels with St. John's wort

■ Nursing considerations

Assessment

- **History:** Allergy to cardiac glycosides, ventricular tachycardia, ventricular fibrillation, heart block, sick sinus syndrome, IHSS, acute MI, renal insufficiency, decreased K⁺, decreased Mg²⁺, increased Ca²⁺, pregnancy, lactation
- **Physical:** Weight; orientation, affect, reflexes, vision; P, BP, baseline ECG, cardiac auscultation, peripheral pulses, peripheral perfusion, edema; R, adventitious sounds; abdominal percussion, bowel sounds, liver evaluation; urinary output; electrolyte levels, LFTs, renal function tests

Interventions

⊗ **Warning** Monitor apical pulse for 1 min before administering; hold dose if pulse low-

er than 60 beats/min in adult or lower than 90 beats/min in infant; retake pulse in 1 hr. If adult pulse remains lower than 60 beats/min or infant pulse remains lower than 90 beats/min, hold drug and notify prescriber. Note any change from baseline rhythm or rate.

- Check dosage and preparation carefully.
- Avoid IM injections, which may be very painful.
- Follow diluting instructions carefully, and use diluted solution promptly.
- Avoid giving with meals; taking this drug with food will delay absorption and alter drug pharmacokinetics.
- Have emergency equipment ready; have K⁺ salts, lidocaine, phenytoin, atropine, and cardiac monitor readily available in case toxicity develops.

⊗ **Warning** Monitor for therapeutic drug levels: 0.5–2 ng/mL.

Teaching points

- Do not stop taking this drug without notifying your health care provider.
- Take pulse at the same time each day, and record it on a calendar (normal pulse for you is ____; call your health care provider if your pulse rate falls below ____.)
- Weigh yourself every other day with the same clothing and at the same time. Record this on the calendar.
- Do not start taking any prescription or over-the-counter products without talking to your health care provider. Some combinations may increase the risk of digoxin toxicity and may put you at risk of adverse reactions.
- Wear or carry a medical alert tag stating that you are on this drug.
- Have regular medical checkups, which may include blood tests, to evaluate the effects and dosage of this drug.
- Report slow or irregular pulse, rapid weight gain, loss of appetite, nausea, diarrhea, vomiting, blurred or “yellow” vision, unusual tiredness and weakness, swelling of the ankles, legs or fingers, difficulty breathing.

▷ digoxin immune fab (bovine; digoxin-specific antibody fragments)

(*di jox' in*)

Digibind, DigiFab

PREGNANCY CATEGORY C

Drug class

Antidote

Therapeutic actions

Antigen-binding fragments (fab) derived from specific antidigoxin antibodies; binds molecules of digoxin, making them unavailable at the site of action; fab-fragment complex accumulates in the blood and is excreted by the kidneys.

Indications

- Treatment of potentially life-threatening digoxin toxicity (serum digoxin level exceeding 10 nanograms/mL, serum K⁺ exceeding 5 mEq/L in setting of digoxin toxicity)

Contraindications and cautions

- Contraindicated with allergy to sheep products.
- Use cautiously with pregnancy or lactation.

Available forms

Powder for injection—38 mg/vial (*Digibind*), 40 mg/vial (*DigiFab*)

Dosages

Adults and pediatric patients

Dosage is determined by serum digoxin level or estimate of the amount of digoxin ingested. If no estimate is available and serum digoxin levels cannot be obtained, use 800 mg (20 vials *DigiFab*) or 760 mg (20 vials *Digibind*), which should treat most life-threatening ingestions in adults and children.

Digibind

- Estimated fab fragment dose based on amount of digoxin ingested:

Estimated Number of 0.25-mg Tablets or 0.2-mg Capsules Ingested	Dose (No. of Vials of <i>Digibind</i>)
25	10
50	20
75	30
100	40
150	60
200	80

- Estimated fab fragments dose based on serum digoxin concentration (*Digibind*):

Wt (kg)	Serum Digoxin Concentration (ng/mL)							
	1	2	4	8	12	16	20	
Pediatric patients (dose in mg)	1	0.4	1	1.5	3	5	6	8
	3	1	2	5	9	14	18	23
	5	2	4	8	15	23	30	38
	10	4	8	15	30	46	61	76
Adults (dose in vials)	20	8	15	30	61	91	122	152
	40	0.5	1	2	3	5	7	8
	60	0.5	1	3	5	7	10	12
	70	1	2	3	6	9	11	14
	80	1	2	3	7	10	13	16
100	1	2	4	8	12	16	20	

DigiFab

- Estimated fab fragment dose based on amount of digoxin ingested:

Estimated Number of 0.25-mg Tablets or 0.2-mg Capsules Ingested	Dose (Number of Vials of <i>DigiFab</i>)
25	10
50	20
75	30
100	40
150	60
200	80

- Estimated fab fragments dose based on serum digoxin concentration (*DigiFab*):

	Wt (kg)	Serum Digoxin Concentration (ng/mL)						
		1	2	4	8	12	16	20
Pediatric patients (dose in mg)*	1	0.4	1	1.5	3	5	6.5	8
	3	1	2.5	5	10	14	19	24
	5	2	4	8	16	24	32	40
	10	4	8	16	32	48	64	80
	20	8	16	32	64	96	128	160
Adults (dose in vials)	40	0.5	1	2	3	5	7	8
	60	0.5	1	3	5	7	10	12
	70	1	2	3	6	9	11	14
	80	1	2	3	7	10	13	16
	100	1	2	4	8	12	16	20

* Dilution of reconstituted vial to 1 mg/mL is desirable.

Equations also are available for calculating exact dosage from serum digoxin concentrations.

Pharmacokinetics

Route	Onset	Duration
IV	15–30 min	4–6 hr

Metabolism: $T_{1/2}$: 15–20 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dissolve the contents in each vial with 4 mL of sterile water for injection. Mix gently to give an approximate isosmotic solution with a protein concentration of 10 mg/mL (*DigiFab*) or 9.5 mg/mL (*Digibind*). Use reconstituted solution promptly. Store in refrigerator for up to 4 hr. Discard after that time. Reconstituted solution may be further diluted with sterile isotonic saline.

Infusion: Administer IV over 30 min. Use a 0.22-micron filter for *Digibind*; administer as a bolus injection if cardiac arrest is imminent.

Adverse effects

- **CV:** *Low cardiac output states*, heart failure, rapid ventricular response in patients with atrial fibrillation

- **Hematologic:** Hypokalemia due to reactivation of Na^+ , K^+ , ATPase
- **Hypersensitivity:** Allergic reactions: Drug fever to **anaphylaxis**

Nursing considerations

Assessment

- **History:** Allergy to sheep products, digoxin drug history, lactation, pregnancy
- **Physical:** P, BP, auscultation, baseline ECG, serum digoxin levels, serum electrolytes

Interventions

⊗ **Warning** Check dosage carefully before administering. The two available brand names have slightly different recommended doses. Distinguish between *Digibind* and *DigiFab*.

- Arrange for serum digoxin concentration determinations before administration when possible.
- Monitor patient's cardiac response to digoxin overdose and therapy—cardiac rhythm, serum electrolytes, T, BP.
- Keep life-support equipment and emergency drugs (IV inotropes) readily available for severe overdose.

⊗ **Warning** Do not redigitalize patient until digoxin immune-fab has been cleared from the body; several days to a week or longer in cases of renal insufficiency. Serum digoxin levels will be very high and will be unreliable for up to 3 days after administration.

Teaching points

- Report muscle cramps, dizziness, palpitations.

dihydroergotamine mesylate

See Appendix U, *Less commonly used drugs*.

diltiazem hydrochloride

(dil' tye' a zem)

Apo-Diltiaz (CAN), Apo-Diltiaz CD (CAN) **ONC**, Apo-Diltiaz SR (CAN) **ONC**, Cardizem, Cardizem CD **ONC**, Cardizem LA **ONC**, Cartia XT **ONC**, Dilacor XR **ONC**, Dilt-CD **ONC**, Dilt-XR **ONC**, Diltia XT **ONC**, Diltzac **ONC**, Gen-Diltiazem (CAN), Gen-Diltiazem CD (CAN) **ONC**, Novo-Diltiazem (CAN), Novo-Diltiazem CD (CAN) **ONC**, Nu-Diltiaz (CAN), Nu-Diltiaz-CD (CAN) **ONC**, ratio-Diltiazem (CAN), Taztia XT **ONC**, Tiazac **ONC**

PREGNANCY CATEGORY C

Drug classes

Antianginal
Antihypertensive
Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and arterial muscle cells, resulting in the depression of impulse formation in specialized cardiac pacemaker cells, slowing of the velocity of conduction of the cardiac impulse, depression of myocardial contractility, and dilation of coronary arteries and arterioles and peripheral arterioles; these effects lead to decreased cardiac work, decreased cardiac energy consumption, and in patients with vasospastic (Prinzmetal's) angina, increased delivery of oxygen to myocardial cells.

Indications

- Angina pectoris due to coronary artery spasm (Prinzmetal's variant angina)
- Effort-associated angina; chronic stable angina in patients not controlled by beta-adrenergic blockers, nitrates
- ER and SR forms only: Essential hypertension
- Parenteral: Paroxysmal supraventricular tachycardia, atrial fibrillation, atrial flutter

Contraindications and cautions

- Contraindicated with allergy to diltiazem, impaired hepatic or renal function, sick sinus

syndrome, heart block (second or third degree), severe hypertension, cardiogenic shock, acute MI with cardiogenic shock (oral), lactation.

Available forms

Tablets—30, 60, 90, 120 mg; ER capsules **ONC**—60, 90, 120, 180, 240, 300, 360, 420 mg; ER tablets **ONC**—120, 180, 240, 300, 360, 420 mg; injection—5 mg/mL; powder for injection—25 mg

Dosages

Evaluate patient carefully to determine the appropriate dose of this drug.

Adults

Initially, 30 mg PO qid before meals and at bedtime; gradually increase dose at 1- to 2-day intervals to 180–360 mg PO in three to four divided doses.

ER

Cardizem CD and Cartia XT: 180–240 mg daily PO for hypertension; 120–180 mg daily PO for angina.

Cardizem LA: 120–540 mg daily PO for hypertension; 180–360 mg/day PO for chronic, stable angina. May be given with nitroglycerin or nitrate therapy.

Dilacor XR, Diltia XT, Dilt-CD, and Dilt-XR: 180–240 mg daily PO as needed; up to 480 mg has been used.

Tiazac, Taztia XT: 120–240 mg daily PO for hypertension—once daily dose; 120–180 mg PO once daily for angina.

IV

Direct IV bolus: 0.25 mg/kg (20 mg for the average patient); second bolus of 0.35 mg/kg. *Continuous IV infusion:* 5–10 mg/hr with increases up to 15 mg/hr; may be continued for up to 24 hr.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	30–60 min	2–3 hr
ER	30–60 min	6–11 hr
IV	Immediate	2–3 min

Metabolism: Hepatic; $T_{1/2}$: 3.5–6 hr; 5–7 hr (ER)

Distribution: May cross placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: For continuous infusion, transfer to normal saline, D₅W, D₅W/0.45% sodium chloride as below. Mix thoroughly. Use within 24 hr. Keep refrigerated.

Diluent Volume (mL)	Quantity of Injection	Final Concentration (mg/mL)	Dose (mg/hr)	Infusion Rate (mL/hr)
100	125 mg	1	10	10
	(25 mL)	—	15	15
250	250 mg	0.83	10	12
	(50 mL)	—	15	18
500	250 mg	0.45	10	22
	(50 mL)	—	15	33

Infusion: Administer bolus dose over 2 min. For continuous infusion, rate of 10 mg/hr is the recommended rate. Do not use continuous infusion longer than 24 hr.

Incompatibility: Do not mix in the same solution with furosemide solution.

Adverse effects

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue*
- **CV:** *Peripheral edema, hypotension, arrhythmias, bradycardia, AV block, asystole*
- **Dermatologic:** *Flushing, rash*
- **GI:** *Nausea, hepatic injury, reflux*

Interactions

- * **Drug-drug** • Increased serum levels and toxicity of cyclosporine if taken with diltiazem
- Possible depression of myocardial contractility, AV conduction if combined with beta blockers; use caution and monitor patient closely
- * **Drug-food** • Decreased metabolism and increased risk of toxic effects if taken with grapefruit juice; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to diltiazem, impaired hepatic or renal function, sick sinus syndrome, heart block, lactation, pregnancy
- **Physical:** Skin lesions, color, edema; P, BP, baseline ECG, peripheral perfusion, auscultation; R, adventitious sounds; liver evaluation, normal output; LFTs, renal function tests, urinalysis

Interventions

- Monitor patient carefully (BP, cardiac rhythm, and output) while drug is being titrated to therapeutic dose; dosage may be increased more rapidly in hospitalized patients under close supervision.
- Monitor BP carefully if patient is on concurrent doses of nitrates.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- Ensure patient swallows ER or SR preparations whole; do not cut, crush, or chew.

Teaching points

- Swallow extended-release and long-acting preparations whole; do not cut, crush, or chew; do not drink grapefruit juice while using this drug.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (regulate light, noise, and temperature; medicate if severe).
- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

▽ dimenhydrinate

(*dye men hye' dri nate*)

Oral preparations: Apo-Dimenhydrinate (CAN), Children's Dramamine, Dimetabs, Dramamine, Gravol (CAN), Triptone

Parenteral preparations: Dinat, Dramanate, Dymenate

PREGNANCY CATEGORY B

Drug classes

Anticholinergic
Antihistamine
Anti-motion-sickness drug

Therapeutic actions

Antihistamine with antiemetic and anticholinergic activity; depresses hyperstimulated labyrinthine function; may block synapses in the vomiting center; peripheral anticholinergic effects may contribute to anti-motion-sickness efficacy.

Indications

- Prevention and treatment of nausea, vomiting, or vertigo of motion sickness

Contraindications and cautions

- Contraindicated with allergy to dimenhydrinate or its components, lactation.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias, pregnancy.

Available forms

Tablets—50 mg; chewable tablets—50 mg; injection—50 mg/mL; liquid—12.5 mg/4 mL, 12.5 mg/5 mL; 15.62 mg/5 mL

Dosages**Adults****Oral**

50–100 mg every 4–6 hr PO; for prophylaxis, first dose should be taken 30 min before exposure to motion. Do not exceed 400 mg in 24 hr.

Parenteral

50 mg IM as needed; 50 mg in 10 mL sodium chloride injection given IV over 2 min.

Pediatric patients 6–12 yr

25–50 mg PO every 6–8 hr, not to exceed 150 mg/day.

Pediatric patients 2–6 yr

Up to 25 mg PO every 6–8 hr, not to exceed 75 mg/day.

Pediatric patients younger than 2 yr

Only on advice of physician; 1.25 mg/kg IM qid, not to exceed 300 mg/day.

Neonates

Contraindicated.

Geriatric patients

Can cause dizziness, sedation, syncope, confusion, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	2 hr	3–6 hr
IM	20–30 min	1–2 hr	3–6 hr
IV	Immediate	1–2 hr	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: May cross placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute 50 mg in 10 mL sodium chloride injection.

Infusion: Administer by direct IV injection over 2 min.

Incompatibilities: Do not combine with tetracycline, thiopental.

Y-site incompatibilities: Do not mix with aminophylline, heparin, hydrocortisone, hydroxyzine, phenobarbital, phenytoin, prednisolone, promethazine.

Adverse effects

- **CNS:** Drowsiness, confusion, nervousness, restlessness, headache, dizziness, vertigo, lassitude, tingling, heaviness and weakness of hands; insomnia and excitement (especially in children), hallucinations, seizures, **death**, blurring of vision, diplopia
- **CV:** Hypotension, palpitations, tachycardia
- **Dermatologic:** Urticaria, drug rash, photosensitivity
- **GI:** Epigastric distress, anorexia, nausea, vomiting, diarrhea or constipation; dryness of mouth, nose, and throat
- **GU:** Urinary hesitancy, urinary retention
- **Respiratory:** Nasal stuffiness, chest tightness, thickening of bronchial secretions
- **Other:** **Anaphylaxis;** in geriatric patients may cause mental status changes, excessive sedation, constipation; in men, may cause urinary retention

Interactions

★ **Drug-drug** • Increased depressant effects with alcohol, other CNS depressants

■ Nursing considerations**Assessment**

- **History:** Allergy to dimenhydrinate or its components, lactation, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bronchial asthma, bladder neck obstruction, pyloroduodenal obstruction, cardiac arrhythmias
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC

Interventions

⊗ **Warning** Keep epinephrine 1:1,000 readily available when using parenteral preparations; hypersensitivity reactions, including anaphylaxis, have occurred.

Teaching points

- Take drug as prescribed; avoid excessive dosage.
- Drug works best if taken before motion sickness occurs.
- Avoid alcohol; serious sedation could occur.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); epigastric distress, diarrhea or constipation (take drug with food); dry mouth (use frequent mouth care, suck sugarless lozenges); thickening of bronchial secretions, dryness of nasal mucosa (try another motion sickness remedy).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

▷ **dimercaprol**

See Appendix U, *Less commonly used drugs*.

▷ **dinoprostone** (prostaglandin E₂)

(*dye noe prost' obn*)

Cervidil, Prepidil, Prostin E2

PREGNANCY CATEGORY C

Drug classes

Abortifacient
Prostaglandin

Therapeutic actions

Stimulates the myometrium of the pregnant uterus to contract, similar to the contractions of the uterus during labor, thus evacuating the contents of the uterus.

Indications

- Termination of pregnancy 12–20 wk from the first day of the last menstrual period
- Evacuation of the uterus in the management of missed abortion or intrauterine fetal death up to 28 wk gestational age
- Management of nonmetastatic gestational trophoblastic disease (benign hydatidiform mole)
- Initiation of cervical ripening before induction of labor

Contraindications and cautions

- Contraindicated with allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease; women in whom prolonged uterine contractions are inappropriate (eg, caesarean delivery, uterine surgery, fetal distress, obstetric emergency).
- Use cautiously with history of asthma; hypotension; hypertension; CV, adrenal, renal, or hepatic disease; anemia; jaundice; diabetes; epilepsy; scarred uterus; cervicitis, infected endocervical lesions, acute vaginitis.

Available forms

Vaginal suppository—20 mg; vaginal gel—0.5 mg; vaginal insert—10 mg

Dosages

Adults

- **Termination of pregnancy:** Insert one suppository (20 mg) high into the vagina; keep supine for 10 min after insertion. Additional suppositories may be given at 3- to 5-hr intervals based on uterine response and tolerance. Do not give longer than 2 days.
- **Cervical ripening:** Give 0.5 mg gel via provided cervical catheter with patient in the dorsal position and cervix visualized using a speculum. Repeat dose may be given if no response in 6 hr. Wait 6–12 hr before beginning oxytocin IV to initiate labor. Insert: Place one insert transversely in the posterior fornix of the vagina. Keep patient supine for 2 hr; one insert delivers 0.3 mg/hr over 12 hr. Remove, using retrieval system, at onset of active labor or 12 hr after insertion.

Pharmacokinetics

Route	Onset	Peak	Duration
Intravaginal	10 min	30–45 min	2–3 hr

Metabolism: Tissue; $T_{1/2}$: 5–10 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, paresthesias, anxiety, weakness, syncope, dizziness
- **CV:** *Hypotension*, arrhythmias, chest pain
- **Fetal:** Abnormal heart rates
- **GI:** *Vomiting, diarrhea, nausea*
- **GU:** Endometritis, perforated uterus, uterine rupture, uterine or vaginal pain, incomplete abortion
- **Respiratory:** Coughing, dyspnea
- **Other:** Chills, diaphoresis, backache, breast tenderness, eye pain, skin rash, pyrexia

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred among *Prostin VR Pediatric* (alprostadil), *Prostin FZ* (dinoprost—available outside the US), *Prostin E₂* (dinoprostone), and *Prostin 15* (carboprost in Europe). Confusion has also been reported with Prepidil (dinoprostone) and bepridil. Use extreme caution.

Assessment

- **History:** Allergy to prostaglandin preparations; acute PID; active cardiac, hepatic, pulmonary, renal disease; history of asthma; hypotension; hypertension; anemia; jaundice; diabetes; epilepsy; scarred uterus; cervicitis, infected endocervical lesions, acute vaginitis
- **Physical:** T; BP, P, auscultation; R, adventitious sounds; bowel sounds, liver evaluation; vaginal discharge, pelvic examination, uterine tone; LFTs, renal function tests, WBC, urinalysis, CBC

Interventions

- Store suppositories in freezer; bring to room temperature before insertion.
- Store cervical gel in refrigerator. Gel is stable for 24 mo at 2°–8°C
- Arrange for pre- or concurrent treatment with antiemetic and antidiarrheal drugs to decrease the incidence of GI side effects.
- Ensure that abortion is complete or that other measures are used to complete the abortion if drug effects are not sufficient.
- Monitor temperature, using care to differentiate prostaglandin-induced pyrexia from postabortion endometritis pyrexia.
- Give gel using aseptic technique via cervical catheter to patient in dorsal position. Patient should remain in this position 15–30 min.
- Monitor uterine tone and vaginal discharge throughout procedure and several days after the procedure.
- Ensure adequate hydration throughout procedure.
- Be prepared to support patient through labor (cervical ripening). Give oxytocin infusion 6–12 hr after dinoprostone.

Teaching points

- If you have never had a vaginal suppository, a health care provider will explain the procedure. You will need to lie down for 10 minutes after insertion.
- You will need to stay on your side for 15–30 minutes after injection of gel.
- You may experience these side effects: Nausea, vomiting, diarrhea, uterine or vaginal pain, fever, headache, weakness, dizziness.
- Report severe pain, difficulty breathing, palpitations, eye pain, rash.

diphenhydramine hydrochloride

(*dye fen hye' dra meen*)

Oral: Allerdryl (CAN), AllerMax Caplets, Banophen, Banophen Allergy, Benadryl Allergy, Diphen AF, Diphenhist, Diphenhist Captabs, Genahist, Siladryl

Oral prescription preparations:

Benadryl

Parenteral preparations:

Benadryl

PREGNANCY CATEGORY B

Drug classes

Antihistamine

Anti-motion-sickness drug

Antiparkinsonian

Cough suppressant

Sedative-hypnotic

Therapeutic actions

Competitively blocks the effects of histamine at H₁-receptor sites, has atropine-like, antipruritic, and sedative effects.

Indications

- Relief of symptoms associated with perennial and seasonal allergic rhinitis; vasomotor rhinitis; allergic conjunctivitis; mild, uncomplicated urticaria and angioedema; amelioration of allergic reactions to blood or plasma; dermatographism; adjunctive therapy in anaphylactic reactions
- Active and prophylactic treatment of motion sickness
- Nighttime sleep aid
- Parkinsonism (including drug-induced parkinsonism and extrapyramidal reactions), in the elderly intolerant of more potent drugs, for milder forms of the disorder in other age-groups, and in combination with centrally acting anticholinergic antiparkinsonian drugs
- Syrup formulation: Suppression of cough due to colds or allergy

Contraindications and cautions

- Contraindicated with allergy to antihistamines, third trimester of pregnancy, lactation.
- Use cautiously with narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, pregnancy; elderly patients who may be sensitive to anticholinergic effects.

Available forms

Capsule soft gels—25 mg; capsules—25, 50 mg; tablets—25, 50 mg; chewable tablets—12.5 mg; elixir—12.5 mg/5 mL; syrup—12.5 mg/5 mL; liquid—12.5 mg/5 mL; injection—10, 50 mg/mL; solution—12.5 mg/5 mL.

Dosages

Adults

Oral

25–50 mg every 4–6 hr PO, not to exceed 300 mg/24 hr.

- *Motion sickness:* Give full dose prophylactically 30 min before exposure to motion, and repeat before meals and at bedtime.
- *Nighttime sleep aid:* 25–50 mg PO at bedtime.
- *Cough suppression:* 25 mg every 4 hr PO, not to exceed 150 mg in 24 hr.

Parenteral

10–50 mg IV or deep IM or up to 100 mg if required. Maximum daily dose is 400 mg.

Pediatric patients

Oral

2–6 yr: 12.5–25 mg PO every 12 hr.

6–12 yr: 12.5–25 mg tid–qid PO or 5 mg/kg/day PO or 150 mg/m² per day PO. Maximum daily dose, 300 mg.

- *Motion sickness:* Give full dose prophylactically 30 min before exposure to motion and repeat before meals and at bedtime.
- *Cough suppression:*
 - 2–6 yr: 6.25 mg every 4 hr, not to exceed 25 mg in 24 hr.
 - 6–12 yr: 12.5 mg every 4 hr PO, not to exceed 75 mg in 24 hr.

Parenteral

5 mg/kg/day or 150 mg/m² per day IV or by deep IM injection. Maximum daily dose is 300 mg divided into four doses.

Geriatric patients

More likely to cause dizziness, sedation, syncope, toxic confusional states, and hypotension in elderly patients; use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	15–30 min	1–4 hr	4–7 hr
IM	20–30 min	1–4 hr	4–8 hr
IV	Rapid	30–60 min	4–8 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–7 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: No additional preparation required.

Infusion: Administer slowly each 25 mg over 1 min by direct injection or into tubing of running IV.

Incompatibilities: Do not combine with amobarbital, amphotericin B, hydrocortisone, phenobarbital, phenytoin, thiopental.

Y-site incompatibility: Do not mix with foscarnet.

Adverse effects

- **CNS:** *Drowsiness, sedation, dizziness, disturbed coordination*, fatigue, confusion, restlessness, excitation, nervousness, tremor, headache, blurred vision, diplopia
- **CV:** Hypotension, palpitations, bradycardia, tachycardia, extrasystoles
- **GI:** *Epigastric distress*, anorexia, increased appetite and weight gain, nausea, vomiting, diarrhea or constipation
- **GU:** Urinary frequency, dysuria, urinary retention, early menses, decreased libido, impotence
- **Hematologic:** **Hemolytic anemia, hypoplastic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia**
- **Respiratory:** *Thickening of bronchial secretions*, chest tightness, wheezing, nasal stuffiness, dry mouth, dry nose, dry throat, sore throat

- **Other:** Urticaria, rash, **anaphylactic shock**, photosensitivity, excessive perspiration

Interactions

• **Drug-drug** • Possible increased and prolonged anticholinergic effects with MAOIs • Risk of increased sedation with alcohol, CNS depressants; avoid this combination

Nursing considerations**Assessment**

- **History:** Allergy to any antihistamines, narrow-angle glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, asthmatic attack, bladder neck obstruction, pyloroduodenal obstruction, third trimester of pregnancy, lactation
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; vision examination; P, BP; R, adventitious sounds; bowel sounds; prostate palpation; CBC with differential

Interventions

- Administer with food if GI upset occurs.
- Administer syrup form if patient is unable to take tablets.
- Monitor patient response, and arrange for adjustment of dosage to lowest possible effective dose.

Teaching points

- Take as prescribed; avoid excessive dosage.
- Take with food if GI upset occurs.
- Avoid alcohol; serious sedation could occur.
- These side effects may occur: Dizziness, sedation, drowsiness (use caution driving or performing tasks requiring alertness); epigastric distress, diarrhea or constipation (take drug with meals); dry mouth (use frequent mouth care, suck sugarless lozenges); thickening of bronchial secretions, dryness of nasal mucosa (use a humidifier).
- Report difficulty breathing, hallucinations, tremors, loss of coordination, unusual bleeding or bruising, visual disturbances, irregular heartbeat.

dipyridamole

See Appendix U, *Less commonly used drugs*.

disopyramide phosphate

(*dye soe peer' a mide*)

Norpace, Norpace CR **ONC**, Rythmodan (CAN), Rythmodan-LA (CAN) **ONC**

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic

Therapeutic actions

Type 1a antiarrhythmic: Decreases rate of diastolic depolarization, decreases automaticity, decreases the rate of rise of the action potential, prolongs the refractory period of cardiac muscle cells.

Indications

- Treatment of ventricular arrhythmias considered to be life-threatening
- Unlabeled use: Treatment of paroxysmal supraventricular tachycardia

Contraindications and cautions

- Contraindicated with cardiogenic shock, allergy to disopyramide, cardiac conduction abnormalities (eg, Wolff-Parkinson-White syndrome, sick sinus syndrome, heart block, prolonged QT interval).
- Use cautiously with heart failure, hypotension, cardiac myopathies, urinary retention, glaucoma, myasthenia gravis, renal or hepatic disease, potassium imbalance, pregnancy, lactation.

Available forms

Capsules—100, 150 mg; CR capsules **ONC**—100, 150 mg; ER tablets **ONC**—150 mg (CAN)

Dosages

Evaluate patient carefully and monitor cardiac response closely to determine the correct dosage for each patient.

Adults

400–800 mg/day PO given in divided doses every 6 hr or every 12 hr if using the CR products.

- **Rapid control of ventricular arrhythmias:** 300 mg PO (immediate release). If no response within 6 hr, give 200 mg PO every 6 hr; may increase to 250–300 mg every 6 hr if no response in 48 hr.
- **Patients with cardiomyopathy:** No loading dose, 100 mg PO every 6–8 hr (immediate release).

Pediatric patients

Give in equal, divided doses every 6 hr PO, adjusting the dose to the patient's need.

Age	Daily Dosage (mg/kg)
Younger than 1 yr	10–30
1–4 yr	10–20
4–12 yr	10–15
12–18 yr	6–15

Patients with renal impairment

Loading dose of 150 mg PO may be given, followed by 100 mg at the intervals shown.

Creatinine

Clearance (mL/min)	Interval
30–40	Every 8 hr
15–30	Every 12 hr
Less than 15	Every 24 hr

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2 hr	1.5–8.5 hr

Metabolism: Hepatic; $T_{1/2}$: 4–10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, fatigue, headache, *blurred vision*
- **CV:** Heart failure, hypotension, cardiac conduction disturbances
- **GI:** *Dry mouth, constipation*, nausea, abdominal pain, gas
- **GU:** *Urinary hesitancy and retention, impotence*
- **Other:** *Dry nose, eyes, and throat; rash; itching; muscle weakness; malaise; aches and pains*

Interactions

- ★ **Drug-drug** • Decreased disopyramide plasma levels if used with phenytoins, rifampin
- Risk of increased disopyramide effects with antiarrhythmics, erythromycin, quinidine

■ Nursing considerations

Assessment

- **History:** Allergy to disopyramide, heart failure, hypotension, Wolff-Parkinson-White syndrome, sick sinus syndrome, heart block, cardiac myopathies, urinary retention, glaucoma, myasthenia gravis, renal or hepatic disease, potassium imbalance, labor or delivery, lactation, pregnancy
- **Physical:** Weight; orientation, reflexes; P, BP, auscultation, ECG, edema; R, adventitious sounds; bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, blood glucose, serum K⁺

Interventions

⊗ **Black box warning** Monitor patient for possible refractory arrhythmias that can be life-threatening; reserve use for life-threatening arrhythmias.

- Check that patients with supraventricular tachyarrhythmias have been digitalized before starting disopyramide.
- Reduce dosage in patients weighing less than 110 lb.
- Reduce dosage in patients with hepatic or renal failure.
- Monitor patients with severe refractory tachycardia, who may be given up to 1,600 mg/day continuously.
- Make a pediatric suspension form (1–10 mg/mL) by adding contents of the immediate-release capsule to cherry syrup, if desired. Store in amber glass bottle, and refrigerate. Shake well before using. Stable for 1 mo.
- Take care to differentiate the CR form from the immediate-release preparation. Ensure that patient swallows CR form whole; do not cut, crush, or chew.
- Monitor BP, orthostatic pressure.

⊗ **Warning** Evaluate for safe and effective serum levels (2–8 mcg/mL).

Teaching points

- You will require frequent monitoring of cardiac rhythm and blood pressure.

- Swallow controlled-release capsules whole; do not cut, crush, or chew.
- Take missed dose as soon as possible, unless within 4 hours of next dose. Do not double up on next dose.
- Do not stop taking this drug for any reason without consulting your health care provider.
- Return for regular follow-up visits to check your heart rhythm and blood pressure.
- You may experience these side effects: Dry mouth (try frequent mouth care, suck sugarless lozenges); constipation (laxatives may be ordered); difficulty voiding (empty the bladder before taking drug); muscle weakness or aches and pains.
- Report swelling of fingers or ankles, difficulty breathing, dizziness, urinary retention, severe headache or visual changes.

▷ disulfiram

(*dye sul' fi ram*)

Antabuse

PREGNANCY CATEGORY C

Drug classes

Antialcoholic drug
Enzyme inhibitor

Therapeutic actions

Inhibits the enzyme aldehyde dehydrogenase, blocking oxidation of alcohol and allowing acetaldehyde to accumulate to concentrations in the blood 5–10 times higher than normally achieved during alcohol metabolism; accumulation of acetaldehyde produces the highly unpleasant reaction described below that deters consumption of alcohol.

Indications

- Aids in the management of selected chronic alcoholics who want to remain in a state of enforced sobriety

Contraindications and cautions

- Contraindicated with allergy to disulfiram or other thiuram derivatives used in pesticides and rubber vulcanization, severe myocardial disease or coronary occlusion; psychoses, current or recent treatment

with metronidazole, paraldehyde, alcohol, alcohol-containing preparations (eg, cough syrups), pregnancy.

- Use cautiously with diabetes mellitus, hypothyroidism, epilepsy, cerebral damage, chronic and acute nephritis, hepatic cirrhosis or impairment.

Available forms

Tablets—250 mg

Dosages

⊗ **Black box warning** Never administer to an intoxicated patient or without patient's knowledge. Do not administer until patient has abstained from alcohol for at least 12 hr.

Adults

- **Initial dosage:** Administer maximum of 500 mg/day PO in a single dose for 1–2 wk. If a sedative effect occurs, administer at bedtime or decrease dosage.
- **Maintenance regimen:** 125–500 mg/day PO. Do not exceed 500 mg/day. Continue use until patient fully recovers socially and has basis for permanent self-control.
- **Trial with alcohol (do not give to anyone older than 50 yr):** After 1–2 wk of therapy with 500 mg/day PO, a drink of 15 mL of 100-proof whiskey or its equivalent is taken slowly. Dose may be repeated once, if patient is hospitalized and support facility is available.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	12 hr	1–2 wk

Metabolism: Hepatic; $T_{1/2}$: Unclear

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, lungs

Adverse effects

Disulfiram with alcohol

- **CNS:** Throbbing headaches, syncope, weakness, vertigo, confusion, seizures, unconsciousness, throbbing in head and neck
- **CV:** Flushing, chest pain, palpitations, tachycardia, hypotension, **arrhythmias, CV collapse, acute heart failure, MI**
- **Dermatologic:** Sweating
- **EENT:** Blurred vision

- **GI:** Nausea, copious vomiting, thirst
- **Respiratory:** Respiratory difficulty, dyspnea, hyperventilation
- **Other: Death**

Disulfiram alone

- **CNS:** *Drowsiness, fatigability, headache, restlessness, peripheral neuropathy, optic or retrobulbar neuritis*
- **Dermatologic:** *Skin eruptions, acneiform eruptions, allergic dermatitis*
- **GI:** *Metallic or garliclike aftertaste, hepatotoxicity*

Interactions

- **Drug-drug** • Increased serum levels and risk of toxicity of phenytoin and its congeners, diazepam, chlordiazepoxide • Increased therapeutic and toxic effects of theophyllines and caffeine • Increased PT caused by disulfiram may lead to a need to adjust dosage of oral anticoagulants • Severe alcohol-intolerance reactions with any alcohol-containing liquid medications (eg, elixirs, tinctures) • Acute toxic psychosis with metronidazole

Nursing considerations

Assessment

- **History:** Allergy to disulfiram or other thiram derivatives; severe myocardial disease or coronary occlusion; psychoses; current or recent treatment with metronidazole, paraldehyde, alcohol, alcohol-containing preparations (eg, cough syrups, tonics); diabetes mellitus, hypothyroidism, epilepsy, cerebral damage, chronic and acute nephritis, hepatic cirrhosis or impairment; pregnancy
- **Physical:** Skin color, lesions; thyroid palpation; orientation, affect, reflexes; P, auscultation, BP; R, adventitious sounds; liver evaluation; LFTs, renal function tests, CBC, SMA-12

Interventions

- Do not administer until patient has abstained from alcohol for at least 12 hr.
- Administer orally; tablets may be crushed and mixed with liquid beverages.
- Monitor LFTs before, in 10–14 days, and every 6 mo during therapy to evaluate for hepatic impairment.
- Monitor CBC, SMA-12 before and every 6 mo during therapy.

- If patient reports ability to drink alcohol while on this drug, assume noncompliance. Directly observe drug ingestion.
- Inform patient about the seriousness of disulfiram–alcohol reaction and the potential consequences of alcohol use. Disulfiram should not be taken for at least 12 hr after alcohol ingestion, and a reaction may occur up to 2 wk after disulfiram therapy is stopped; all forms of alcohol must be avoided.
- Arrange for treatment with antihistamines if skin reaction occurs.

⊗ **Warning** Institute supportive measures if disulfiram–alcohol reaction occurs; oxygen, carbon dioxide combination, massive doses of vitamin C IV, ephedrine have been used.

Teaching points

- Take drug daily; if drug makes you dizzy or tired, take it at bedtime. Tablets may be crushed and mixed with liquid.
- Abstain from forms of alcohol (beer, wine, liquor, vinegars, cough mixtures, sauces, aftershave lotions, liniments, colognes, liquid medications). Using alcohol while taking this drug can cause severe, unpleasant reactions—flushing, copious vomiting, throbbing headache, difficulty breathing, even death.
- Wear or carry a medical ID while you are taking this drug to alert any medical emergency personnel that you are taking it.
- Have periodic blood tests while taking drug to evaluate its effects on the liver.
- You may experience these side effects: Drowsiness, headache, fatigue, restlessness, blurred vision (use caution driving or performing tasks that require alertness); metallic aftertaste (transient).
- Report unusual bleeding or bruising, yellowing of skin or eyes, chest pain, difficulty breathing, ingestion of any alcohol.

DANGEROUS DRUG

DOBUTamine **hydrochloride**

(*doe' byoo ta meen*)

PREGNANCY CATEGORY B

Drug classes

Beta₁-selective adrenergic agonist
Sympathomimetic

Therapeutic actions

Positive inotropic effects are mediated by beta₁-adrenergic receptors in the heart; increases the force of myocardial contraction with relatively minor effects on heart rate, arrhythmogenesis; has minor effects on blood vessels.

Indications

- For inotropic support in the short-term treatment of adults with cardiac decompensation due to depressed contractility, resulting from either organic heart disease or from cardiac surgical procedures
- Investigational use in children with congenital heart disease undergoing diagnostic cardiac catheterization, to augment CV function

Contraindications and cautions

- Contraindicated with IHSS; hypovolemia (dobutamine is not a substitute for blood, plasma, fluids, electrolytes, which should be restored promptly when loss has occurred and in any case before treatment with dobutamine); acute MI (may increase the size of an infarct by intensifying ischemia); general anesthesia with halogenated hydrocarbons or cyclopropane, which sensitize the myocardium to catecholamines; pregnancy.
- Use cautiously with diabetes mellitus, lactation; allergy to sulfites, more common in asthmatic patients.

Available forms

Injection—12.5 mg/mL; injection in 5% dextrose injection—1 mg/mL, 2 mg/mL, 4 mg/mL

Dosages

Administer only by IV infusion using an infusion pump or other device to control the rate of flow. Titrate on the basis of the patient's hemodynamic and renal response. Close monitoring is necessary.

Adults

2–20 mcg/kg/min IV is usual rate to increase cardiac output; rarely, rates up to 40 mcg/kg/min are needed.

Pediatric patients

Safety and efficacy not established. When used investigational in children undergoing cardiac catheterization (see above), doses of 2 and 7.75 mcg/kg/min were infused for 10 min.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	Up to 10 min	Length of infusion

Metabolism: Hepatic; $T_{1/2}$: 2 min

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute vials to at least 50 mL with 5% dextrose injection, 0.9% sodium chloride injection, or sodium lactate injection. Store final diluted solution in glass or Viaflex container at room temperature. Stable for 24 hr. Do not freeze. (Drug solutions may exhibit a pink color that increases with time; this indicates oxidation of the drug, not a loss of potency up to 24 hr.)

Infusion: May be administered through common IV tubing with dopamine, lidocaine, tobramycin, nitroprusside, potassium chloride, or protamine sulfate. Titrate rate based on patient response—P, BP, rhythm; use of an infusion pump is suggested.

Incompatibilities: Do not mix drug with alkaline solutions, such as 5% sodium bicarbonate injection; do not mix with hydrocortisone sodium succinate, cefazolin, penicillin, sodium ethacrylate; sodium heparin.

Y-site incompatibilities: Do not mix with acyclovir, alteplase, aminophylline, foscarnet.

Adverse effects

- **CNS:** *Headache*
- **CV:** *Increase in HR, increase in systolic BP, increase in ventricular ectopic beats (PVCs),* anginal pain, palpitations, shortness of breath
- **GI:** *Nausea*

Interactions

* **Drug-drug** • Increased effects with TCAs (eg, imipramine), methyldopa

Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between dobutamine and dopamine; use caution.

Assessment

- **History:** IHSS, hypovolemia, acute MI, general anesthesia with halogenated hydrocarbons or cyclopropane, diabetes, lactation, pregnancy
- **Physical:** Weight, skin color; T; P, BP, pulse pressure, auscultation; R, adventitious sounds; urine output; serum electrolytes, Hct, ECG

Interventions

- Arrange to digitalize patients who have atrial fibrillation with a rapid ventricular rate before giving dobutamine—dobutamine facilitates AV conduction.
- ⊗ **Warning** Monitor urine flow, cardiac output, pulmonary wedge pressure, ECG, and BP closely during infusion; adjust dose and rate accordingly.

Teaching points

- Used only in acute emergencies; teaching depends on patient's awareness and emphasizes need for the drug.

DANGEROUS DRUG**docetaxel**

(*dobs eh tax' ell*)

Taxotere

PREGNANCY CATEGORY D

Drug class

Antineoplastic (taxoid)

Therapeutic actions

Inhibits the normal dynamic reorganization of the microtubule network that is essential for dividing cells; leads to cell death in rapidly dividing cells.

Indications

- Treatment of patients with locally advanced or metastatic breast cancer after failure of prior chemotherapy
- Treatment of non–small-cell lung cancer after failure with platinum-based chemotherapy, with metastases
- First-line treatment of unresectable, locally advanced, or metastatic non–small-cell lung cancer in patients who have not received prior chemotherapy when used in combination with cisplatin
- Treatment of androgen-independent metastatic prostate cancer with prednisone
- Adjuvant post-surgery treatment of patients with operable node-positive breast cancer in combination with doxorubicin and cyclophosphamide
- Induction treatment of patients with locally advanced squamous cell carcinoma of the head and neck, in combination with cisplatin and 5-FU, before the patient undergoes chemoradiotherapy or radiotherapy
- Treatment of advanced gastric adenocarcinoma in patients who have not received chemotherapy for advanced disease with cisplatin and 5-FU
- Unlabeled uses: Esophageal, ovarian, small-cell lung, urothelial cancers

Contraindications and cautions

- Contraindicated with hypersensitivity to docetaxel or drugs using polysorbate 80; bone marrow depression with neutrophil counts less than 1,500 cells/mm², lactation, pregnancy.
- Use cautiously with hepatic impairment, history of treatment with platinum-based chemotherapy.

Available forms

Injection—20 mg/0.5 mL, 80 mg/2 mL

Dosages

Adults

- *Breast cancer*: 60–100 mg/m² IV infused over 1 hr every 3 wk.
- *Non–small-cell lung cancer*: 75 mg/m² IV over 1 hr every 3 wk.
- *First-line treatment of non–small-cell lung cancer*: 75 mg/m² of Taxotere given

over 1 hr followed by 75 mg/m² cisplatin IV given over 30–60 min every 3 wk.

- *Androgen-independent metastatic prostate cancer*: 75 mg/m² IV every 3 wk as a 1-hr infusion with 5 mg prednisone PO bid constantly throughout therapy. Premedicate with dexamethasone 8 mg PO 12 hr, 3 hr, and 1 hr before docetaxel infusion. Reduce dosage to 60 mg/m² if febrile neutropenia, severe or cumulative cutaneous reactions, moderate neurosensory signs or symptoms, or neutrophil count less than 500 mm³ occurs for longer than 1 wk. Stop therapy if reactions continue with reduced dose.
- *Operable node-positive breast cancer*: 75 mg/m² IV given 1 hr after doxorubicin 50 mg/m² and cyclophosphamide 500 mg/m² every 3 wk for 6 courses. Adjust dosage based on neutrophil count.
- *Induction for squamous cell cancer of the head and neck before radiotherapy*: 75 mg/m² as a 1-hr IV infusion followed by cisplatin 75 mg/m² IV over 1 hr on day 1, followed by 5-FU 750 mg/m²/day IV for 5 days. Repeat every 3 wk for four cycles before radiotherapy starts.
- *Induction for squamous cell cancer of the head and neck before chemoradiotherapy*: 75 mg/m² as a 1-hr IV infusion, followed by cisplatin 100 mg/m² as a 30-min–3-hr infusion followed by 5-FU 1,000 mg/m²/day as a continuous infusion on days 1–4. Administer every 3 wk for three cycles before chemoradiotherapy starts. If GI toxicity occurs, consider reducing dosage of 5-FU, docetaxol, or both.
- *Advanced gastric adenocarcinoma*: 75 mg/m² IV as a 1-hr infusion followed by cisplatin 75 mg/m² IV as a 1- to 3-hr infusion (both on day 1), followed by 5-FU 750 mg/m²/day IV as a 24-hr infusion for 5 days. Repeat cycle every 3 wk.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
IV	Slow	20–24 hr

Metabolism: Hepatic; T_{1/2}: 36 min and 11.1 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Dilute concentrate with provided diluent; resultant concentration is 10 mg/mL. Stand vials at room temperature for 5 min before diluting; stable at room temperature for 8 hr; refrigerate unopened vials, protect from light; avoid use of PVC infusion bags and tubing. Final dilution: Add to 250 mL normal saline solution or 5% dextrose injection; final concentration is 0.3–0.74 mg/mL. Premedicate patient with oral corticosteroids before beginning infusion.

Infusion: Administer over 1 hr.

Adverse effects

- **CNS:** Neurosensory disturbances, including paresthesias, pain, *asthenia*
- **CV:** Sinus tachycardia, hypotension, arrhythmias, **fluid retention**
- **GI:** *Nausea, vomiting, diarrhea, stomatitis*, constipation
- **Hematologic:** **Bone marrow depression, infection**
- **Other:** *Hypersensitivity reactions, myalgia, arthralgia, alopecia*

Interactions

* **Drug-drug** • Possible increase in effectiveness and toxicity with cyclosporine, ketoconazole, erythromycin; avoid these combinations • Avoid giving live vaccines within 3 mo of administration because of immunosuppression

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Taxotere* (docetaxel) and *Taxol* (paclitaxel). Serious adverse effects can occur; use extreme caution.

Assessment

- **History:** Hypersensitivity to docetaxel, polysorbate 80; bone marrow depression; hepatic impairment, pregnancy, lactation

- **Physical:** Neurologic status; T; P; BP, peripheral perfusion; abdominal examination, mucous membranes; LFTs, CBC

Interventions

⊗ **Black box warning** Do not give drug unless blood counts are within acceptable parameters (neutrophils exceed 1,500 cells/m²).

⊗ **Warning** Handle drug with great care; wearing gloves is recommended; if drug comes into contact with skin, wash immediately with soap and water.

⊗ **Warning** Premedicate patient before administration with oral corticosteroids (eg, dexamethasone 16 mg/day PO for 3 days starting 1 day before docetaxel administration) to reduce severity of fluid retention.

- Monitor BP and P during administration.
- Arrange for blood counts before and regularly during therapy.
- Monitor patient's neurologic status frequently during treatment; provide safety measures as needed.

⊗ **Black box warning** Do not give with hepatic impairment; increased risk of toxicity and death. Monitor LFTs carefully.

⊗ **Black box warning** Monitor patient for hypersensitivity reactions, possibly severe; do not give with history of hypersensitivity.

⊗ **Black box warning** Monitor patient carefully for fluid retention and treat accordingly.

Teaching points

- This drug is given IV once every 3 weeks; mark calendar with days to return for treatment.
- You may experience these side effects: Nausea and vomiting (if severe, antiemetics may be helpful; eat frequent small meals); weakness, lethargy (take frequent rest periods); increased susceptibility to infection (avoid crowds, exposure to many people or diseases); numbness and tingling in fingers or toes (avoid injury to these areas; use care if performing tasks that require precision); loss of hair (arrange for a wig or other head covering; keep the head covered at extremes of temperature).
- Report severe nausea and vomiting; fever, chills, sore throat; unusual bleeding or bruising; numbness or tingling in fingers or toes; fluid retention or swelling.

dofetilide

(*doe fe' ti lyed*)

Tikosyn

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic

Therapeutic actions

Selectively blocks potassium channels, widening the QRS complex and prolonging the action potential; has no effect on calcium channels or cardiac contraction; Class III antiarrhythmic.

Indications

- Conversion of atrial fibrillation or flutter to normal sinus rhythm
- Maintenance of normal sinus rhythm in patients with atrial fibrillation or flutter of more than 1-week's duration who have been converted to sinus rhythm

Contraindications and cautions

- Contraindicated with hypersensitivity to dofetilide, ibutilide; second- or third-degree AV heart block; prolonged QT intervals; lactation.
- Use cautiously with ventricular arrhythmias, renal impairment, severe hepatic impairment, pregnancy.

Available forms

Capsules—125, 250, 500 mcg

Dosages

Adults

Dosage is based on ECG response and creatinine clearance. For creatinine clearance greater than 60 mL/min, 500 mcg bid PO; for creatinine clearance 40–60 mL/min, 250 mcg bid PO; for creatinine clearance 20–less than 40 mL/min, 125 mcg bid PO; for creatinine clearance less than 20 mL/min, use is contraindicated.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 10 hr

Distribution: May cross placenta, may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, fatigue*, light-headedness, dizziness, tingling in arms, numbness
- **CV: Ventricular arrhythmias**, hypotension, hypertension
- **GI:** Nausea, flatulence, diarrhea

Interactions

★ **Drug-drug** ⊗ **Warning** Increased risk of serious to life-threatening arrhythmias with disopyramide, quinidine, procainamide, amiodarone, sotalol; do not give together • Increased risk of proarrhythmias if given with phenothiazines, TCAs, antihistamines • Increased risk of serious adverse effects if given with verapamil, cimetidine, trimethoprim, ketoconazole; do not use these combinations

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to dofetilide, ibutilide; second- or third-degree AV heart block, time of onset of atrial arrhythmia; prolonged QT intervals; pregnancy; lactation; ventricular arrhythmias
- **Physical:** Orientation, BP, P, auscultation, ECG, R, adventitious sounds, renal function tests

Interventions

- Dofetilide is only available to those who have completed a *Tikosyn* education program.
- Determine time of onset of arrhythmia and timing of conversion to sinus rhythm before beginning therapy (for maintenance).
- ⊗ **Black box warning** Monitor patient's ECG before and periodically during administration; monitor continually for at least 3 days. Dosage may be adjusted based on the maintenance of sinus rhythm. Risk of induced arrhythmias exist.

- Monitor serum creatinine prior to and every 3 mo during treatment; periodically monitor potassium, magnesium levels.
- Do not attempt electroconversion within 24 hr of starting therapy; if then successful, closely monitor patient for 3 days.
- Provide appointments for continued follow-up including ECG monitoring; tendency to revert to the atrial arrhythmia after conversion increases with length of time patient was in the abnormal rhythm.

Teaching points

- This drug should be taken twice a day at the same time each day. It will help to keep your heart in a normal rhythm.
- If you miss a dose, skip the dose and resume regular dosing schedule. Do not double up on doses.
- Arrange for follow-up medical evaluation, including ECG, which is important to monitor the effect of this drug on your heart.
- These side effects may occur: Headache, fatigue, dizziness, light-headedness (avoid driving a car or operating dangerous equipment if these effects occur).
- Report chest pain, difficulty breathing, numbness or tingling, palpitations.

dolasetron mesylate (*doe laz' e tron*)

Anzemet

PREGNANCY CATEGORY B

Drug classes

Antiemetic

Serotonin receptor blocker

Therapeutic actions

Selectively binds to serotonin receptors in the CTZ, blocking the nausea and vomiting caused by the release of serotonin by mucosal cells during chemotherapy, radiotherapy, or surgical invasion (an action that stimulates the CTZ and causes nausea and vomiting).

Indications

- Prevention and treatment of nausea and vomiting associated with emetogenic chemotherapy
- Prevention of postoperative nausea and vomiting
- Injection only: Treatment of postoperative nausea and vomiting
- Unlabeled use: Treatment and prevention of radiation therapy–induced nausea and vomiting

Contraindications and cautions

- Contraindicated with allergy to dolasetron or any of its components; markedly prolonged QTc interval, second- or third-degree AV block.
- Use cautiously in any patient at risk of developing prolongation of cardiac conduction intervals, especially QT interval (congenital QT syndrome, hypokalemia, hypomagnesemia), pregnancy, lactation.

Available forms

Tablets—50, 100 mg; injection—12.5 mg/0.625 mL, 20 mg/mL

Dosages

Adults

100 mg PO within 1 hr before chemotherapy or within 2 hr before surgery; or 1.8 mg/kg IV about 30 min before chemotherapy or 100 mg IV injection. For prevention of postoperative nausea and vomiting, 12.5 mg IV about 15 min before stopping anesthesia. For treatment of postoperative nausea and vomiting, 12.5 mg IV as soon as needed.

Pediatric patients 2–16 yr

1.8 mg/kg PO using tablets or injection diluted in apple or apple-grape juice within 1 hr before chemotherapy; for prevention of postoperative nausea and vomiting, 1.2 mg/kg PO using tablets or injection diluted in apple or apple-grape juice within 2 hr before surgery; or 1.8 mg/kg IV for chemotherapy–induced nausea and vomiting about 30 min before chemotherapy; up to a maximum of 100 mg; 0.35 mg/kg IV about 15 min before stopping anesthesia to prevent postoperative nausea and vomiting; 0.35 mg/kg IV as soon as needed to treat postoperative nausea and vomiting; up to a maximum of 12.5 mg per dose.

Pediatric patients younger than 2 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr
IV	Immediate	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 3.5–5 hr**Distribution:** May cross placenta; may enter breast milk**Excretion:** Feces, urine**IV FACTS**

Preparation: Dilute in 50 mL 5% dextrose injection, 0.9% sodium chloride injection, 5% dextrose and 0.45% sodium chloride injection, lactated Ringer's, 10% mannitol; 3% sodium chloride injection; do not mix in any alkaline solution, precipitates may form. Stable at room temperature for 24 hr, or 48 hr if refrigerated, after dilution.

Infusion: Up to 100 mg may be administered IV undiluted over 30 sec or infuse diluted over up to 15 min.

Incompatibilities: Dilute only in recommended solutions. IV infusion line should be flushed before and after administration.

Adverse effects

- **CNS:** Headache, dizziness, somnolence, drowsiness, sedation, fatigue
- **CV:** Tachycardia, ECG changes
- **GI:** Diarrhea, constipation, abdominal pain
- **Other:** Fever, pruritus, injection site reaction

Interactions

★ **Drug-drug** • Possible cardiac arrhythmias with drugs that cause ECG interval prolongation • Potential for severe toxic reaction with high-dose anthracycline therapy • Decreased levels if combined with rifampin

■ Nursing considerations**Assessment**

- **History:** Allergy to dolasetron, pregnancy, lactation, QTc prolongation, hypokalemia, hypomagnesemia, pregnancy, lactation
- **Physical:** Orientation, reflexes, affect; BP; P, baseline ECG

Interventions

- If patient is unable to swallow tablets, dilute injection in apple or apple-grape juice; dosage remains the same; solution is stable for 2 hr at room temperature.
- Provide mouth care, sugarless lozenges to suck to help alleviate nausea.
- Obtain baseline ECG and periodically monitor ECG in any patient at risk for QTc prolongation.
- Provide appropriate analgesics for headache.

Teaching points

- This drug may be given IV or orally when you are receiving your chemotherapy; it will help decrease nausea and vomiting.
- You may experience these side effects: Dizziness, drowsiness (use caution if driving or performing tasks that require alertness), diarrhea; headache (appropriate medication will be arranged to alleviate this problem).
- Report severe headache, fever, numbness or tingling, palpitations, fainting episodes, change in color of stools or urine.

donepezil hydrochloride*(doe nep' ab zill)*

Aricept, Aricept ODT

PREGNANCY CATEGORY C**Drug classes**Alzheimer's disease drug
Cholinesterase inhibitor**Therapeutic actions**

Centrally acting reversible cholinesterase inhibitor leading to elevated acetylcholine levels in the cortex, which slows the neuronal degradation that occurs in Alzheimer's disease.

Indications

- Treatment of dementia of the Alzheimer's type, including severe dementia
- Unlabeled uses: Possible treatment for vascular dementia; improvement of memory in MS patients

Contraindications and cautions

- Contraindicated with allergy to donepezil.
- Use cautiously with sick sinus syndrome, GI bleeding, seizures, asthma, pregnancy, lactation.

Available forms

Tablets—5, 10, 23 mg; orally disintegrating tablets—5, 10 mg; oral solution—1 mg/mL

Dosages**Adults**

5 mg PO daily at bedtime for mild to moderate disease. May be increased to 10 or 23 mg daily after 4–6 wk. 10 mg PO daily for severe disease.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–4 hr

Metabolism: Hepatic; $T_{1/2}$: 70 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Insomnia, fatigue*, dizziness, confusion, ataxia, somnolence, tremor, agitation, depression, anxiety, abnormal thinking
- **CV:** Bradycardia
- **Dermatologic:** *Rash*, flushing, purpura
- **GI:** *Nausea, vomiting, diarrhea, dyspepsia, anorexia, abdominal pain*, flatulence, constipation, **hepatotoxicity**
- **Other:** *Muscle cramps*

Interactions

- *** Drug-drug** • Increased effects and risk of toxicity with theophylline, cholinesterase inhibitors • Decreased effects of anticholinergics
- Increased risk of GI bleeding with NSAIDs
- Decreased efficacy with anticholinergics

■ Nursing considerations**CLINICAL ALERT!**

Name confusion has occurred between *Aricept* (donepezil) and *Aciphex* (rabeprazole); use caution.

Assessment

- **History:** Allergy to donepezil, pregnancy, lactation, sick sinus syndrome, GI bleeding, seizures, asthma
- **Physical:** Orientation, affect, reflexes; BP, P; abdominal examination; renal function tests, LFTs

Interventions

- Administer at bedtime each day.
- Provide small, frequent meals if GI upset is severe.
- Place orally disintegrating tablet on tongue; allow to dissolve and follow with water.
- Notify surgeons that patient is on donepezil; exaggerated muscle relaxation may occur if succinylcholine-type drugs are used.

Teaching points

- Take this drug exactly as prescribed, at bedtime.
- Place orally disintegrating tablet on your tongue; allow it to dissolve and then drink water.
- This drug does not cure the disease but is thought to slow down the degeneration associated with the disease.
- Continue taking this drug if no change in symptoms is noted.
- Arrange for regular blood tests and follow-up visits while adjusting to this drug.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); insomnia, fatigue, confusion (use caution if driving or performing tasks that require alertness).
- Report severe nausea, vomiting, changes in stool or urine color, diarrhea, changes in neurologic functioning, yellowing of eyes or skin.

DANGEROUS DRUG

DOPamine hydrochloride
(*doe' pa meen*)

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic agonist

Beta₁-selective adrenergic agonist

Dopaminergic drug
Sympathomimetic

Therapeutic actions

Drug acts directly and by the release of norepinephrine from sympathetic nerve terminals; dopaminergic receptors mediate dilation of vessels in the renal and splanchnic beds, which maintains renal perfusion and function; alpha receptors, which are activated by higher doses of dopamine, mediate vasoconstriction, which can override the vasodilating effects; beta₁ receptors mediate a positive inotropic effect on the heart.

Indications

- Correction of hemodynamic imbalances present in the shock syndrome due to MI, trauma, endotoxic septicemia, open heart surgery, renal failure, and chronic cardiac decompensation in heart failure
- Poor perfusion of vital organs
- Low cardiac output
- Hypotension
- Unlabeled uses: COPD, heart failure, RDS in infants

Contraindications and cautions

- Contraindicated with pheochromocytoma, tachyarrhythmias, ventricular fibrillation, hypovolemia (dopamine is not a substitute for blood, plasma, fluids, electrolytes, which should be restored promptly when loss has occurred), general anesthesia with halogenated hydrocarbons or cyclopropane, which sensitize the myocardium to catecholamines.
- Use cautiously with atherosclerosis, arterial embolism, Raynaud's disease, cold injury, frostbite, diabetic endarteritis, Buerger's disease (monitor color and temperature of extremities), pregnancy, lactation.

Available forms

Injection—40, 80, 160 mg/mL; injection in 5% dextrose—80, 160, 320 mg/100 mL

Dosages

Dilute before using; administer only by IV infusion, using an infusion pump to control the rate of flow. Titrate on the basis of patient's hemodynamic and renal response. Close monitoring is necessary. In titrating to desired sys-

toxic BP response, optimum administration rate for renal response may be exceeded, thus necessitating a reduction in rate after hemodynamic stabilization.

Adults

- *Patients likely to respond to modest increments of cardiac contractility and renal perfusion:* Initially, 2–5 mcg/kg/min IV.
- *Patients who are more seriously ill:* Initially, 5 mcg/kg/min IV. Increase in increments of 5–10 mcg/kg/min up to a rate of 20–50 mcg/kg/min. Check urine output frequently if doses exceed 16 mcg/kg/min.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	10 min	Length of infusion

Metabolism: Hepatic; T_{1/2}: 2 min

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Prepare solution for IV infusion as follows: Add 200–400 mg dopamine to 250–500 mL of one of the following IV solutions: 0.9% sodium chloride solution; 5% dextrose injection; 5% dextrose and 0.45% or 0.9% sodium chloride solution; 5% dextrose in lactated Ringer's solution; sodium lactate (1/6 Molar) injection; lactated Ringer's injection. Commonly used concentrations are 800 mcg/mL (200 mg in 250 mL) and 1,600 mcg/mL (400 mg in 250 mL). The 160-mg/mL concentrate may be preferred in patients with fluid retention. Protect drug solutions from light; drug solutions should be clear and colorless.

Infusion: Determine infusion rate based on patient response.

Incompatibilities: Do not mix with other drugs; do not add to 5% sodium bicarbonate or other alkaline IV solutions, oxidizing drugs, or iron salts because drug is inactivated in alkaline solution (solutions become pink to violet).

Y-site incompatibilities: Do not give with acyclovir, alteplase, amphotericin B.

Adverse effects

- **CNS:** Headache, anxiety
- **CV:** *Ectopic beats, tachycardia, anginal pain, palpitations, hypotension, vasoconstriction, dyspnea*, bradycardia, hypertension, widened QRS
- **GI:** *Nausea, vomiting*
- **Other:** Piloerection, azotemia, gangrene with prolonged use

Interactions

★ **Drug-drug** • Increased effects with MAOIs, TCAs (imipramine) • Increased risk of hypertension with methyldopa • Seizures, hypotension, bradycardia when infused with phenytoin

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between dopamine and dobutamine; use caution.

Assessment

- **History:** Pheochromocytoma, tachyarrhythmias, ventricular fibrillation, hypovolemia, general anesthesia with halogenated hydrocarbons or cyclopropane, occlusive vascular disease, pregnancy, labor, and delivery
- **Physical:** Body weight; skin color, T, P, BP, pulse pressure; R, adventitious sounds; urine output; serum electrolytes, Hct, ECG

Interventions

⊗ **Warning** Exercise extreme caution in calculating and preparing doses; dopamine is a very potent drug; small errors in dosage can cause serious adverse effects. Drug should always be diluted before use if not prediluted.

- Reduce initial dosage to one-tenth of usual dose in patients who have been on MAOIs.
- Administer into large veins of the antecubital fossa in preference to veins in hand or ankle.

⊗ **Black box warning** To prevent sloughing and necrosis after extravasation, infiltrate area with 10–15 mL saline containing

5–10 mg phentolamine. Do so as soon as possible after extravasation occurs.

- Monitor urine flow, cardiac output, and BP closely during infusion.

Teaching points

- Drug is used only in acute emergency; teaching will depend on patient's awareness and will relate mainly to patient's status and monitors, rather than to drug. Instruct patient to report any pain at injection site.

▽ doripenem

(door *ib pen'* em)

Doribax

PREGNANCY CATEGORY B

Drug class

Carbapenem antibiotic

Therapeutic actions

Drug inhibits synthesis of bacterial cell wall and causes cell death in susceptible cells. Structure and action are similar to those of beta lactams.

Indications

- Treatment of complicated intra-abdominal infections caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacteroides caccea*, *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Streptococcus intermedius*, *Streptococcus constellatus*, *Peptostreptococcus micros*
- Treatment of complicated UTI, including pyelonephritis, caused by *E. coli*, *K. pneumoniae*, *Proteus mirabilis*, *P. aeruginosa*, *Acinetobacter baumannii*

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of this drug or drugs in this class; history of anaphylactic reaction to beta-lactams.
- Use cautiously with sodium valproate therapy, pregnancy, lactation.

Available forms

Single-use vials—500 mg

Dosages**Adults**

500 mg IV over 1 hr every 8 hr for 5–14 days (intra-abdominal infection) or for 10 days (UTI or pyelonephritis).

Patients with renal impairment

If creatinine clearance is equal to or greater than 30 and equal to or less than 50 mL/min, 250 mg IV every 8 hr; if creatinine clearance is greater than 10 and less than 30 mL/min, 250 mg IV every 12 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	End of infusion	Length of infusion

Metabolism: Hepatic; $T_{1/2}$: 1 hr

Distribution: Does not cross placenta; may enter breast milk

Excretion: Unchanged in urine

IV FACTS

Preparation: Constitute vial with 10 mg sterile water for injection or 0.9% sodium chloride injection; gently shake to form a suspension (concentration is 50 mg/mL). Add suspension to 100 mL normal saline solution or 5% dextrose; gently shake until clear. Infusion concentration is 4.5 mg/mL. If using normal saline solution, drug stays stable for 8 hr at room temperature or 24 hr refrigerated; if using 5% dextrose, stable for 4 hr at room temperature or 24 hr refrigerated. Do not freeze.

Infusion: Infuse over 1 hr.

Incompatibility: Do not mix with or add to solutions containing any other drugs.

Adverse effects

- **CNS:** Headache
- **GI:** Nausea, diarrhea, including *C. difficile* diseases
- **Other:** Rash, phlebitis, superinfection, hypersensitivity reaction

Interactions

* **Drug-drug** • Risk for significant reduction in serum valproic acid level and risk of seizures if combined; alternative antibiotic

treatment should be considered • Increased serum doripenem level if combined with probenecid; avoid this combination

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to doripenem, its components, drugs of this class, or beta lactams; pregnancy, lactation
- **Physical:** T, orientation, abdominal examination

Interventions

- Obtain culture and sensitivity tests to ensure appropriate use of the drug.
- Ensure that patient is not controlling seizures with valproic acid therapy; serious drug interaction and seizures could occur.
- Do not administer by inhalation; serious pneumonitis has occurred.
- Administer IV every 8 hr for full length of prescribed dose to prevent emergence of resistant strains of bacteria.
- Monitor injection site for possible phlebitis.
- Encourage women of childbearing age to use barrier contraceptives while on this drug because effects of drug on fetus are not known.
- Advise lactating women to find another method of feeding; potential effects on the baby are not known.
- Monitor patient for possible *C. difficile* diarrhea. Provide fluid and electrolyte management, protein supplements, and antibiotic treatment as needed. Monitor patient for up to 2 mo after therapy.

Teaching points

- This drug is given by IV infusion every 8 hours for 5–14 days, depending on your infection and your response to the drug; it is important to complete the full course of drug therapy.
- If you are being treated as an outpatient and miss a dose, contact your health care provider immediately.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, another method of feeding the baby should be selected.
- It is not known how this drug could affect a fetus, if you are pregnant or decide to become

pregnant while on this drug, consult your health care provider.

- You may experience these side effects: Headache (consult your health care provider, medication may be available to help); nausea (frequent small meals may help); diarrhea (if it becomes severe, contact your health care provider immediately); irritation and inflammation at the injection site.
- Report difficulty breathing; severe or persistent rash, redness, or pain at the injection site; severe diarrhea.

dornase alfa

See Appendix U, *Less commonly used drugs*.

doxapram hydrochloride (*docks' a pram*)

Dopram

PREGNANCY CATEGORY B

Drug classes

Analeptic
Respiratory stimulant

Therapeutic actions

Stimulates the peripheral carotid chemoreceptors to cause an increase in tidal volume and slight increase in respiratory rate; this stimulation also has a pressor effect.

Indications

- To stimulate respiration in patients with drug-induced postanesthesia respiratory depression or apnea; also used to “stir up” patients in combination with oxygen postoperatively
- To stimulate respiration, hasten arousal in patients experiencing drug-induced CNS depression
- As a temporary measure in hospitalized patients with acute respiratory insufficiency superimposed on COPD
- Unlabeled use: Treatment of apnea of prematurity when methylxanthines have failed, obstructive sleep apnea, laryngospasm secondary to tracheal extubation

Contraindications and cautions

- Contraindicated with newborns (contains benzyl alcohol), epilepsy, incompetence of the ventilatory mechanism, flail chest, hypersensitivity to doxapram, head injury, pneumothorax, acute bronchial asthma, pulmonary fibrosis, severe hypertension, CVA.
- Use cautiously with pregnancy, lactation.

Available forms

Injection—20 mg/mL

Dosages

Adults

- *Postanesthetic use*: Single injection of 0.5–1 mg/kg IV; do not exceed 1.5 mg/kg as a total single injection or 2 mg/kg when given as multiple injections at 5-min intervals.

Infusion

250 mg in 250 mL of dextrose or sodium chloride solution; initiate at 5 mg/min until response is seen; maintain at 1–3 mg/min; recommended total dose is 300 mg or 4 mg/kg.

- *COPD associated with acute hypercapnia*: Mix 400 mg in 180 mL of IV infusion; start infusion at 1–2 mg/min (0.5–1 mL/min); check blood gases, and adjust rate accordingly. Do not use for longer than 2 hr. Maximum of 3 mg/min.
- *Management of drug-induced CNS depression*:

Intermittent injection

Priming dose of 1–2 mg/kg IV; repeat in 5 min. Repeat every 1–2 hr until patient awakens; if relapse occurs, repeat at 1–2 hr intervals.

Intermittent IV infusion

Priming dose of 1–2 mg/kg IV; if no response, infuse 250 mg in 250 mL of dextrose or saline solution at a rate of 1–3 mg/min, discontinue at end of 2 hr if patient awakens; repeat in 30 min–2 hr if relapse occurs; do not exceed 3 g/day.

Pediatric patients

Do not give to children younger than 12 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	20–40 sec	1–2 min	5–12 min

Metabolism: Hepatic; $T_{1/2}$: 2.4–4.1 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Add 250 mg doxapram to 250 mL of 5% or 10% dextrose or 0.9% sodium chloride solution.

Infusion: Initiate infusion at 5 mg/min; once response is seen, 1–3 mg/min is satisfactory.

Incompatibilities: Do not mix in alkaline solutions—precipitate or gas may form; aminophylline, sodium bicarbonate, thiopental.

Adverse effects

- **CNS:** Headache, dizziness, apprehension, disorientation, pupillary dilation, *increased reflexes*, hyperactivity, **seizures**, muscle spasticity, clonus, pyrexia, flushing sweating
- **CV:** Arrhythmias, chest pain, tightness in the chest, *increased BP*
- **GI:** Nausea, vomiting, diarrhea
- **GU:** Urinary retention, spontaneous voiding, proteinuria
- **Hematologic:** Decreased Hgb, Hct
- **Respiratory:** Cough, dyspnea, tachypnea, laryngospasm, **bronchospasm**, hiccups, rebound hypoventilation, hyperventilation

Interactions

* **Drug-drug** • Increased pressor effect with sympathomimetics, MAOIs • Increased effects with halothane, cyclopropane, enflurane (delay treatment for at least 10 min after discontinuance of anesthesia) • Possible masked residual effects of muscle relaxants if combined with doxapram • Risk of increased muscle activity, agitation with aminophylline, theophylline; use caution

■ Nursing considerations

Assessment

- **History:** Epilepsy, incompetence of the ventilatory mechanism, flail chest, hypersensitivity to doxapram, head injury, pneumothorax, acute bronchial asthma, pulmonary fibrosis, severe hypertension, CVA, lactation, pregnancy
- **Physical:** T; skin color; weight; R, adventitious sounds; P, BP, ECG; reflexes; urinary output; arterial blood gases, CBC

Interventions

- Administer IV only.
- ⊗ **Warning** Monitor injection site for extravasation. Discontinue, and restart in another vein if extravasation occurs; apply cold compresses.
- Monitor patient carefully until fully awake—P, BP, ECG, reflexes and respiratory status. Patients with COPD should have arterial blood gases monitored during drug use.
- Do not use longer than 2 hr.
- ⊗ **Warning** Discontinue drug and notify physician if deterioration, sudden hypotension, or dyspnea occurs.

Teaching points

- Drug is used in emergency; patient teaching should be general and include procedure and drug.

▷ doxazosin mesylate (dox ay' zoe sin mess' ab late)

Cardura, Cardura XL DNC

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic blocker
Antihypertensive

Therapeutic actions

Reduces total peripheral resistance through alpha-blockade, causing an antihypertensive effect. The degree of smooth muscle tone in prostate/bladder neck is also mediated by alpha receptors. Its blockade reduces urethral resistance and relieves obstructions.

Indications

- Treatment of mild-to-moderate hypertension, alone or as part of combination therapy
- Treatment of BPH

Contraindications and cautions

- Contraindicated with lactation.
- Use cautiously with allergy to doxazosin, heart failure, renal failure, pregnancy, hepatic impairment.

Available forms

Tablets—1, 2, 4, 8 mg; ER tablets **ORC**—4, 8 mg

Dosages**Adults**

- **Hypertension:** Initially, 1 mg daily PO, given once daily. For maintenance, 2, 4, 8, or 16 mg daily PO, given once a day; dose may be increased every 2 wk. Do not use ER tablets.
- **BPH:** Initially, 1 mg PO daily; for maintenance, may increase to 2 mg, 4 mg, 8 mg daily, adjusted at 1–2 wk intervals. For ER tablets, 4 mg PO once daily at breakfast; may be increased after 3–4 wk to maximum of 8 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 22 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **CNS:** *Headache, fatigue, dizziness, postural dizziness, lethargy, vertigo*, asthenia, anxiety, paresthesia, insomnia, eye pain, conjunctivitis
- **CV:** *Tachycardia, palpitations, edema, orthostatic hypotension*, chest pain
- **GI:** *Nausea, dyspepsia, diarrhea*, abdominal pain, flatulence, constipation
- **GU:** *Sexual dysfunction*, increased urinary frequency
- **Other:** Dyspnea, increased sweating, rash, rhinitis, muscle cramps

Interactions

* **Drug-drug** • Increased hypotensive effects if taken with alcohol, nitrates, other antihypertensives

■ Nursing considerations**Assessment**

- **History:** Allergy to doxazosin, heart failure, renal failure, hepatic impairment, lactation, pregnancy

- **Physical:** Weight; skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds, status of nasal mucous membranes; bowel sounds, normal output; voiding pattern, normal output; renal function tests, urinalysis

Interventions

- Ensure that patient does not cut, crush, or chew ER tablets.
- Monitor edema, weight in patients with incipient cardiac decompensation, and arrange to add a thiazide diuretic to the drug regimen if sodium and fluid retention, signs of impending heart failure occur.

⊗ **Warning** Monitor patient carefully with first dose; chance of orthostatic hypotension, dizziness and syncope are great with the first dose. Establish safety precautions.

- Monitor signs and symptoms of BPH to adjust dosage.

Teaching points

- Take this drug exactly as prescribed, once a day. Do not cut, crush, or chew extended-release tablets. Dizziness or syncope may occur at beginning of therapy. Change position slowly to avoid increased dizziness. Taking your first dose at bedtime may decrease excessive dizziness.
- You may experience these side effects: Dizziness, weakness (when changing position, in the early morning, after exercise, in hot weather, and after consuming alcohol; some tolerance may occur after a while; avoid driving or engaging in tasks that require alertness; change position slowly, use caution in climbing stairs, lie down if dizziness persists); GI upset (eat frequent small meals); impotence; stuffy nose; most of these effects gradually disappear with continued therapy.
- Report frequent dizziness or fainting.

doxepin hydrochloride

(*dox' e pin*)

Apo-Doxepin (CAN), Sinequan, Zonalon

PREGNANCY CATEGORY C

Drug classes

Antidepressant
TCA (tertiary amine)

Therapeutic actions

Mechanism of action unknown; TCAs inhibit the reuptake of the neurotransmitters norepinephrine and serotonin, leading to an increase in their effects; anticholinergic at CNS and peripheral receptors; sedative.

Indications

- Relief of symptoms of depression (endogenous depression most responsive); sedative effects may help depression associated with anxiety and sleep disturbance
- Treatment of depression in patients with bipolar disorder, psychotic depressive disorders
- Treatment of anxiety
- Treatment of pruritus in adults with atopic dermatitis, lichen chronicus (5% topical cream)
- Unlabeled uses: Neuropathy, neurogenic pain

Contraindications and cautions

- Contraindicated with hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation, pregnancy.
- Use cautiously with EST; preexisting CV disorders (severe coronary heart disease, progressive heart failure, angina pectoris, paroxysmal tachycardia); angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric patients (schizophrenic or paranoid patients may exhibit a worsening of psychosis); patients with bipolar disorder; patients with suicidal ideation (overdose may be fatal); elective surgery (TCAs should be

discontinued as long as possible before surgery); geriatric patients (may be more sensitive to drug and adverse effects).

Available forms

Capsules—10, 25, 50, 75, 100, 150 mg; oral concentrate—10 mg/mL; cream—30-g, 40-g tubes

Dosages

Adults

- *Mild to moderate anxiety or depression:* Initially, 25 mg tid PO; individualize dosage. Usual optimum dosage is 75–150 mg/day; alternatively, total daily dosage, up to 150 mg, may be given at bedtime.
- *More severe anxiety or depression:* Initially, 50 mg tid PO; if needed, may gradually increase to 300 mg/day. Dose may be taken all at once at bedtime.
- *Mild symptomatology or emotional symptoms accompanying organic disease:* 25–50 mg PO is often effective.
- *Pruritus:* Apply cream four times/day at least 3–4 hr apart for 8 days. Do not cover dressing.

Pediatric patients

Not recommended for children younger than 12 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	4 hr

Metabolism: Hepatic; $T_{1/2}$: 8–25 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Sedation and anticholinergic (atropine-like) effects; confusion* (especially in elderly), *disturbed concentration*, hallucinations, disorientation, decreased memory, feelings of unreality, delusions, anxiety, nervousness, restlessness, agitation, panic, insomnia, nightmares, hypomania, mania, exacerbation of psychosis, drowsiness, weakness, fatigue, headache, numbness, tingling, paresthesias of extremities, incoordination, motor hyperactivity, akathisia, ataxia, tremors, peripheral neuropathy,

- extrapyramidal symptoms, seizures, speech blockage, dysarthria, tinnitus, altered EEG
- **CV:** *Orthostatic hypotension*, hypertension, syncope, tachycardia, palpitations, **MI**, arrhythmias, heart block, precipitation of heart failure, CVA
 - **Endocrine:** Elevated or depressed blood sugar; elevated prolactin levels; inappropriate ADH secretion
 - **GI:** *Dry mouth, constipation*, paralytic ileus, *nausea*, vomiting, anorexia, epigastric distress, diarrhea, flatulence, dysphagia, peculiar taste, increased salivation, stomatitis, glossitis, parotid swelling, abdominal cramps, black tongue, hepatitis, jaundice (rare), elevated transaminase, altered alkaline phosphatase
 - **GU:** Urinary retention, delayed micturition, dilation of the urinary tract, gynecomastia, testicular swelling; breast enlargement, menstrual irregularity and galactorrhea; changes in libido; impotence
 - **Hematologic:** Bone marrow depression, including agranulocytosis; eosinophilia, purpura, thrombocytopenia, leukopenia
 - **Hypersensitivity:** Rash, pruritus, vasculitis, petechiae, photosensitization, edema (generalized or of face and tongue), drug fever
 - **Withdrawal:** Symptoms on abrupt discontinuation of prolonged therapy: Nausea, headache, vertigo, nightmares, malaise
 - **Other:** Nasal congestion, excessive appetite, weight gain or loss; sweating (paradoxical effect in a drug with prominent anticholinergic effects), alopecia, lacrimation, hyperthermia, flushing, chills

Interactions

* **Drug-drug** • Increased TCA levels and pharmacologic (especially anticholinergic) effects with cimetidine, fluoxetine • Increased TCA levels (due to decreased metabolism) with methylphenidate, phenothiazines, hormonal contraceptives, disulfiram • Hyperpyretic crises, severe seizures, hypertensive episodes, and deaths with MAOIs • Increased antidepressant response and cardiac arrhythmias with thyroid medication • Increased or decreased effects with estrogens • Delirium with disulfiram • Sympathetic hyperactivity, sinus tachycardia, hypertension, agitation with levodopa • Increased biotrans-

formation of TCAs in patients who smoke cigarettes • Increased sympathomimetic (especially alpha-adrenergic) effects of direct-acting sympathomimetic drugs (norepinephrine, epinephrine), due to inhibition of uptake into adrenergic nerves • Increased anticholinergic effects of anticholinergic drugs (including anticholinergic antiparkinsonian drugs) • Increased response (especially CNS depression) to barbiturates • Increased CNS suppression with alcohol or other CNS depressants; avoid this combination • Decreased antihypertensive effect of clonidine, other antihypertensives (because the uptake of the antihypertensive drug into adrenergic neurons is inhibited) • Decreased effects of indirect-acting sympathomimetic drugs (ephedrine) because of inhibition of uptake into adrenergic nerves

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Sinequan* (doxepin) and saquinavir; use caution.

Assessment

- **History:** Hypersensitivity to any tricyclic drug; concomitant therapy with an MAOI; recent MI; myelography within previous 24 hr or scheduled within 48 hr; lactation; EST; preexisting CV disorders; angle-closure glaucoma, increased IOP, urinary retention, ureteral or urethral spasm; seizure disorders; hyperthyroidism; impaired hepatic, renal function; psychiatric treatment; bipolar disorder; elective surgery; pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes, vision and hearing; P, BP, orthostatic BP, perfusion; bowel sounds, normal output, liver evaluation; urine flow, normal output; usual sexual function, frequency of menses, breast and scrotal examination; LFTs, urinalysis, CBC, ECG

Interventions

- ⊗ **Black box warning** Risk of suicidality in children, adolescents, and young adults increases. Monitor patient accordingly.
- ⊗ **Warning** Limit drug access with depressed and potentially suicidal patients.

- Give most of dose at bedtime if drowsiness or severe anticholinergic effects occur.
- Dilute oral concentrate with approximately 120 mL of water, milk, or fruit juice just prior to administration; do not prepare or store bulk dilutions.
- Expect clinical antianxiety response to be rapidly evident, although antidepressant response may require 2–3 wk.
- Reduce dosage if minor side effects develop; discontinue the drug if serious side effects occur.
- Arrange for CBC if patient develops fever, sore throat, or other sign of infection during therapy.

Teaching points

- Take drug exactly as prescribed; do not stop abruptly or without consulting the health care provider. If using the topical form, do not cover the application area.
- Avoid alcohol, sleep-inducing drugs, over-the-counter drugs.
- Avoid prolonged exposure to sunlight or sunlamps; use a sunscreen or protective garments for exposure to sunlight.
- You may experience these side effects: Headache, dizziness, drowsiness, weakness, blurred vision (reversible; safety measures will be needed if severe; avoid driving or performing tasks that require alertness while these persist); nausea, vomiting, loss of appetite, dry mouth (eat frequent small meals; frequent mouth care and sucking sugarless candies may help); nightmares, inability to concentrate, confusion; changes in sexual function, suicidal thoughts.
- Report dry mouth, difficulty in urination, excessive sedation, suicidal thoughts.

▷ doxercalciferol

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▷ DOXORubicin hydrochloride

(*dox oh roo' bi sin*)

Adriamycin PFS, Adriamycin RDF, Doxil

PREGNANCY CATEGORY D

Drug classes

Antibiotic

Antineoplastic

Therapeutic actions

Cytotoxic: Binds to DNA and inhibits DNA synthesis in susceptible cells, causing cell death.

Indications

- To produce regression in the following neoplasms: ALL, AML, Wilms' tumor, neuroblastoma, soft tissue and bone sarcoma, breast carcinoma, ovarian carcinoma, transitional cell bladder carcinoma, thyroid carcinoma, Hodgkin's and non-Hodgkin's lymphomas, bronchogenic carcinoma
- Liposomal form: Treatment of AIDS-related Kaposi's sarcoma, ovarian cancer that has progressed or recurred after platinum-based chemotherapy

Contraindications and cautions

- Contraindicated with allergy to doxorubicin hydrochloride, malignant melanoma, kidney carcinoma, large bowel carcinoma, brain tumors, CNS metastases, myelosuppression, cardiac disease (may predispose to cardiac toxicity), pregnancy, lactation.
- Use cautiously with impaired hepatic function, previous courses of doxorubicin or daunorubicin therapy (may predispose to cardiac toxicity), prior mediastinal irradiation, concurrent cyclophosphamide therapy (predispose to cardiac toxicity).

Available forms

Powder for injection—10, 20, 50, 100, 150 mg; injection (aqueous)—2 mg/mL; preservative-free injection—2 mg/mL; injection (lipid)—2 mg/mL; liposomal—20-mg, 50-mg injectables

Dosages

Adults

60–75 mg/m² as a single IV injection administered at 21-day intervals. Alternate schedule: 30 mg/m² IV on each of 3 successive days, repeated every 4 wk.

Liposomal form

For AIDS-related Kaposi's sarcoma, 20 mg/m² IV every 3 wk starting with initial rate of 1 mg/min. If no adverse effects, increase rate to complete dose in 1 hr.

For ovarian cancer, initially 50 mg/m² IV at 1 mg/min; if no adverse effects, complete infusion in 1 hr. Repeat every 4 wk.

Patients with elevated bilirubin

For serum bilirubin 1.2–3 mg/100 mL, use 50% of normal dose. For serum bilirubin exceeding 3 mg/100 mL, use 25% of normal dose.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Rapid	2 hr	24–36 hr

Metabolism: Hepatic; T_{1/2}: 12 min, then 3.3 hr, then 29.6 hr

Distribution: May cross placenta; enters breast milk

Excretion: Bile, feces, urine

IV FACTS

Preparation: Reconstitute the 10-mg vial with 5 mL, the 50-mg vial with 25 mL of 0.9% sodium chloride to give a concentration of 2 mg/mL doxorubicin. Reconstituted solution is stable for 7 days at room temperature and normal light or 15 days if refrigerated. Protect from sunlight. Liposomal form: Dilute dose to maximum of 90 mg in 250 mL of 5% dextrose injection; do not use in-line filters; refrigerate and use within 24 hr.

Infusion: Administer slowly into tubing of a freely running IV infusion of sodium chloride injection or 5% dextrose injection; attach the tubing to a butterfly needle inserted into a large vein; avoid veins over joints or in extremities with poor perfusion. Rate of administration will depend on the vein and dosage; do not give in less than 3–5 min; red streaking over the vein and facial flushing are often signs of too-rapid administration. Liposomal form: Single dose infused over 30 min; rapid infusion increases risk of reaction.

Incompatibilities: Do not mix with heparin, dexamethasone sodium phosphatase (a precipitate forms and the IV solution must not be used), aminophylline, and 5-FU (doxorubicin decomposes) denoted by a color change from red to blue-purple.

Y-site incompatibilities: Do not give with furosemide, heparin.

Adverse effects

- **CV: Cardiac toxicity**, heart failure, phlebosclerosis
- **Dermatologic:** *Complete but reversible alopecia*, hyperpigmentation of nailbeds and dermal creases, facial flushing
- **GI:** *Nausea, vomiting, mucositis*, anorexia, diarrhea
- **GU:** *Red urine*
- **Hematologic:** *Myelosuppression*, hyperuricemia due to cell lysis
- **Hypersensitivity:** Fever, chills, urticaria, **anaphylaxis**
- **Local: Severe local cellulitis**, vesication and tissue necrosis if extravasation occurs
- **Other:** Carcinogenesis (documented in experimental models)

Interactions

* **Drug-drug** • Decreased serum levels and actions of digoxin if taken concurrently with doxorubicin

Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between conventional doxorubicin and liposomal doxorubicin; use caution.

Assessment

- **History:** Allergy to doxorubicin hydrochloride, malignant melanoma, kidney carcinoma, large bowel carcinoma, brain tumors, CNS metastases, myelosuppression, cardiac disease, impaired hepatic function, previous courses of doxorubicin or daunorubicin therapy, prior mediastinal irradiation, concurrent cyclophosphamide therapy, lactation, pregnancy
- **Physical:** T; skin color, lesions; weight; hair; nailbeds; local injection site; auscultation, peripheral perfusion, pulses, ECG; R, adventitious sounds; liver evaluation, mucous membranes; CBC, LFTs, uric acid levels

Interventions

- Do not give IM or subcutaneously because severe local reaction and tissue necrosis occur.
- ⊗ **Black box warning** Monitor injection site for extravasation and for reports of

burning or stinging. If these events occur, discontinue administration and restart in another vein. Local subcutaneous extravasation: Local infiltration with corticosteroid may be ordered; flood area with normal saline; apply cold compress to area. If ulceration begins, arrange consultation with plastic surgeon.

⊗ **Black box warning** Monitor patient's response frequently at beginning of therapy: Serum uric acid level, cardiac output (listen for S_3); CBC changes may require a decrease in the dose; consult with physician; risk of heart failure, myelosuppression, liver damage. Record doses received to monitor total dosage; toxic effects are often dose-related, as total dose approaches 550 mg/m².

- Ensure adequate hydration during the course of therapy to prevent hyperuricemia.

Teaching points

- Prepare a calendar of days to return for drug therapy.
- Avoid pregnancy while using this drug; using barrier contraceptives is advised.
- Arrange for regular medical follow-up, including blood tests.
- You may experience these side effects: Rash, skin lesions, loss of hair, changes in nails (you may want to obtain a wig before hair loss occurs; skin care may help); loss of appetite, nausea, mouth sores (frequent mouth care, eat frequent small meals; try to maintain good nutrition; a dietitian may be able to help; an antiemetic may be ordered); red urine (transient).
- Report difficulty breathing, sudden weight gain, swelling, burning or pain at injection site, unusual bleeding or bruising.

▷ doxycycline

(*dox i sye' kleen*)

Adoxa, Apo-Doxy (CAN), Atridox, Doryx, Doxy 100, Doxy 200, Doxycin (CAN), Monodox, Nu-Doxycycline (CAN), Oracea, Periostat, Vibramycin, Vibra-Tabs

PREGNANCY CATEGORY D

Drug classes

Tetracycline antibiotic

Therapeutic actions

Bacteriostatic: Inhibits protein synthesis of susceptible bacteria, causing cell death.

Indications

- Infections caused by rickettsia; *Mycoplasma pneumoniae*; agents of psittacosis, ornithosis, lymphogranuloma venereum, and granuloma inguinale; *Borrelia recurrentis*; *Haemophilus ducreyi*; *Pasteurella pestis*; *Pasteurella tularensis*; *Bartonella bacilliformis*; *Bacteroides*; *Vibrio comma*; *Vibrio fetus*; *Brucella*; *Escherichia coli*; *Enterobacter aerogenes*; *Shigella*; *Acinetobacter calcoaceticus*; *Haemophilus influenzae*, *Klebsiella*, *Streptococcus pneumoniae*, *Staphylococcus aureus*
- When penicillin is contraindicated, infections caused by *Neisseria gonorrhoeae*, *Treponema pallidum*, *Treponema pertenue*, *Listeria monocytogenes*, *Clostridium*, *Bacillus anthracis*, *Chlamydia psittaci*, *Chlamydia trachomatis*
- Oral tetracyclines used for acne, uncomplicated adult urethral, endocervical, or rectal infections caused by *C. trachomatis*
- Acute intestinal amebiasis
- Reduction of incidence and progression of disease following exposure to anthrax
- Malaria prophylaxis for malaria due to *Plasmodium falciparum* for short-term use in travelers
- Treatment of inflammatory lesions (papules and pustules) of rosacea in adults; not for generalized erythema of rosacea
- Treatment of periodontal disease as an adjunct to scaling and root planing
- Unlabeled uses: Prevention of traveler's diarrhea commonly caused by enterotoxigenic *E. coli*; Lyme disease; CDC-recommended treatment of STDs, including granuloma inguinale, syphilis, chlamydial infections in patients older than 8 yr, pelvic inflammatory disease, epididymitis, and sexual assault prophylaxis

Contraindications and cautions

- Contraindicated with allergy to tetracyclines.
- Use cautiously with renal or hepatic impairment, pregnancy, lactation.

Available forms

Tablets—20, 50, 75, 100 mg; DR tablets—75, 100 mg; capsules—50, 100 mg; coated pellets, capsules—75, 100 mg; powder for oral suspension—25 mg; syrup—50 mg/5 mL; powder for injection—100, 200 mg; injection—42.5 mg

Dosages**Adults**

- *Rosacea*: 40 mg/day PO in the morning with a full glass of water, on an empty stomach, for up to 9 mo.

Adults and pediatric patients older than 8 yr and weighing more than 45 kg

200 mg IV in one or two infusions (each over 1–4 hr) on the first treatment day, followed by 100–200 mg/day IV, depending on the severity of the infection, or 200 mg PO on day 1, followed by 100 mg/day PO.

- *Primary or secondary syphilis*: 100 mg PO bid for 14 days.
- *Acute gonococcal infection*: 100 mg PO, then 100 mg at bedtime, followed by 100 mg bid for 3 days; or 300 mg PO followed by 300 mg in 1 hr.
- *Traveler's diarrhea*: 100 mg/day PO as prophylaxis.
- *Malaria prophylaxis*: 100 mg PO daily.
- *Antibrax prophylaxis*: 100 mg PO bid for 60 days.
- *CDC recommendations for STDs*: 100 mg bid PO for 7–28 days, depending on disease being treated.
- *Periodontal disease*: 20 mg PO bid, following scaling and root planing.

Pediatric patients older than 8 yr and weighing less than 45 kg

4.4 mg/kg, IV in one or two infusions, followed by 2.2–4.4 mg/kg/day IV in one or two infusions; or 4.4 mg/kg, PO in two divided doses the first day of treatment, followed by 2.2–4.4 mg/kg/day on subsequent days.

- *Lyme disease*: 100 mg PO bid for 14–21 days.
- *Malaria prophylaxis*: 2 mg/kg/day PO, up to 100 mg/day.
- *Antibrax prophylaxis*: 2.2 mg/kg PO bid for 60 days.

Geriatric patients or patients with renal failure

IV doses of doxycycline may not be as toxic as other tetracyclines in these patients.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.5–4 hr
IV	Rapid	End of infusion

Metabolism: $T_{1/2}$: 15–25 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Prepare solution of 10 mg/mL, reconstitute with 10 mL (100-mg vial): 20 mL (200-mg vial) of sterile water for injection; dilute further with 100–1,000 mL (100-mg vial) or 200–2,000 mL (200-mg vial) of sodium chloride injection, 5% dextrose injection, Ringer's injection, 10% invert sugar in water, lactated Ringer's injection, 5% dextrose in lactated Ringer's, Normosol-M in D₅W, Normosol-R in D₅W, or Plasma-Lyte 56 or 148 in 5% Dextrose. If mixed in lactated Ringer's or 5% dextrose in lactated Ringer's, infusion must be completed within 6 hr after reconstitution; otherwise, may be stored up to 72 hr if refrigerated and protected from light, but infusion should then be completed within 12 hr; discard solution after that time.

Infusion: Infuse slowly over 1–4 hr.

Adverse effects

- **Dental:** *Discoloring and inadequate calcification of primary teeth of fetus if used by pregnant women, discoloring and inadequate calcification of permanent teeth if used during period of dental development*
- **Dermatologic:** *Phototoxic reactions, rash, exfoliative dermatitis* (more frequent and more severe with this tetracycline than with any others)
- **GI:** Fatty liver, **liver failure**, *anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, esophageal ulcer*
- **Hematologic:** **Hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia**, leukocytosis, **leukopenia**

- **Local:** Local irritation at injection site
- **Other:** Superinfections, nephrogenic diabetes insipidus syndrome

Interactions

• **Drug-drug** • Decreased absorption with antacids, iron, alkali • Decreased therapeutic effects with barbiturates, carbamazepine, phenytoins • Increased digoxin toxicity with doxycycline • Increased nephrotoxicity with methoxyflurane • Decreased activity of penicillins

• **Drug-food** • Decreased effectiveness of doxycycline if taken with food, dairy products

• **Drug-lab test** • Interference with culture studies for several days following therapy

■ Nursing considerations

Assessment

- **History:** Allergy to tetracyclines, renal or hepatic impairment, pregnancy, lactation
- **Physical:** Skin status, R and sounds, GI function and liver evaluation, urinary output and concentration, urinalysis and BUN, LFTs, renal function tests; culture infected area before beginning therapy

Interventions

- Patients on long-term treatment for rosacea should be given drug in the morning, on an empty stomach, with a full glass of water.
- Administer the oral medication without regard to food or meals; if GI upset occurs, give with meals; patients being treated for periodontal disease should receive tablet at least 1 hr before morning and evening meals.
- Protect patient from light and sun exposure.

Teaching points

- Take drug throughout the day for best results; if GI upset occurs, take drug with food. If being treated for periodontal disease, take at least 1 hour before morning and evening meals. If being treated for rosacea, take first thing in the morning, on an empty stomach, with a full glass of water.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised.
- You may experience these side effects: Sensitivity to sunlight (wear protective clothing, use sunscreen), diarrhea.

- Report rash, itching, difficulty breathing, dark urine or light-colored stools, pain at injection site.

▷ dronabinol (delta-9-tetrahydrocannabinol, delta-9-THC)

(*droe nab' i nol*)

Marinol

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-III

Drug classes

Antiemetic
Appetite stimulant

Therapeutic actions

Principal psychoactive substance in marijuana; has complex CNS effects; mechanism of action as antiemetic is not understood.

Indications

- Treatment of nausea and vomiting associated with cancer chemotherapy in patients who have failed to respond adequately to conventional antiemetic treatment (should be used only under close supervision by a responsible individual because of potential to alter the mental state)
- Treatment of anorexia associated with weight loss in patients with AIDS for appetite stimulation

Contraindications and cautions

- Contraindicated with allergy to dronabinol or sesame oil vehicle in capsules, nausea and vomiting arising from any cause other than cancer chemotherapy, lactation.
- Use cautiously with hypertension; heart disease; manic, depressive, schizophrenic patients (dronabinol may unmask symptoms of these disease states); pregnancy; history of substance abuse; seizures.

Available forms

Capsules—2.5, 5, 10 mg

Dosages

Adults and pediatric patients

- **Antiemetic:** Initially, 5 mg/m² PO 1–3 hr prior to the administration of chemotherapy. Repeat dose every 2–4 hr after chemotherapy is given, for a total of four to six doses per day. If the 5 mg/m² dose is ineffective and there are no significant side effects, increase dose by 2.5 mg/m² increments to a maximum of 15 mg/m² per dose.
- **Appetite stimulation:** Initially, give 2.5 mg PO bid before lunch and supper. May reduce dose to 2.5 mg/day as a single evening or bedtime dose; up to 10 mg PO bid (not recommended for pediatric use).

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	2–4 hr	4–6 hr

Metabolism: Hepatic; T_{1/2}: 25–36 hr

Distribution: May cross placenta; enters breast milk

Excretion: Bile, feces, urine

Adverse effects

- **CNS:** *Drowsiness; elation, laughing easily; heightened awareness, “high” dizziness; anxiety; muddled thinking; perceptual difficulties; impaired coordination; irritability; depression; weird feeling, weakness, sluggishness, headache; unsteadiness, hallucinations, memory lapse;* paresthesia, visual distortions; ataxia; paranoia, depersonalization; disorientation, confusion; tinnitus, nightmares, speech difficulty
- **CV:** Tachycardia, orthostatic hypotension; syncope
- **Dependence:** Psychological and physical dependence; tolerance to CNS and subjective effects after 30 days of use; withdrawal syndrome (irritability, insomnia, restlessness, hot flashes, sweating, rhinorrhea, loose stools, hiccups, anorexia) beginning 12 hr and ending 96 hr after discontinuation of high doses of the drug
- **Dermatologic:** Facial flushing, perspiring
- **GI:** *Dry mouth,* nausea, vomiting
- **GU:** Decrease in pregnancy rate, spermatogenesis when doses higher than those used clinically were given in preclinical studies

Interactions

• **Drug-drug** • Do not give with ritonavir, alcohol, sedatives, hypnotics, other psychotomimetic substances • Increased tachycardia, hypertension, drowsiness with anticholinergics, antihistamines, TCAs • Use caution if combined with dofetilide

Nursing considerations

Assessment

- **History:** Allergy to dronabinol or sesame oil vehicle in capsules; nausea and vomiting arising from any cause other than cancer chemotherapy; hypertension; heart disease; manic, depressive, schizophrenic disorders; lactation; pregnancy; seizures; substance abuse
- **Physical:** Skin color, texture; orientation, reflexes, bilateral grip strength, affect; P, BP, orthostatic BP; status of mucous membranes

Interventions

- Store capsules in refrigerator.
- Limit prescriptions to the minimum necessary for a single cycle of chemotherapy because of abuse potential.
- Warn patient about drug's profound effects on mental status and abuse potential before giving drug; patient needs full information regarding the use of this drug.
- Warn patient about drug's potential effects on mood and behavior to prevent panic in case these occur.
- Patient should be supervised by a responsible adult while taking drug; monitor during the first cycle of chemotherapy in which dronabinol is used to determine how long patient will need supervision.
- **Warning** Discontinue drug if psychotic reaction occurs; observe patient closely until evaluated and counseled; patient should participate in decision about further use of drug, perhaps at lower dosage.

Teaching points

- Take drug exactly as prescribed; a responsible adult should be with you at all times while you are taking this drug.
- Avoid alcohol, sedatives, and over-the-counter drugs, including nose drops and cold remedies, while you are taking this drug.

- You may experience these side effects: Mood changes (euphoria, feeling “high” or weird, laughing, anxiety, depression, hallucinations, memory lapse, impaired thinking); weakness, faintness (change position slowly to avoid injury); dizziness, drowsiness (do not drive or perform tasks that require alertness if you experience these effects).
- Report bizarre thoughts, uncontrollable behavior or thought processes, fainting, dizziness, irregular heartbeat.

dronedarone (drob neh' dab roan)

Multaq

PREGNANCY CATEGORY X

Drug class

Antiarrhythmic

Therapeutic actions

Mechanism of action is not clear. Has properties of all antiarrhythmic classes; affects action potential of cardiac cells to alter conduction.

Indications

- To reduce risk of cardiovascular hospitalization in patients with paroxysmal or persistent atrial fibrillation or atrial flutter with a recent episode of either and associated cardiovascular risk factors (age older than 70 yr, hypertension, diabetes, prior CVA, left atrial diameter 50 mm or more, left ventricular ejection factor less than 40%) who are in sinus rhythm or will be cardioverted

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, class IV heart failure or recent acute failure requiring hospitalization or referral to a specialized heart failure clinic, second- or third-degree heart block, sick sinus syndrome, pulse rate less than 50, concomitant use of drugs or herbs that prolong QT interval, prolonged QT interval, severe hepatic impairment, concurrent use of CYP3A inhibitors, pregnancy, lactation.

- Use cautiously with mild to moderate hepatic impairment, hypokalemia, hypomagnesemia, mild to moderate heart failure.

Available forms

Tablets—400 mg

Dosages

Adults

400 mg PO bid with morning and evening meal.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3–6 hr

Metabolism: Hepatic; $T_{1/2}$: 13–19 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces

Adverse effects

- **CV:** Bradycardia, *prolonged QT interval, heart failure*
- **GI:** *Nausea, diarrhea*, vomiting, abdominal pain, dyspepsia
- **Other:** *Asthenic conditions*, hypokalemia, hypomagnesemia, *rash*

Interactions

- *** Drug-drug** • Increased risk of serious arrhythmias if combined with other antiarrhythmics; avoid this combination • Risk of digoxin toxicity if combined with dronedarone; cut digoxin dose in half and monitor patient closely • Risk of calcium channel blocker toxicity if combined; start with low dose of calcium channel blocker and monitor patient closely to verify effects and tolerability • Risk of serious bradycardia with beta blockers; start beta blocker with low dose and monitor patient closely • Risk of serious toxicity with CYP3A inhibitors (clarithromycin, itraconazole, ketoconazole, nefazodone, ritonavir; this combination is contraindicated • Decreased effectiveness with CYP3A inducers (phenobarbital, phenytoin, rifampin); avoid this combination • Increased serum levels of sirolimus, tacrolimus; adjust dosage and monitor patient closely • Risk of increased serum statins levels;

adjust dosage accordingly and monitor patient closely

★ **Drug-food** • Risk of serious adverse effects if combined with grapefruit juice; avoid this combination

★ **Drug-alternative therapy** • Risk of serious arrhythmia if combined with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, heart failure or recent acute heart failure requiring hospitalization or referral to a specialized heart failure clinic, second- or third-degree heart block, sick sinus syndrome, pulse rate less than 50, concomitant use of drugs or herbs that prolong the QT interval, prolonged QT interval, hepatic impairment, concurrent use of CYP3A inhibitors, hypokalemia, hypomagnesemia, pregnancy, lactation
- **Physical:** Skin color, lesions; P, BP, ECG with QT evaluation, heart sounds, peripheral exam for edema; abdominal exam; LFTs; serum electrolytes

Interventions

- Obtain baseline and periodic ECGs to monitor for QT interval prolongation.
- Ensure that patient does not have serious heart failure; closely monitor patient with mild to moderate heart failure for worsening of condition.
- Administer drug twice a day with morning and evening meal. Do not make up missed doses.
- Encourage patient to avoid grapefruit juice.
- Check patient's complete drug list and ensure that interacting drugs are not being used, and that appropriate dosage adjustments have been considered.
- Advise patient to use contraceptive measures; drug can cause serious fetal abnormalities.
- Advise patient to select another method of feeding the baby if nursing.
- Arrange for regular monitoring of heart rhythm, cardiac status.

Teaching points

- Take this drug twice a day with your morning and evening meal.
- If you forget a dose, take the next dose at the regular time. Do not attempt to make up or double doses.
- Do not drink grapefruit juice or use St. John's wort while taking this drug; serious adverse effects could occur.
- Continue to take this drug as prescribed, even if you are feeling well; you may be feeling well because the drug is working.
- Keep a record of all drugs, herbs, and over-the-counter medications you are taking and review it with your health care provider. This drug interacts with many of these drugs and serious complications could occur. Your health care provider may need to adjust the dosages of these drugs for your safety.
- This drug can cause serious harm to a fetus. The use of contraceptive measures is advised. If you become pregnant or wish to become pregnant, discuss this with your health care provider.
- This drug appears in breast milk and could seriously affect a baby. If you are nursing, use another method of feeding the baby.
- You may experience these side effects: Nausea, vomiting, diarrhea, abdominal pain (small, frequent meals may help; consult your health care provider if abdominal pain becomes too uncomfortable), slow heart rate (you should learn to take your pulse; contact your health care provider if your heart rate becomes markedly slower), rash.
- You will need periodic ECGs to monitor the effects of this drug on your atrial arrhythmias.
- Report shortness of breath, wheezing; difficulty sleeping because of breathing problems; rapid weight gain of 5 pounds or more; swelling in the feet or legs; the need to prop yourself up with many pillows to sleep at night; extreme fatigue.

▼ droperidol

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG**drotrecogin alfa
(activated)***(drow tra cob' gin)*

Xigris

PREGNANCY CATEGORY C

Drug classes

Anti-sepsis agent

Human activated protein

Therapeutic actions

A human activated protein that exerts an antithrombotic effect by inhibiting factors Va and VIIIa; may also have indirect profibrinolytic activity. May exert an anti-inflammatory effect by inhibiting human necrosis factor production by monocytes, blocking leukocyte adhesion to cells, and limiting thrombin-induced inflammatory responses within the microvascular endothelium. Mechanism of action in severe sepsis is not completely understood but thought to be a combination of the above effects leading to a decrease in the complex organ failure associated with sepsis.

Indications

- Reduction of mortality in adult patients with severe sepsis (sepsis with acute organ dysfunction) who have a high risk of death

Contraindications and cautions

- Contraindicated with allergy to drotrecogin, active internal bleeding, hemorrhagic CVA within the last 3 mo; intracranial or intraspinal surgery or severe head trauma within the last 2 mo; trauma with an increased risk of life-threatening bleeding; presence of an epidural catheter; intracranial neoplasm or mass lesion or evidence of cerebral herniation.
- Use cautiously with known bleeding disorders; recent use of thrombolytic (within 3 days) or anticoagulant (within 7 days); GI bleeding within the last 6 wk; recent use of aspirin (more than 650 mg/day) or other platelet inhibitors (within 7 days); chronic, severe hepatic disease; pregnancy; lactation.

Available forms

Single-use vials—5, 20 mg

Dosages**Adults**

24 mcg/kg/hr by IV infusion for a total of 96 hr; do not exceed 24 mcg/kg/hr.

Pediatric patients

Safety and efficacy not established for patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
IV	Minutes	Length of infusion

Metabolism: Plasma; T_{1/2}: Unknown

Distribution: May cross placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: Protect from heat and light. Reconstitute 5-mg vial with 2.5 mL sterile water for injection; 20-mg vials with 10 mL sterile water for injection (resulting solution contains 2 mg/mL). Add the diluent slowly and avoid shaking or inverting the vial; gently swirl until the powder is completely dissolved. Dilute reconstituted solution with 0.9% sodium chloride injection; inject solution slowly against the side of the infusion bag. Avoid agitation. Gently invert bag to mix; do not transport in a mechanical delivery system. Reconstituted solution must be used within 3 hr; diluted solution must be used within 14 hr at room temperature. May store in refrigerator for up to 12 hours. Total in-use time should not exceed 24 hr. If particulate matter is present or solution is discolored, discard solution.

Infusion: Infuse via a dedicated line at a rate of 24 mcg/kg/hr; do not administer by bolus or IV push injection.

Incompatibilities: Do not mix with any other drug solution; can be mixed in solution only with 0.9% sodium chloride injection, lactated Ringer's injection, dextrose, or dextrose and saline mixtures. Always administer via a separate line.

Adverse effects

- **CNS:** Intracranial bleeding
- **GI:** GI bleeding, intra-abdominal bleeding, retroperitoneal bleeding
- **GU:** GU bleeding
- **Hematologic: Bleeding**
- **Other:** Skin or soft-tissue bleeding, intrathoracic bleeding

Interactions

★ **Drug-drug** • Increased risk for bleeding to severe bleeding if combined with other drugs that affect coagulation (eg, platelet inhibitors, anticoagulants); if this combination is used, monitor patient very closely for hemorrhagic effects and discontinue drug as appropriate

★ **Drug-lab test** • False-low clotting factor values using aPTT assay; avoid this test, and use PT for monitoring drug effects

■ Nursing considerations**Assessment**

- **History:** Allergy to drotrecogin, active internal bleeding, hemorrhagic CVA within the last 3 mo, intracranial or intraspinal surgery or severe head trauma within the last 2 mo, trauma with an increased risk of life-threatening bleeding, presence of an epidural catheter, intracranial neoplasm or mass lesion or evidence of cerebral herniation, known bleeding disorders, recent thrombolytic (3 days) or anticoagulant (7 days) therapy, GI bleeding within the last 6 wk, recent use of aspirin or other platelet inhibitors (7 days), chronic severe hepatic disease, pregnancy, lactation
- **Physical:** T, body weight, skin color, lesions, P, R, BP, GI, cardiac and respiratory evaluation, PT

Interventions

- Obtain a baseline and regular PT level to evaluate effects of drug on coagulopathy; do not rely on aPTT assays.
- Arrange for packed RBC availability when drug is started.
- Discontinue drug 2 hr before any invasive procedure with inherent bleeding risk; once hemostasis has been achieved, restarting of drug may be considered—12 hr after ma-

ajor invasive procedure or immediately if uncomplicated, minor procedure.

⊗ **Warning** Stop drotrecogin immediately if clinically significant bleeding occurs. Reevaluate use of this and other drugs that affect coagulation before resuming therapy.

- Continue monitoring and other supportive measures being used to treat the sepsis.
- Ensure that IV bag is covered with UV protective bag.
- Do not administer for longer than 96 hr.
- Monitor patient closely for any signs of bleeding and take appropriate steps to limit blood loss.

Teaching points

Many patients with severe sepsis are not cognizant; patients should be told what they are being given and what effects they may experience.

- This drug must be given IV; you will be monitored very closely.
- Bleeding may occur as a result of this drug.
- You will be closely followed with blood tests to monitor the effects of this drug on your blood.

duloxetine hydrochloride

(do **locks'** ab teen)

Cymbalta OND

PREGNANCY CATEGORY C

Drug classes

Antidepressant

Serotonin and norepinephrine reuptake inhibitor

Therapeutic actions

Inhibits neuronal serotonin and norepinephrine reuptake in the CNS resulting in a potentiation of serotonin and norepinephrine effects with resultant antidepressive effects.

Indications

- Treatment of major depressive disorder
- Management of neuropathic pain associated with diabetic peripheral neuropathy
- Treatment and maintenance therapy of generalized anxiety disorder
- Treatment of fibromyalgia
- Unlabeled uses: Stress incontinence

Contraindications and cautions

- Contraindicated with allergy to any component of drug, concurrent use of MAOIs, uncontrolled narrow-angle glaucoma, lactation, concurrent substantial alcohol use, end-stage renal disease, hepatic impairment.
- Use cautiously with pregnancy, history of mania, history of seizures, controlled narrow-angle glaucoma.

Available forms

DR capsules **ORIG**—20, 30, 60 mg

Dosages

Adults

- *Major depressive disorder*: 20 mg PO bid; up to 60 mg/day given once a day or 30 mg bid has been used; may be increased in 30-mg increments to a maximum of 120 mg/day.
- *Switching from an MAOI*: Allow at least 14 days to elapse between discontinuing the MAOI and beginning duloxetine.
- *Switching to an MAOI*: Allow at least 5 days to elapse between discontinuing duloxetine and starting an MAOI.
- *Diabetic neuropathic pain*: 60 mg/day PO taken as a single dose, without regard to food.
- *Generalized anxiety disorder*: 60 mg/day PO; may be increased in 30-mg increments to maximum of 120 mg/day.
- *Fibromyalgia*: 30 mg/day PO for 1 wk; then increase to 60 mg/day.

Pharmacokinetics

Route	Peak	Duration
Oral	2 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 8–17 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness*, somnolence, tremor, blurred vision, *insomnia*, anxiety, suicidal ideation, agitation, irritability
- **CV:** Increased BP, increased heart rate
- **GI:** *Nausea*, *dry mouth*, *constipation*, *diarrhea*, **hepatotoxicity**, vomiting, decreased appetite
- **GU:** Decreased libido, abnormal orgasm, erectile dysfunction, delayed ejaculation, dysuria
- **Other:** Hot flushes, *fatigue*, *increased sweating*, rash

Interactions

• *** Drug-drug** • Risk of increased serum levels and toxic effects if combined with fluvoxamine; avoid this combination • Risk of bleeding if taken with NSAIDs, aspirin, warfarin • Risk of serotonin syndrome if combined with other SSRIs, triptans, linezolid, lithium, tramadol; avoid these combinations • Risk of higher serum levels if combined with paroxetine, fluoxetine, quinidine; use caution • Risk of increased levels of TCAs, phenothiazines, propafenone, flecainide if combined with duloxetine; monitor patient closely and adjust dosage as needed • Risk of serious to potentially fatal reactions if combined with MAOIs; avoid this combination and make sure patient has not had an MAOI for at least 14 days before beginning duloxetine • Risk of toxicity if combined with alcohol; avoid this combination

• *** Drug-alternative therapy** • Risk of serotonin syndrome if combined with St. John's wort; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to any component of the drug, concurrent use of MAOIs, narrow-angle glaucoma, lactation, concurrent substantial alcohol use, end-stage renal disease, hepatic impairment, pregnancy, history of mania, history of seizures
- **Physical:** Skin lesions, orientation, reflexes, affect; BP, P; abdominal examination

Interventions

- Ensure that patient is not taking an MAOI and has not taken one in at least 14 days before starting therapy.
- Monitor patient for signs of hepatotoxicity—darkened urine, right upper quadrant pain, flulike symptoms, elevated liver enzymes—especially if the patient uses alcohol excessively or has a history of liver impairment.

⊗ **Black box warning** Monitor patient for increased depression, including agitation, irritability, and increased suicidal ideation, especially when beginning therapy or changing dosage; especially likely with children, adolescents, and young adults. Provide appropriate interventions and protection. Drug is not approved for pediatric use.

- Ensure that patient swallows capsules whole; they should not be cut, crushed, or chewed, nor should the capsule be opened and the contents sprinkled on food.
- Instruct the patient not to consume considerable amounts of alcohol while on this drug; occurrence of liver damage is much greater when combined with alcohol; if the patient cannot refrain from alcohol intake, a different antidepressant should be used.
- Encourage the use of barrier contraceptives during treatment with this drug; fetal abnormalities are possible.
- Help the patient find another method of feeding the baby if lactating.
- Arrange to taper the drug when discontinuing; tapering decreases the risk of adverse events.

Teaching points

- Take this drug two times a day; it may be taken with or without food; if taking for diabetic neuropathy, take once a day.
- If you forget a dose, take it as soon as you remember and return to your usual regimen. Do not make up doses and do not take more than two doses in 24 hours.
- Swallow the capsule whole; do not cut, crush, chew, or sprinkle the contents of the capsule on food.

- Be aware that this drug should not be taken during pregnancy; if you suspect that you are pregnant, or wish to become pregnant, consult your health care provider.
- You should find another method of feeding the baby if you are nursing; it is not known if this drug crosses into breast milk.
- Do not stop this drug abruptly; it should be tapered slowly to decrease adverse effects.
- You may experience impaired judgment, impaired thinking, or impaired motor skills. You should not drive or operate hazardous machinery or sign important documents or make important decisions until you are certain that *Cymbalta* has not affected your ability to engage in these activities safely.
- You may experience these side effects: Dry mouth, diarrhea, abdominal discomfort, nausea (sucking on sugarless lozenges may help; consult your health care provider if this becomes a problem); depression, thoughts of suicide (you and your family should discuss this possibility and they should be on the alert for signs that this is happening; if this occurs, consult your health care provider); changes in libido or sexual response (discuss this with your health care provider).
- Report depression or thoughts of suicide, changes in color of stool or urine, sexual dysfunction, agitation, fever, hallucinations, rapid heart rate.

dutasteride

(du tas' teh ride)

Avodart OND

PREGNANCY CATEGORY X

Drug classes

Androgen hormone inhibitor
BPH drug

Therapeutic actions

Inhibits the intracellular enzyme (5 alpha-reductase) that converts testosterone into a potent androgen (DHT); does not affect andro-

gen receptors in the body; the prostate gland is dependent on DHT for its development and maintenance.

Indications

- Treatment of symptomatic BPH in men with an enlarged prostate gland
- In combination with tamsulosin for treatment of symptomatic BPH in men with enlarged prostate gland

Contraindications and cautions

- Contraindicated with allergy to any component of the product, other 5-alpha-reductase inhibitors, women, children, pregnancy, lactation.
- Use cautiously with hepatic impairment.

Available forms

Capsule —0.5 mg

Dosages

Adults

0.5 mg/day PO. Swallow whole.

- *Combination therapy with tamsulosin:* 0.5 mg/day PO with tamsulosin 0.4 mg/day PO.

Pediatric patients

Contraindicated in pediatric patients.

Pharmacokinetics

Route	Peak	Duration
Oral	2–3 hr	Unknown

Metabolism: Hepatic; $T_{1/2}$: 5 wk

Distribution: Crosses placenta; may enter breast milk (but not indicated for use in women)

Excretion: Feces

Adverse effects

- **GI:** Abdominal upset
- **GU:** Impotence, decreased libido, decreased volume of ejaculation
- **Other:** Breast enlargement, breast tenderness

Interactions

• **Drug-drug** • Possible increased serum levels with ketoconazole, ritonavir, verapamil, diltiazem, cimetidine, ciprofloxacin

• **Drug-lab test** • Decreased PSA levels; false decrease in PSA does not mean that patient is free of risk of prostate cancer

Nursing considerations

Assessment

- **History:** Allergy to any component of the product or other 5 alpha-reductase inhibitors, hepatic impairment, pregnancy, lactation
- **Physical:** Liver evaluation, abdominal examination; LFTs, renal function tests, normal urine output, prostate examination

Interventions

- Assess patient to ensure that problem is BPH and that other disorders (eg, prostate cancer, infection, strictures, hypotonic bladder) have been ruled out.
- Administer without regard to meals; ensure that the patient swallows capsules whole; do not cut, crush, or chew capsules.
- Arrange for regular follow-up, including prostate examination, PSA levels, and evaluation of urine flow.
- Monitor urine flow and output. Increase in urine flow may not occur in all patients.
- **Warning** Do not allow pregnant women to handle dutasteride capsules because of risk of absorption, which could adversely affect the fetus.

• **Warning** Caution patient that if his sexual partner is or may become pregnant, she should be protected from his semen, which contains dutasteride and could adversely affect the fetus. The patient should use a condom or discontinue dutasteride therapy.

- Caution patient that he will not be able to donate blood until at least 6 mo after the last dose of dutasteride.
- Alert patient that libido may be decreased as well as volume of ejaculate; these effects are usually reversible when the drug is stopped.
- Provide counseling to help patient deal with effects on sexuality.

Teaching points

- Take this drug without regard to meals. Swallow the capsule whole; do not cut, crush, or chew capsules. If you miss a dose, take the capsule as soon as you remember and take the next dose the following day. Do not take more than one capsule each day.

- Arrange to have regular medical follow-up while you are on this drug to evaluate your response.
- This drug has serious adverse effects on unborn babies; do not allow a pregnant woman to handle the drug; if your sexual partner is or may become pregnant, protect her from exposure to your semen by using a condom; you may need to discontinue the drug if this is not acceptable.
- You will not be able to donate blood until at least 6 months after your last dose of dutas-teride to prevent inadvertently giving dutas-teride to a pregnant woman in a blood transfusion.
- You may experience these side effects: Loss of libido, impotence, decreased amount of ejaculate (these effects are usually reversible when the drug is stopped).
- Report inability to void, groin pain, sore throat, fever, weakness.

dyphylline (dihydroxypropyl theophyllin)

(*dye' fi lin*)

Dylix, Lufyllin, Lufyllin-400

PREGNANCY CATEGORY C

Drug classes

Bronchodilator
Xanthine

Therapeutic actions

A theophylline derivative that is not metabolized to theophylline; relaxes bronchial smooth muscle, causing bronchodilation and increasing vital capacity, which has been impaired by bronchospasm and air trapping; at high doses it also inhibits the release of slow-reacting substance of anaphylaxis and histamine.

Indications

- Symptomatic relief or prevention of bronchial asthma and reversible bronchospasm associated with chronic bronchitis and emphysema

Contraindications and cautions

- Contraindicated with hypersensitivity to any xanthine or to ethylenediamine, peptic ulcer, active gastritis.
- Use cautiously with cardiac arrhythmias, acute myocardial injury, heart failure, cor pulmonale, severe hypertension, severe hypoxemia, renal or hepatic disease, hyperthyroidism, alcoholism, pregnancy, lactation.

Available forms

Tablets—200, 400 mg; elixir—100 mg/15 mL

Dosages

Individualize dosage based on clinical responses with monitoring of serum dyphylline levels; serum theophylline levels do not measure dyphylline; equivalence of dyphylline to theophylline is not known.

Adults

Up to 15 mg/kg, PO every 6 hr.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or impaired adults

Use cautiously in elderly men and with cor pulmonale, heart failure, or renal disease.

Pharmacokinetics

Route	Peak	Duration
Oral	1 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, insomnia*, irritability; restlessness, dizziness, muscle twitching, seizures, severe depression, stammering speech; abnormal behavior: Withdrawal, mutism, and unresponsiveness alternating with hyperactivity; brain damage, **death**
- **CV:** Palpitations, sinus tachycardia, ventricular tachycardia, life-threatening ventricular arrhythmias, circulatory failure, hypotension
- **GI:** *Nausea, vomiting, diarrhea*, loss of appetite, hematemesis, epigastric pain, gastroesophageal reflux during sleep, increased AST

- **GU:** Proteinuria, increased excretion of renal tubular cells and RBCs; diuresis (dehydration), urinary retention in men with prostate enlargement
- **Respiratory:** Tachypnea, respiratory arrest
- **Other:** Fever, flushing, hyperglycemia, SIADH, rash

Interactions

• **Drug-drug** • Increased effects with probenecid, mexiletine • Increased cardiac toxicity with halothane • Decreased effects of benzodiazepines, nondepolarizing neuromuscular blockers • Mutually antagonistic effects of beta blockers and dyphylline

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any xanthine or to ethylenediamine, peptic ulcer, active gastritis, cardiac arrhythmias, acute myocardial injury, heart failure, cor pulmonale, severe hypertension, severe hypoxemia, renal or hepatic disease, hyperthyroidism, alcoholism, labor, lactation
- **Physical:** Bowel sounds, normal output; P, auscultation, BP, perfusion, ECG; R, adventitious sounds; frequency, voiding, normal output pattern, urinalysis, renal function tests; liver palpation, LFTs; thyroid function tests; skin color, texture, lesions; reflexes, bilateral grip strength, affect, EEG

Interventions

- Give with food if GI effects occur.
- Monitor patient carefully for clinical signs of adverse effects.
- Keep diazepam readily available to treat seizures.

Teaching points

- Take this drug exactly as prescribed (around the clock for adequate control of asthma attacks).
- Avoid excessive intake of coffee, tea, cocoa, cola beverages, and chocolate.
- Keep all appointments for monitoring of response to this drug.
- You may experience these side effects: Nausea, loss of appetite (take with food); diffi-

culty sleeping, depression, emotional lability.

- Report nausea, vomiting, severe GI pain, restlessness, seizures, irregular heartbeat.

▽ ecallantide

See Appendix U, *Less commonly used drugs*.

▽ eculizumab

See Appendix U, *Less commonly used drugs*.

▽ edetate calcium disodium (calcium EDTA)

(*ed' e tate*)

Calcium Disodium Versenate

PREGNANCY CATEGORY B

Drug class

Antidote

Therapeutic actions

Calcium in this compound is easily displaced by heavy metals, such as lead, to form stable complexes that are excreted in the urine; edetate disodium has strong affinity to calcium, lowering calcium levels and pulling calcium out of extracirculatory stores during slow infusion.

Indications

- Acute and chronic lead poisoning and lead encephalopathy

Contraindications and cautions

- Contraindicated with sensitivity to EDTA preparations, anuria, increased intracranial pressure (rapid IV infusion).
- Use cautiously with cardiac disease, heart failure, lactation, renal impairment, pregnancy.

Available forms

Injection—200 mg/mL

Dosages

Effective by IV, IM routes; IM route is safest in children and patients with lead encephalopathy.

Adults and pediatric patients

- **Lead poisoning:** For blood levels 20–70 mcg/dL, 1,000 mg/mg²/day IV or IM for 5 days. Interrupt therapy for 2–4 days; follow with another 5 days of treatment if indicated. For blood levels higher than 70 mcg/dL, combine with dimercaprol therapy.

Pharmacokinetics

Route	Onset	Peak
IM, IV	1 hr	24–48 hr

Metabolism: $T_{1/2}$: 20–60 min (IV), 90 min (IM)

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: *Lead poisoning:* Dilute the 5 mL ampule with 250–500 mL of 0.9% sodium chloride or 5% dextrose solution. *Pediatric:* Dissolve dose in a sufficient volume of 5% dextrose injection or 0.9% sodium chloride injection to bring the final concentration to not more than 3%.

Infusion: *Lead poisoning:* Infuse the total daily dose over 4–24 hr. *Pediatric:* Infuse over 3 hr or more. Do not exceed the patient's cardiac reserve.

Adverse effects

- **CNS:** Headache, transient circumoral paresthesia, numbness
- **CV:** Heart failure, blood pressure changes, thrombophlebitis
- **GI:** Nausea, vomiting, diarrhea (edetate disodium)
- **GU:** Renal tubular necrosis
- **Hematologic:** Electrolyte imbalance (hypocalcemia, hypokalemia, hypomagnesemia, altered blood sugar)

Interactions

- *** Drug-drug** • Decreased effectiveness of zinc insulin with edetate calcium disodium; suggest use of other insulin preparation

Nursing considerations

Assessment

- **History:** Sensitivity to EDTA preparations; anuria; increased intracranial pressure; cardiac disease, heart failure, lactation, pregnancy
- **Physical:** Pupillary reflexes, orientation; P, BP; urinalysis, BUN, serum electrolytes

Interventions

⊗ **Black box warning** Reserve use for serious conditions that require aggressive therapy; serious toxicity can occur.

- Administer IM or IV.
- Avoid excess fluids in patients with lead encephalopathy and increased intracranial pressure; for these patients, mix edetate calcium disodium 20% solution with procaine to give a final concentration of 0.5% procaine, and administer IM.
- Establish urine flow by IV infusion prior to first dose to those dehydrated from vomiting. Once urine flow is established, restrict further IV fluid. Stop EDTA when urine flow ceases.
- Arrange for periodic BUN and serum electrolyte determinations before and during each course of therapy. Stop drug if signs of increasing renal damage occur.
- Do not administer in larger than recommended doses.

⊗ **Warning** Keep patient supine for a short period because of the possibility of orthostatic hypotension.

Teaching points

- Prepare a schedule of rest and drug days.
- Arrange for periodic blood tests during the course of therapy.
- Constant monitoring of heart rhythm may be needed during drug administration.
- Report pain at injection site, difficulty voiding, markedly decreased urine production.

edrophonium chloride

(ed roe fœ' nee um)

Reversol

PREGNANCY CATEGORY C

Drug classes

Antidote

Cholinesterase inhibitor (anticholinesterase)

Diagnostic agent

Muscle stimulant

Therapeutic actions

Increases the concentration of acetylcholine at the sites of cholinergic transmission; prolongs and exaggerates the effects of acetylcholine by reversibly inhibiting the enzyme acetylcholinesterase, facilitating transmission at the skeletal neuromuscular junction.

Indications

- Differential diagnosis and adjunct in evaluating treatment of myasthenia gravis
- Antidote for nondepolarizing neuromuscular junction blockers (curare, tubocurarine) after surgery

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinesterases, intestinal or urogenital tract obstruction, peritonitis, sulfite sensitivity, lactation.
- Use cautiously with asthma, peptic ulcer, bradycardia, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, pregnancy near term.

Available forms

Injection—10 mg/mL

Dosages

Adults

IM

- *Differential diagnosis of myasthenia gravis:* If veins are inaccessible, inject 10 mg IM. Patients who demonstrate cholinergic reaction (see table) should be retested with 2 mg IM after 30 min to rule out false-negative results.

IV

- *Differential diagnosis of myasthenia gravis:* Prepare tuberculin syringe containing 10 mg edrophonium with IV needle. Inject 2 mg IV in 15–30 sec; leave needle in vein. If no reaction occurs after 45 sec, inject the remaining 8 mg. If a cholinergic reaction (parasympathomimetic effects, muscle fasciculations, or increased muscle weakness) occurs after 2 mg, discontinue the test, and administer atropine sulfate 0.4–0.5 mg IV. May repeat test after 30 min.
- *Evaluation of treatment requirements in myasthenia gravis:* 1–2 mg IV 1 hr after oral intake of the treatment drug. Responses are summarized below:

Response to Edrophonium Test	Myasthenia (Under-treated)	Cholinergic (Over-treated)
<i>Muscle strength:</i> ptosis, diplopia, respiration, limb strength	Increased	Decreased
<i>Fasciculations:</i> orbicularis oculi facial and limb muscles	Absent	Present or absent
<i>Side reactions:</i> lacrimation, sweating, salivating, nausea, vomiting, diarrhea, abdominal cramps	Absent	Severe

- *Edrophonium test in crisis:* Secure controlled respiration immediately if patient is apneic, then administer test. If patient is in cholinergic crisis, administration of edrophonium will increase oropharyngeal secretions and further weaken respiratory muscles. If crisis is myasthenic, administration of edrophonium will improve respiration, and patient can be treated with longer-acting IV anticholinesterase medication. To administer the test, draw up no more than 2 mg edrophonium into the syringe. Give 1 mg IV initially. Carefully observe cardiac response. If after 1 min this dose does not further impair the patient, inject the remaining 1 mg. If after a 2-mg dose no clear improvement in respiration occurs, discontinue all anticholinesterase drug therapy, and control ventilation by tracheostomy and assisted respiration.

- **Antidote for nondepolarizing neuromuscular junction blockers:** 10 mg given slowly IV over 30–45 sec so that onset of cholinergic reaction can be detected; repeat when necessary. Maximal dose for any patient is 40 mg.

Pediatric patients

IV

- **Differential diagnosis of myasthenia gravis:**

Infants: 0.5 mg.

Child weighing 34 kg or less: 1 mg.

Child weighing more than 34 kg: 2 mg.

If child does not respond in 45 sec, dose may be titrated up to 5 mg in child less than 34 kg, up to 10 mg in child more than 34 kg, given in increments of 1 mg every 30–45 sec.

IM

- **Differential diagnosis of myasthenia gravis:**
Child weighing 34 kg or less: 2 mg.
Child weighing more than 34 kg: 5 mg. A delay of 2–10 min occurs until reaction.

Pharmacokinetics

Route	Onset	Duration
IM	2–10 min	5–30 min
IV	30–60 sec	5–20 min

Metabolism: $T_{1/2}$: 5–10 min

Distribution: May cross placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: No preparation is required.

Infusion: Rate of infusion varies with reason for administration; see Dosages.

Adverse effects

Parasympathomimetic effects

- **CV:** *Bradycardia, cardiac arrhythmias, AV block and nodal rhythm, cardiac arrest*; decreased cardiac output, leading to hypotension, syncope
- **Dermatologic:** Diaphoresis, flushing
- **EENT:** *Lacrimation, miosis*, spasm of accommodation, diplopia, conjunctival hyperemia
- **GI:** *Salivation, dysphagia, nausea, vomiting, increased peristalsis, abdominal cramps*, flatulence, diarrhea

- **GU:** *Urinary frequency and incontinence, urinary urgency*
- **Respiratory:** *Increased pharyngeal and tracheobronchial secretions, laryngospasm, bronchospasm, bronchiolar constriction, dyspnea*

General effects

- **CNS:** Seizures, dysarthria, dysphonia, drowsiness, dizziness, headache, loss of consciousness
- **Dermatologic:** Rash, urticaria, **anaphylaxis**
- **Local:** Thrombophlebitis after IV use
- **Peripheral:** Skeletal muscle weakness, fasciculations, muscle cramps, arthralgia
- **Respiratory:** Respiratory muscle paralysis, central respiratory paralysis

Interactions

- **Drug-drug** • Risk of profound muscular depression refractory to anticholinesterases if given concurrently with corticosteroids, succinylcholine

Nursing considerations

Assessment

Administering edrophonium for diagnostic purposes is generally supervised by a neurologist or other physician skilled and experienced in dealing with myasthenic patients; administering edrophonium to reverse neuromuscular blocking drugs is generally supervised by an anesthesiologist. Any nurse participating in the care of a patient receiving anticholinesterases should keep these points in mind.

- **History:** Hypersensitivity to anticholinesterases; intestinal or urogenital tract obstruction, peritonitis, lactation, asthma, peptic ulcer, cardiac arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, epilepsy, pregnancy near term
- **Physical:** Bowel sounds, normal output; frequency, voiding pattern, normal output; R, adventitious sounds; P, auscultation, BP; reflexes, bilateral grip strength, EEG; thyroid function tests; skin color, texture, lesions

Interventions

- Administer IV slowly with constant monitoring of patient's response.

- Overdosage with anticholinesterase drugs can cause muscle weakness (cholinergic crisis) that is difficult to differentiate from myasthenic weakness; edrophonium is used to help make this diagnostic distinction. The administration of atropine may mask the parasympathetic effects of anticholinesterases and confound the diagnosis.

⊗ **Warning** Keep atropine sulfate readily available as an antidote and antagonist to edrophonium.

Teaching points

- The patient should know what to expect during diagnostic test with edrophonium (patients receiving drug to reverse neuromuscular blockers will not be aware of drug effects and do not require specific teaching about the drug).

efavirenz

(eff'ah vye' renz)

Sustiva ORIG

PREGNANCY CATEGORY D

Drug classes

Antiviral

Non-nucleoside reverse transcriptase inhibitor

Therapeutic actions

A non-nucleoside reverse transcriptase inhibitor shown to be effective in suppressing the HIV virus in adults and children.

Indications

- Treatment of HIV and AIDS in adults and children when used in combination with other antiretroviral drugs

Contraindications and cautions

- Contraindicated with life-threatening allergy to any component, lactation.
- Use cautiously with hepatic impairment, hypercholesterolemia, psychiatric disorders, pregnancy.

Available forms

Capsules ORIG—50, 200 mg; tablets ORIG—600 mg

Dosages

Adults

600 mg PO daily in conjunction with a protease inhibitor or other nucleoside reverse transcriptase inhibitor. In combination with voriconazole 400 mg PO every 12 hr: 300 mg/day efavirenz PO.

Pediatric patients 3 yr and older

Dosage is based on weight of child as follows:

Weight (kg)	Daily Dosage (mg)
10– less than 15	200 PO
15– less than 20	250 PO
20– less than 25	300 PO
25– less than 32.5	350 PO
32.5– less than 40	400 PO
40 or more	600 PO

Pediatric patients younger than 3 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–5 hr

Metabolism: Hepatic; $T_{1/2}$: 52–76 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*, insomnia, *drowsiness*, *asthenia*, malaise, *dizziness*, paresthesia, somnolence, impaired concentration, depression, suicidal ideation
- **GI:** *Nausea*, *diarrhea*, anorexia, vomiting, dyspepsia, liver impairment
- **Other:** Increased cholesterol, *rash*

Interactions

★ **Drug-drug** ⊗ **Warning** Possible severe adverse effects if taken with astemizole, cisapride, pimozone, bepridil, midazolam, rifabutin, triazolam, ergot derivatives; avoid these combinations, which are contraindications • Possible increased hepatic impairment if combined with alcohol or hepatotoxic drugs; avoid this combination • Decreased levels of voriconazole if combined; adjust dosages of both drugs • Decreased effectiveness of indinavir, saquinavir; consider dosage adjustments • Decreased serum levels of efavirenz if combined with rifampin • Risk of increased levels of

ritonavir when combined • Risk of decreased methadone levels and withdrawal symptoms of methadone if taken with efavirenz

★ **Drug-food** • Decreased absorption and therapeutic effects if taken with a high-fat meal; avoid taking with food

★ **Drug-lab test** • False-positive urine cannabinoid test

★ **Drug-alternative therapy** • Decreased effectiveness of efavirenz with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Life-threatening allergy to any component, impaired hepatic function, pregnancy, lactation, hypercholesterolemia
- **Physical:** Skin rashes, lesions, texture; body T; affect, reflexes, peripheral sensation; bowel sounds, liver evaluation; LFTs, CBC and differential, serum cholesterol

Interventions

- Arrange to monitor hematologic indices every 2 wk during therapy.
- Ensure that patient is taking this drug as part of a combination therapy program.
- ⊗ **Warning** Administer the drug at bedtime for the first 2–4 wk of therapy to minimize the CNS effects of the drug.
- Monitor patient for signs of opportunistic infections that will need to be treated appropriately.
- Administer the drug once a day, with meals if GI effects occur. Avoid high-fat meals.
- Provide comfort measures to help patient to cope with drug's effects—environmental control (temperature, lighting), back rubs, mouth care.
- Recommend patient use barrier contraceptives while taking this drug; serious fetal deformities have occurred.
- Establish safety precautions if CNS effects occur, especially likely during the first few days of treatment.
- Offer support and encouragement to the patient to deal with the diagnosis as well as the effects of drug therapy.

Teaching points

- Take drug once a day. Take the drug at bedtime to cut down some of the unpleasant effects of the drug. You may take the drug with meals if GI upset is a problem. Avoid taking this drug with high-fat meals. Be sure to take your other drugs regularly along with the efavirenz. Do not break tablets; swallow them whole.
- Efavirenz is not a cure for AIDS or HIV; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- Efavirenz does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination; use appropriate precautions.
- Use barrier contraceptives while you are taking this drug; serious fetal deformities can occur. If you wish to become pregnant, consult your health care provider.
- Report any medications or herbs you are taking to your health care provider; avoid St. John's wort while taking this drug.
- You may experience these side effects: Nausea, loss of appetite, GI upset (eat frequent small meals; consult your health care provider if this becomes severe); dizziness, drowsiness (this is more likely at the beginning of drug therapy; avoid driving and operating machinery if these occur).
- Report extreme fatigue, lethargy, severe headache, severe nausea, vomiting, difficulty breathing, rash, depression, changes in color of stools, thoughts of suicide.

▽ eletriptan hydrobromide

(*ell ab trip' tan*)

Relpax

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug

5-HT receptor selective agonist

Triptan

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients.

Indications

- Treatment of acute migraines with or without aura in adults

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of eletriptan, allergy to other triptans, ischemic heart disease, cerebrovascular syndrome, peripheral vascular disease, uncontrolled hypertension, hemiplegic or basilar migraine, severe hepatic impairment, within 24 hr of using any other triptan or ergotamine-containing medication.
- Use cautiously with pregnancy, lactation, hepatic impairment.

Available forms

Tablets—20, 40 mg

Dosages

Adults

Individualize dosage; 20–40 mg PO. If the headache improves but then returns, a second dose may be given after waiting at least 2 hr. Maximum daily dose, 80 mg.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1.5–2 hr

Metabolism: Hepatic; $T_{1/2}$: 4 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine, nonrenal processes

Adverse effects

- **CNS:** *Hypertonia, hypesthesia, vertigo*, abnormal dreams, anxiety
- **CV: Palpitations**, hypertension, tachycardia, angina, **MI**
- **GI:** Nausea, anorexia, constipation, esophagitis, flatulence
- **Respiratory:** *Pharyngitis*, dyspnea, asthma, URI, rhinitis
- **Other:** Fever, chills, *sweating*, bone pain

Interactions

- *** Drug-drug** • Risk of prolonged vasospastic reactions if combined with ergot-containing drugs; do not use within 24 hr of each other
- Risk of greatly elevated serum levels of CYP3A4 inhibitors—ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, nelfinavir—and of eletriptan if combined; do not use within 72 hr of each other
- Risk of combined effects if used within 24 hr of other triptans; do not use within 24 hr of each other
- Risk of serotonin syndrome if combined with other serotonergic drugs, such as SSRIs

Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of eletriptan, allergy to other triptans, presence of ischemic heart disease, cerebrovascular syndrome, peripheral vascular disease, uncontrolled hypertension, hemiplegic or basilar migraine, severe hepatic impairment, use within 24 hr of any other triptan or ergotamine-containing medication, pregnancy, lactation, hepatic impairment
- **Physical:** T, orientation, reflexes, peripheral sensation; P, BP; R, adventitious sounds; abdominal examination; LFTs

Interventions

- Administer to relieve acute migraine, not as a prophylactic measure; supervise first dose of drug.
- Ensure that the patient has not taken an ergot-containing compound or other triptan within 24 hr.
- Do not administer more than two doses in a 24-hr period.
- Establish safety measures if CNS or visual disturbances occur.
- Control environment (eg, lighting, temperature) as appropriate to help relieve migraine.

⊗ **Warning** Monitor BP of patients with possible coronary artery disease; discontinue at any sign of angina, prolonged high BP, tachycardia, chest discomfort.

Teaching points

- Take drug exactly as prescribed, at the onset of headache or aura. Do not take this drug to prevent a migraine; it is used only

to treat migraines that are occurring. If the headache persists after you take this drug, you may repeat the dose 2 hours later.

- Do not take more than two doses in 24-hour period. Do not take any other migraine medication while you are taking this drug. If your headache is not relieved, consult your health care provider.
- Maintain your usual procedures during a migraine—eg, control lighting, noise.
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- This drug interacts with many other drugs; consult with your health care provider if you are taking any other medications or if you add any drugs to your drug regimen.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant, contact your health care provider and refrain from using drug.
- You may experience these side effects: Dizziness, drowsiness (avoid driving and using dangerous machinery while taking this drug); numbness, tingling, feelings of tightness or pressure.
- Report chest pain, numbness, chills.

eltrombopag

See Appendix U, *Less commonly used drugs*.

emtricitabine (*em tra cye' tab ben*)

Emtriva

PREGNANCY CATEGORY B

Drug classes

Anti-HIV drug

Antiviral

Nucleoside reverse transcriptase inhibitor

Therapeutic actions

HIV-1 reverse transcriptase inhibitor; competes with a natural substrate and is incorporated into the viral DNA, leading to chain termination.

Indications

- In combination with other antiretroviral drugs for the treatment of HIV-1 infection in adults and children

Contraindications and cautions

- Contraindicated with allergy to any components of the product; lactation (HIV-infected mothers are discouraged from breast-feeding); concurrent use of lamivudine, *Atripla*, *Truvada*.
- Use cautiously with pregnancy; hepatic impairment; signs of lactic acidosis, risk factors for lactic acidosis including female gender and obesity; infection with hepatitis B virus; impaired renal function.

Available forms

Capsules—200 mg; oral solution—10 mg/mL

Dosages

Adults

200 mg daily PO, with or without food or 240 mg (24 mL) oral solution/day PO.

Pediatric patients 3 mo–17 yr

6 mg/kg/day PO to a maximum 240 mg (24 mL) oral solution; children weighing more than 33 kg and able to swallow a capsule may take one 200-mg capsule/day PO.

Pediatric patients up to 3 mo

3 mg/kg oral solution PO once daily

Patients with renal impairment

For dialysis patients, 200 mg PO every 96 hr. For renally impaired patients, use these dosages:

CrCl (mL/min)	Capsule dosage (mg)	Oral solution dosage (mg)
50 or more	200 daily	240 daily
30–49	200 every 48 hr	120 daily
15–29	200 every 72 hr	80 daily
Less than 15	200 every 96 hr	60 daily

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 10 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, asthenia, depression, insomnia, dizziness*, peripheral neurological symptoms, neuritis, paresthesias, *abnormal dreams*
- **GI:** *Nausea, diarrhea, abdominal pain*, vomiting, dyspepsia, **severe hepatomegaly with steatosis, sometimes fatal**; *elevated liver enzymes and bilirubin*
- **Metabolic:** **Lactic acidosis, sometimes severe**, hyperglycemia
- **Respiratory:** *Cough, rhinitis*
- **Other:** *Rash*, arthralgia, myalgia, fat redistribution

■ Nursing considerations

Assessment

- **History:** Allergy to any components of the product, lactation, pregnancy, hepatic impairment, signs of lactic acidosis, obesity, renal impairment, hepatitis B infection
- **Physical:** T; orientation, reflexes; R, adventitious sounds; abdominal examination, LFTs, renal function tests

Interventions

- Ensure that HIV antibody testing has been done before initiating therapy to reduce risk of emergence of HIV resistance.
- Ensure that patient is taking this drug in combination with other antiretroviral drugs.
- Ensure that patient is not taking combination drugs *Atripla, Truvada*; concurrent use is contraindicated.
- Monitor patients regularly to evaluate liver and renal function.

⊗ **Black box warning** Use caution if patient has or is suspected of having hepatitis B; serious resurgence of the disease can occur.

- Administer this drug without regard to food.

⊗ **Black box warning** Withdraw drug and monitor patient if patient develops signs of lactic acidosis or hepatotoxicity, including hepatomegaly and steatosis.

- Encourage women of childbearing age to use barrier contraceptives while taking this drug because the effects of the drug on the fetus are not known.
- Advise women who are breast-feeding to find another method of feeding the baby; HIV-infected woman are advised not to breast-feed.

- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others.

Teaching points

- Take this drug once a day with or without food and in combination with your other antiviral drugs.
- Take the drug every day; if you miss a dose, take it as soon as you remember and then take the next dose at the usual time the next day. Do not double any doses.
- This drug does not cure your HIV infection and you will still be able to pass it to others; using condoms is advised. Women of childbearing age are encouraged not to become pregnant while taking this drug; barrier contraceptives are recommended.
- This drug may enter breast milk; if you are nursing a baby, you should find another method of feeding the baby.
- With some antiviral drugs, there is a redistribution of body fat—a “buffalo hump” appears and fat is distributed around the trunk and lost in the limbs; the long-term effects of this redistribution are not known.
- You may experience these side effects: Nausea, diarrhea, abdominal pain, headache (try to maintain your intake of nutrition and fluid as much as possible; eat frequent small meals and take the drug with food).
- Report severe weakness, muscle pain, trouble breathing, dizziness, cold feelings in your arms or legs, palpitations, yellowing of the eyes or skin, darkened urine or light-colored stools.

▼ enalapril maleate (e nal' a pril)

Vasotec

enalaprilat Vasotec I.V.

PREGNANCY CATEGORY D

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Renin, synthesized by the kidneys, is released into the circulation where it acts on a plasma precursor to produce angiotensin I, which is converted by ACE to angiotensin II, a potent vasoconstrictor that also causes release of aldosterone from the adrenals; both of these actions increase BP. Enalapril blocks the conversion of angiotensin I to angiotensin II, decreasing BP, decreasing aldosterone secretion, slightly increasing serum K⁺ levels, and causing Na⁺ and fluid loss; increased prostaglandin synthesis also may be involved in the antihypertensive action. In patients with heart failure, peripheral resistance, afterload, preload, and heart size are decreased.

Indications

Oral

- Treatment of hypertension alone or in combination with other antihypertensives, especially thiazide-type diuretics
- Treatment of acute and chronic heart failure
- Treatment of asymptomatic left ventricular dysfunction (LVD)

Parenteral

- Treatment of hypertension when oral therapy is not possible

Contraindications and cautions

- Contraindicated with pregnancy, allergy to enalapril.
- Use cautiously with impaired renal function; salt or volume depletion (hypotension may occur); lactation.

Available forms

Tablets—2.5, 5, 10, 20 mg; injection—1.25 mg/mL

Dosages

Adults

Oral

- *Hypertension:*
Patients not taking diuretics: Initial dose is 5 mg/day PO. Adjust dosage based on patient response. Usual range is 10–40 mg/day as a single dose or in two divided doses.
Patients taking diuretics: Discontinue diuretic for 2–3 days if possible. If it is not possible to discontinue diuretic, give initial dose

of 2.5 mg, and monitor for excessive hypotension for at least 2 hr.

Converting to oral therapy from IV therapy: 5 mg daily with subsequent doses based on patient response.

- *Heart failure:* 2.5 mg PO daily or bid in conjunction with diuretics and digitalis. Maintenance dose is 2.5–20 mg/day given in two divided doses. Maximum daily dose is 40 mg.
- *Asymptomatic LVD:* 2.5 mg PO bid; target maintenance dose 20 mg/day in two divided doses.

Parenteral

Give IV only. 1.25 mg every 6 hr given IV over 5 min. A response is usually seen within 15 min, but peak effects may not occur for 4 hr.

- *Hypertension:*

Converting to IV therapy from oral therapy:

1.25 mg every 6 hr; monitor patient response.

Patients taking diuretics: 0.625 mg IV over 5 min. If adequate response is not seen after 1 hr, repeat the 0.625-mg dose. Give additional doses of 1.25 mg every 6 hr.

Pediatric patients 2 mo–16 yr

Oral

- *Hypertension:* Initial dose is 0.08 mg/kg PO once daily; maximum dose is 5 mg.

Geriatric patients and patients with renal impairment and heart failure

Oral

Excretion is reduced in renal failure; use smaller initial dose, and adjust upward to a maximum of 40 mg/day PO. For patients on dialysis, use 2.5 mg on dialysis days.

CrCl (mL/min)	Serum Creatinine	Initial Dose
More than 80	Not applicable	5 mg/day
80 or less— more than 30	Less than 3 mg/dL	5 mg/day
Less than 30	More than 3 mg/dL	2.5 mg/day

IV

If creatinine clearance is less than 30 mL/min, the initial dose is 0.625 mg, which may be repeated after 1 hr. Additional doses of 1.25 mg every 6 hr may be given with careful patient monitoring.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	60 min	4–6 hr	24 hr
IV	15 min	1–4 hr	6 hr

Metabolism: $T_{1/2}$: 11 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Enalaprilat can be given as supplied or mixed with up to 50 mL of 5% dextrose injection, 0.9% sodium chloride injection, 0.9% sodium chloride injection in 5% dextrose, 5% dextrose in lactated Ringer's, *Isolyte E*. Stable at room temperature for 24 hr.

Infusion: Give by slow IV infusion over at least 5 min.

Adverse effects

- **CNS:** *Headache, dizziness, fatigue, insomnia, paresthesias*
- **CV:** Syncope, chest pain, palpitations, hypotension in salt- or volume-depleted patients
- **GI:** Gastric irritation, *nausea*, vomiting, *diarrhea*, abdominal pain, dyspepsia, elevated liver enzymes
- **GU:** Proteinuria, renal insufficiency, renal failure, polyuria, oliguria, urinary frequency, impotence
- **Hematologic:** *Decreased Hct and Hgb*
- **Other:** *Cough*, muscle cramps, hyperhidrosis

Interactions

★ **Drug-drug** • Decreased hypotensive effect if taken concurrently with indomethacin, rifampin, NSAIDs

■ Nursing considerations

Assessment

- **History:** Allergy to enalapril, impaired renal function, salt or volume depletion, lactation, pregnancy
- **Physical:** Skin color, lesions, turgor; T; orientation, reflexes, affect, peripheral sensation; P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC, and differential

Interventions

⊗ **Warning** Alert surgeon, and mark the patient's chart with notice that enalapril is being taken; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

⊗ **Black box warning** Be aware that use of this drug in second and third trimesters can cause serious injury or death to the fetus; advise contraceptive use.

- Monitor patients on diuretic therapy for excessive hypotension after the first few doses of enalapril.
- Monitor patient closely in any situation that may lead to a drop in BP secondary to reduced fluid volume (excessive perspiration and dehydration, vomiting, diarrhea) because excessive hypotension may occur.
- Arrange for reduced dosage in patients with impaired renal function.

⊗ **Warning** Monitor patient carefully because peak effect may not be seen for 4 hr. Do not administer second dose until BP has been checked.

Teaching points

- Do not stop taking the medication without consulting your health care provider.
- Be careful in any situation that may lead to a drop in blood pressure (diarrhea, sweating, vomiting, dehydration).
- Avoid over-the-counter medications, especially cough, cold, and allergy medications that may interact with this drug.
- You may experience these side effects: GI upset, loss of appetite, change in taste perception (will pass with time); mouth sores (frequent mouth care may help); rash; fast heart rate; dizziness, light-headedness (usually passes in a few days; change position slowly, limit activities to those not requiring alertness and precision).
- Use of contraception is advised while taking this drug; fetal abnormalities or death may occur.
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heart-beat, chest pains; swelling of the face, eyes, lips, tongue, difficulty breathing.

enfuvirtide (*en foo veer' tide*)

Fuzeon

PREGNANCY CATEGORY B

Drug classes

Anti-HIV drug
Fusion inhibitor

Therapeutic actions

Prevents the entry of the HIV-1 virus into cells by inhibiting the fusion of the virus membrane with the viral and cellular membrane.

Indications

- In combination with other antiretrovirals for the treatment of HIV-1 infection in treatment-experienced patients with evidence of HIV-1 replication despite ongoing antiretroviral therapy

Contraindications and cautions

- Contraindicated with hypersensitivity to any component of enfuvirtide, lactation.
- Use cautiously with history of lung disease, pregnancy.

Available forms

Powder for injection—90 mg/mL

Dosages

Adults

90 mg bid by subcutaneous injection into the upper arm, anterior thigh, or abdomen.

Pediatric patients 6–16 yr

2 mg/kg bid by subcutaneous injection, up to a maximum of 90 mg/dose into the upper arm, anterior thigh, or abdomen.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	4–8 hr

Metabolism: Hepatic; $T_{1/2}$: 3.2–4.4 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Tissue recycling of amino acids, not excreted

Adverse effects

- **CNS:** Dizziness, insomnia, depression, anxiety, peripheral neuropathy
- **GI:** Nausea, diarrhea, constipation, pancreatitis, abdominal pain, taste perversion, increased appetite
- **Respiratory: Pneumonia,** cough
- **Other:** Injection site reactions—pain, discomfort, redness, nodules; hypersensitivity reactions, fatigue, rash

■ Nursing considerations Assessment

- **History:** Allergy to any components of the product, lactation, pregnancy, lung disease
- **Physical:** T; orientation, reflexes; R, adventitious sounds; skin evaluation

Interventions

- Make sure that the patient is taking this drug in combination with other antiretrovirals.
- Monitor patients regularly to evaluate lung function and viral load.
- Administer this drug by subcutaneous injection only; rotate sites regularly.
- Encourage women of childbearing age to use barrier contraceptives while taking this drug because the effects of the drug on the fetus are not known.
- Advise women who are breast-feeding to find another method of feeding the baby; HIV-infected women are advised not to breast-feed.
- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others.

Teaching points

- Administer this drug by subcutaneous injection; you and a significant other should learn the proper method for preparing and administering the drug and for properly disposing of the syringes and needles.
- Administer the drug every day; if you miss a dose, contact your health care provider immediately.

- Rotate injection sites among the upper arm, abdomen, and anterior thigh; keep a record of the sites.
- Keep any reconstituted drug in the refrigerator; use within 24 hours.
- Bring refrigerated solution to room temperature before injecting; discard any unused portions.
- Continue taking your other antiviral drugs; the drugs are designed to be taken in combination.
- This drug does not cure the HIV infection and you will still be able to pass it to others; using condoms is advised. Women of child-bearing age are discouraged from becoming pregnant while taking this drug; using barrier contraceptives is recommended.
- Select another method of feeding the baby if you are nursing a baby.
- Local reactions at the site of the injection occur commonly. Review the proper administration technique regularly, and rotate injection sites. If you experience severe pain, redness, or hardness at the site, consult your health care provider.
- You may experience these side effects: Nausea, diarrhea, abdominal pain, headache; (try to maintain your intake of nutrition and fluid as much as possible; eat frequent small meals); dizziness, lack of sleep (avoid driving and operating dangerous machinery if this occurs).
- Report chills, fever, any sign of infection, difficulty breathing or signs of respiratory infection, cough with fever, rapid breathing, shortness of breath.

DANGEROUS DRUG

enoxaparin
 (en ocks' a par in)

Lovenox

PREGNANCY CATEGORY B**Drug classes**

Antithrombotic

Low-molecular-weight heparin

Therapeutic actions

Low-molecular-weight heparin that inhibits thrombus and clot formation by blocking fac-

tor Xa, factor IIa, preventing the formation of clots.

Indications

- Prevention of DVT, which may lead to pulmonary embolism following hip replacement, knee replacement surgery, abdominal surgery
- Prevention of ischemic complications of unstable angina and non-Q-wave MI
- Treatment of DVT, pulmonary embolus with warfarin
- Prevention of DVT in medical patients who are at risk for thromboembolic complications due to severely restricted mobility during acute illnesses
- Treatment of acute ST-segment elevation MI, managed medically or with subsequent percutaneous coronary intervention

Contraindications and cautions

- Contraindicated with hypersensitivity to enoxaparin, heparin, pork products; severe thrombocytopenia; uncontrolled bleeding.
- Use cautiously with pregnancy or lactation, history of GI bleed, spinal tap, spinal/epidural anesthesia.

Available forms

Injection—30 mg/0.3 mL; 40 mg/0.4 mL; 60 mg/0.6 mL; 80 mg/0.8 mL; 100 mg/1 mL; 120 mg/0.8 mL; 150 mg/mL; 300 mg/3 mL

Dosages**Adults**

- *DVT prophylaxis after hip or knee replacement surgery:* 30 mg subcutaneously bid with initial dose 12–24 hr after surgery. Continue throughout the postoperative period for 7–10 days; then 40 mg daily subcutaneously for up to 3 wk may be used.
- *Patients undergoing abdominal surgery:* 40 mg/day subcutaneously begun within 2 hr preoperatively and continued for 7–10 days.
- *Outpatient DVT treatment:* 1 mg/kg subcutaneously every 12 hr.
- *Inpatient DVT treatment:* 1.5 mg/kg subcutaneously once daily or 1 mg/kg every 12 hr.
- *Unstable angina and non-Q-wave MI:* 1 mg/kg subcutaneously every 12 hr for 2–8 days.

- **Prevention of DVT in high-risk medical patients:** 40 mg/day subcutaneously for 6–11 days; has been used up to 14 days.
- **Treatment of MI:**
Younger than 75 yr: 30-mg IV bolus plus 1 mg/kg subcutaneous dose followed by 1 mg/kg subcutaneously every 12 hr with aspirin. (Maximum, 100 mg for first two doses only.)
75 yr and older: 0.75 mg/kg subcutaneously every 12 hr. (Maximum, 75 mg for first two doses only.)

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment (creatinine clearance less than 30 mL/min)

- **DVT prophylaxis:** 30 mg/day subcutaneously.
- **DVT treatment:** 1 mg/kg subcutaneously once daily.
- **MI treatment:** For patient younger than 75 yr, 30-mg IV bolus; then 1 mg/kg subcutaneously followed by 1 mg/kg/day subcutaneously. For patient 75 yr or older, 1 mg/kg/day subcutaneously.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	20–60 min	3–5 hr	12 hr

Metabolism: $T_{1/2}$: 4.5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **Hematologic: Hemorrhage;** *bruising;* thrombocytopenia; elevated AST, ALT levels; hyperkalemia
- **Hypersensitivity:** Chills, fever, urticaria, asthma
- **Other:** Fever; pain; local irritation, hematoma, erythema at site of injection, epidural or spinal hematoma with spinal tap, spinal/epidural anesthesia

Interactions

• **Drug-drug** • Increased bleeding tendencies with oral anticoagulants, salicylates,

NSAIDs, penicillins, cephalosporins • Risk of severe bleeding if combined with heparin

• **Drug-lab test** • Increased AST, ALT levels

• **Drug-alternative therapy** • Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo, and ginseng therapy, high-dose vitamin E

Nursing considerations

Assessment

- **History:** Recent surgery or injury; sensitivity to heparin, pork products, enoxaparin; lactation; history of GI bleed; pregnancy
- **Physical:** Peripheral perfusion, R, stool guaiac test, PTT or other tests of blood coagulation, platelet count, renal function tests

Interventions

- Give drug as soon as possible after hip surgery, within 12 hr of knee surgery, and within 2 hr preoperatively for abdominal surgery.
- **Black box warning** Be aware of increased risk of spinal hematoma and neurologic damage if used with spinal/epidural anesthesia; if must be used, monitor patient closely.
- Give deep subcutaneous injections; do not give enoxaparin by IM injection.
- Administer by deep subcutaneous injection; patient should be lying down. Alternate between the left and right anterolateral and posterolateral abdominal wall. Introduce the whole length of the needle into a skinfold held between the thumb and forefinger; hold the skinfold throughout the injection.
- Apply pressure to all injection sites after needle is withdrawn; inspect injection sites for signs of hematoma; do not massage injection sites.
- Do not mix with other injections or infusions.
- Store at room temperature; fluid should be clear, colorless to pale yellow.
- Provide for safety measures (electric razor, soft toothbrush) to prevent injury to patient who is at risk for bleeding.
- Check patient for signs of bleeding; monitor blood tests.
- Alert all health care providers that patient is taking enoxaparin.

- Discontinue and initiate appropriate therapy if thromboembolic episode occurs despite enoxaparin therapy.
- ⊗ **Warning** Have protamine sulfate (enoxaparin antidote) readily available in case of overdose.
- Treat overdose as follows: Protamine sulfate (1% solution). Each mg of protamine neutralizes 1 mg enoxaparin. Give very slowly IV over 10 min.

Teaching points

- Have periodic blood tests to monitor your response to this drug.
- You and a significant other may need to learn to give the drug by subcutaneous injection and how to properly dispose of needles and syringes. Rotate injection sites.
- Avoid injury while you are taking this drug: Use an electric razor; avoid activities that might lead to injury.
- Report nosebleed, bleeding of the gums, unusual bruising, black or tarry stools, cloudy or dark urine, abdominal or lower back pain, severe headache.

entacapone

(en tab *kap' own*)

Comtan

PREGNANCY CATEGORY C

Drug class

Antiparkinsonian

Therapeutic actions

Selectively and reversibly inhibits COMT, an enzyme that eliminates biologically active catecholamines, including dopa, dopamine, norepinephrine, epinephrine; when given with levodopa, entacapone's inhibition of COMT is believed to increase the plasma concentrations and duration of action of levodopa.

Indications

- Adjunct with levodopa and carbidopa in the treatment of the signs and symptoms of idiopathic Parkinson's disease in patients who are experiencing "wearing off" of drug effects

Contraindications and cautions

- Contraindicated with hypersensitivity to drug or its component.
- Use cautiously with hypertension, hypotension, hepatic or renal impairment, pregnancy, lactation.

Available forms

Tablets—200 mg

Dosages

Adults

200 mg PO taken concomitantly with the dose of levodopa-carbidopa, a maximum of eight times/day.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1 hr

Metabolism: Hepatic; $T_{1/2}$: 0.4–0.7 hr, then 2.4 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Disorientation, confusion*, memory loss, **hallucinations**, psychoses, agitation, nervousness, delusions, delirium, paranoia, euphoria, excitement, *light-headedness, dizziness*, depression, drowsiness, weakness, giddiness, paresthesias, heaviness of the limbs, numbness of fingers, *dyskinesias, hyperkinesia*
- **CV:** *Hypotension, orthostatic hypotension*
- **Dermatologic:** Rash, urticaria, other dermatoses
- **GI:** *Nausea, vomiting*, epigastric distress, flatulence, diarrhea
- **Respiratory:** URIs, dyspnea, sinus congestion, **rhabdomyolysis**
- **Other:** *Fever*, urine discoloration

Interactions

- **Drug-drug** • Increased toxicity and serum levels if combined with MAOIs; avoid this combination • Possible decreased excretion if combined with probenecid, cholestyramine, erythromycin, rifampin, ampicillin, or

chloramphenicol; if one of these combinations is used, monitor patient closely • Risk of increased heart rate, arrhythmias, excessive BP changes if combined with norepinephrine, dopamine, dobutamine, isoetharine, isoproterenol, methyl dopa, apomorphine, or epinephrine; administer with extreme caution and monitor patient closely

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to drug or its components, hypertension, hypotension, hepatic or renal impairment, pregnancy, lactation
- **Physical:** Body weight; body T; skin color, lesions; orientation, affect, reflexes, bilateral grip strength, visual examination; P, BP, orthostatic BP, auscultation; bowel sounds, normal output, liver evaluation; urinary output, voiding pattern, LFTs, renal function tests

Interventions

⊗ **Warning** Administer only in conjunction with levodopa and carbidopa. Monitor patient response, customary levodopa dosage may need to be decreased.

- Provide sugarless lozenges or ice chips to suck if dry mouth is a problem.
- Give with meals if GI upset occurs; give before meals to patients bothered by dry mouth; give after meals if drooling is a problem or if drug causes nausea.
- Advise patient to use barrier contraceptives, serious birth defects can occur while using this drug; advise nursing mothers to use another means of feeding the baby because drug can enter breast milk and adversely affect the infant.
- Establish safety precautions if CNS, vision changes, hallucinations, or hypotension occurs (use side rails, accompany patient when ambulating).
- Provide additional comfort measures appropriate to patient with parkinsonism.

Teaching points

- Take this drug exactly as prescribed. Always take with your levodopa and carbidopa.
- Use barrier contraceptives while taking this drug; serious birth defects can occur. Do not

nurse while on this drug; the drug enters breast milk and can adversely affect the baby.

- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving a car or engaging in activities that require alertness and visual acuity; if these occur, rise slowly when changing positions to help decrease dizziness); nausea (eat frequent small meals); dry mouth (suck sugarless lozenges or ice chips); hallucinations (this is a side effect of the drug; use care and have someone stay with you if this occurs); constipation (maintain adequate fluid intake and exercise regularly; if this does not help, consult your health care provider); reddish brown discoloration of urine (a drug effect).
- Report constipation, rapid or pounding heartbeat, confusion, eye pain, hallucinations, rash.

▼ entecavir (*en tek' ah veer*)

Baraclude

PREGNANCY CATEGORY C

Drug classes

Antiviral
Nucleoside analogue

Therapeutic actions

Blocks activities of reverse transcriptases preventing the formation of viral DNA and leading to decreased viral load associated with hepatitis B.

Indications

- Treatment of chronic hepatitis B infection in adults with evidence of active viral replication and either evidence of persistent elevations in serum aminotransferases or histologically active disease

Contraindications and cautions

- Contraindicated with known hypersensitivity to entecavir or any of its components, lactation, co-infection with HIV in patients not receiving highly active antiretroviral therapy.

- Use cautiously with pregnancy, renal impairment, liver transplant, concurrent use of drugs that alter renal function.

Available forms

Tablets—0.5, 1 mg; oral solution—0.05 mg/mL

Dosages

Adults and children 16 yr and older with no previous nucleoside treatment

0.5 mg/day PO on an empty stomach at least 2 hr after a meal or 2 hr before the next meal.

Adults and children 16 yr and older with a history of viremia also receiving lamivudine or with known resistance mutations

1 mg/day PO on an empty stomach at least 2 hr after a meal or 2 hr before the next meal.

Pediatric patients younger than 16 yr

Safety and efficacy not established.

Patients with renal impairment

Creatinine clearance of 50 mL/min or more, 0.5 mg/day PO (1 mg/day PO with lamivudine resistance); creatinine clearance of 30–less than 50 mL/min, 0.25 mg/day PO or 0.5 mg PO every 48 hr (0.5 mg/day PO or 1 mg every 48 hr with lamivudine resistance); creatinine clearance of 10–less than 30 mL/min, 0.15 mg/day PO or 0.5 mg PO every 72 hr (0.3 mg/day PO or 1 mg every 72 hr with lamivudine resistance); creatinine clearance less than 10 mL/min, 0.05 mg/day PO or 0.5 mg PO every 7 days (0.1 mg/day PO or 1 mg every 7 days with lamivudine resistance); in hemodialysis, 0.05 mg/day PO or 0.5 mg PO every 7 days (0.1 mg/day PO or 1 mg PO every 7 days with lamivudine resistance).

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–1.5 hr

Metabolism: $T_{1/2}$: 128–149 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** *Dizziness, headache, fatigue*, somnolence, insomnia

- **GI:** *Nausea*, vomiting, diarrhea, dyspepsia, lactic acidosis and severe hepatomegaly with steatosis
- **Other:** Acute exacerbations of hepatitis B (with discontinuation of therapy)

Interactions

- *** Drug-drug** • Risk of decreased excretion and toxic effects if combined with drugs that alter renal function; monitor patient carefully and adjust dosages as needed

■ Nursing considerations

Assessment

- **History:** Allergy to any components of the product, lactation, pregnancy; renal impairment; signs of lactic acidosis
- **Physical:** T; orientation, reflexes; abdominal examination, LFTs, renal function tests

Interventions

- Assess renal function before beginning therapy; adjust dosage as appropriate.
- Maintain other measures used to help patient deal with chronic hepatitis B.
- Monitor patient regularly to evaluate effects of drug on the body.
- Administer this drug on an empty stomach, at least 2 hr after a meal or 2 hr before the next meal.

⊗ **Black box warning** Withdraw drug and monitor patient if patient develops signs of lactic acidosis or hepatotoxicity, including hepatomegaly and steatosis.

⊗ **Black box warning** Do not use in patients co-infected with HIV unless patient is receiving highly active antiretroviral therapy because of high risk of HIV resistance. HIV testing should be offered to all patients before starting entecavir therapy. Acute exacerbations of hepatitis B can also occur.

- Effects of the drug on a fetus are not known. Advise women of childbearing age to use barrier contraceptives while on this drug.
- Advise women who are nursing to find another method of feeding the baby; potential effects on the baby are not known.
- Advise patient that this drug does not cure the disease and there is still a risk of transmitting the disease to others.
- Monitor for worsening of hepatitis if drug is withdrawn.

Teaching points

- This drug is not a cure for hepatitis B. It may decrease the number of viruses in your body and may improve the condition of your liver.
- ⊗ **Warning** You should still take precautions to prevent the spread of hepatitis B; do not share any personal items that may have blood or body fluids on them; use condoms if having intercourse.
- Always take *Baraclude* on an empty stomach at least 2 hours after a meal and at least 2 hours before the next meal.
- If you are using the oral solution, use the measuring spoon provided to measure out your dose. Swallow the medicine directly from the measuring spoon. Rinse the spoon with water and allow to air dry after each use. Store the solution at room temperature.
- If you forget a dose of the drug, take that dose as soon as you remember, then take your next dose at the usual time. Do not take two doses at the same time.
- Do not run out of *Baraclude*. If you are running low, contact your health care provider; if you stop taking this drug, your hepatitis symptoms could get worse and become very serious.
- You will need to have regular health care, including blood tests, to monitor the effects of this drug on your body.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, another method of feeding the baby should be selected.
- It is not known how this drug could affect a fetus. If you are pregnant or decide to become pregnant while on this drug, consult your health care provider.
- You may experience the following side effects: Headache (consult your health care provider, medication may be available to help); dizziness (avoid driving a car or operating hazardous equipment if this occurs); nausea (frequent small meals may help).
- Report unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, feeling cold, lightheadedness, fast or irregular heartbeat, dark urine, yellowing of the eyes or skin, light-colored stools.

DANGEROUS DRUG

▽ ephedrine sulfate

(e'fed'rin)

PREGNANCY CATEGORY C

Drug classes

Bronchodilator
Sympathomimetic
Vasopressor

Therapeutic actions

Peripheral effects are mediated by receptors in target organs and are due in part to the release of norepinephrine from nerve terminals. Effects mediated by these receptors include vasoconstriction (increased BP, decreased nasal congestion alpha receptors), cardiac stimulation (beta₁), and bronchodilation (beta₂). Longer acting but less potent than epinephrine; also has CNS stimulant properties.

Indications

Parenteral

- Treatment of hypotensive states, especially those associated with spinal anesthesia; Stokes-Adams syndrome with complete heart block; CNS stimulant in narcolepsy and depressive states; acute bronchospasm; myasthenia gravis
- Pressor drug in hypotensive states following sympathectomy, overdose with ganglionic-blocking drugs, antiadrenergic drugs, or other drugs used for lowering BP
- Relief of acute bronchospasm (epinephrine is the preferred drug)

Oral

- Treatment of allergic disorders, such as bronchial asthma, and temporary relief of wheezing, shortness of breath, and tightness of the chest

Contraindications and cautions

- Contraindicated with allergy to ephedrine, angle-closure glaucoma, anesthesia with cyclopropane or halothane, thyrotoxicosis, diabetes, hypertension, CV disorders, women in labor whose BP is lower than 130/80 mm Hg.

- Use cautiously with angina, arrhythmias, prostatic hypertrophy, unstable vasomotor syndrome, lactation.

Available forms

Capsules—25 mg; injection—50 mg/mL

Dosages

May be given PO, IM, slow IV, or subcutaneously.

Adults

Parenteral

- **Hypotensive episodes, allergic disorders:** 25–50 mg IM (fast absorption), subcutaneously (slower absorption), or 5–25 mg IV given slowly; may be repeated in 5–10 min.

Oral

- **Acute asthma:** Administer the smallest effective dose (12.5–25 mg PO every 4 hr).

Pediatric patients

Parenteral

0.5 mg/kg or 16.7 mg/m² IM or subcutaneously every 4–6 hr.

Oral

Not recommended for children younger than 12 yr.

Geriatric patients

More likely to experience adverse reactions; use with caution.

Pharmacokinetics

Route	Onset	Duration
Oral	30–40 min	3–5 hr
IM	10–20 min	1 hr
IV	Instant	1 hr

Metabolism: Hepatic; T_{1/2}: 3–6 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Administer as provided; no preparation required.

Infusion: Administer directly into vein or tubing of running IV; administer slowly, each 10 mg over at least 1 min.

Adverse effects

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness,*

drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, symptoms of paranoid schizophrenia

- **CV:** Arrhythmias, **hypertension resulting in intracranial hemorrhage, CV collapse with hypotension, palpitations, tachycardia, precordial pain in patients with ischemic heart disease**
- **GI:** *Nausea,* vomiting, anorexia
- **GU:** Constriction of renal blood vessels and *decreased urine formation* (initial parenteral administration), *dysuria, vesical sphincter spasm* resulting in difficult and painful urination, urinary retention in males with prostatism
- **Other:** *Pallor,* respiratory difficulty, orofacial dystonia, sweating

Interactions

• **Drug-drug** • Severe hypertension with MAOIs, TCAs • Additive effects and increased risk of toxicity with urinary alkalinizers • Decreased vasopressor response with reserpine, methyl dopa, urinary acidifiers

• **Drug-alternative therapy** • Coadministration with ephedra, ma huang, guarana, and caffeine leads to additive effects and may lead to overstimulation, increased BP, CVA, and death

Nursing considerations

Assessment

- **History:** Allergy to ephedrine; angle-closure glaucoma; anesthesia with cyclopropane or halothane; thyrotoxicosis, diabetes, hypertension, CV disorders; prostatic hypertrophy, unstable vasomotor syndrome; lactation
- **Physical:** Skin color, T; orientation, reflexes, peripheral sensation, vision; P, BP, auscultation, peripheral perfusion; R, adventitious sounds; urinary output pattern, bladder percussion, prostate palpation

Interventions

- Protect solution from light; give only if clear; discard any unused portion.
- Monitor urine output with parenteral administration; initially renal blood vessels

may be constricted and urine formation decreased.

- Avoid prolonged use of systemic ephedrine (a syndrome resembling an anxiety effect may occur); temporary cessation of the drug usually reverses this syndrome.
- Monitor CV effects carefully; patients with hypertension may experience changes in BP because of the additional vasoconstriction. If a nasal decongestant is needed, give pseudoephedrine.

Teaching points

- Do not exceed recommended dose.
- Avoid over-the-counter medications. Many of them contain the same or similar drugs and serious overdosage can occur.
- You may experience these side effects: Dizziness, weakness, restlessness, tremor, lightheadedness, (avoid driving or operating dangerous equipment); urinary retention (empty your bladder before taking drug).
- Report nervousness, palpitations, sleeplessness, sweating.

DANGEROUS DRUG

epinephrine
(adrenaline)
(ep i nef' rin)

epinephrine bitartrate

Aerosol: Primatene Mist

epinephrine hydrochloride

Insect-sting emergencies:

EpiPen Auto-Injector (delivers 0.3 mg IM adult dose), EpiPen Jr. Auto-Injector (delivers 0.15 mg IM for children)

OTC solutions for nebulization:

AsthmaNefrin, microNefrin, Nephron, S₂

PREGNANCY CATEGORY C

Drug classes

Alpha-adrenergic agonist
Antiasthmatic

Beta₁- and beta₂-adrenergic agonist
Bronchodilator
Cardiac stimulant
Sympathomimetic
Vasopressor

Therapeutic actions

Naturally occurring neurotransmitter, the effects of which are mediated by alpha or beta receptors in target organs. Effects on alpha receptors include vasoconstriction, contraction of dilator muscles of iris. Effects on beta receptors include positive chronotropic and inotropic effects on the heart (beta₁ receptors); bronchodilation, vasodilation, and uterine relaxation (beta₂ receptors); decreased production of aqueous humor.

Indications

- IV: In ventricular standstill after all other measures have failed to restore circulation, given by trained personnel by intracardiac puncture and intramyocardial injection; treatment and prophylaxis of cardiac arrest and attacks of transitory AV heart block with syncopal seizures (Stokes-Adams syndrome); syncope due to carotid sinus syndrome; acute hypersensitivity (anaphylactoid) reactions, serum sickness, urticaria, angioneurotic edema; in acute asthmatic attacks to relieve bronchospasm not controlled by inhalation or subcutaneous injection; relaxation of uterine musculature; additive to local anesthetic solutions for injection to prolong their duration of action and limit systemic absorption
- Injection: Relief from respiratory distress of bronchial asthma.
- Aerosols and solutions for nebulization: Temporary relief from acute attacks of bronchial asthma, COPD

Contraindications and cautions

- Contraindicated with allergy or hypersensitivity to epinephrine or components of preparation (many of the inhalant and ophthalmic products contain sulfites: Sodium bisulfite, sodium or potassium metabisulfite; check label before using any of these products in a sulfite-sensitive patient); narrow-angle glaucoma; shock other than anaphylactic shock; hypovolemia; general anesthesia with halogenated hydrocarbons

or cyclopropane; organic brain damage, cerebral arteriosclerosis; cardiac dilation and coronary insufficiency; tachyarrhythmias; ischemic heart disease; hypertension; renal impairment (drug may initially decrease renal blood flow); COPD patients who have developed degenerative heart disease; diabetes mellitus; hyperthyroidism; lactation.

- Use cautiously with prostatic hypertrophy (may cause bladder sphincter spasm, difficult and painful urination), history of seizure disorders, psychoneurotic individuals, labor and delivery (may delay second stage of labor; can accelerate fetal heart beat; may cause fetal and maternal hypoglycemia), children (syncope has occurred when epinephrine has been given to asthmatic children). Use EpiPen Auto-Injector cautiously with hyperthyroidism, CAD, hypertension, diabetes, elderly patients, pregnancy, and patients weighing less than 30 kg.

Available forms

Solution for inhalation—1:100, 1:1,000, 1.125%, 1%; aerosol—0.35 mg, 0.5%, 0.22 mg; injection—1, 5 mg/mL; solution for injection—1:1,000, 1:2,000, 1:10,000, 1:100,000; suspension for injection—1:200

Dosages

Adults

Epinephrine injection

- *Hypersensitivity or bronchospasm*: 0.1–0.25 mg (1–2.5 mL of 1:10,000 solution) injected slowly.
- *Cardiac arrest*: 0.5–1 mg (5–10 mL of 1:10,000 solution) IV during resuscitation, 0.5 mg every 5 min. Intracardiac injection into left ventricular chamber, 0.3–0.5 mg (3–5 mL of 1:10,000 solution).

Intraspinal

0.2–0.4 mL added to anesthetic spinal fluid mixture. Concentrations of 1:100,000–1:20,000 are usually used.

1:1,000 solution

- *Respiratory distress*: 0.2–1 mL of 1:1,000 solution subcutaneously or IM.

1:200 suspension (for subcutaneous administration only)

- *Respiratory distress*: 0.1–0.3 mL (0.5–1.5 mg) subcutaneously.

Inhalation (aerosol)

Begin treatment at first symptoms of bronchospasm. Individualize dosage. Wait 1–5 min between inhalations to avoid overdose.

Inhalation (OTC)

4 yr and older: 1 inhalation, wait 1 min, then may use once more. Do not repeat for at least 3 hr.

Inhalation (nebulization)

Place not more than 10 drops into the nebulizer reservoir. Place nebulizer nozzle into partially opened mouth. Patient inhales deeply while bulb is squeezed one to three times (not more than every 3 hr).

Pediatric patients

Epinephrine injection

- *1:1,000 solution, children*: 0.01 mg/kg or 0.3 mL/m² (0.01 mg/kg or 0.3 mg/m²) subcutaneously; repeat every 4 hr if needed. Do not exceed 0.5 mL (0.5 mg) in a single dose. For infants, use 0.05 mg subcutaneously as initial dose, repeat every 20–30 min as needed. For neonates, use 0.01 mg/kg subcutaneously.
- *1:200 suspension, infants and children (1 mo–1 yr)*: 0.005 mL/kg (0.025 mg/kg) subcutaneously.
- *Children 30 kg or less*: 0.15 mg or 0.01 mg/kg by autoinjector.
- *Hypersensitivity or bronchospasm*: For neonates, use 0.01 mg/kg IV. For infants, use 0.05 mg IV as initial dose and repeat every 20–30 min as needed with 1:10,000 solution.

Geriatric patients or patients with renal failure

Use with caution.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	5–10 min	20 min	20–30 min
IM	5–10 min	20 min	20–30 min
IV	Instant	20 min	20–30 min
Inhalation	3–5 min	20 min	1–3 hr
Eye	Less than 1 hr	4–8 hr	24 hr

Metabolism: Neural

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

IV FACTS

Preparation: 0.5 mL dose may be diluted to 10 mL with sodium chloride injection for direct injection; prepare infusion by mixing 1 mg in 250 mL D₅W (4 mcg/mL).

Infusion: Administer by direct IV injection or into the tubing of a running IV, each 1 mg over 1 min, or run infusion at 1–4 mcg/min (15–60 mL/hr).

Adverse effects

Systemic administration

- **CNS:** *Fear, anxiety, tenseness, restlessness, headache, light-headedness, dizziness, drowsiness, tremor, insomnia, hallucinations, psychological disturbances, seizures, CNS depression, weakness, blurred vision, ocular irritation, tearing, photophobia, symptoms of paranoid schizophrenia*
- **CV:** Arrhythmias, **hypertension resulting in intracranial hemorrhage, CV collapse with hypotension, palpitations, tachycardia, precordial pain in patients with ischemic heart disease**
- **GI:** *Nausea, vomiting, anorexia*
- **GU:** Constriction of renal blood vessels and *decreased urine formation* (initial parenteral administration), *dysuria, vesical sphincter spasm* resulting in difficult and painful urination, urinary retention in males with prostatism
- **Other:** *Pallor, respiratory difficulty, orofacial dystonia, sweating*

Local injection

- **Local:** Necrosis at sites of repeat injections (due to intense vasoconstriction)

Nasal solution

- **Local:** Rebound congestion, local burning and stinging

Ophthalmic solutions

- **CNS:** *Headache, brow ache, blurred vision, photophobia, difficulty with night vision, pigmentary (adrenochrome) deposits in the cornea, conjunctiva, or lids with prolonged use*
- **Local:** *Transient stinging on initial instillation, eye pain or ache, conjunctival hyperemia*

Interactions

• **Drug-drug** • Increased sympathomimetic effects with TCAs (eg, imipramine) • Excessive hypertension with propranolol, beta-blockers • Decreased cardiostimulating and bronchodilating effects with beta-adrenergic blockers (eg, propranolol) • Decreased vasopressor effects with chlorpromazine, phenothiazines • Decreased antihypertensive effect of methyldopa

Nursing considerations

Assessment

- **History:** Allergy or hypersensitivity to epinephrine or components of drug preparation; narrow-angle glaucoma; shock other than anaphylactic shock; hypovolemia; general anesthesia with halogenated hydrocarbons or cyclopropane; organic brain damage, cerebral arteriosclerosis; cardiac dilation and coronary insufficiency; tachyarrhythmias; ischemic heart disease; hypertension; renal impairment; COPD; diabetes mellitus; hyperthyroidism; prostatic hypertrophy; history of seizure disorders; psychoneuroses; labor and delivery; lactation
- **Physical:** Weight; skin color, T, turgor; orientation, reflexes, IOP; P, BP; R, adventitious sounds; prostate palpation, normal urine output; urinalysis, renal function tests, blood and urine glucose, serum electrolytes, thyroid function tests, ECG

Interventions

- **Warning** Use extreme caution when calculating and preparing doses; epinephrine is a very potent drug; small errors in dosage can cause serious adverse effects. Double-check pediatric dosage.
- Use minimal doses for minimal periods of time; “epinephrine-fastness” (a form of drug tolerance) can occur with prolonged use.
- Protect drug solutions from light, extreme heat, and freezing; do not use pink or brown solutions. Drug solutions should be clear and colorless (does not apply to suspension for injection).
- Shake the suspension for injection well before withdrawing the dose.

- Rotate subcutaneous injection sites to prevent necrosis; monitor injection sites frequently.

⊗ **Warning** Keep a rapidly acting alpha-adrenergic blocker (phentolamine) or a vasodilator (a nitrate) readily available in case of excessive hypertensive reaction.

⊗ **Warning** Have an alpha-adrenergic blocker or facilities for intermittent positive pressure breathing readily available in case pulmonary edema occurs.

⊗ **Warning** Keep a beta-adrenergic blocker (propranolol; a cardioselective beta-adrenergic blocker, such as atenolol, should be used in patients with respiratory distress) readily available in case cardiac arrhythmias occur.

- Do not exceed recommended dosage of inhalation products; administer pressurized inhalation drug forms during second half of inspiration, because the airways are open wider and the aerosol distribution is more extensive. If a second inhalation is needed, administer at peak effect of previous dose, 3–5 min.

Teaching points

- Do not exceed recommended dosage; adverse effects or loss of effectiveness may result. Read the instructions that come with respiratory inhalant products, and consult your health care provider or pharmacist if you have any questions.
- You may experience these side effects: Dizziness, drowsiness, fatigue, apprehension (use caution if driving or performing tasks that require alertness); anxiety, emotional changes; nausea, vomiting, change in taste (eat frequent small meals); fast heart rate.
- Report chest pain, dizziness, insomnia, weakness, tremor or irregular heart beat (respiratory inhalant), difficulty breathing, productive cough, failure to respond to usual dosage (respiratory inhalant).

epirubicin hydrochloride

See Appendix U, *Less commonly used drugs*.

eplerenone (ep ler' eb noun)

Inspira

PREGNANCY CATEGORY B

Drug classes

Aldosterone receptor blocker
Antihypertensive

Therapeutic actions

Binds to aldosterone receptors, blocking the binding of aldosterone, leading to increased loss of sodium and water and lowering of BP.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensive drugs
- Heart failure, post-MI, improvement in the survival of patients with left ventricular dysfunction after a heart attack
- Unlabeled uses: Alone or with ACE inhibitors to reduce left ventricular hypertrophy; adjunct in diabetic hypertensives with microalbuminuria

Contraindications and cautions

- Contraindicated with allergy to eplerenone, hyperkalemia (exceeding 5.5 mEq/L), type 2 diabetes with microalbuminuria, severe renal impairment (creatinine clearance less than 50 mL/min or serum creatinine level higher than 2 mg/dL in males or 1.8 mg/dL in females), lactation.
- Use cautiously with hepatic impairment, pregnancy, concurrent treatment with potassium supplements, potassium-sparing diuretics, CYP450 and CYP3A4 inhibitors (eg, ketoconazole).

Available forms

Tablets—25, 50 mg

Dosages

Adults

- **Hypertension:** Initially, 50 mg/day PO as a single daily dose; if necessary, may be increased to 50 mg PO bid after a minimum of a 4-wk trial period. Maximum, 100 mg/day.

- **Heart failure post-MI:** Start with 25 mg/day PO titrate to 50 mg/day over 4 wk.
- **Heart failure:** If serum K⁺ is lower than 5, increase dose; if 5–5.4, no adjustment necessary; if 5.5–5.9, decrease dose; if 6 or higher, withhold dose.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	1.5 hr

Metabolism: Hepatic; T_{1/2}: 4–6 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

CNS: Headache, dizziness, fatigue

CV: Angina, **MI**

GI: Diarrhea, abdominal pain

GU: Abnormal vaginal bleeding, albuminuria, changes in sexual function

Metabolic: Hypercholesterolemia, **hyperkalemia**

Respiratory: Cough

Other: Gynecomastia and breast pain in men, flulike symptoms

Interactions

*** Drug–drug** ⊗ **Warning** Risk of serious toxic effects if combined with strong inhibitors of the CYP450 3A4 system (ketoconazole, itraconazole, erythromycin, verapamil, saquinavir, fluconazole); if any of these drugs are being used, initiate treatment with 25 mg eplerenone and monitor patient closely.

- Increased risk of hyperkalemia if combined with ACE inhibitors and ARBs; monitor patient closely
- Possible risk of lithium toxicity if combined with lithium; monitor serum lithium levels closely if this combination is necessary
- Possible risk of decreased antihypertensive effect if combined with NSAIDs; monitor BP carefully
- Risk of hyperkalemia also with potassium supplements, potassium-sparing diuretics such as spironolactone, amiloride, triamterene; avoid concomitant use

Nursing considerations

Assessment

- **History:** Allergy to eplerenone, hyperkalemia, type 2 diabetes mellitus, severe renal impairment, lactation, hepatic impairment, pregnancy, concurrent treatment with potassium supplements, CYP450 or CYP3A4 inhibitors
- **Physical:** Orientation, reflexes; BP; R; urinary output; LFTs, renal function tests, serum potassium levels, serum cholesterol

Interventions

- Arrange for pretreatment and periodic evaluation of serum potassium and renal function.
- Establish baseline patient weight to monitor drug effect.
- Administer once a day, in the morning, so increased urination will not interrupt sleep.
- Avoid giving patient any foods rich in potassium (see Appendix D, *Important Dietary Guidelines for Patient Teaching*, for a complete list).
- Establish appropriate safety precautions if patient experiences adverse CNS effects.
- Suggest another method of feeding the baby if the drug is needed in a lactating woman.

Teaching points

- Take this drug early in the morning so any increase in urination will not affect sleep.
- Weigh yourself on a regular basis, at the same time of day and in the same clothes, and record this weight on your calendar.
- This drug may interact with many other medications. Alert any health care provider caring for you that you are taking this drug.
- This drug should not be taken during pregnancy or when nursing a baby; using barrier contraceptives is suggested.
- You will need periodic blood tests to evaluate the effect of this drug on your serum potassium level and cholesterol level.
- Avoid foods that are high in potassium (fruits, *Sanka* coffee).
- You may experience these side effects: Dizziness (use caution and avoid driving a car or performing other tasks that require alertness if you experience dizziness); enlargement or pain of the breasts (it may help to know that

this is a drug effect and will pass when drug therapy is ended).

- Report weight change of more than 3 pounds in 1 day, severe dizziness, trembling, numbness, muscle weakness or cramps, palpitations.

epoetin alfa **(EPO, erythropoietin)** (e'poe e'tin)

Epogen, Eprex (CAN), Procrit

PREGNANCY CATEGORY C

Drug class

Recombinant human erythropoietin

Therapeutic actions

A natural glycoprotein produced in the kidneys, which stimulates red blood cell production in the bone marrow.

Indications

- Treatment of anemia associated with chronic renal failure, including patients older than 1 mo on dialysis
- Treatment of anemia related to therapy with azidothymidine (AZT) in HIV-infected patients
- Treatment of anemia related to chemotherapy in cancer patients
- Reduction of allogenic blood transfusions in surgical patients
- Unlabeled uses: Pruritus associated with renal failure; myelodysplastic syndromes; chronic inflammation associated with rheumatoid arthritis

Contraindications and cautions

- Contraindicated with uncontrolled hypertension; hypersensitivity to mammalian cell-derived products or to albumin human; contains benzyl alcohol, which can be fatal in premature infants.
- Use cautiously with pregnancy, lactation, sickle cell anemia, myelodysplastic syndromes, porphyria, hypercoagulable disorders.

Available forms

Injection—2,000, 3,000, 4,000, 10,000, 20,000, 40,000 units/mL

Dosages

Monitor patient closely; target Hgb 10–12 g/dL.

Adults

- *Anemia of chronic renal failure:* Starting dose, 50–100 units/kg three times weekly IV for dialysis patients and IV or subcutaneously for nondialysis patients. Reduce dose if Hgb increases more than 1 g/dL in any 2-wk period. Reduce dose by 25% if Hgb is 12 g/dL. Increase dose if Hgb does not increase by 1 g/dL after 4 wk of therapy or if Hgb is less than 10 g/dL. For maintenance dose, individualized based on Hgb—generally, 75–100 units/kg three times weekly. If on dialysis, median dose is 75 units/kg three times weekly. Target Hgb range is 10–12 g/dL.
 - *Treatment of anemia in HIV-infected patients on AZT therapy:* For patients receiving AZT dose of 4,200 mg/wk or less with serum erythropoietin levels of 500 milliunits/mL or less, use 100 units/kg IV or subcutaneously three times/wk for 8 wk; when desired response is achieved, titrate dose to maintain Hgb with lowest possible dose.
 - *Treatment of anemia in cancer patients on chemotherapy (Procrit only):* 150 units/kg subcutaneously three times/wk or 40,000 units subcutaneously weekly; after 8 wk, can be increased to 300 units/kg or 60,000 units subcutaneously weekly.
 - *Reduction of allogenic blood transfusions in surgery:* 300 units/kg/day subcutaneously for 10 days before surgery, on day of surgery, and 4 days after surgery. Or, 600 units/kg/day subcutaneously 21, 14, and 7 days before surgery and on day of surgery. Make sure that Hgb is higher than 10 g/dL and lower than 13 g/dL.
 - *Chronic renal failure:* IV administration should be used instead of subcutaneous injection. Dosage should start slowly and be increased based on Hgb levels; check Hgb levels weekly until stable, then monthly.
- Pediatric patients 1 mo–16 yr**
- *Chronic renal failure:* 50 units/kg IV or subcutaneously 3 times/wk.
 - *Anemia of prematurity:* 25–100 units/kg/dose 3 times/wk.

- **Cancer:** 600 units/kg/wk IV. Maximum dose, 60,000 units in children 5 yr and older.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	7–14 days	5–24 hr	24 hr

Metabolism: Serum; $T_{1/2}$: 4–13 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: As provided; no additional preparation. Enter vial only once; do not shake vial. Discard any unused solution. Refrigerate.

Infusion: Administer by direct IV injection or into tubing of running IV.

Incompatibilities: Do not mix with any other drug solution.

Adverse effects

- **CNS:** *Headache, arthralgias, fatigue, asthenia, dizziness, seizure, CVA, TIA*
- **CV:** *Hypertension, edema, chest pain, DVT*
- **GI:** *Nausea, vomiting, diarrhea*
- **Other:** Clotting of access line, **development of anti-erythropoietin antibodies with subsequent pure red cell aplasia and extreme anemia, tumor progression and shortened survival (with cancers)**

■ Nursing considerations

Assessment

- **History:** Uncontrolled hypertension, hypersensitivity to mammalian cell-derived products or to albumin human, lactation
- **Physical:** Reflexes, affect; BP, P; urinary output, renal function tests; CBC, Hct, iron levels, electrolytes

Interventions

⊗ **Black box warning** Risk of death and serious CV events is increased if Hgb target is higher than 12 g/dL. Use lowest levels of drug needed to increase Hgb to lowest level needed to avoid transfusion.

⊗ **Black box warning** Incidence of DVT is higher in patients who are receiving

erythropoietin-stimulating agents preoperatively to reduce need for transfusion; consider antithrombotic prophylaxis if used for this purpose.

⊗ **Black box warning** Patients with cancer are at risk for more rapid tumor progression, shortened survival, and death when Hgb level target is more than 12 g/dL. Risk of death is increased in cancer patients not receiving radiation or chemotherapy.

- Confirm chronic, renal nature of anemia; not intended as a treatment of severe anemia or substitute for emergency transfusion.
- Patients with chronic renal failure on hemodialysis should receive the drug IV, not by subcutaneous injection, to decrease the risk of developing anti-erythropoietin antibodies.
- Gently mix; do not shake, shaking may denature the glycoprotein. Use only one dose per vial; do not reenter the vial. Discard unused portions.
- Do not give with any other drug solution.
- Administer dose three times per week. If administered independent of dialysis, administer into venous access line. If patient is not on dialysis, administer IV or subcutaneously.
- Monitor access lines for signs of clotting.
- Arrange for Hgb reading before administration of each dose to determine dosage. If patient fails to respond within 8 wk of therapy, evaluate patient for other etiologies of the problem.
- Monitor patient for sudden loss of response and severe anemia with low reticulocyte count; withhold drug and check patient for anti-erythropoietin antibodies. If antibodies are present, discontinue drug permanently and do not switch to any other erythropoietic agent; cross-sensitivity can occur.
- Monitor Hgb levels; target range is 10–12 g/dL; do not exceed 12 g/dL.
- Evaluate iron stores before and periodically during therapy. Supplemental iron may need to be ordered.
- Institute seizure precautions.

Teaching points

- Drug must be given three times per week and can only be given IV, subcutaneously, or into

a dialysis access line. Prepare a schedule of administration dates.

- If you will be giving yourself injections, you and a significant other should learn proper administration technique; dispose of syringes and needles appropriately.
- Keep appointments for blood tests needed to determine the effects of the drug on your blood count and to determine dosage.
- Maintain all of the usual activities and restrictions that apply to your chronic renal failure. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Dizziness, headache, seizures (avoid driving or performing hazardous tasks); fatigue, joint pain (may be medicated); nausea, vomiting, diarrhea (proper nutrition is important).
- Report difficulty breathing, numbness or tingling, chest pain, seizures, severe headache.

▷ **epoprostenol sodium (prostacyclin, PGX, PGI₂)**

See Appendix U, *Less commonly used drugs*.

▷ **eprosartan mesylate**
(*ep row sar' tan*)

Teveten

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

Antihypertensive
ARB

Therapeutic actions

Selectively blocks the binding of angiotensin II to specific tissue receptors found in the vascular smooth muscle and adrenal gland; this action blocks the vasoconstriction effect of the renin–angiotensin system as well as the release of aldosterone leading to decreased BP.

Indications

- Treatment of hypertension, alone or in combination with other antihypertensive drugs, particularly diuretics and calcium channel blockers
- Unlabeled use: Heart failure, left ventricular hypertrophy, diabetic nephropathy

Contraindications and cautions

- Contraindicated with hypersensitivity to any ARB, pregnancy (use during the second or third trimester can cause injury or even death to the fetus), lactation.
- Use cautiously with renal impairment, hypovolemia, hyperkalemia.

Available forms

Tablets—600 mg

Dosages

Adults

Usual starting dose is 600 mg PO daily. Can be administered in divided doses bid with a total daily dose of 400–800 mg/day being effective. Patients with moderate and severe renal impairment, maximum dose is 600 mg/day. If used as part of combination therapy, eprosartan should be added to established dose of other antihypertensive, starting at the lowest dose and increasing dosage based on patient response.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–2 hr

Metabolism: Hepatic; T_{1/2}: 5–9 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, syncope, muscle weakness, *fatigue, depression*
- **CV:** Hypotension
- **Dermatologic:** Rash, inflammation, urticaria, pruritus, alopecia, dry skin
- **GI:** Diarrhea, *abdominal pain*, nausea, constipation

- **Renal:** Hyperkalemia, increased BUN
- **Respiratory:** *URI symptoms*, cough, sinus disorders
- **Other:** Cancer (in preclinical studies), UTIs, angioedema

Interactions

* **Drug-drug** • Use caution when combining with other drugs that may elevate serum potassium concentrations—potassium-sparing diuretics, potassium supplements, or potassium-containing salt substitutes

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any ARB, pregnancy, lactation, renal impairment, hypovolemia, hyperkalemia
- **Physical:** Skin lesions, turgor; T; reflexes, affect; BP; R, respiratory auscultation; renal function tests

Interventions

- Administer without regard to meals.
- ⊗ **Black box warning** Ensure that patient is not pregnant before beginning therapy, suggest the use of barrier birth control while using eprosartan; fetal injury and deaths have been reported.
- Find an alternate method of feeding the infant if given to a nursing mother. Depression of the renin–angiotensin system in infants is potentially very dangerous.
- ⊗ **Warning** Alert surgeon and mark the patient's chart with notice that eprosartan is being taken. The blockage of the renin–angiotensin system following surgery can produce problems. Hypotension may be reversed with volume expansion.
- If BP control does reach desired levels, diuretics or other antihypertensives may be added to the drug regimen. Monitor patient's BP carefully.
- Monitor patient closely in any situation that may lead to a decrease in BP secondary to reduction in fluid volume—excessive perspiration, dehydration, vomiting, diarrhea—excessive hypotension can occur.

Teaching points

- Take drug without regard to meals. Do not stop taking this drug without consulting your health care provider.
- Use a barrier method of birth control while taking this drug; if you become pregnant or desire to become pregnant, consult your health care provider.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); nausea, abdominal pain (proper nutrition is important, consult with your dietitian to maintain nutrition); symptoms of upper respiratory tract or urinary tract infection, cough (do not self-medicate, consult your health care provider if this becomes uncomfortable).
- Report fever, chills, dizziness, pregnancy, prolonged episodes of severe nausea, vomiting, and diarrhea.

⚠ DANGEROUS DRUG

▽ **eptifibatide**
(*ep tiff'ib'ab tide*)

Integrilin

PREGNANCY CATEGORY B

Drug classes

Antiplatelet drug
Glycoprotein IIb/IIIa receptor agonist

Therapeutic actions

Inhibits platelet aggregation by binding to the glycoprotein IIb/IIIa receptor on the platelet, which prevents the binding of fibrinogen and other adhesive ligands to the platelet.

Indications

- Treatment of acute coronary syndrome
- Prevention of cardiac ischemic complications in patients undergoing elective, emergency, or urgent percutaneous coronary intervention

Contraindications and cautions

- Contraindicated with allergy to eptifibatide, bleeding diathesis, hemorrhagic CVA, active, abnormal bleeding or CVA within 30 days, uncontrolled or severe hypertension, major

surgery within 6 wk, dialysis, severe renal impairment, low platelet count.

- Use cautiously in the elderly; with pregnancy, lactation, renal insufficiency.

Available forms

Injection—0.75, 2 mg/mL

Dosages

Adults

- **Acute coronary syndrome:** 180 mcg/kg IV (maximum of 22.6 mg) over 1–2 min as soon as possible after diagnosis, then 2 mcg/kg/min (maximum 15 mg/hr) by continuous IV infusion for up to 72 hr. If patient is to undergo percutaneous coronary intervention, continue for 18–24 hr after the procedure, up to 96 hr of therapy. Reduce infusion dose to 1 mcg/kg/min if serum creatinine is greater than 2 mg/dL.
- **Percutaneous coronary intervention:** 180 mcg/kg IV as a bolus immediately before the procedure, then 2 mcg/kg/min by continuous IV infusion for 18–24 hr. May give a second bolus of 180 mcg/kg 10 min after the first bolus is given.

Pediatric patients

Not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	15 min	45 min	2–4 hr

Metabolism: Tissue; $T_{1/2}$: 1.5–2.5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Withdraw bolus from 10-mL vial. No preparation needed for continuous infusion. Spike the 100-mL vial with a vented infusion set. Protect from light.

Infusion: Infuse bolus quickly; infuse as continuous infusion using guidelines under Dosages section.

Compatibilities: May be given with alteplase, atropine, dobutamine, heparin, lidocaine, meperidine, metoprolol, morphine, nitroglycerin, verapamil.

Incompatibility: Do not mix with furosemide.

Adverse effects

- **CNS:** Headache, dizziness, weakness, syncope, flushing
- **Dermatologic:** Rash, pruritus
- **GI:** Nausea, GI distress, constipation, diarrhea
- **Hematologic:** Thrombocytopenia
- **Other:** Bleeding, hypotension

Interactions

• **Drug-drug** • Use caution when combining with other drugs that affect blood clotting—thrombolytics, anticoagulants, ticlopidine, dipyridamole, clopidogrel, NSAIDs; increased risk of bleeding or hemorrhage

Nursing considerations

Assessment

- **History:** Allergy to eptifibatide; bleeding diathesis; hemorrhagic CVA; active, abnormal bleeding or CVA within 30 days; uncontrolled or severe hypertension; major surgery within 6 wk; dialysis; severe renal impairment; low platelet count; pregnancy, lactation
- **Physical:** Skin color, temperature, lesions; orientation, reflexes, affect; P, BP, orthostatic BP, baseline ECG, peripheral perfusion; respiratory rate, adventitious sounds, aPTT, PT, active clotting time

Interventions

- Use eptifibatide in conjunction with heparin and aspirin.

⊗ **Warning** As much as possible, avoid arterial and venous puncture, IM injection, catheterization, and intubation in patient using this drug to minimize blood loss.

- Avoid the use of noncompressible IV access sites to prevent excessive, uncontrollable bleeding.
- Arrange for baseline and periodic tests of CBC, PT, aPTT, and active clotting time. Maintain aPTT of 50–70 sec and active bleeding time of 300–350 sec.
- Properly care for femoral access site to minimize bleeding. Document aPTT lower than 45 sec or activated clotting time lower than 150 sec, and stop heparin for 3–4 hr before pulling sheath.

- Provide comfort measures and arrange for analgesics if headache occurs.

Teaching points

- This drug is given to minimize blood clotting and cardiac damage. It must be given IV.
- You will be monitored closely and periodic blood tests will be done to monitor the effects of this drug on your body.
- You may experience these side effects: Dizziness, light-headedness, bleeding.
- Report light-headedness, palpitations, pain at IV site, bleeding.

ergonovine maleate

(*er goe noe' veen*)

Ergotrate

PREGNANCY CATEGORY UNKNOWN

Drug class

Oxytocic

Therapeutic actions

Increases the strength, duration, and frequency of uterine contractions, and decreases postpartum uterine bleeding by direct effects at neuroreceptor sites.

Indications

- Prevention and treatment of postpartum and postabortal hemorrhage due to uterine atony
- Unlabeled use: Oxytocin challenge test, to diagnose coronary artery spasm in patients with variant angina

Contraindications and cautions

- Contraindicated with allergy to ergonovine, induction of labor, threatened spontaneous abortion, history of CVA.
- Use cautiously with hypertension, heart disease, venoatrial shunts, mitral-valve stenosis, obliterative vascular disease, sepsis, hepatic or renal impairment, lactation.

Available forms

Tablets—0.2 mg

Dosages

Adults

1–2 tablets (0.2–0.4 mg) PO every 6–12 hr until the danger of uterine atony has passed (usually 48 hr).

Pharmacokinetics

Route	Onset	Duration
Oral	6–15 min	90–180 min

Metabolism: Hepatic; $T_{1/2}$: 0.5–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, headache*, ringing in the ears
- **CV:** Elevation of BP—more common with ergonovine than other oxytocics
- **GI:** *Nausea, vomiting, diarrhea*
- **Hypersensitivity:** Allergic response, including shock
- **Other:** Ergotism—nausea, BP changes, weak pulse, dyspnea, chest pain, numbness and coldness of the extremities, confusion, excitement, delirium, hallucinations, seizures, coma

Nursing considerations

Assessment

- **History:** Allergy to ergonovine, induction of labor, threatened spontaneous abortion, hypertension, heart disease, venoatrial shunts, peripheral vascular disease, sepsis, hepatic or renal impairment, lactation
- **Physical:** Uterine tone; orientation, reflexes, affect; P, BP, edema; R, adventitious sounds; CBC, LFTs, renal function tests

Interventions

- Initial therapy postpartum is usually with a parenteral drug, then switch to oral drug to minimize late postpartum bleeding.
- Monitor postpartum women for BP changes and amount and character of vaginal bleeding.
- Arrange for discontinuation of drug if signs of ergotism occur.
- Avoid prolonged use of the drug.

Teaching points

- Usually part of an immediate medical situation. Teaching about the complication of delivery or abortion should include drug. The patient needs to know the name of the drug and what she can expect once it is administered.
- You may experience these side effects: Nausea, vomiting, dizziness, headache, ringing in the ears.
- Report difficulty breathing, headache, numb or cold extremities, severe abdominal cramping.

▽ ergotamine tartrate

See Appendix U, *Less commonly used drugs*.

▽ erlotinib

See Appendix U, *Less commonly used drugs*.

▽ ertapenem

(er tab **pen'** em)

Invanz

PREGNANCY CATEGORY B

Drug classes

Antibiotic
Methyl-carbapenem

Therapeutic actions

Bactericidal: Inhibits synthesis of susceptible bacterial cell wall causing cell death.

Indications

- Community-acquired pneumonia caused by *Streptococcus pneumoniae* (penicillin-susceptible strains only), *Haemophilus influenzae* (beta-lactamase–negative strains only), *Moraxella catarrhalis*
- Skin and skin structure infections including diabetic foot infections without osteomyelitis caused by *Staphylococcus aureus* (methicillin-susceptible strains only), *Streptococcus pyogenes*, *Escherichia coli*, *Streptococcus agalactiae*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Bacteroides*

fragilis, *Porphyromonas asaccharolytica*, *Prevotella bivia*, *Peptostreptococcus* species

- Complicated GU infections, including pyelonephritis caused by *E. coli* or *K. pneumoniae*.
- Complicated intra-abdominal infections due to *E. coli*, *Clostridium clostridiiforme*, *Eubacterium lentum*, *Peptostreptococcus* species, *B. fragilis*, *Bacteroides distasonis*, *Bacteroides ovatus*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*
- Acute pelvic infections, including postpartum endomyometritis, septic abortion, post-surgical gynecologic infections due to *S. agalactiae*, *E. coli*, *B. fragilis*, *P. asaccharolytica*, *Peptostreptococcus* species, *P. bivia*
- Prophylaxis of surgical-site infection after elective colorectal surgery in adults

Contraindications and cautions

- Contraindicated with allergies to any component of the drug and to beta lactam antibiotics; allergy to amide-type local anesthetics (IM use); allergy to penicillins, cephalosporins, other allergens.
- Use cautiously with pregnancy; lactation, seizure disorder.

Available forms

Vials for reconstitution—1 g/vial

Dosages

Adults and children 13 yr and older

1 g IM or IV each day; length of treatment varies with infection—intra-abdominal, 5–14 days; urinary tract, 10–14 days; skin and skin structure, 7–14 days; community-acquired pneumonia, 10–14 days; acute pelvic infections, 3–10 days.

Prophylaxis: 1 g IV 1 hr before surgical incision.

Pediatric patients 3 mo to 12 yr

15 mg/kg IV or IM bid for 3–14 days; do not exceed 1 g/day.

Patients with renal impairment

For creatinine clearance of 30 mL/min or less, use 500 mg IV or IM daily.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	30 min
IM	10 min	2 hr

Metabolism: $T_{1/2}$: 4 hr

Distribution: Crosses the placenta; enters breast milk

Excretion: Urine, unchanged

IV FACTS

Preparation: Reconstitute 1-g vial with 10 mL of water for injection, 0.9% sodium chloride injection or bacteriostatic water for injection; do not dilute with diluents containing dextrose. Shake well to dissolve and transfer to 50 mL of 0.9% sodium chloride injection; use within 6 hr of reconstitution, or store refrigerated for up to 24 hr, but use within 4 hr of removal from refrigeration; inspect solution for particulate matter.

Infusion: Infuse over 30 min.

Incompatibilities: Do not mix in solution or in the same line as any other medications or any solution containing dextrose.

Adverse effects

- **CNS:** *Headache*, dizziness, asthenia, fatigue, insomnia, altered mental status, anxiety, **seizures**
- **CV:** Heart failure, arrhythmias, edema, swelling, hypotension, hypertension, chest pain
- **GI:** *Nausea*, vomiting, *diarrhea*, abdominal pain, constipation, dyspepsia, **pseudomembranous colitis**, liver toxicity, GERD
- **GU:** Vaginitis
- **Hypersensitivity:** *Ranging from rash to fever* to **anaphylaxis**; serum sickness reaction
- **Local:** *Pain*, *phlebitis*, thrombophlebitis, inflammation at IV site
- **Respiratory:** Pharyngitis, rales, respiratory distress, cough, dyspnea, rhonchi
- **Other:** Fever, rash, vaginitis

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Avinza* (extended-release morphine) and *Invanz* (ertapenem); use extreme caution.

Assessment

- **History:** Allergies to any component of the drug and to beta-lactam antibiotics; allergy to amide-type local anesthetics (IM use), penicillins, cephalosporins, other allergens; pregnancy, lactation, seizures
- **Physical:** T, skin status, swelling, orientation, reflexes, R, adventitious sounds, P, BP, peripheral perfusion, culture of affected area, sensitivity tests

Interventions

- Culture infected area and arrange for sensitivity tests before beginning drug therapy and during therapy if expected response is not seen.
- Prepare IM solution as follows: Reconstitute 1-g vials with 3.2 mL of 1% lidocaine injection without epinephrine; shake to form solution; immediately withdraw contents for injection.
- Administer IM injections deeply into large muscle mass within 1 hr of reconstitution.
- ⊗ **Warning** Have emergency and life-support equipment readily available in case of severe hypersensitivity reaction.
- Discontinue drug if hypersensitivity reaction occurs.
- Monitor injection site for adverse reactions.
- Ensure ready access to bathroom facilities and provide frequent small meals if GI complications occur.
- Arrange for treatment of superinfections if they occur.

Teaching points

- You may experience these side effects: Nausea, diarrhea, dizziness, headache (consult your health care provider if any of these are severe).
- Report severe diarrhea, difficulty breathing, unusual tiredness or fatigue, pain at injection site.

Erythrocin I.V. (CAN), Erythrocin Lactobionate

erythromycin stearate

Apo-Erythro-S (CAN)

PREGNANCY CATEGORY B

Drug class

Macrolide antibiotic

Therapeutic actions

Bacteriostatic or bactericidal in susceptible bacteria; binds to cell membrane, causing change in protein function, leading to cell death.

Indications

Systemic administration

- Acute infections caused by sensitive strains of *Streptococcus pneumoniae*, *Mycoplasma*

pneumoniae, *Listeria monocytogenes*, *Legionella pneumophila*

- URIs, lower respiratory tract infections, skin and soft-tissue infections caused by group A beta-hemolytic streptococci when oral treatment is preferred to injectable benzathine penicillin
- PID caused by *Neisseria gonorrhoeae* in patients allergic to penicillin
- In conjunction with sulfonamides in URIs caused by *Haemophilus influenzae*
- As an adjunct to antitoxin in infections caused by *Corynebacterium diphtheriae* and *Corynebacterium minutissimum*
- Prophylaxis against alpha-hemolytic streptococcal endocarditis before dental or other procedures in patients allergic to penicillin who have valvular heart disease
- Oral erythromycin: Treatment of intestinal amebiasis caused by *Entamoeba histolytica*; infections in the newborn and in pregnancy that are caused by *Chlamydia trachomatis* and in adult chlamydial infections when tetracycline cannot be used; primary syphilis (*Treponema pallidum*) in penicillin-allergic patients; eliminating *Bordetella pertussis* organisms from the nasopharynx of infected individuals and as prophylaxis in exposed and susceptible individuals
- Unlabeled uses: Erythromycin base is used with neomycin before colorectal surgery to reduce wound infection; treatment of severe diarrhea associated with *Campylobacter* enteritis or enterocolitis; treatment of genital, inguinal, or anorectal lymphogranuloma venereum infection; treatment of *Haemophilus ducreyi* (chancroid)

Ophthalmic ointment

- Treatment of superficial ocular infections caused by susceptible strains of microorganisms; prophylaxis of ophthalmia neonatorum caused by *N. gonorrhoeae* or *C. trachomatis*

Topical dermatologic solutions for acne

- Treatment of acne vulgaris

Topical dermatologic

- Granules used with flexible hydroactive dressings for dermal ulcers, pressure ulcers, leg ulcers, superficial wounds, and postoperative wounds

- Treatment of skin infections caused by sensitive microorganisms

Contraindications and cautions

Systemic administration

- Contraindicated with allergy to erythromycin.
- Use cautiously with hepatic impairment, lactation (secreted and may be concentrated in breast milk; may modify bowel flora of nursing infant and interfere with fever workups).

Ophthalmic ointment

- Contraindicated with allergy to erythromycin; viral, fungal, mycobacterial infections of the eye.

Available forms

Base: Tablets—250, 333, 500 mg; DR tablets—500 mg; DR capsules—250 mg; ophthalmic ointment—5 mg/g. Estolate: Tablets—500 mg; capsules—250 mg; suspension—125, 250 mg/5 mL. Stearate tablets—250, 500 mg ethylsuccinate: Ethylsuccinate tablets—200, 400 mg; suspension—200, 400 mg/5 mL, 100 mg/2–5 mL; powder for suspension—200 mg/5 mL; granules for suspension—400 mg/5 mL; topical solution—1.5%, 2%; topical gel, ointment—2%. Lactobionate injection—500, 1,000 mg.

Dosages

Systemic administration

Oral preparations of the different erythromycin salts differ in pharmacokinetics: 400 mg erythromycin ethylsuccinate produces the same free erythromycin serum levels as 250 mg of erythromycin base, stearate, or estolate.

Adults

15–20 mg/kg/day in continuous IV infusion or up to 4 g/day in divided doses every 6 hr; 250 mg (400 mg of ethylsuccinate) every 6 hr PO or 500 mg every 12 hr PO or 333 mg every 8 hr PO, up to 4 g/day, depending on the severity of the infection.

- *Streptococcal infections*: 250 mg every 6 hr or 500 mg every 12 hr (for group A beta-hemolytic streptococcal infections, continue therapy for at least 10 days).
- *Legionnaires disease*: 1–4 g/day PO or IV in divided doses for 10–21 days (ethylsuccinate 1.6 g/day; optimal doses not established).

- *Dysenteric amebiasis*: 250 mg (400 mg of ethylsuccinate) PO every 6 hr or 333 mg every 8 hr for 10–14 days.
- *Acute PID* (N. gonorrhoeae): 500 mg of lactobionate or gluceptate IV every 6 hr for 3 days and then 250 mg stearate or base PO every 6 hr or 333 mg every 8 hr or 500 mg every 12 hr for 7 days.
- *Chlamydial infections*: Urogenital infections during pregnancy: 500 mg PO qid or 666 mg every 8 hr for at least 7 days, one-half this dose every 8 hr for at least 14 days if intolerant to first regimen. Urethritis in males: 800 mg of ethylsuccinate PO tid for 7 days.
- *Primary syphilis*: 30–40 g (48–64 g of ethylsuccinate) in divided doses over 10–15 days.
- *CDC recommendations for STDs*: 500 mg PO qid for 7–30 days, depending on the infection.

Pediatric patients

30–50 mg/kg/day PO in divided doses. Specific dosage determined by severity of infection, age, and weight.

- *Dysenteric amebiasis*: 30–50 mg/kg/day in divided doses for 10–14 days.
- *Pertussis*: 40–50 mg/kg/day PO daily in divided doses for 14 days.
- *Chlamydial infections*: 50 mg/kg/day PO in divided doses, for at least 2 (conjunctivitis of newborn) or 3 (pneumonia of infancy) wk.

Ophthalmic ointment

Adults and pediatric patients

One-half–inch ribbon instilled into conjunctival sac of affected eye two to six times per day, depending on severity of infection.

Topical

Adults and pediatric patients

- *Dermatologic solution for acne*: Apply to affected areas morning and evening.
- *Topical dermatologic*: Flexible hydroactive dressings and granules applied and kept in place for 1–7 days.

Pharmacokinetics

Route	Onset	Peak
Oral	1–2 hr	1–4 hr
IV	Rapid	1 hr

Metabolism: Hepatic; $T_{1/2}$: 1.5–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Reconstitute powder for IV infusion only with sterile water for injection without preservatives—10 mL for 250- and 500-mg vials, 20 mL for 1-g vials. Prepare intermittent infusion as follows: Dilute 250–500 mg in 100–250 mL of 0.9% sodium chloride injection or 5% dextrose in water. Prepare for continuous infusion by adding reconstituted drug to 0.9% sodium chloride injection, lactated Ringer's injection, or D_5W that will make a solution of 1 g/L.

Infusion: *Intermittent infusion:* Administer over 20–60 min qid; infuse slowly to avoid vein irritation. Administer continuous infusion within 4 hr, or buffer the solution to neutrality if administration is prolonged.

Incompatibilities: *Glucaptate*—do not add to aminophylline, pentobarbital, secobarbital, tetracycline. *Lactobionate*—do not mix with heparin, metoclopramide, tetracycline.

Y-site incompatibilities: Avoid chloramphenicol, heparin, phenobarbital, phenytoin.

Adverse effects

Systemic administration

- **CNS:** Reversible hearing loss, confusion, uncontrollable emotions, abnormal thinking
- **CV: Ventricular arrhythmias** (with IV)
- **GI:** *Abdominal cramping, anorexia, diarrhea, vomiting, pseudomembranous colitis*, hepatotoxicity
- **Hypersensitivity:** Allergic reactions ranging from rash to **anaphylaxis**
- **Other:** *Superinfections*

Ophthalmic ointment

- **Dermatologic:** Edema, urticaria, dermatitis, angioneurotic edema
- **Local:** *Irritation, burning, itching* at site of application

Topical dermatologic preparations

- **Local:** *Superinfections*, particularly with long-term use

Interactions

Systemic administration

• **Drug-drug** • Increased serum levels of digoxin • Increased effects of oral anticoagulants, theophylline, carbamazepine, ergot derivatives, disopyramide, calcium blockers, HMG-CoA reductase inhibitors, midazolam, proton pump inhibitors, quinidine • Increased therapeutic and toxic effects of corticosteroids • Increased levels of cyclosporine and risk of renal toxicity

• **Drug-food** • Decreased metabolism and increased risk of toxic effects if taken with grapefruit juice; avoid this combination

• **Drug-lab test** • Interferes with fluorometric determination of urinary catecholamines • Decreased urinary estriol levels due to inhibition of hydrolysis of steroids in the gut

Topical dermatologic solution for acne

• **Drug-drug** • Increased irritant effects with peeling, desquamating, or abrasive agents

Nursing considerations

Assessment

- **History:** Allergy to erythromycin, hepatic impairment, lactation; viral, fungal, mycobacterial infections of the eye (ophthalmologic), pregnancy
- **Physical:** Site of infection; skin color, lesions; orientation, affect, hearing tests; R, adventitious sounds; GI output, bowel sounds, liver evaluation; culture and sensitivity tests of infection, urinalysis, LFTs

Interventions

Systemic administration

- Culture site of infection before therapy.
- Administer oral erythromycin base or stearate on an empty stomach, 1 hr before or 2–3 hr after meals, with a full glass of water (oral erythromycin estolate, ethylsuccinate, and certain enteric-coated tablets [review the manufacturer's instructions] may be given without regard to meals).
- Administer around the clock to maximize effect; adjust schedule to minimize sleep disruption.
- Monitor liver function in patients on prolonged therapy.

- Give some preparations with meals, as directed, or substitute one of these preparations, if GI upset occurs with oral therapy.

Topical dermatologic solution for acne

- Wash affected area, rinse well, and dry before application.

Ophthalmic and topical dermatologic preparation

- Use topical products only when needed. Sensitization produced by the topical use of an antibiotic may preclude its later systemic use in serious infections. Topical antibiotic preparations not normally used systemically are best.
- Culture site before beginning therapy.
- Cover the affected area with a sterile bandage if needed (topical).

Teaching points

Systemic administration

- Take oral drug on an empty stomach, 1 hour before or 2–3 hours after meals, with a full glass of water; some forms may be taken without regard to meals. Do not drink grapefruit juice while on this drug. The drug should be taken around the clock; schedule to minimize sleep disruption. Finish the full course of the drug therapy.
- You may experience these side effects: Stomach cramping, discomfort (take the drug with meals, if appropriate); uncontrollable emotions, crying, laughing, abnormal thinking (reversible).
- Report severe or watery diarrhea, severe nausea or vomiting, dark urine, yellowing of the skin or eyes, loss of hearing, rash or itching.

Ophthalmic ointment

- Pull the lower eyelid down gently and squeeze a one-half-inch ribbon of the ointment into the sac, avoid touching the eye or lid. A mirror may be helpful. Gently close the eye, and roll the eyeball in all directions.
- Drug may cause temporary blurring of vision, stinging, or itching.
- Report stinging or itching that becomes pronounced.

Topical dermatologic solution for acne

- Wash and rinse area, and pat it dry before applying solution.

- Use fingertips or an applicator to apply; wash hands thoroughly after application.

escitalopram oxalate

(*ess si tal' ob pram*)

Lexapro

PREGNANCY CATEGORY C

Drug classes

Antidepressant
SSRI

Therapeutic actions

Potentiates serotonergic activity in the CNS by inhibiting reuptake of serotonin resulting in antidepressant effect with little effect on norepinephrine or dopamine; an isomer of citalopram.

Indications

- Treatment of major depressive disorder
- Maintenance treatment for patients with major depressive disorder
- Treatment of generalized anxiety disorder
- Maintenance treatment for major depressive disorder in patients 12–17 yr
- Unlabeled uses: Panic disorder, PTSD

Contraindications and cautions

- Contraindicated with MAOI, pimozide use; with allergy to drug or to citalopram or any component of the drug.
- Use cautiously in the elderly and with renal or hepatic impairment, illnesses of metabolism or hemodynamic response, pregnancy, lactation, suicidal patients, patients with mania or seizure disorders.

Available forms

Tablets—5, 10, 20 mg; oral solution—1 mg/5 mL

Dosages

Adults

- *Major depressive disorder*: Initially, 10 mg/day PO as a single daily dose; if needed, may be increased to 20 mg/day after a minimum

of 1-wk trial period. For maintenance, 10–20 mg/day PO; reassess periodically.

- **Generalized anxiety disorder:** 10 mg/day PO; may be increased to 20 mg/day after 1 wk if needed. Treatment beyond 8 wk not tested.

Pediatric patients 12–17 yr

- **Major depressive disorder:** 10 mg/day PO as a single dose. Maximum dose, 20 mg/day.

Geriatric patients or adults with hepatic impairment

10 mg/day PO as a single dose; do not increase dose.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	3.5–6.5 hr

Metabolism: Hepatic; $T_{1/2}$: 27–32 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Somnolence, dizziness*, insomnia, fatigue, complex sleep disorders, serotonin syndrome (with abrupt discontinuation)
- **Dermatologic:** Sweating
- **GI:** *Nausea*, dry mouth, constipation, diarrhea, indigestion, abdominal pain, decreased appetite
- **GU:** *Ejaculatory disorders*, impotence, anorgasmia in females, decreased libido
- **Respiratory:** Rhinitis, sinusitis, flulike symptoms
- **Other:** **Anaphylaxis, angioedema**, serotonin syndrome

Interactions

• **Drug-drug** • Risk of serious toxic effects if combined with citalopram; do not use these drugs concomitantly • Increased escitalopram levels and toxicity if taken with MAOIs; ensure that patient has been off the MAOI for at least 14 days before administering escitalopram • Risk of serotonin syndrome—a syndrome characterized by increased BP, T, severe anxiety, agitation, rigidity, and can occur when multiple serotonin elevating drugs are used. Monitor patient carefully • Possible severe adverse effects if combined with other centrally acting CNS drugs including alcohol; use caution • Possible decreased effects of escitalo-

pram if combined with carbamazepine, lithium; monitor patient closely

• **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort; avoid this combination

Nursing considerations

CLINICAL ALERT!

There is potential for name confusion between escitalopram and citalopram and between *Lexapro* (escitalopram) and *Loxixane* (loxapine); use caution.

Assessment

- **History:** MAOI use; allergy to drug, citalopram, or any component of the drug; renal or hepatic impairment; older age; pregnancy; lactation; suicidal tendencies; metabolic illnesses or problems with hemodynamic response; alcoholism
- **Physical:** Orientation, reflexes; P, BP, perfusion; R, bowel sounds, normal output; urinary output; liver evaluation; LFTs, renal function tests

Interventions

⊗ **Black box warning** Monitor patient for risk of suicidality, especially when starting or altering dosage; children, adolescents, and young adults are at increased risk.

- Give once a day, in the morning or in the evening; may be taken with food if desired.
- Encourage patient to continue use for 4–6 wk, as directed, to ensure adequate levels to affect depression.

⊗ **Warning** Limit amount of drug given in prescription to potentially suicidal patients.

⊗ **Warning** If discontinuing drug after long-term use, taper dosage gradually to avoid withdrawal syndrome.

⊗ **Warning** Use during third trimester of pregnancy has led to prolonged hospitalization, need for respiratory support, and tube feedings for the baby.

- Advise any depressed patients to avoid the use of alcohol while being treated with antidepressive drugs.
- Establish appropriate safety precautions if patient experiences adverse CNS effects.
- Institute appropriate therapy for patient suffering from depression.

Teaching points

- Take this drug exactly as directed, and as long as directed; it may take several weeks to realize the benefits of the drug. The drug may be taken with food if desired.
- Do not stop taking this medication without consulting your health care provider.
- Avoid the use of alcohol while you are taking this drug.
- This drug should not be taken during pregnancy or when nursing a baby; using barrier contraceptives is suggested.
- You may experience these side effects: Drowsiness, dizziness, tremor (use caution and avoid driving a car or performing other tasks that require alertness if you experience daytime drowsiness); GI upset (frequent small meals, frequent mouth care may help); alterations in sexual function (this is a drug effect and will pass when drug therapy is ended); allergic reaction; swelling; complex sleep disorders.
- Report severe nausea, vomiting; blurred vision; excessive sweating, suicidal ideation, sexual dysfunction, insomnia.

DANGEROUS DRUG

 **esmolol hydrochloride**
(*ess' moe lol*)

Brevibloc

PREGNANCY CATEGORY C

Drug classes

Antiarrhythmic

Beta₁-selective adrenergic blocker

Therapeutic actions

Blocks beta-adrenergic receptors in the heart and juxtaglomerular apparatus, reducing the influence of the sympathetic nervous system on these tissues; decreasing the excitability of the heart, cardiac output, and release of renin; and lowering BP and heart rate. At low doses, acts relatively selectively at the beta₁-adrenergic receptors of the heart; has very rapid onset and short duration.

Indications

- Supraventricular tachycardia, when rapid but short-term control of ventricular rate is desirable (atrial fibrillation, flutter, perioperative or postoperative situations)
- Noncompensatory tachycardia when heart rate requires specific intervention
- Intraoperative and postoperative tachycardia and hypertension when intervention is needed
- **NEW INDICATION:** Unlabeled use: Unstable angina

Contraindications and cautions

- Contraindicated with decompensated heart failure, cardiogenic shock, second- or third-degree heart block (in the absence of a pacemaker), bradycardia.
- Use cautiously with bronchospastic disease, pregnancy, lactation.

Available forms

Injection—10 mg/mL, 20 mg/mL

Dosages

Adults

Individualize dosage by titration (loading dose followed by a maintenance dose). Initial loading dose of 500 mcg/kg/min IV for 1 min followed by a maintenance dose of 50 mcg/kg/min for 4 min. If adequate response is not observed in 5 min, repeat loading dose and follow with maintenance infusion of 100 mcg/kg/min. Repeat titration as necessary, increasing rate of maintenance dose in increments of 50 mcg/kg/min. As desired heart rate or safe end point is approached, omit loading infusion and decrease incremental dose in maintenance infusion to 25 mcg/kg/min (or less), or increase interval between titration steps from 5 to 10 min. Usual range is 50–200 mcg/kg/min. Infusions for up to 24 hr have been used; up to 48 hr may be well tolerated. Dosage should be individualized based on patient response; do not exceed 300 mcg/kg/min.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	< 5 min	10–20 min	10–30 min

Metabolism: RBC esterases; $T_{1/2}$: 9 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute drug before infusing as follows: Add the contents of 2 ampules of esmolol (2.5 g) to a compatible diluent: 5% dextrose injection, 5% dextrose in Ringer's injection; 5% dextrose and 0.9% or 0.45% sodium chloride injection; lactated Ringer's injection; 0.9% or 0.45% sodium chloride injection after removing 20 mL from a 500 mL bottle, to make a drug solution with a concentration of 10 mg/mL. Diluted solution is stable for 24 hr at room temperature.

Infusion: Rate of infusion is determined by patient response; see Dosages section above.

Incompatibilities: Do not mix in solution with diazepam, furosemide, thiopental, or sodium bicarbonate.

Adverse effects

- **CNS:** *Light-headedness*, speech disorder, *midscapular pain*, *weakness*, *rigors*, somnolence, confusion
- **CV:** *Hypotension*, pallor, bradycardia
- **GI:** Taste perversion
- **GU:** Urine retention
- **Local:** *Inflammation*, induration, edema, erythema, burning at the site of infusion
- **Other:** Fever, rhonchi, flushing

Interactions

★ **Drug-drug** • Increased therapeutic and toxic effects with verapamil • Impaired anti-hypertensive effects with ibuprofen, indomethacin, piroxicam

■ Nursing considerations**Assessment**

- **History:** Cardiac, cerebrovascular disease; bronchospastic disease; pregnancy, lactation

- **Physical:** P, BP, ECG; orientation, reflexes; R, adventitious sounds; urinary output

Interventions

- Ensure that drug is not used in chronic settings when transfer to another drug is anticipated.
- Do not give undiluted drug.
- ⊗ **Warning** Do not mix with sodium bicarbonate, diazepam, furosemide, or thiopental.
- Monitor BP, HR, and ECG closely.

Teaching points

- This drug is reserved for emergency use; incorporate information about this drug into an overall teaching plan.

esomeprazole magnesium (perprazole, S-omeprazole)

(*ess oh me' pray zol*)

Nexium , Nexium IV

PREGNANCY CATEGORY B

Drug classes

Antisecretory drug
Proton pump inhibitor

Therapeutic actions

Gastric acid-pump inhibitor: Suppresses gastric acid secretion by specific inhibition of the hydrogen–potassium ATPase enzyme system at the secretory surface of the gastric parietal cells; blocks the final step of acid production; is broken down less in the first pass through the liver than the parent compound omeprazole, allowing for increased serum levels.

Indications

- GERD—treatment of heartburn and other related symptoms
- Erosive esophagitis—short-term (4–8 wk) treatment for healing and symptom relief; also used for maintenance therapy following healing of erosive esophagitis
- Short-term treatment of GERD with a history of erosive esophagitis by IV route for

up to 10 days, when oral therapy is not possible

- As part of combination therapy for the treatment of duodenal ulcer associated with *Helicobacter pylori*
- Reduction in occurrence of gastric ulcers associated with continuous NSAID use in patients at risk (60 yr and older, history of gastric ulcers) for developing gastric ulcers
- Treatment of pathological hypersecretory conditions, including Zollinger-Ellison syndrome
- Unlabeled uses: Non-GERD dyspepsia, Barrett esophagus, stress ulcer prophylaxis

Contraindications and cautions

- Contraindicated with hypersensitivity to omeprazole, esomeprazole, or other proton pump inhibitor.
- Use cautiously with hepatic impairment, pregnancy, lactation.
- Possible increased risk of *C. difficile* infection.

Available forms

DR capsules **ORC**—20, 40 mg; DR powder for suspension—10, 20, 40 mg; injection—20, 40 mg/vial

Dosages

Adults

- *Healing of erosive esophagitis*: 20–40 mg PO daily for 4–8 wk. An additional 4–8 wk course of therapy can be considered for patients who have not healed.
- *Maintenance of healing of erosive esophagitis*: 20 mg PO daily.
- *Symptomatic GERD*: 20 mg daily for 4 wk. An additional 4-wk course of therapy can be considered if symptoms have not resolved.
- *Short-term treatment of GERD when oral therapy is not possible*: 20–40 mg IV by injection over at least 3 min or IV infusion over 10–30 min.
- *Duodenal ulcer*: 40 mg/day PO for 10 days with 1,000 mg PO bid amoxicillin and 500 mg PO bid clarithromycin.
- *Reduction of risk of gastric ulcers with NSAID use*: 20–40 mg PO daily for 6 mo.

Pediatric patients (12–17 yr)

- *Short-term treatment of GERD*: 20–40 mg/day PO for up to 8 wk.

Pediatric patients (1–11 yr)

- *Treatment of GERD*: 10 mg/day PO for up to 8 wk.
- *Healing of erosive esophagitis*:
Weight less than 20 kg: 10 mg/day PO for up to 8 wk.
Weight of 20 kg or more: 10–20 mg/day PO for up to 8 wk.

Patients with hepatic impairment

Do not exceed 20 mg/day in patients with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–2 hr	1.5 hr	17 hr

Metabolism: Hepatic; $T_{1/2}$: 1–1.5 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Reconstitute with 5 mL of 0.9% sodium chloride injection; withdraw 5 mL of reconstituted solution. May be further diluted with 0.9% sodium chloride, lactated Ringer's, or 5% dextrose to a volume of 50 mL for infusion. Do not use if particulate matter is seen in solution, or solution is discolored. May be stored at room temperature for up to 12 hr.

Injection: Inject 5 mL directly or into line of running IV over no less than 3 min.

Infusion: Infuse dilute solution (50 mL) over 10–30 min.

Incompatibilities: Do not mix with other medications; flush tubing before and after each dose with 0.9% sodium chloride, lactated Ringer's, 5% dextrose.

Adverse effects

- **CNS**: *Headache, dizziness*, asthenia, vertigo, insomnia, apathy, anxiety, paresthesias, dream abnormalities
- **Dermatologic**: Rash, inflammation, urticaria, pruritus, alopecia, dry skin

- **GI:** *Diarrhea, abdominal pain, nausea, vomiting*, constipation, dry mouth, tongue atrophy, flatulence
- **Respiratory:** *URI symptoms, sinusitis*, cough, epistaxis
- **Other:** Bone loss, increased risk of fractures with long-term use

Interactions

• **Drug-drug** • Increased serum levels and potential increase in toxicity of benzodiazepines when taken concurrently • May interfere with absorption of drugs dependent upon presence of acidic environment (eg, ketoconazole, iron salts, digoxin) • Decreased levels of atazanavir if combined.

■ Nursing considerations

CLINICAL ALERT!

Potential for name confusion exists between esomeprazole and omeprazole; use caution. Name confusion has been reported between *Nexium* (esomeprazole) and *Nexavar* (sorafenib); use caution.

Assessment

- **History:** Hypersensitivity to any proton pump inhibitor; hepatic impairment; pregnancy, lactation
- **Physical:** Skin lesions; T; reflexes, affect; urinary output, abdominal examination; respiratory auscultation, LFTs

Interventions

- ⊗ **Warning** Arrange for further evaluation of patient after 4 wk of therapy for gastroesophageal reflux disorders. Symptomatic improvement does not rule out gastric cancer.
 - If administering antacids, they may be administered concomitantly with esomeprazole.
 - Administer IV for maximum of 10 days; switch to oral form as soon as possible.
 - Prepare suspension by emptying packet into 15 mL water. Stir, let thicken 2–3 min, stir, and administer within 30 min. Rinse container with water and have patient drink.
 - Ensure that the patient swallows capsule whole; do not crush, or chew; patients having difficulty swallowing may open capsule and sprinkle in applesauce or disperse in tap

water, orange or apple juice, or yogurt; do not crush or chew pellets.

- To administer through a nasogastric (NG) tube, capsules can be opened and granules emptied into a syringe and delivered through the tube. For suspension form, add 15 mL of water to syringe, add packet, shake syringe, let thicken for 2–3 min, shake syringe, and inject through NG tube. Use within 30 min of preparation.
- Obtain baseline liver function tests and monitor periodically during therapy.
- Maintain supportive treatment as appropriate for underlying problem.
- Provide additional comfort measures to alleviate discomfort from GI effects and headache.
- Establish safety precautions if dizziness or other CNS effects occur (use side rails, accompany patient).

Teaching points

- Take the drug at least 1 hour before meals. Swallow the capsules whole; do not chew or crush. If you cannot swallow the capsule, it can be opened and sprinkled in applesauce or mixed in tap water, orange or apple juice, or yogurt; do not crush or chew the pellets. If using suspension, add 1 tablespoon water to packet, stir, let stand for 2–3 minutes to set, stir again, and drink within 30 minutes of preparing. Then rinse container with water and immediately drink remaining granules. This drug will need to be taken for 4–8 weeks, at which time your condition will be reevaluated.
- Arrange to have regular medical follow-up visits while you are using this drug.
- Maintain all of the usual activities and restrictions that apply to your condition. If this becomes difficult, consult your health care provider.
- You may experience these side effects: Dizziness (avoid driving a car or performing hazardous tasks); headaches (consult your health care provider if these become bothersome; medications may be available to help); nausea, vomiting, diarrhea (proper nutrition is important; consult with your dietitian to maintain nutrition; ensure ready access to bathroom); symptoms of upper respiratory tract infection, cough (it may help to know that this is a drug effect; do not self-

medicate; consult your health care provider if this becomes uncomfortable).

- Report severe headache, worsening of symptoms, fever, chills, darkening of the skin, changes in color of urine or stool.

estazolam

(es taz' e lam)

ProSom

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-IV

Drug classes

Benzodiazepine

Sedative-hypnotic

Therapeutic actions

Exact mechanisms of action not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; potentiates the effects of GABA, an inhibitory neurotransmitter.

Indications

- Insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings, or early morning awakening
- Recurring insomnia or poor sleeping habits
- Acute or chronic medical situations requiring restful sleep

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (increased risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery ("floppy infant" syndrome reported), lactation (secreted in breast milk; chronic administration of diazepam, another benzodiazepine, to nursing mothers has caused infants to become lethargic and lose weight).
- Use cautiously with impaired liver or renal function, debilitation, depression, suicidal tendencies, history of substance abuse.

Available forms

Tablets—1, 2 mg

Dosages

Individualize dosage.

Adults

1 mg PO before bedtime; up to 2 mg may be needed.

Pediatric patients

Not for use in patients younger than 18 yr.

Geriatric patients or patients with debilitating disease

1 mg PO if healthy; start with 0.5 mg in debilitated patients.

Pharmacokinetics

Route	Onset	Peak
Oral	45–60 min	2 hr

Metabolism: Hepatic; $T_{1/2}$: 10–24 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, light-headedness, disorientation, restlessness, asthenia, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms, mild paradoxical excitatory reactions during first 2 wk of treatment* (especially in psychiatric patients, aggressive children, and with high dosage), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion, complex sleep disorders
- **CV:** *Bradycardia, tachycardia, CV collapse*, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued (more common with abrupt discontinuation of higher dosage used for longer than 4 mo)
- **Dermatologic:** Urticaria, pruritus, skin rash, dermatitis

- **GI:** *Constipation, diarrhea, dyspepsia*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes: LDH, alkaline phosphatase, AST, ALT; hepatic impairment, jaundice
- **GU:** *Incontinence, urinary retention, changes in libido*, menstrual irregularities
- **Hematologic:** Decreased Hct, blood dyscrasias
- **Other:** Hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia, **anaphylaxis, angioedema**

Interactions

★ **Drug-drug** • Increased CNS depression when taken with alcohol, phenothiazines, opioids, barbiturates • Decreased sedative effects of estazolam if taken concurrently with theophylline, aminophylline, rifampin, and TCAs

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; labor; lactation; impaired liver or renal function, debilitation, depression, suicidal tendencies
- **Physical:** Skin color, lesions; T, orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Arrange to monitor liver and renal function and CBC during long-term therapy.
- ⊗ **Warning** Taper dosage gradually after long-term therapy, especially in epileptic patients.

Teaching points

- Take drug exactly as prescribed; do not stop taking this drug without consulting your health care provider.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs while taking this drug.
- Be aware that this drug provides symptomatic relief and is not a cure for insomnia.

It may be habit-forming; it works best if used on an “as needed” basis and not every night.

- You may experience these side effects: Transient drowsiness, dizziness (avoid driving or engaging in dangerous activities); complex sleep disorders; allergic reaction; swelling; GI upset (take the drug with water); depression, dreams, emotional upset, crying; sleep may be disturbed for several nights after discontinuing the drug.
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of the extremities, visual changes, difficulty voiding.

▽ estradiol (*ess tra dye' ole*)

estradiol

Oral: Estrace, Gynodiol

Transdermal system: Alora, Climara, Estraderm, Menostar, Vivelle, Vivelle Dot

Topical vaginal cream: Estrace

Vaginal ring: Estring

Topical emulsion: Estrasorb

Gel: Divigel, Elestrint, Estrogele

Topical spray: Evamist

estradiol acetate

Tablets: Femtrace

Vaginal ring: Femring

estradiol cypionate

Injection in oil: Depo-Estradiol

estradiol hemihydrate

Vaginal tablet: Vagifem

estradiol valerate

Injection in oil: Delestrogen

PREGNANCY CATEGORY X

Drug classes

Estrogen
Hormone

Therapeutic actions

Estradiol is the most potent endogenous female sex hormone. Estrogens are important in the development of the female reproductive system and secondary sex characteristics; affect the release of pituitary gonadotropins; cause capillary dilatation, fluid retention, protein anabolism and thin cervical mucus; conserve calcium and phosphorus and encourage bone formation; inhibit ovulation and prevent postpartum breast discomfort. They are responsible for proliferation of the endometrium; absence or decline of estrogen produces signs and symptoms of menopause on the uterus, vagina, breasts, cervix; relief in androgen-dependent prostatic carcinoma is attributable to competition with androgens for receptor sites, decreasing influence of the androgens.

Indications

- *Femtrace*, *Estrasorb*, estradiol cypionate, estradiol valerate: Vasomotor symptoms
- Estradiol acetate tablets (*Femtrace*), estradiol gel 0.1% (*Divigel*), estradiol spray (*Evamist*): Treatment of moderate to severe vasomotor symptoms associated with menopause
- *Vagifem*, *Estrace*, *Estring*: Vaginal atrophy
- *Femring*, tablets, transdermal (except *Menostar*), *EstroGel*: Vasomotor symptoms and vaginal atrophy
- Estradiol oral, transdermal, estradiol valerate: Prevention of postmenopausal osteoporosis
- Estradiol oral, transdermal, estradiol cypionate, valerate: Treatment of female hypogonadism, female castration, primary ovarian failure
- Estradiol oral, estradiol valerate: Palliation of inoperable prostatic cancer
- Estradiol oral: Palliation of inoperable, progressing breast cancer

Contraindications and cautions

- Contraindicated with allergy to estrogens, allergy to tartrazine (in 2-mg oral tablets), breast cancer (with exceptions), estrogen-dependent neoplasm, undiagnosed abnormal genital bleeding, active or past history of thrombophlebitis or thromboembolic disorders, pregnancy (potential serious fetal defects; women of childbearing age should be

advised of risks and birth control measures suggested), history of breast cancer.

- Use cautiously with metabolic bone disease, renal or hepatic insufficiency, heart failure, lactation.

Available forms

Transdermal—release rates of 0.014, 0.025, 0.0375, 0.05, 0.06, 0.075, 0.1 mg/24 hr; tablets—0.5, 1, 1.5, 2 mg; *Femtrace*—0.45, 0.9, 1.8 mg; injection—5, 10, 20, 40 mg/mL; vaginal cream—0.1 mg/g; vaginal ring—2 mg; *Femring*—0.05 mg/day, 0.1 mg/day; vaginal tablet—25 mcg; topical emulsion—2.5 mg/g; gel—0.06%, 0.1%; topical spray—1.53 mg

Dosages

Adults

- *Moderate to severe vasomotor symptoms, atrophic vaginitis, kraurosis vulvae associated with menopause*: 1–2 mg/day PO. Adjust dose to control symptoms. For gel, 0.25 g of 0.1% gel applied to right or left upper thigh on alternating days; may be increased to 0.5 or 1 g/day to control symptoms. For topical spray (*Evamist*), 1 spray once daily to forearm; may be increased to 2–3 sprays daily. Cyclic therapy (3 wk on/1 wk off) is recommended, especially in women who have not had a hysterectomy. 1–5 mg estradiol cypionate in oil IM every 3–4 wk. 10–20 mg estradiol valerate in oil IM, every 4 wk. The 0.014- to 0.05-mg system is applied to the skin weekly or twice weekly. If oral estrogens have been used, start transdermal system 1 wk after withdrawal of oral form. Given on a cyclic schedule (3 wk on/1 wk off). Attempt to taper or discontinue medication every 3–6 mo.
 - *Female hypogonadism, female castration, primary ovarian failure*: 1–2 mg/day PO. Adjust dose to control symptoms. Cyclic therapy (3 wk on/1 wk off) is recommended. 1.5–2 mg estradiol cypionate in oil IM at monthly intervals. 10–20 mg estradiol valerate in oil IM every 4 wk. The 0.05-mg system is applied to skin twice weekly as above.
- ### Vaginal
- *Vaginal cream*: 2–4 g intravaginally daily for 1–2 wk, then reduce to one-half dosage

for similar period followed by maintenance doses of 1 g one to three times/wk thereafter. Discontinue or taper at 3- to 6-mo intervals.

- **Vaginal ring:** Insert one ring high into vagina. Replace every 90 days.
- **Vaginal tablet:** 1 tablet inserted vaginally daily for 2 wk; then twice weekly.

Oral

- **Prostatic cancer (inoperable):** 1–2 mg PO tid. Administer long-term. 30 mg or more estradiol valerate in oil IM every 1–2 wk.
- **Breast cancer (inoperable, progressing):** 10 mg tid PO for at least 3 mo.
- **Prevention of postpartum breast engorgement:** 10–25 mg estradiol valerate in oil IM as a single injection at the end of the first stage of labor.
- **Osteoporosis prevention:** 0.5 mg/day PO given cyclically—23 days on, 5 days rest—starting as soon after menopause as possible.

Topical emulsion

Relief of menopausal symptoms: Apply lotion to legs, thighs, or calves once daily. Apply gel to one arm once daily.

Pediatric patients

Not recommended due to effect on growth of the long bones.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	Days

Metabolism: Hepatic; $T_{1/2}$: Not known

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Steepening of the corneal curvature with a resultant change in visual acuity and intolerance to contact lenses, *headache*, migraine, dizziness, mental depression, chorea, **seizures**
- **CV:** Increased BP, thromboembolic and thrombotic disease
- **Dermatologic:** *Photosensitivity*, *peripheral edema*, *chloasma*, erythema nodosum or multiforme, hemorrhagic eruption, loss of scalp hair, hirsutism, urticaria, dermatitis

- **GI:** Gallbladder disease (in postmenopausal women), **hepatic adenoma**, *nausea*, *vomiting*, *abdominal cramps*, *bloating*, **cholestatic jaundice**, **colitis**, **acute pancreatitis**
- **GU:** Increased risk of postmenopausal endometrial cancer, *breakthrough bleeding*, *change in menstrual flow*, *dysmenorrhea*, *premenstrual-like syndrome*, amenorrhea, vaginal candidiasis, cystitis-like syndrome, endometrial cystic hyperplasia
- **Hematologic:** Hypercalcemia, decreased glucose tolerance
- **Local:** *Pain at injection site*, sterile abscess, postinjection flare
- **Other:** Weight changes, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido, breast tenderness

Topical vaginal cream

Systemic absorption may cause uterine bleeding in menopausal women and may cause serious bleeding of remaining endometrial foci in sterilized women with endometriosis

Interactions

- **Drug-drug** • Increased therapeutic and toxic effects of corticosteroids • Decreased serum levels of estradiol with drugs that enhance hepatic metabolism of the drug—barbiturates, phenytoin, rifampin, carbamazepine
- **Drug-lab test** • Increased prothrombin and factors VII, VIII, IX, and X; thyroid-binding globulin with increased PBI, T_4 ; increased uptake of free T_3 resin (free T_4 is unaltered), serum triglycerides and phospholipid concentration • Decreased antithrombin III, pregnanediol excretion, response to metyrapone test, serum folate concentration • Impaired glucose tolerance

Nursing considerations

Assessment

- **History:** Allergy to estrogens, tartrazine; breast cancer; estrogen-dependent neoplasm; undiagnosed abnormal genital bleeding; active or previous thrombophlebitis or thromboembolic disorders; pregnancy; lactation; metabolic bone disease; renal insufficiency; heart failure
- **Physical:** Skin color, lesions, edema; breast examination; injection site; orientation, affect, reflexes; P, auscultation, BP, peripheral

perfusion; R, adventitious sounds; bowel sounds, liver evaluation, abdominal examination; pelvic examination; serum calcium, phosphorus, LFTs, renal function tests; Papanicolaou (PAP) test, glucose tolerance test

Interventions

⊗ **Black box warning** Arrange for pre-treatment and periodic (at least annual) history and physical, which should include BP, breasts, abdomen, pelvic organs, and a Pap test; may increase risk of endometrial cancer.

⊗ **Black box warning** Do not use to prevent CV events or dementia; may increase risk, including thrombophlebitis, pulmonary embolism, CVA, MI.

⊗ **Black box warning** Caution patient of the risks of estrogen use, the need to prevent pregnancy during treatment, for frequent medical follow-up, and for periodic rests from drug treatment.

- Administer cyclically for short-term only when treating postmenopausal conditions because of the risk of endometrial neoplasm; taper to the lowest effective dose, and provide a drug-free week each month.
- Apply transdermal system to a clean, dry area of skin on the trunk of the body, preferably the abdomen; do not apply to breasts; rotate the site at least 1 wk between applications; avoid the waistline because clothing may rub the system off; apply immediately after opening and compress for about 10 sec to attach.
- Apply topical gel to upper thighs, alternating right and left daily. Do not apply to irritated skin, and do not wash site for at least 1 hr.
- Apply topical spray to forearm. Let dry for at least 30 min.
- Insert vaginal ring as deeply as possible into upper one-third of vagina. Ring will remain in place for 3 months. Then, remove and evaluate need for continued therapy. If a ring falls out during 3 mo, rinse with warm water and reinsert.
- Insert vaginal tablet as high into vagina as is comfortable for patient; use supplied applicator.

⊗ **Warning** Arrange for the concomitant use of progestin therapy during long-term es-

trogen therapy in women with a uterus; this will mimic normal physiologic cycling and allow for a cyclic uterine bleeding that may decrease the risk of endometrial cancer. Women without a uterus do not need progestin.

- Administer parenteral preparations by deep IM injection only. Monitor injection sites and rotate with each injection to decrease development of abscesses.

Teaching points

- Use this drug in cycles or short term; prepare a calendar of drug days, rest days, and drug-free periods.
- Apply transdermal system and vaginal cream properly; insert vaginal tablet as high into the vagina as is comfortable.
- Apply gel to upper thighs, alternating right and left daily. Do not apply to irritated skin, and do not wash site for at least 1 hour.
- Apply one spray to forearm each day. Let dry for at least 30 minutes.
- Insert vaginal ring high in vagina; it should remain in place for 3 months. If it falls out before that time, rinse with warm water and reinsert.
- Potentially serious side effects include cancers, blood clots, and liver problems; it is very important to have periodic medical examinations throughout therapy.
- This drug cannot be given to pregnant women because of serious toxic effects to the baby; use of contraceptives is advised.
- You may experience these side effects: Nausea, vomiting, bloating; headache, dizziness, mental depression (use caution if driving or performing tasks that require alertness); sensitivity to sunlight (use a sunscreen and wear protective clothing); rash, loss of scalp hair, darkening of the skin on the face; changes in menstrual patterns.
- Report pain in the groin or calves of the legs, chest pain or sudden shortness of breath, abnormal vaginal bleeding, lumps in the breast, sudden severe headache, dizziness or fainting, changes in vision or speech, weakness or numbness in the arm or leg, severe abdominal pain, yellowing of the skin or eyes, severe mental depression, pain at injection site.

Estrogen

Hormone

Therapeutic actions

Estrogens are endogenous female sex hormones important in the development of the female reproductive system and secondary sex characteristics. They affect the release of pituitary gonadotropins; cause capillary dilatation, fluid retention, protein anabolism, and thin cervical mucus; conserve calcium and phosphorus; encourage bone formation; inhibit ovulation and prevent postpartum breast discomfort. They are responsible for the proliferation of the endometrium; absence or decline of estrogen produces signs and symptoms of menopause on the uterus, vagina, breasts, cervix. Their efficacy as palliation in male patients with androgen-dependent prostatic carcinoma is attributable to their competition with androgens for receptor sites, thus decreasing the influence of androgens.

Indications

Oral

- Palliation of moderate to severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with menopause
- Treatment of female hypogonadism; female castration; primary ovarian failure
- Osteoporosis: To retard progression
- Palliation of inoperable prostatic cancer
- Palliation of metastatic breast cancer
- *Cenestin, Enjuvia*: Treatment of moderate to severe vasomotor symptoms associated with menopause

Parenteral

- Treatment of uterine bleeding due to hormonal imbalance in the absence of organic pathology

Vaginal cream

- Treatment of atrophic vaginitis and kraurosis vulvae associated with menopause

Contraindications and cautions

- Contraindicated with allergy to estrogens, breast cancer (with exceptions), estrogen-dependent neoplasm, undiagnosed abnormal genital bleeding, active or past thrombophlebitis or thromboembolic disorders from previous estrogen use, pregnancy (serious fetal defects; women of childbearing age should be advised of risks and birth control measures suggested).
- Use cautiously with metabolic bone disease, renal or hepatic insufficiency, heart failure, lactation.

Available forms

Tablets—0.3, 0.45, 0.625, 0.9, 1.25 mg; injection—25 mg; vaginal cream—0.625 mg/g

Dosages

Oral drug should be given cyclically (3 wk on/1 wk off) except in selected cases of carcinoma and prevention of postpartum breast engorgement.

Adults

- *Moderate to severe vasomotor symptoms associated with menopause*: 0.3–0.625 mg/day PO.
- *Atrophic vaginitis, kraurosis vulvae associated with menopause*: 0.5–2 g vaginal cream daily intravaginally or topically, depending on severity of condition. Taper or discontinue at 3- to 6-mo intervals. Or, 0.3 mg/day PO continually.
- *Female hypogonadism*: 0.3–0.625 mg/day PO for 3 wk followed by 1 wk of rest. Adjust dose depending on severity of symptoms and responsiveness of endometrium.
- *Female castration, primary ovarian failure*: 1.25 mg/day PO. Adjust dosage by patient response to lowest effective dose.
- *Prostatic cancer (inoperable)*: 1.25–2.5 mg tid PO. Judge effectiveness by phosphatase determinations and by symptomatic improvement.

- **Osteoporosis:** Start with lowest dose, 0.3 mg/day PO given continuously or cyclically (25 days on/5 days off). Adjust dosage based on individual response.
- **Breast cancer (inoperable, progressing):** 10 mg tid PO for at least 3 mo.
- **Abnormal uterine bleeding due to hormonal imbalance:** 25 mg IV or IM. Repeat in 6–12 hr as needed. IV route provides a more rapid response.

Pediatric patients

Not recommended due to effect on growth of the long bones.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	Days
IV	Gradual	Hours

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute with provided diluent; add to normal saline, dextrose, and invert sugar solutions. Refrigerate unconstituted parenteral solution; use reconstituted solution within a few hours. Refrigerated reconstituted solution is stable for 60 days; do not use solution if darkened or precipitates have formed.

Infusion: Inject slowly over 2–5 min.

Incompatibilities: Do not mix with protein hydrolysate, ascorbic acid, or any solution with an acid pH.

Adverse effects

- **CNS:** Steepening of the corneal curvature with a resultant change in visual acuity and intolerance to contact lenses, *headache*, migraine, dizziness, mental depression, chorea, **seizures**
- **CV:** Increased BP, thromboembolic and thrombotic disease
- **Dermatologic:** *Photosensitivity, peripheral edema, chloasma*, erythema nodosum or multiforme, hemorrhagic eruption, loss

of scalp hair, hirsutism, urticaria, dermatitis

- **GI:** Gallbladder disease (in postmenopausal women), **hepatic adenoma**, *nausea, vomiting, abdominal cramps, bloating, cholestatic jaundice, colitis, acute pancreatitis*
- **GU:** Increased risk of endometrial cancer in postmenopausal women, *breakthrough bleeding, change in menstrual flow, dysmenorrhea, premenstrual-like syndrome, amenorrhea, vaginal candidiasis, cystitis-like syndrome, endometrial cystic hyperplasia*
- **Hematologic:** Hypercalcemia, decreased glucose tolerance
- **Local:** *Pain at injection site, sterile abscess, postinjection flare*
- **Other:** Weight changes, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido, breast tenderness

Topical vaginal cream

Systemic absorption may cause uterine bleeding in menopausal women and serious bleeding of remaining endometrial foci in sterilized women with endometriosis

Interactions

- **Drug-drug** • Increased therapeutic and toxic effects of corticosteroids • Decreased serum levels of estrogen with drugs that enhance hepatic metabolism of the drug: Barbiturates, phenytoin, rifampin, carbamazepine
- **Drug-lab test** • Increased prothrombin and factors VII, VIII, IX, and X; thyroid-binding globulin with increased PBI, T_4 ; increased uptake of free T_3 resin (free T_4 is unaltered), serum triglycerides and phospholipid concentration • Decreased antithrombin III, pregnanediol excretion, response to metyrapone test, serum folate concentration • Impaired glucose tolerance

Nursing considerations Assessment

- **History:** Allergy to estrogens; breast cancer, estrogen-dependent neoplasm; undiagnosed abnormal genital bleeding; active or previous thrombophlebitis or thromboembolic disorders; pregnancy; lactation; meta-

bolic bone disease; renal insufficiency; heart failure

- **Physical:** Skin color, lesions, edema; breast examination; injection site; orientation, affect, reflexes; P, auscultation, BP, peripheral perfusion; R, adventitious sounds; bowel sounds, liver evaluation, abdominal examination; pelvic examination; serum calcium, phosphorus; LFTs, renal function tests; Papanicolaou (Pap) test; glucose tolerance test

Interventions

⊗ **Black box warning** Arrange for pretreatment and periodic (at least annual) history and physical, which should include BP, breasts, abdomen, pelvic organs, and a Pap test; increased risk of endometrial cancer.

⊗ **Black box warning** Do not use to prevent CV events or dementia; may increase risk, including thrombophlebitis, pulmonary embolism, CVA, MI.

⊗ **Black box warning** Caution patient of the risks involved with estrogen use, the need to prevent pregnancy during treatment, for frequent medical follow-up, and periodic rests from drug treatment.

⊗ **Warning** Give cyclically for short term only when treating postmenopausal conditions because of the risk of endometrial neoplasm; taper to the lowest effective dose, and provide a drug-free week each month.

- Refrigerate unconstituted parenteral solution; use reconstituted solution within a few hours.
- Refrigerated reconstituted solution is stable for 60 days; do not use solution if darkened or precipitates have formed.

⊗ **Warning** Arrange for the concomitant use of progestin therapy during long-term estrogen therapy in women with a uterus; this will mimic normal physiologic cycling and allow for cyclic uterine bleeding, which may decrease the risk of endometrial cancer. Women without a uterus do not need progestin.

Teaching points

- Use this drug cyclically or short term; prepare a calendar of drug days, rest days, and drug-free periods.
- Use vaginal cream properly.

- Potentially serious side effects can occur: Cancers, blood clots, liver problems; it is very important that you have periodic medical examinations throughout therapy.
- This drug cannot be given to pregnant women because of serious toxic effects to the baby; use of contraceptives is advised.
- You may experience these side effects: Nausea, vomiting, bloating; headache, dizziness, mental depression (use caution if driving or performing tasks that require alertness); sensitivity to sunlight (use a sunscreen and wear protective clothing); rash, loss of scalp hair, darkening of the skin on the face; changes in menstrual patterns.
- Report pain in the groin or calves of the legs, chest pain or sudden shortness of breath, abnormal vaginal bleeding, lumps in the breast, sudden severe headache, dizziness or fainting, changes in vision or speech, weakness or numbness in the arm or leg, severe abdominal pain, yellowing of the skin or eyes, severe mental depression, pain at injection site.

They are responsible for the proliferation of the endometrium; absence or decline of estrogen produces signs and symptoms of menopause on the uterus, vagina, breasts, cervix. Palliation with androgen-dependent prostatic carcinoma is attributable to competition for androgen receptor sites, decreasing the influence of androgens.

Indications

- Palliation of moderate to severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with menopause
- Treatment of female hypogonadism; female castration; primary ovarian failure
- Palliation of inoperable prostatic cancer
- Palliation of inoperable, metastatic breast cancer in men, postmenopausal women

Contraindications and cautions

- Contraindicated with allergy to estrogens, breast cancer (with exceptions), estrogen-dependent neoplasm, undiagnosed abnormal genital bleeding, active or past thrombophlebitis or thromboembolic disorders from previous estrogen use, pregnancy (serious fetal defects; women of childbearing age should be advised of the risks and birth control measures suggested).
- Use cautiously with metabolic bone disease, renal or hepatic insufficiency, heart failure, lactation.

Available forms

Tablets—0.3, 0.625, 1.25, 2.5 mg

Dosages

Administer PO only.

Adults

- *Moderate to severe vasomotor symptoms, atrophic vaginitis, kraurosis vulvae associated with menopause:* 0.3–1.25 mg/day PO for atrophic vaginitis and kraurosis vulvae. 1.25 mg/day PO for vasomotor symptoms. Adjust to lowest effective dose. Cyclic therapy (3 wk of daily estrogen followed by 1 wk of rest from drug therapy) is recommended. If patient has not menstruated in 2 mo, start at any time. If patient is still menstruating, start therapy on day 5 of bleeding.
- *Female hypogonadism:* 2.5–7.5 mg/day PO in divided doses for 20 days on/10 days off. If bleeding does not occur by the end of that period, repeat the same dosage schedule. If bleeding does occur before the end of the 10-day rest, begin a 20-day estrogen-progestin cyclic regimen with progestin given orally during the last 5 days of estrogen ther-

- apy. If bleeding occurs before this cycle is finished, restart course on day 5 of bleeding.
- *Female castration, primary ovarian failure:* 1.25 mg/day PO cyclically. Adjust dosage by patient response to lowest effective dose.
- *Prostatic cancer (inoperable):* 1.25–2.5 mg tid PO. In long-term therapy, judge effectiveness by symptomatic response and serum phosphatase determinations.
- *Breast cancer (inoperable, progressing):* 10 mg tid PO for at least 3 mo in selected men and postmenopausal women.

Pediatric patients

Not recommended due to effect on growth of the long bones.

Estrogen
Hormone

Therapeutic actions

Estrogens are endogenous female sex hormones important in the development of the female reproductive system and secondary sex characteristics. They cause capillary dilatation, fluid retention, protein anabolism, and thin cervical mucus; conserve calcium and phosphorus and encourage bone formation; inhibit ovulation and prevent postpartum breast discomfort. They are responsible for the proliferation of the endometrium; absence or decline of estrogen produces signs and symptoms of menopause on the uterus, vagina, breasts, cervix. Palliation with androgen-dependent prostatic carcinoma is attributable to competition with androgens for receptor sites, decreasing the influence of androgens.

Indications

- Palliation of moderate to severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with menopause
- Treatment of female hypogonadism, female castration, primary ovarian failure
- Prevention of osteoporosis

Contraindications and cautions

- Contraindicated with allergy to estrogens, breast cancer (with exceptions), estrogen-dependent neoplasm, undiagnosed abnormal genital bleeding, active or past thrombophlebitis or thromboembolic disorders from previous estrogen use, pregnancy (serious fetal defects; advise women of child-bearing age of the potential risks and suggest birth control measures).

- Use cautiously with metabolic bone disease, renal or hepatic insufficiency, heart failure, lactation.

Available forms

Tablets—0.625, 1.25, 2.5, 5 mg

Dosages

Adults

- *Moderate to severe vasomotor symptoms, atrophic vaginitis, kraurosis vulvae associated with menopause:* 0.75–6 mg/day PO given cyclically (3 wk on and 1 wk off). Use lowest possible dose.
- *Female hypogonadism, female castration, primary ovarian failure:* 1.5–9 mg/day PO for the first 3 wk, followed by a rest period of 8–10 days. Repeat if bleeding does not occur at end of rest period.
- *Prevention of osteoporosis:* 0.75 mg daily PO for 25 days of a 31-day cycle per month.

Pediatric patients

Not recommended due to effect on growth of the long bones.

Pharmacokinetics

- **CV:** Increased BP, thromboembolic and thrombotic disease
- **Dermatologic:** *Photosensitivity, peripheral edema, chloasma*, erythema nodosum or multiforme, hemorrhagic eruption, loss of scalp hair, hirsutism, urticaria, dermatitis
- **GI:** Gallbladder disease (in postmenopausal women), **hepatic adenoma**, *nausea, vomiting, abdominal cramps, bloating, cholestatic jaundice, colitis*, acute pancreatitis

- **GU:** Increased risk of endometrial cancer in postmenopausal women, *breakthrough bleeding, change in menstrual flow, dysmenorrhea, premenstrual-like syndrome, amenorrhea, vaginal candidiasis, cystitis-like syndrome, endometrial cystic hyperplasia*
- **Hematologic:** Hypercalcemia, decreased glucose tolerance
- **Other:** Weight changes, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido, breast tenderness

Interactions

- * **Drug-drug** • Increased therapeutic and toxic effects of corticosteroids • Decreased serum levels of estrogens if taken with drugs that enhance hepatic metabolism of the drug: barbiturates, phenytoin, rifampin, carbamazepine
- * **Drug-lab test** • Increased prothrombin and factors VII, VIII, IX, and X; thyroid-binding globulin with increased PBI, T_4 , increased uptake of free T_3 resin (free T_4 is unaltered), serum triglycerides and phospholipid concentration • Decreased antithrombin III, pregnanediol excretion, response to metyrapone test, serum folate concentration • Impaired glucose tolerance

■ Nursing considerations

Assessment

- **History:** Allergy to estrogens; breast cancer, estrogen-dependent neoplasm; undiagnosed abnormal genital bleeding; thrombophlebitis or thromboembolic disorders; pregnancy; lactation; metabolic bone disease; renal insufficiency; heart failure
- **Physical:** Skin color, lesions, edema; breast examination; injection site; orientation, affect, reflexes; P, auscultation, BP, peripheral perfusion; R, adventitious sounds; bowel sounds, liver evaluation, abdominal examination; pelvic examination; serum calcium, phosphorus; LFTs, renal function tests; Papanicolaou (Pap) test; glucose tolerance test

Interventions

⊗ **Black box warning** Arrange for pre-treatment and periodic (at least annual) history and physical examination, which should include BP, breasts, abdomen, pelvic organs, and a Pap test; increased risk of endometrial cancer.

⊗ **Black box warning** Do not use to prevent CV events or dementia; may increase risk, including thrombophlebitis, pulmonary embolism, CVA, MI.

⊗ **Black box warning** Caution patient of the risks involved with estrogen use, the need to prevent pregnancy during treatment, for frequent medical follow-up, and for periodic rests from drug treatment.

⊗ **Black box warning** Give cyclically for short term only when treating postmenopausal conditions because of the risk of endometrial neoplasm. Taper to the lowest effective dose and provide a drug-free week each month.

⊗ **Warning** Arrange for the concomitant use of progestin therapy during long-term estrogen therapy in postmenopausal women with a uterus; this will mimic normal physiologic cycling and allow for a cyclic uterine bleeding, which may decrease the risk of endometrial cancer. Women without a uterus do not need progestin.

Teaching points

- Prepare a calendar of drug days, rest days, and drug-free periods.
- This drug cannot be given to pregnant women because of serious toxic effects to the baby; use of contraceptives is advised.
- Potentially serious side effects can occur, including cancers, blood clots, and liver problems; it is very important that you have periodic medical examinations throughout therapy.
- You may experience these side effects: Nausea, vomiting, bloating; headache, dizziness, mental depression (use caution driving or performing tasks that require alertness); sensitivity to sunlight (use a sunscreen and wear protective clothing); rash, loss of scalp hair, darkening of the skin on the face; changes in menstrual patterns.
- Report pain in the groin or calves of the legs, chest pain or sudden shortness of breath, abnormal vaginal bleeding, lumps in the breast, sudden severe headache, dizziness or fainting, changes in vision or speech, weakness or numbness in the arm or leg, severe abdominal pain, yellowing of the skin or eyes, severe mental depression.

eszopiclone*(ess zop' ab klone)*Lunesta **ORIG**

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE
SCHEDULE IV**Drug classes**Nonbenzodiazepine hypnotic
Sedative-hypnotic**Therapeutic actions**

Exact mechanism of action is not known. It is thought to interact with GABA receptors at binding domains near benzodiazepine receptor sites, leading to sedation.

Indications

- Treatment of insomnia

Contraindications and cautions

- No known contraindications.
- Use cautiously with geriatric or debilitated patients, diseases or conditions that could affect metabolism or hemodynamics, signs or symptoms of depression, pregnancy, or lactation; history of substance abuse (may be habit-forming).

Available formsTablets **ORIG**—1, 2, 3 mg**Dosage****Adult**

Initial dose—2 mg PO taken immediately before bedtime. Dosage may be increased to 3 mg PO immediately before bedtime if clinically needed. The tablet should be swallowed whole, not cut or crushed. Avoid taking with meals.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Initial dose—1 mg PO taken immediately before bedtime if the primary complaint is falling asleep. If the primary complaint is difficulty staying asleep, 2 mg PO immediately before bedtime may be used.

Patients with severe hepatic impairment

1 mg PO immediately before bedtime. Use caution and monitor the patient closely.

Patients concurrently using CYP3A4 inhibitors

1 mg PO immediately before bedtime. May be increased to 2 mg with caution.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1 hr

Metabolism: Hepatic ; $T_{1/2}$: 6 hr**Distribution:** May cross placenta; may pass into breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** *Dizziness, somnolence, nervousness, anxiety, depression, hallucinations, headache, complex sleep disorders, abnormal thinking, suicidal thoughts*
- **GI:** Unpleasant taste, dry mouth, dyspepsia, nausea, vomiting
- **GU:** Dysmenorrhea, gynecomastia
- **Respiratory:** Respiratory infection
- **Other:** Viral infection, rash, **anaphylaxis, angioedema**

Interactions

- *** Drug-drug** • Risk of additional effects on psychomotor performance if combined with ethanol • Increased serum levels and risk of adverse effects if combined with potent CYP3A4 inhibitors (ketoconazole, itraconazole, clarithromycin, nefazodone, ritonavir, nelfinavir)
- Risk of decreased serum levels and effectiveness if combined with rifampin

Nursing considerations**Assessment**

- **History:** Lactation, pregnancy, depression, underlying medical conditions that could affect metabolism or hemodynamics
- **Physical:** Orientation, reflexes, affect; R, adventitious sounds; abdominal examination

Interventions

- Ensure that the patient swallows the tablet whole; do not cut, crush or allow patient to chew tablet.
- Administer drug only if patient is in bed and able to stay in bed for up to 8 hr; changes in cognition and motor function can be a safety issue.
- Monitor patients using drug for suicidal thoughts.
- Do not administer this drug after a fatty or large meal, absorption can be affected.
- Effects of the drug on a fetus are not known. Advise women of childbearing age to use barrier contraceptives while on this drug.
- It is not known if this drug would affect a nursing baby. Advise nursing women to use another method of feeding the baby.

Teaching points

- Take this drug exactly as prescribed. Do not use it longer than advised by your health care provider.
- Swallow the tablet whole, do not break or crush the tablet.
- Do not share this drug with anyone else. Store the drug in its original container and keep it out of the reach of children.
- Do not take this drug unless you are about to get into bed and are able to get 8 or more hours of sleep before you need to be alert again.
- Do not take this drug with or immediately after a high-fat or heavy meal, which could interfere with the absorption and effectiveness of the drug.
- Do not combine this drug with other sleep-inducing drugs, including over-the-counter products.
- It is not known how this drug would affect a pregnancy. If you think you are pregnant or would like to become pregnant, consult your health care provider.
- This drug should not be taken while nursing a baby. If you are nursing a baby, another method of feeding the baby should be used while you are using this drug.
- Do not drink alcohol while you are using this drug.
- You may experience sleeping problems the first night or two after stopping any sleep medicine, including *Lunesta*.

- You may experience these side effects: Changes in thinking, alertness (do not drive a car, operate potentially dangerous equipment, or make important legal decisions the day after you take this drug); complex sleep disorders; allergic reaction; swelling; headache (consult your health care provider for potential pain medications if this occurs); unpleasant taste, nausea (frequent mouth care, frequent small meals may help).
- Report depression, thoughts of suicide or disturbing thoughts, rash, severe headache, changes in behavior.

etanercept (ee tan er' sept)

Enbrel

PREGNANCY CATEGORY B

Drug classes

Antiarthritic

Disease-modifying antirheumatic drug

Therapeutic actions

Genetically engineered tumor necrosis factor receptors from Chinese hamster ovary cells; keep inflammatory response to autoimmune disease in check by reacting with and deactivating free-floating tumor necrosis factor released by active leukocytes.

Indications

- Reduction of the signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in patients with moderately to severely active rheumatoid arthritis; to delay the structural damage associated with rheumatoid arthritis; or may be used in combination with methotrexate when patients do not respond to methotrexate alone
- Reduction of signs and symptoms of moderately to severely active polyarticular juvenile idiopathic arthritis in patients 2 yr and older
- Reduction of signs and symptoms and to improve function in patients with psoriatic arthritis; may be used alone or in combination with methotrexate

- Treatment of ankylosing spondylitis
- Treatment of adult patients with chronic moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy
- Unlabeled uses: Heart failure, Crohn's disease, graft-versus-host disease, hidradenitis suppurativa, nephrotic syndrome, pyoderma gangrenosum

Contraindications and cautions

- Contraindicated with allergy to etanercept or Chinese hamster products, lactation, pregnancy, cancer, severe infection including sepsis, CNS demyelinating disorders, myelosuppression.
- Use cautiously with renal or hepatic disorders, any infection, heart failure, latex allergy.

Available forms

Powder for injection—25 mg; prefilled single-use syringe—25, 50 mg/mL.

Dosages

Adults

- *Plaque psoriasis*: 50 mg/dose subcutaneously twice weekly 3 or 4 days apart for 3 mo; then maintenance dose of 50 mg/wk subcutaneously.
- *Ankylosing spondylitis, rheumatoid arthritis, psoriatic arthritis*: 50 mg/wk subcutaneously.

Pediatric patients 2–17 yr

0.8 mg/kg subcutaneously once weekly. Maximum dose, 50 mg/wk.

Pediatric patients younger than 2 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	72 hr

Metabolism: Tissue; $T_{1/2}$: 115 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Tissues

Adverse effects

- **CNS:** CNS demyelinating disorders (**MS, myelitis, optic neuritis**), dizziness, headache

- **CV:** hypotension, DVT, MI, heart failure
- **GI:** Abdominal pain, dyspepsia
- **Hematologic:** **Pancytopenia**
- **Respiratory:** URIs, congestion, rhinitis, cough, pharyngitis
- **Other:** *Irritation at injection site*; **increased risk of serious infections, cancers**; ANA development; autoimmune diseases, rash

Interactions

- **Drug-drug** • Increased risk of serious infection with other immunosuppressants; monitor patient closely

Nursing considerations

Assessment

- **History:** Allergy to etanercept or Chinese hamster ovary products; pregnancy, lactation; serious infections; cancer; CNS demyelinating disorders, myelosuppression
- **Physical:** Skin lesions, color; R, adventitious sounds; injection site evaluation; range-of-motion to monitor drug effectiveness; CNS—neurologic evaluation, reflexes; CBC

Interventions

- **Warning** Obtain a baseline and periodic CBC; discontinue drug at signs of severe bone marrow suppression.
- **Warning** Obtain baseline values of neurologic function; discontinue drug at any sign of CNS demyelinating disorders.
- Advise patient that this drug does not cure the disease and appropriate therapies for rheumatoid arthritis should be used.
- Reconstitute for injection by slowly injecting 1 mL sterile bacteriostatic water provided with powder into the vial; swirl gently, do not shake; avoid foaming; liquid should be clear and free of particulate matter; use within 6 hr of reconstitution. Do not mix with any other medications.
- Rotate injection sites between abdomen, thigh, and upper arm. Maintain a chart to ensure that sites are rotated regularly.
- Teach patient and a significant other how to reconstitute and administer subcutaneous injections; observe the process periodically.
- **Black box warning** Monitor patient for any sign of infection; discontinue drug if

infection occurs; risk of serious infections, including TB, or death exists.

⊗ **Black box warning** There is an increased risk of lymphoma and other cancers in children taking this drug for juvenile rheumatoid arthritis, Crohn's disease, or other inflammatory conditions.

- Evaluate drug effectiveness periodically; 1–2 wk may be required before any change is noted; if no response has occurred within 3 mo, discontinue drug.
- Do not administer drug with any vaccinations; allow at least 2–3 wk between starting this drug and a vaccination.
- Stop drug if patient develops lupus-like symptoms.
- Protect patient from exposure to infections and ensure routine physical examinations and monitoring for potential cancers and autoimmune diseases.

Teaching points

- Take this drug exactly as prescribed. Note that this drug does not cure rheumatoid arthritis and appropriate therapies to deal with the disease should be followed. You and a significant other should learn how to prepare the drug and to administer subcutaneous injections. Prepare a chart of injection sites to ensure that sites are rotated on a regular basis. Consult your health care provider about proper disposal of needles and syringes.
- Arrange for frequent, regular medical follow-up visits, including blood tests to follow the effects of the drug on your body.
- You may experience these side effects: Signs and symptoms of upper respiratory infections, cough, sore throat (consult your health care provider for potential treatment if this becomes severe); headache (analgesics may be available to help); increased susceptibility to infections (avoid crowded areas and people who might have infections; use strict handwashing and good hygiene).
- Report fever, chills, lethargy; rash, difficulty breathing; swelling; worsening of arthritis; severe diarrhea; numbness, tingling; bruising, bleeding.

ethacrynic acid

See Appendix U, *Less commonly used drugs*.

ethambutol hydrochloride

(*e tham' byoo tole*)

Etibi (CAN), Myambutol

PREGNANCY CATEGORY C

Drug class

Antitubercotic (second line)

Therapeutic actions

Inhibits the synthesis of metabolites in growing mycobacterium cells, impairing cell metabolism, arresting cell multiplication, and causing cell death.

Indications

- Treatment of pulmonary TB in conjunction with at least one other antitubercotic

Contraindications and cautions

- Contraindicated with allergy to ethambutol; optic neuritis.
- Use cautiously with impaired renal function, lactation, pregnancy (use other antitubercotics), visual problems (cataracts, diabetic retinopathy).

Available forms

Tablets—100, 400 mg

Dosages

Ethambutol is not administered alone; use in conjunction with other antitubercotics.

Adults

- **Initial treatment:** 15 mg/kg/day PO as a single daily oral dose. Continue therapy until bacteriologic conversion has become permanent and maximal clinical improvement has occurred.
- **Retreatment:** 25 mg/kg/day as a single daily oral dose. After 60 days, reduce dose to 15 mg/kg/day as a single daily dose.

Pediatric patients

Not recommended for patients younger than 13 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	2–4 hr	20–24 hr

Metabolism: Hepatic; $T_{1/2}$: 3.3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Optic neuritis* (loss of visual acuity, changes in color perception), *fever*, *malaise*, *headache*, dizziness, mental confusion, disorientation, hallucinations, peripheral neuritis
- **GI:** *Anorexia*, *nausea*, *vomiting*, GI upset, abdominal pain, transient liver impairment
- **Hypersensitivity:** Allergic reactions—dermatitis, pruritus, anaphylactoid reaction
- **Other:** **Toxic epidermal necrolysis**, **thrombocytopenia**, joint pain, acute gout

Interactions

* **Drug-drug** • Decreased absorption with aluminum salts

■ Nursing considerations**Assessment**

- **History:** Allergy to ethambutol, optic neuritis, impaired renal function, pregnancy, lactation
- **Physical:** Skin color, lesions; T, orientation, reflexes, ophthalmologic examination; liver evaluation, bowel sounds; CBC, LFTs, renal function tests

Interventions

- Administer with food if GI upset occurs.
- Administer in a single daily dose; must be used in combination with other antitubercotics.
- Arrange for follow-up of LFTs, renal function tests, CBC, ophthalmologic examinations.

Teaching points

- Take drug in a single daily dose; it may be taken with meals if GI upset occurs.

- Take this drug regularly; avoid missing doses. Do not discontinue this drug without first consulting your health care provider.
- Avoid using aluminum-containing antacids within at least 4 hours of taking drug.
- Arrange to have periodic medical checkups, which will include an eye examination and blood tests.
- You may experience these side effects: Nausea, vomiting, epigastric distress; skin rashes or lesions; visual changes, disorientation, confusion, drowsiness, dizziness (use caution if driving or operating dangerous machinery; use precautions to avoid injury).
- Report changes in vision (blurring, altered color perception), rash.

▽ ethionamide

(*e thye on am' ide*)

Trecator

PREGNANCY CATEGORY C

Drug class

Antitubercotic (third line)

Therapeutic actions

Bacteriostatic against *Mycobacterium tuberculosis*; mechanism of action is not known.

Indications

- TB—any form that is not responsive to first-line antitubercotics—in conjunction with other antitubercotics

Contraindications and cautions

- Contraindicated with allergy to ethionamide, pregnancy.
- Use cautiously with hepatic impairment, diabetes mellitus, lactation.

Available forms

Tablets—250 mg

Dosages**Adults**

Always use with at least one other antitubercotic. 15–20 mg/kg/day PO up to a maxi-

mum 1 g/day; dosage may be divided if GI upset is intolerable. Concomitant use of pyridoxine is recommended to prevent or minimize the symptoms of peripheral neuritis. Alternative dosing: 250 mg/day PO; gradually titrate to optimal dose.

Pediatric patients

10–20 mg/kg/day PO in two or three divided doses after meals (not to exceed 1 g/day) or 15 mg/kg/24 hr as a single daily dose.

Pharmacokinetics

Route	Peak	Duration
Oral	3 hr	9 hr

Metabolism: Hepatic; $T_{1/2}$: 2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Depression, drowsiness, asthenia, seizures, peripheral neuritis, neuropathy, olfactory disturbances, blurred vision, diplopia, optic neuritis, dizziness, headache, restlessness, tremors, psychosis
- **CV:** Orthostatic hypotension
- **Dermatologic:** Rash, acne, alopecia, thrombocytopenia, pellagra-like syndrome
- **GI:** Anorexia, nausea, vomiting, diarrhea, metallic taste, stomatitis, hepatitis
- **Other:** Gynecomastia, impotence, menorrhagia, difficulty managing diabetes mellitus

■ Nursing considerations

Assessment

- **History:** Allergy to ethionamide; hepatic impairment, diabetes mellitus; pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes, ophthalmologic examination, affect; BP, orthostatic BP; liver evaluation; LFTs, blood and urine glucose

Interventions

- Arrange for culture and sensitivity tests before use.
- Give only with other antituberculotics.
- **⊗ Warning** Arrange for follow-up of LFTs before and every 2–4 wk during therapy.
- Monitor diabetic patients carefully.
- Caution patient to avoid pregnancy.

Teaching points

- Take drug once a day; take with food if GI upset occurs. Dose may be divided if GI upset is severe.
- Take this drug regularly; avoid missing doses. Do not discontinue this drug without first consulting your health care provider.
- Do not use this drug during pregnancy; serious fetal abnormalities have been reported. Use of barrier contraceptives is advised.
- Arrange to have regular, periodic medical checkups, including blood tests.
- You may experience these side effects: Loss of appetite, nausea, vomiting, metallic taste in mouth, increased salivation (take the drug with food, frequent mouth care, frequent small meals may help), diarrhea; drowsiness, depression, dizziness, blurred vision (use caution operating a car or dangerous machinery; change position slowly; avoid injury); impotence, menstrual difficulties.
- Report unusual bleeding or bruising, severe GI upset, severe changes in vision.

ethosuximide (*eth ob sux' i mide*)

Zarontin

PREGNANCY CATEGORY C

Drug classes

Antiepileptic
Succinimide

Therapeutic actions

Suppresses the EEG pattern associated with lapses of consciousness in absence (petit mal) seizures; reduces frequency of attacks; mechanism of action not understood, but may act in inhibitory neuronal systems.

Indications

- Control of absence (petit mal) seizures; may be given in combination with other antiepileptics especially when other forms of epilepsy coexist with absence seizures

Contraindications and cautions

- Contraindicated with hypersensitivity to succinimides, lactation.

- Use cautiously with hepatic, renal abnormalities; pregnancy, blood dyscrasias, intermittent porphyria.

Available forms

Capsules—250 mg; syrup—250 mg/5 mL

Dosages

Adults and pediatric patients 6 yr and older

Initial dose is 500 mg/day PO. Increase by small increments to maintenance level. One method is to increase the daily dose by 250 mg every 4–7 days until control is achieved with minimal side effects. Give dosage of more than 1.5 g/day in divided doses only under strict supervision (compatible with other antiepileptics when other forms of epilepsy coexist with absence seizures).

Pediatric patients 3–6 yr

Initial dose is 250 mg/day PO. Increase as described for adults above. The optimal dose for most children is 20 mg/kg/day in one dose or two divided doses.

Pharmacokinetics

Route	Peak
Oral	3–7 hr

Metabolism: Hepatic; $T_{1/2}$: 30 hr in children, 60 hr in adults

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** *Drowsiness, ataxia, dizziness, irritability, nervousness, headache, blurred vision*, myopia, photophobia, hiccups, euphoria, dreamlike state, lethargy, hyperactivity, fatigue, insomnia, increased frequency of **grand mal seizures** may occur when used alone in some patients with mixed types of epilepsy, confusion, instability, mental slowness, depression, hypochondriacal behavior, sleep disturbances, night terrors, aggressiveness, inability to concentrate
- **Dermatologic:** **Stevens-Johnson syndrome**, *pruritus, urticaria*, pruritic erythematous rashes, skin eruptions, erythema

multiforme, systemic lupus erythematosus, alopecia, hirsutism

- **GI:** *Nausea, vomiting, vague gastric upset, epigastric and abdominal pain, cramps, anorexia, diarrhea, constipation, weight loss*, swelling of tongue, gum hypertrophy
- **Hematologic:** **Eosinophilia, granulocytopenia, leukopenia, agranulocytosis, aplastic anemia, monocytosis, pancytopenia**
- **Other:** Vaginal bleeding, periorbital edema, hyperemia, muscle weakness, abnormal LFTs, renal function tests

Interactions

• **Drug-drug** • Decreased serum levels of primidone • Risk of increased effects if combined with other CNS depressants including alcohol

Nursing considerations

Assessment

- **History:** Hypersensitivity to succinimides; hepatic, renal abnormalities; lactation, pregnancy
- **Physical:** Skin color, lesions; orientation, affect, reflexes, bilateral grip strength, vision examination; bowel sounds, normal output, liver evaluation; LFTs, renal function tests, urinalysis, CBC with differential, EEG

Interventions

- ⊗ **Warning** Reduce dosage, discontinue, or substitute other antiepileptic gradually; abrupt discontinuation may precipitate absence (petit mal) status.
- Monitor CBC and differential before and frequently during therapy.
- ⊗ **Warning** Discontinue drug if rash, depression of blood count, or unusual depression, aggressiveness, or behavioral alterations occur.
- Arrange counseling for women of child-bearing age who need long-term maintenance therapy with antiepileptics and who wish to become pregnant.
- ⊗ **Warning** Evaluate for therapeutic serum levels (40–100 mcg/mL).

Teaching points

- Take this drug exactly as prescribed. Do not discontinue this drug abruptly or change dosage.
- Avoid alcohol, sleep-inducing, or over-the-counter drugs while you are using this drug.
- Arrange for frequent checkups to monitor this drug; keep all appointments for check-ups.
- Wear a medical ID at all times so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or performing tasks requiring alertness or visual acuity); GI upset (take the drug with food or milk and eat frequent small meals).
- Report rash, joint pain, unexplained fever, sore throat, unusual bleeding or bruising, drowsiness, dizziness, blurred vision, pregnancy.

ethotoin (eth' i toe in)

Peganone

PREGNANCY CATEGORY D

Drug classes

Antiepileptic
Hydantoin

Therapeutic actions

Has antiepileptic activity without causing general CNS depression; stabilizes neuronal membranes and prevents hyperexcitability caused by excessive stimulation; limits the spread of seizure activity from an active focus.

Indications

- Control of grand mal (tonic-clonic) and complex partial (psychomotor) seizures; may be combined with other antiepileptics

Contraindications and cautions

- Contraindicated with hypersensitivity to hydantoins, pregnancy, lactation, hepatic abnormalities, hematologic disorders.

- Use cautiously with acute intermittent porphyria; hypotension, severe myocardial insufficiency; diabetes mellitus, hyperglycemia.

Available forms

Tablets—250 mg

Dosages

Administer in four–six divided doses daily. Take after eating; space as evenly as possible.

Adults

Initial dose should be 1 g/day PO. Increase gradually over several days; usual maintenance dose is 2–3 g/day PO in four–six divided doses; less than 2 g/day is ineffective in most adults. If replacing another drug, reduce the dose of the other drug gradually as ethotoin dose is increased.

Pediatric patients

Initial dose should not exceed 750 mg/day PO in four–six divided doses; maintenance doses range from 500 mg/day to 1 g/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–3 hr

Metabolism: Hepatic; $T_{1/2}$: 3–9 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Nystagmus, ataxia, dysarthria, slurred speech, mental confusion, dizziness, drowsiness, insomnia, transient nervousness, motor twitchings, fatigue, irritability, depression, numbness, tremor, headache, photophobia, diplopia, conjunctivitis*
- **Dermatologic:** Scarlatiniform, morbilliform, maculopapular, urticarial and non-specific rashes; also serious and sometimes fatal dermatologic reactions: Bullous, exfoliative, or purpuric dermatitis, lupus erythematosus, and **Stevens-Johnson syndrome; toxic epidermal necrolysis**, hirsutism, alopecia, coarsening of the facial features, enlargement of the lips, Peyronie's disease

- **GI:** *Nausea*, vomiting, diarrhea, constipation, *gingival hyperplasia*, toxic hepatitis, **liver damage**, hypersensitivity reactions with hepatic involvement, including hepatocellular degeneration and **hepatocellular necrosis**
- **GU:** Nephrosis
- **Hematologic:** **Thrombocytopenia, leukopenia, granulocytopenia, agranulocytosis, pancytopenia; macrocytosis and megaloblastic anemia that usually respond to folic acid therapy; eosinophilia, monocytosis, leukocytosis, simple anemia, hemolytic anemia, aplastic anemia, hyperglycemia**
- **Respiratory:** **Pulmonary fibrosis**, acute pneumonitis
- **Other:** Lymph node hyperplasia, sometimes progressing to **frank malignant lymphoma**, monoclonal gammopathy and **multiple myeloma** (prolonged therapy), polyarthropathy, osteomalacia, weight gain, chest pain, periarteritis nodosa

Interactions

- * **Drug-drug** • Increased pharmacologic effects with chloramphenicol, cimetidine, disulfiram, isoniazid, phenacetamide, phenylbutazone, sulfonamides, trimethoprim • Complex interactions and effects when hydantoins and valproic acid are given together: Toxicity with apparently normal serum ethotoin levels; decreased plasma levels of valproic acid given with hydantoins; breakthrough seizures when the two drugs are given together • Decreased pharmacologic effects with antineoplastics, diazoxide, folic acid, rifampin, theophyllines
- Increased pharmacologic effects and toxicity with primidone, fluconazole, amiodarone
- Increased hepatotoxicity with acetaminophen
- Decreased pharmacologic effects of these drugs: Corticosteroids, cyclosporine, disopyramide, doxycycline, estrogens, levodopa, methadone, metyrapone, mexiletine, hormonal contraceptives, carbamazepine
- * **Drug-lab test** • Interference with the metyrapone and the 1-mg dexamethasone tests; avoid the use of hydantoins for at least 7 days prior to metyrapone testing

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to hydantoins; hepatic abnormalities; hematologic disorders; acute intermittent porphyria; hypotension, severe myocardial insufficiency; diabetes mellitus, hyperglycemia; pregnancy; lactation
- **Physical:** T; skin color, lesions; lymph node palpation; orientation, affect, reflexes, vision examination; P, BP; R, adventitious sounds; bowel sounds, normal output, liver evaluation; periodontal examination; LFTs, urinalysis, CBC and differential, blood proteins, blood and urine glucose, EEG, ECG

Interventions

- Give after food to enhance absorption and reduce GI upset; give in four–six divided doses as evenly spaced as possible.
- Administer with other antiepileptics to regulate seizures.
- ⊗ **Warning** Reduce dosage, discontinue, or substitute other antiepileptic gradually; abrupt discontinuation may precipitate status epilepticus.
- ⊗ **Warning** Discontinue drug if rash, depression of blood count, enlarged lymph nodes, hypersensitivity reaction, signs of liver damage, or Peyronie's disease (induration of the corpora cavernosa of the penis) occurs. Institute another antiepileptic promptly.
- Monitor hepatic function periodically during long-term therapy; monitor blood counts, urinalysis monthly.
- Monitor urine sugar of patients with diabetes mellitus regularly. Adjustment of dosage of hypoglycemic drug may be needed because antiepileptic may inhibit insulin release and induce hyperglycemia.
- ⊗ **Warning** Arrange to have lymph node enlargement occurring during therapy evaluated carefully. Lymphadenopathy, which simulates Hodgkin's disease, has occurred. Lymph node hyperplasia may progress to lymphoma.
- Monitor blood proteins to detect early malfunction of the immune system (multiple myeloma).

- Arrange dental consultation for patients on long-term therapy; proper oral hygiene can prevent development of gum hyperplasia.
 - Arrange counseling for women of child-bearing age who need long-term maintenance therapy with antiepileptics and who wish to become pregnant.
- ⊗ **Warning** Evaluate for therapeutic serum levels (15–50 mcg/mL).

Teaching points

- Take this drug exactly as prescribed, after food to enhance absorption and reduce GI upset. Space doses as evenly apart as possible throughout the day.
 - Do not discontinue this drug abruptly or change dosage.
 - Maintain good oral hygiene—regular brushing and flossing—to prevent gum disease while you are taking this drug.
 - Arrange frequent dental checkups to prevent serious gum disease.
 - Arrange for frequent checkups to monitor your response to this drug; keep all appointments for checkups.
- ⊗ **Warning** Monitor your blood sugar regularly, and report any abnormality if you are a diabetic.
- ⊗ **Warning** Use some form of contraception, other than birth control pills, while you are on this drug. This drug is not recommended for use during pregnancy. If you wish to become pregnant, discuss with your health care provider.
- Wear or carry a medical alert tag at all times so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
 - You may experience these side effects: Drowsiness, dizziness, confusion, blurred vision (avoid driving or performing tasks requiring alertness or visual acuity); GI upset (take the drug with food and eat frequent small meals).
 - Report rash, severe nausea or vomiting, drowsiness, slurred speech, impaired coordination, swollen glands, bleeding, swollen or tender gums, yellowish discoloration of the skin or eyes, joint pain, unexplained fever, sore throat, unusual bleeding or bruising, persistent headache, malaise, any indica-

tion of an infection or bleeding tendency, abnormal erection, pregnancy.

▼ etidronate disodium

(e *tid'* ro nate)

CO Etidronate (CAN), Didronel,
Gen-Etidronate (CAN)

PREGNANCY CATEGORY C

Drug classes

Bisphosphonate
Calcium regulator

Therapeutic actions

Slows normal and abnormal bone resorption; reduces bone formation and bone turnover.

Indications

- Treatment of Paget's disease of bone
- Treatment of heterotopic ossification
- Unlabeled uses: Prevention and treatment of corticosteroid-induced osteoporosis, prevention of osteoporosis with spinal cord injury

Contraindications and cautions

- Contraindicated with allergy to bisphosphonates, hypocalcemia, pregnancy, lactation, severe renal impairment, clinically overt osteomalacia.
- Use cautiously with renal impairment, upper GI disease, enterocolitis.

Available forms

Tablets—200, 400 mg

Dosages

Adults

- *Paget's disease*: 5–10 mg/kg/day PO for up to 6 mo; or 11–20 mg/kg/day PO for up to 3 mo. Doses above 10 mg/kg/day should be reserved for when lower doses are ineffective or when there is an urgent need to suppress rapid bone turnover or reduce elevated cardiac output. If retreatment is needed, wait at least 90 days between treatment regimens.
- *Heterotopic ossification*: 20 mg/kg/day PO for 2 wk followed by 10 mg/kg/day PO for 10 wk (following spinal cord injury); 20 mg/

kg/day PO for 1 mo preoperatively if due to total hip replacement, then 20 mg/kg/day PO for 3 mo postoperatively.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Use caution and monitor patient frequently.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	90 days

Metabolism: Not metabolized; $T_{1/2}$: 1–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache*
- **GI:** *Nausea, diarrhea*, altered taste, metallic taste
- **Hematologic:** Elevated BUN, serum creatinine
- **Skeletal:** *Increased or recurrent bone pain*, focal osteomalacia

Interactions

* **Drug-drug** • Increased risk of GI distress with aspirin • Decreased absorption with antacids, calcium, iron, multivalent cations; separate dosing by at least 2 hr

* **Drug-food** • Significantly decreased absorption and serum levels if taken with any food; administer on an empty stomach 2 hr before meals

■ Nursing considerations

Assessment

- **History:** Allergy to bisphosphonates, renal failure, upper GI disease, lactation, pregnancy
- **Physical:** Muscle tone, bone pain; bowel sounds; urinalysis, serum calcium, serum alkaline phosphatase, serum phosphate, renal function tests

Interventions

- Administer with a full glass of water, 2 hr before meals.
- Monitor serum calcium levels before, during, and after therapy.

⊗ **Warning** Ensure 3-mo rest period after treatment for Paget's disease if retreatment is required, 7 days between treatments for hypercalcemia of malignancy.

- Ensure adequate vitamin and calcium intake.
- Provide comfort measures if bone pain returns.

Teaching points

- Take this drug with a full glass of water 2 hours before meals. Avoid eating 2 hours before and 2 hours after taking this drug.
- Periodic blood tests may be required to monitor your calcium levels.
- You may experience these side effects: Nausea, diarrhea, bone pain, headache (analgesics may be available to help).
- Report twitching, muscle spasms, dark-colored urine, severe diarrhea.

 **etodolac**
(ee toe doe' lak)

PREGNANCY CATEGORY C

Drug classes

Analgesic (nonopioid)
NSAID

Therapeutic actions

Inhibits prostaglandin synthesis by inhibiting the enzyme, cyclo-oxygenase.

Indications

- Acute or long-term use in the management of signs and symptoms of osteoarthritis, rheumatoid arthritis, and juvenile rheumatoid arthritis
- Management of pain

Contraindications and cautions

- Contraindicated with significant renal impairment, pregnancy, lactation, hypersensitivity to aspirin, etodolac, or other NSAIDs.
- Use cautiously with impaired hearing; allergies; hepatic, hypertension, and GI conditions.

Available forms

Capsules—200, 300 mg; tablets—400, 500 mg; ER tablets—400, 500, 600 mg

Dosages**Adults**

- **Osteoarthritis, rheumatoid arthritis:** Initially, 600–1,000 mg/day PO in divided doses; maintenance ranges, 600–1,200 mg/day in divided doses. Do not exceed 1,200 mg/day. Patients less than 60 kg: Do not exceed 20 mg/kg. ER: 400–1,000 mg/day PO; adjust based on patient response. Do not exceed 1,200 mg/day.
- **Analgesia, acute pain:** 200–400 mg every 6–8 hr PO. Do not exceed 1,200 mg/day.

Patients 6–16 yr

- **Juvenile rheumatoid arthritis:** The daily dose (given as single dose, extended-release tablets) should be based upon body weight as follows:
 20–30 kg: 400 mg/day PO.
 31–45 kg: 600 mg/day PO.
 46–60 kg: 800 mg/day PO given as 400 mg PO bid.
 More than 60 kg: 1,000 mg/day PO given as 500 mg PO bid.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr
Oral (ER)	Slow	6–7 hr

Metabolism: Hepatic; $T_{1/2}$: 7.3 hr, 8.3 hr (ER)

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness*, somnolence, insomnia, fatigue, tiredness, tinnitus, blurred vision
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain, diarrhea*, vomiting, *constipation*, flatulence, **bleeding ulcers**, elevated liver enzymes, **hepatic failure**
- **GU:** Dysuria, **renal impairment or insufficiency**
- **Hematologic:** Bleeding, platelet inhibition with higher doses

- **Other:** Peripheral edema, **anaphylactoid reactions** to fatal anaphylactic shock

Interactions

• **Drug-drug** • Increased risk of bleeding if combined with anticoagulants, antiplatelet drugs • Possible decreased effectiveness of antihypertensives if taken with etodolac

■ Nursing considerations**Assessment**

- **History:** Renal impairment, impaired hearing, allergy to aspirin or NSAIDs, hepatic, CV, and GI conditions, lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events and GI bleeding; monitor accordingly.

- Give with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** Institute emergency procedures if overdose occurs (gastric lavage, induction of emesis, supportive therapy).

Teaching points

- Take with food or meals if GI upset occurs.
- Take only the prescribed dosage.
- You may experience dizziness or drowsiness (avoid driving or the use of dangerous machinery while on this drug).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools; bleeding.

DANGEROUS DRUG**▽ etoposide (VP-16)**

(e toe *poe'* side)

Etopophos, Toposar, VePesid

PREGNANCY CATEGORY D

Drug classes

Antineoplastic
Mitotic inhibitor

Therapeutic actions

G2-specific cell toxic: Lyses cells entering mitosis; inhibits cells from entering prophase; inhibits DNA synthesis, leading to cell death.

Indications

- Refractory testicular tumors as part of combination therapy (IV)
- Treatment of small-cell lung carcinoma as part of combination therapy
- Unlabeled uses: Bladder cancer, lymphomas, leukemias, Ewing's sarcoma, Kaposi's sarcoma, brain tumors, gestational trophoblastic tumors, ovarian germ-cell tumors, rhabdomyosarcomas, Wilms' tumors, bone marrow transplants

Contraindications and cautions

- Contraindicated with allergy to etoposide, teniposide, *Cremophor EL*; pregnancy, lactation.
- Use cautiously with bone marrow suppression.

Available forms

Capsules—50 mg; injection—20 mg/mL; powder for injection—100 mg

Dosages

Modify dosage based on myelosuppression.

Adults**Parenteral**

- *Testicular cancer*: 50–100 mg/m² per day IV on days 1 to 5 or 100 mg/m² per day IV on days 1, 3, and 5, every 3–4 wk in combination with other chemotherapeutics.
- *Small-cell lung cancer*: 35 mg/m² per day IV for 4 days to 50 mg/m² per day for 5 days; repeat every 3–4 wk after recovery from toxicity.

Oral

Small-cell lung cancer: Two times the IV dose rounded to the nearest 50 mg.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

For creatinine clearance of 15–50 mL/min, give 75% of dose. For creatinine clearance of less than 15 mL/min, consider further dosage reduction.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	60–90 min	20–30 hr
IV	30 min	60 min	20–30 hr

Metabolism: Hepatic; T_{1/2}: 4–11 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Dilute with 5% dextrose injection or 0.9% sodium chloride injection to give a concentration of 0.2 or 0.4 mg/mL. Unopened vials are stable at room temperature for 2 yr; diluted solutions are stable at room temperature for 2 (0.4 mg/mL) or 4 (0.2 mg/mL) days.

Infusion: Administer slowly over 30–60 min. Etoposide phosphate solutions may be administered over 5–20 min. Do not give by rapid IV push.

Adverse effects

- **CNS:** *Somnolence, fatigue*, peripheral neuropathy
- **CV:** Hypotension (after rapid IV administration)
- **Dermatologic:** *Alopecia*
- **GI:** *Nausea, vomiting, anorexia, diarrhea*, stomatitis, aftertaste, liver toxicity
- **Hematologic:** *Myelotoxicity*
- **Hypersensitivity:** Chills, fever, tachycardia, **anaphylactic-like reaction, bronchospasm, dyspnea**
- **Other:** Carcinogenesis

■ Nursing considerations**Assessment**

- **History:** Allergy to etoposide, teniposide, *Cremophor EL*; bone marrow suppression; pregnancy; lactation

- **Physical:** T; weight; hair; orientation, reflexes; BP, P; mucous membranes, abdominal examination; CBC

Interventions

- Do not administer IM or subcutaneously; severe local reaction and tissue necrosis occur.
- ⊗ **Warning** Avoid skin contact with this drug; use rubber gloves; if contact occurs, immediately wash with soap and water.

- Monitor BP during administration; if hypotension occurs, discontinue dose and consult with physician. Fluids and other supportive therapy may be needed.

⊗ **Black box warning** Obtain platelet count, Hgb, Hct, WBC count, differential before starting therapy and prior to each dose. If severe response occurs, discontinue therapy and consult with physician; severe myelosuppression is possible.

⊗ **Black box warning** Monitor patient for severe hypersensitivity reaction with any dose; arrange supportive care.

- Arrange for an antiemetic for severe nausea and vomiting.
- Arrange for wig or other suitable head covering before alopecia occurs. Teach patient the importance of covering the head at extremes of temperature.

Teaching points

- Keep a calendar for specific treatment days and additional courses of therapy.
- Avoid pregnancy while using this drug; you should use barrier contraceptives.
- Have regular blood tests to monitor the drug's effects.
- Avoid exposures to other people with infections, especially during periods of low blood counts.
- You may experience these side effects: Loss of appetite, nausea, vomiting, mouth sores (frequent mouth care, frequent small meals may help; try to maintain good nutrition; a dietitian may be able to help, and an antiemetic may be ordered); loss of hair (arrange for a wig or other suitable head covering before the hair loss occurs; it is important to keep the head covered at extremes of temperature).

- Report severe GI upset, diarrhea, vomiting, unusual bleeding or bruising, fever, chills, sore throat, difficulty breathing.

▶ etravirine (*eh tra vye' rin*)

Intelligence **ONC**

PREGNANCY CATEGORY B

Drug classes

Antiviral

Nonnucleoside reverse transcriptase inhibitor

Therapeutic actions

Binds directly to reverse transcriptase and blocks both RNA and DNA dependent polymerase activity leading to inability for viral replication, a decrease in viral load and subsequent increase, increases number of healthy CD4⁺ cells; does not inhibit human DNA polymerase.

Indications

- In combination with other antiretroviral drugs, for treatment of HIV-1 infection in treatment-experienced adults who have evidence of viral replication and HIV-1 strains resistant to nonnucleoside reverse transcriptase inhibitors and other antiretroviral drugs

Contraindications and cautions

- No known contraindications.
- Women are advised not to nurse a baby while taking drug. Use cautiously with pregnancy.

Available forms

Tablets **ONC**—100 mg

Dosages

Adults

200 mg PO bid following a meal.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	2.5–4 hr

Metabolism: Hepatic; $T_{1/2}$: 21–61 hr

Distribution: May cross placenta, may enter breast milk

Excretion: Feces and urine

Adverse effects

- **CNS:** Headache, peripheral neuropathy, vertigo, blurred vision, insomnia, anxiety, paresthesias
- **CV:** Hypertension
- **Dermatologic:** **Stevens-Johnson syndrome, epidermal necrolysis, rash**
- **GI:** *Diarrhea*, nausea, abdominal pain, vomiting, dry mouth, flatulence
- **Other:** Fatigue; altered fat distribution, immune reconstitution syndrome; **severe hypersensitivity reactions**

Interactions

• *** Drug-drug** • Risk of decreased serum levels and loss of effectiveness if used with efavirenz, nevirapine, rifampin, rifapentine, rifabutin; avoid these combinations • Risk of increased serum levels and risk of toxic effects if used with delavirdine; avoid this combination • Risk of significant alteration in serum level of protease inhibitors (atazanavir, fosamprenavir, nelfinavir, indinavir) if combined; also use low dose ritonavir if this combination is used • Possible loss of therapeutic effect if combined with 600 mg bid ritonavir; avoid this combination • Risk of decreased effectiveness of maraviroc; increase maraviroc dosage to 600 mg bid if this combination is used • Risk of significant changes in therapeutic effect if combined with tipranavir and ritonavir; fosamprenavir and ritonavir; atazanavir and ritonavir; avoid these combinations • Risk of decreased effectiveness of antiarrhythmics; monitor patient closely if this combination is needed • Risk of increased bleeding tendencies with warfarin: if this combination is used; monitor patient closely and adjust dosage of warfarin as needed • Risk of decreased effectiveness of clopidogrel; suggest use of a different drug of etravirine is needed • Risk of significant decrease in effectiveness if combined with carbamazepine, phenobarbital, phenytoin; avoid these combinations • Risk of serum level concentration of azole antifungals if combined; monitor patient carefully and adjust

antifungal dosage as appropriate • Risk of decreased effectiveness of clarithromycin if combined; suggest use of an alternate antibiotic

• *** Drug-alternative therapy** • Risk of decreased serum levels and loss of effectiveness if combined with St. John's wort; avoid this combination

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to any component of the drug, pregnancy, lactation, previous or current anti-HIV regimen
- **Physical:** T; skin color, lesions; orientation, affect; BP; abdominal examination

Interventions

- Give this drug with other antiretrovirals.
- **⊗ Warning** Discontinue drug at first sign of severe skin or hypersensitivity reaction; fatalities have been reported.
- Review antiviral therapy and adjust dosage as needed to take into account effects on liver enzymes and numerous drug-drug interactions.
- Have patient swallow tablets whole with liquid, following a meal. Do not administer on an empty stomach. If patient is unable to swallow tablets, put them in a glass of water and stir, when water appears milky have the patient drink the whole glass and rinse several times and drink the rinse each time to get the full dose.
- Encourage nursing mothers to find a different method of feeding the baby while on this drug.

Teaching points

- Take this drug twice a day following a meal; never take on an empty stomach. Swallow the tablets whole; do not cut, crush, or chew the tablets.
- If you cannot swallow the tablets, you can place them in a glass of water, stir well, and when the water looks milky, drink immediately. Fill the glass with water several times and completely swallow each time to get any residue to make sure that you receive the entire dose.
- Always take this drug with other anti-HIV drugs that have been prescribed for you.

- Do not use St. John's wort while taking this drug; antiviral activity could be lost.
- If you miss a dose within 6 hours of the time you usually take it, take the dose following a meal, as soon as possible. Then take your next dose at the regular time. If you miss a dose by more than 6 hours, wait and take the next regularly scheduled dose. Do not double up doses and do not take more than the prescribed amount each day.
- Do not stop taking this drug; if you are running low, talk to your health care provider about a refill; the drug could stop working if stopped for even a short period.
- This drug does not cure HIV or AIDS; opportunistic infections may occur and regular medical care should be sought to deal with the disease.
- This drug does not reduce the risk of transmission of HIV to others by sexual contact or blood contamination; use appropriate precautions.
- It is not known if this drug could affect a fetus. If you wish to become pregnant, discuss this with your health care provider. If you become pregnant while taking this drug, consult your health care provider about enrolling in the *Antiretroviral Pregnancy Registry*.
- It is not known how this drug could affect a nursing baby. Because of the potential for passing the virus on to an infant, women with HIV infection are advised not to breast-feed; another method of feeding the baby should be used while you are taking this drug.
- Your health care provider will monitor CD4⁺ levels regularly while you are taking this drug.
- You may experience these side effects: Headache, fever, rash (medication may be available to relieve these symptoms); dizziness (do not drive a car or operate dangerous machinery until you know how this drug will affect you); changes in fat distribution (decreased fat in the face, legs and arms; increased fat on the back, neck, chest).
- Report rash of any kind, any signs of infection (fever, swelling, redness), inability to eat, any changes in your prescribed medications, severe diarrhea.

▽ everolimus

See Appendix U, *Less commonly used drugs*.

▽ exemestane

See Appendix U, *Less commonly used drugs*.

▽ exenatide (*ex enn' ab tyde*)

Byetta

PREGNANCY CATEGORY C

Drug classes

Antidiabetic

Incretin mimetic drug

Therapeutic actions

An incretin that mimics the enhancement of glucose-dependent insulin secretion by pancreatic beta cells, depresses inappropriately elevated glucagon secretion, and slows gastric emptying, leading to lower blood glucose levels. Also associated with appetite suppression and weight loss.

Indications

- Adjunctive therapy to improve glycemic control in patients with type 2 diabetes who are taking metformin, a thiazolidinedione, a sulfonylurea, or a combination of metformin and a sulfonylurea or metformin and a thiazolidinedione but have not achieved glycemic control
- Monotherapy, with diet and exercise, for treatment of adults with type 2 diabetes

Contraindications and cautions

- Contraindicated with hypersensitivity to exenatide or any of its components, end stage renal disease, severe GI disease, type 1 diabetes, diabetic ketoacidosis, lactation, history of pancreatitis.
- Use cautiously with pregnancy.

Available forms

Solution for injection, solution in a prefilled pen—250 mcg/mL

Dosage

Adult

5 mcg by subcutaneous injection bid at any time within 60 min before the morning and evening meals or the two main meals of the day, approximately 6 hr apart. May be increased to 10 mcg bid after 1 month of therapy, if needed. May be given in combination with oral antidiabetic drugs.

Patients with renal impairment

For creatinine clearance of 30–50 mL/min, use caution when increasing dosage from 5 to 10 mcg. For creatine clearance of less than 30 mL/min, use not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcut.	Rapid	2 hr	8–10 hr

Metabolism: $T_{1/2}$: 2.4 hr

Distribution: Crosses placenta; may pass into breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Headache, feeling jittery, dizziness
- **GI:** *Nausea*, vomiting, dyspepsia, diarrhea, **pancreatitis**
- **Other:** **Hypoglycemia**, injection site reaction, **hemorrhagic** or **necrotizing pancreatitis**

Interactions

★ **Drug-drug** • Slowed gastric emptying and reduced absorption of some oral drugs; use with caution with oral drugs that require rapid absorption; space oral contraceptives and antibiotics at least 1 hr before administering exenatide

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to exenatide or any of its components; end-stage renal disease, severe GI disease; type 1 diabetes, diabetic ketoacidosis; pancreatitis; lactation, pregnancy
- **Physical:** Orientation, reflexes, affect; abdominal examination; injection site; blood glucose levels

Interventions

- Inject subcutaneously within 60 min before the morning and evening meals or the two main meals of the day.
- Maintain other antidiabetic drugs, diet, and exercise regimen for control of diabetes.
- Monitor serum glucose levels and glycosylated Hgb levels to evaluate effectiveness of drug on controlling glucose levels.
- Monitor for pancreatitis. Stop drug and do not restart if signs of pancreatitis develop.
- Arrange for thorough diabetic teaching program to include disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, and hygiene.

Teaching points

- If you are using the prefilled pen, review your manual before each use. Be advised that the needles for the pen need to be purchased separately. Dispose of needles appropriately.
- Do not use solution that appears cloudy.
- Inject it into a site on your thigh, abdomen, or upper arm; rotate injection sites periodically.
- Discard the pen after 30 days, even if solution remains in the pen.
- Inject this drug within 1 hour of your morning and evening meals or your two main meals of the day; do not use if you are not going to be eating. If you forget a dose, do not inject after you have eaten.
- Alcohol consumption can change your blood glucose levels and may alter your response to this drug.
- Do not take this drug if you are not able to eat or if you plan to skip a meal or if your blood sugar is too low.
- Do not change the dosage of this drug without consulting with your health care provider.
- It is not known how this drug would affect a pregnancy. If you think you are pregnant or would like to become pregnant, consult your health care provider.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, consult your health care provider.
- You will need to regularly monitor your blood glucose levels. Your health care provider may change the dose of exenatide or your other

antidiabetic drugs, based on your blood glucose response.

- It is important that you follow the diet and exercise guidelines related to your disease.
- Review the signs and symptoms of hypoglycemia. Be prepared to treat hypoglycemia with fast-acting sugar or glucagon.
- Do not drive a car or operate potentially dangerous machinery until you are aware of how exenatide will affect your blood sugar. Low blood sugar can cause dizziness and changes in thinking.
- You may experience these side effects: Injection site reactions (proper injection and rotation of injection sites should help; if bothersome, consult your health care provider); hypoglycemia (use fast acting sugars or glucagons if this occurs; proper use and eating of meals should prevent this effect); nausea (this usually passes after a few days).
- Report continued nausea; hypoglycemic reactions; redness, pain or swelling at injection sites; stomach pain; vomiting.

ezetimibe (*ee zet' ab mibe*)

Zetia

PREGNANCY CATEGORY C

Drug classes

Cholesterol absorption inhibitor
Cholesterol-lowering drug

Therapeutic actions

Localizes in the brush border of the small intestine and inhibits the absorption of cholesterol from the small intestine; this leads to a decrease delivery of dietary cholesterol to the liver, which will then increase the clearance of cholesterol from the blood and lead to a decrease in serum cholesterol.

Indications

- As an adjunct to diet and exercise to lower the cholesterol, LDL, and Apo-B levels in patients with primary hypercholesterolemia as monotherapy or in combination with HMG-CoA reductase inhibitors (statins)

- In combination with fenofibrate as adjunct to diet to reduce elevated total cholesterol, LDL cholesterol, apolipoprotein B, and non-HDL cholesterol levels in patients with mixed hyperlipidemia
- In combination with atorvastatin or simvastatin for the treatment of homozygous familial hypercholesterolemia as adjuncts to other lipid-lowering treatments
- As adjunctive therapy to diet for the treatment of homozygous sitosterolemia to reduce elevated sitosterol and campesterol levels
- As an adjunct to diet for the reduction of elevated total cholesterol, LDL, and apolipoprotein B as monotherapy in patients with primary hypercholesterolemia

Contraindications and cautions

- Contraindicated with allergy to any component of the drug. If given in combination with an HMG-CoA reductase inhibitor, contraindicated with pregnancy, lactation, active liver disease, or unexplained persistent increases in serum transaminase alkaline phosphorus levels.
- In monotherapy, use cautiously in the elderly and with hepatic impairment, pregnancy, lactation.

Available forms

Tablets—10 mg

Dosages

Adults and children 10 yr and older

10 mg/day PO taken without regard to food; may be taken at the same time as an HMG-CoA reductase inhibitor or fenofibrate; if combined with a bile acid sequestrant, should be taken at least 2 hr before or 4 hr after the bile acid sequestrant.

Pediatric patients younger than 10 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	Moderate	4–12 hr

Metabolism: Small intestine and hepatic;
 $T_{1/2}$: 22 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, fatigue
- **GI:** Abdominal pain, diarrhea
- **Respiratory:** Pharyngitis, sinusitis, *URI, cough*
- **Other:** Back pain, myalgia, arthralgia, viral infection

Interactions

* **Drug-drug** • Decreased serum levels and decreased effectiveness of ezetimibe if combined with cholestyramine; monitor patient closely and space ezetimibe dosing at least 2 hr before or 4 hr or more after the other drug • Increased serum levels of ezetimibe if combined with fenofibrate or gemfibrozil • Risk of cholelithiasis if combined with fibrates • Risk of increased levels and toxicity of ezetimibe and cyclosporine if combined with cyclosporine; if this combination is used monitor patient very carefully.

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the drug; pregnancy, hepatic impairment, lactation, evidence of diet and exercise program
- **Physical:** Skin lesions, color, T; orientation, affect; liver evaluation, bowel sounds; lipid studies, LFTs

Interventions

- Monitor serum cholesterol, LDLs, triglycerides before starting treatment and periodically during treatment.
- Determine that the patient has been on a low-cholesterol diet and exercise program for at least 2 wk before starting ezetimibe.
- If used as part of combination therapy; give drug at the same time as HMG-CoA reductase inhibitors or fenofibrate and at least 2 hr before or 4 hr or more after bile acid sequestrants.
- Encourage the use of barrier contraceptives if used with an HMG-CoA reductase inhibitor.
- Help mother to find another method of feeding her baby if this drug is needed for a nursing

woman; it is not known if the drug enters breast milk.

- Consult with dietitian regarding low-cholesterol diets and provide information about exercise programs.
- Arrange for regular follow-up during long-term therapy.

Teaching points

- Take drug once each day at a time that is easy for you to remember. Do not take more than one tablet per day.
- Continue to take any other lipid-lowering drugs that have been prescribed for you. If you are also taking a bile acid sequestrant, take this drug at least 2 hours before or at least 4 hours after the bile acid sequestrant.
- Continue to follow your low-fat diet and participate in an exercise program.
- If you are nursing a baby, you should find another method of feeding the baby.
- Plan to return for periodic blood tests, including tests of liver function and cholesterol levels, to evaluate the effectiveness of this drug.
- You may experience these side effects: Abdominal pain, diarrhea (these usually pass with time, notify your health care provider if this becomes a problem); dizziness, (avoid driving and operating dangerous machinery until you know how this drug affects you); headache (analgesics may help).
- Report unusual muscle pain, weakness, or tenderness; severe diarrhea; respiratory infections.

▷ factor IX concentrates

AlphaNine SD, Bebulin VH, BeneFIX, Mononine, Profilnine SD

PREGNANCY CATEGORY C

Drug class

Antihemophilic

Therapeutic actions

Human factor IX complex consists of plasma fractions involved in the intrinsic pathway of

blood coagulation; causes an increase in blood levels of clotting factors II, VII, VIII, IX, and X.

Indications

- Factor IX deficiency (hemophilia B, Christmas disease) to prevent or control bleeding

Contraindications and cautions

- Contraindicated with factor VII deficiencies; liver disease with signs of intravascular coagulation or fibrinolysis; do not use if hypersensitive to mouse or hamster protein (*Mononine* or *BeneFIX*).
- Use cautiously with pregnancy, lactation.

Available forms

Injection—varies with brand, see label

Dosages

For factor IX deficiency, dosage depends on severity of deficiency and severity of bleeding; follow treatment carefully with factor IX level assays. Dosage should be calculated based on body weight and plasma factor IX levels and will vary for each preparation and intended use. See manufacturers' details.

Adults

- BeneFIX*, *Bebulin VH*: Administer IV daily—bid: minor hemorrhage—for 1–2 days; moderate hemorrhage—for 2–7 days; major hemorrhage—for 7–10 days.
- Others*: 1 international unit/kg \times body weight (kg) \times desired increase (% of normal).
- BeneFIX*: 1.3 units/kg \times body weight (kg) \times desired increase (% of normal).
- Bebulin VH*: body weight (kg) \times desired increase (% of normal) \times 1.2 units/kg.

Adults and pediatric patients

- Prophylaxis of factor IX deficiency*: 20–30 units/kg IV once or twice a week may prevent spontaneous bleeding in hemophilia B patients. Individualize dose. Increase dose if patient is exposed to trauma or surgery.

Pharmacokinetics

Route	Onset	Duration
IV	Immediate	1–2 days

Metabolism: Plasma; $T_{1/2}$: 24–32 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

IV FACTS

Preparation: Prepare using diluents and needles supplied with product. Refrigerate.

Infusion: ⊗ **Warning** Infuse slowly. 100 units/min and 2–3 mL/min have been suggested. Do not exceed 3 mL/min, and stop or slow the infusion at any sign of headache; pulse, or BP changes.

Adverse effects

- CNS:** *Headache*, flushing, chills, tingling, somnolence, lethargy
- GI:** *Nausea*, vomiting, **hepatitis** (risk associated with use of blood products)
- Hematologic:** *Thrombosis*, DIC, **AIDS** (risk associated with use of blood products; risk is lower with preparations treated with solvent detergents)
- Other:** Chills, fever; BP changes, urticaria, *Creutzfeldt-Jakob disease*

Nursing considerations

Assessment

- History:** Factor VII, factor IX deficiencies; liver disease with signs of intravascular coagulation or fibrinolysis; pregnancy; lactation
- Physical:** Skin color, lesions; T; orientation, reflexes, affect; P, BP, peripheral perfusion; clotting factor levels, LFTs

Interventions

- Administer by IV route only.
- ⊗ **Warning** Decrease rate of infusion if headache, flushing, fever, chills, tingling, or urticaria occur; in some patients, the drug will need to be discontinued.
- Monitor patient's clinical response and factors II, VII, IX, and X levels regularly, and regulate dosage based on response.
- Monitor patient for any sign of thrombosis; use comfort and preventive measures when possible (eg, exercise, support stockings, ambulation, positioning).

Teaching points

- Dosage varies widely.
- Safety precautions are taken to ensure that this blood product is pure and the risk of AIDS and hepatitis is minimal.

- Wear or carry a medical ID to alert emergency medical personnel that you require this treatment.
- Report headache, rash, chills, calf pain, swelling, unusual bleeding, or bruising.

famciclovir sodium

(*fam sye' kloe vir*)

Famvir

PREGNANCY CATEGORY B

Drug class

Antiviral

Therapeutic actions

Antiviral activity; inhibits viral DNA replication in acute herpes zoster.

Indications

- Management of acute herpes zoster (shingles)
- Treatment or suppression of recurrent episodes of genital herpes
- Treatment of recurrent herpes labialis (cold sores) in immunocompetent patients
- Treatment of recurrent orolabial or genital herpes simplex infections in HIV-infected patients
- Unlabeled use: Initial management of herpes genitalis

Contraindications and cautions

- Contraindicated with hypersensitivity to famciclovir or penciclovir, lactation.
- Use cautiously with pregnancy, impaired renal function.

Available forms

Tablets—125, 250, 500 mg

Dosages

Adults

- *Herpes zoster*: 500 mg every 8 hr PO for 7 days.
- *Genital herpes, first episode in immunocompetent patients*: 230 mg tid for 7–10 days.

- *Treatment of recurrent genital herpes*: 125 mg PO bid for 5 days or 1,000 mg PO bid for 1 day.
- *Chronic suppression of recurrent genital herpes*: 250 mg PO bid for up to 1 yr.
- *Recurrent orolabial or genital herpes simplex infection in HIV-infected patients*: 500 mg every 12 hr PO for 7 days.
- *Recurrent herpes labialis*: 1,500 mg PO as a single dose.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

- *Herpes zoster*: Treat for 7 days as indicated below.

CrCl (mL/min)	Dose
60 or more	500 mg every 8 hr
40–59	500 mg every 12 hr
20–39	500 mg every 24 hr
Less than 20	250 mg every 24 hr
Dialysis	250 mg as a single dose after dialysis

- *Recurrent labialis*: Give a single dose as indicated below.

CrCl (mL/min)	Dose
60 or more	1,500 mg
40–59	750 mg
20–39	500 mg
Less than 20	250 mg
Dialysis	250 mg after dialysis

- *Treatment of recurrent genital herpes as single-day dosing*: Give drug as indicated below.

CrCl (mL/min)	Dose
60 and over	1,000 mg every 12 hr
40–59	500 mg every 12 hr
20–39	500 mg single dose
Less than 20	250 mg single dose

- *Treatment of recurrent genital herpes*: Treat for 5 days as indicated below.

CrCl (mL/min)	Dose
40 or more	125 mg every 12 hr
20–39	125 mg every 24 hr
Less than 20	125 mg every 24 hr
Dialysis	125 mg after dialysis

- *Suppression of recurrent genital herpes:*

CrCl (mL/min)	Dose
40 or more	250 mg every 12 hr
20–39	125 mg every 12 hr
Less than 20	125 mg every 24 hr
Dialysis	125 mg after dialysis

- *Recurrent orolabial or genital herpes simplex infection in HIV-infected patients:*

CrCl (mL/min)	Dose
40 or more	500 mg every 12 hr
20–39	500 mg every 24 hr
Less than 20	250 mg every 24 hr
Dialysis	250 mg after dialysis

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	30–60 min

Metabolism: $T_{1/2}$: 2 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dreams, ataxia, coma, confusion, dizziness, *headache*
- **CV:** Arrhythmia, hypertension, hypotension
- **Dermatologic:** *Rash*, alopecia, pruritus, urticaria
- **GI:** Abnormal liver function tests, nausea, vomiting, anorexia, *diarrhea*, abdominal pain
- **Hematologic:** **Granulocytopenia, thrombocytopenia**, anemia
- **Other:** *Fever*, chills, **cancer**, sterility

Interactions

- **Drug-drug** • Increased serum concentration of famciclovir if taken with cimetidine
- Increased digoxin levels if taken together

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to famciclovir or penciclovir, cytopenia; impaired renal function; lactation, pregnancy
- **Physical:** Skin color, lesions; orientation; BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; CBC, Hct, BUN, creatinine clearance, LFTs

Interventions

- Decrease dosage in patients with impaired renal function.

⊗ **Warning** Arrange for CBC before and every 2 days during therapy and at least weekly thereafter. Consult with physician to reduce dosage if WBC or platelet counts fall.

Teaching points

- Take drug for 1, 5, or 7 full days as prescribed.
- Famciclovir does not cure genital herpes; use precautions to prevent transmission.
- You may experience these side effects: Decreased blood count leading to susceptibility to infection (blood tests may be needed; avoid crowds and exposure to disease), headache (analgesics may be ordered), diarrhea.
- Report bruising, bleeding, worsening of condition, fever, infection.

▽ famotidine

(*fa moe' ti deen*)

Apo-Famotidine (CAN), Apo-Famotidine Injectable (CAN), Gen-Famotidine (CAN), Nu-Famotidine (CAN), Pepcid, Pepcid AC, Pepcid AC Maximum Strength, Pepcid RPD

PREGNANCY CATEGORY B

Drug class

Histamine-2 (H_2) receptor antagonist

Therapeutic actions

Competitively blocks the action of histamine at the H_2 receptors of the parietal cells of the stomach; inhibits basal gastric acid secretion and chemically induced gastric acid secretion.

Indications

- Short-term treatment and maintenance of duodenal ulcer
- Short-term treatment of benign gastric ulcer
- Treatment of pathologic hypersecretory conditions (eg, Zollinger-Ellison syndrome)
- Short-term treatment of GERD, esophagitis due to GERD
- OTC: Relief of symptoms of heartburn, acid indigestion, sour stomach

- Unlabeled uses: Part of combination therapy for *Helicobacter pylori*, perioperative suppression of gastric acid secretion, prevention of stress ulcers, prevention of aspiration pneumonitis, treatment of certain types of urticaria

Contraindications and cautions

- Contraindicated with allergy to famotidine; renal failure; lactation.
- Use cautiously with pregnancy, renal or hepatic impairment.

Available forms

Tablets—10, 20, 40 mg; chewable tablets—10 mg; orally disintegrating tablets—20, 40 mg; gelscaps—10 mg; powder for oral suspension—40 mg/5 mL; injection—10 mg/mL; injection, premixed—20 mg/50 mL in 0.9% sodium chloride

Dosages

Adults

- *Acute treatment of active duodenal ulcer*: 40 mg PO or IV at bedtime or 20 mg bid PO or IV. Therapy at full dosage should generally be discontinued after 6–8 wk. May be used with antacids for pain relief.
- *Maintenance therapy for duodenal ulcer*: 20 mg PO at bedtime.
- *Benign gastric ulcer*: 40 mg PO daily at bedtime.
- *Hypersecretory syndrome*: 20 mg every 6 hr PO initially. Doses up to 160 mg every 6 hr have been administered. 20 mg IV every 12 hr in patients unable to take oral drugs.
- *GERD*: 20 mg bid PO for up to 6 wk. For patients with esophagitis, the dose is 20–40 mg bid PO for up to 12 wk.
- *Heartburn, acid indigestion*: 10–20 mg PO for relief; 10–20 mg PO, 15–60 min before eating for prevention. Do not exceed 20 mg/24 hr.

Pediatric patients 1–12 yr

- *Peptic ulcer*: 0.5 mg/kg/day PO at bedtime or divided in two doses up to 40 mg/day; 0.25 mg/kg every 12 hr IV up to 40 mg/day if unable to take orally or for pathological hypersecretory conditions.
- *GERD with or without esophagitis*: 1 mg/kg/day PO divided in two doses up to 40 mg bid.

Infants

- *Younger than 3 mo*: 0.5 mg/kg/dose oral suspension once daily for up to 8 wk.
- *3 mo–1 yr*: 0.5 mg/kg PO bid for up to 8 wk.

Renal impairment

Reduce dosage to 20 mg PO at bedtime or 40 mg PO every 36–48 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	1–3 hr	6–12 hr
IV	Less than 1 hr	0.5–3 hr	8–15 hr

Metabolism: Hepatic; $T_{1/2}$: 2.5–3.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: For direct injection, dilute 2 mL (solution contains 10 mg/mL) with 0.9% sodium chloride injection, water for injection, 5% or 10% dextrose injection, lactated Ringer's injection, or 5% sodium bicarbonate injection to a total volume of 5–10 mL. For infusion, 2 mL diluted with 100 mL 5% dextrose solution or other IVs. Stable for 48 hr at room temperature, 14 days if refrigerated.

Infusion: Inject directly slowly, over not less than 2 min. Infuse over 15–30 min; continuous infusion: 40 mg/24 hr.

Adverse effects

- **CNS**: *Headache*, malaise, *dizziness*, somnolence, insomnia
- **Dermatologic**: Rash
- **GI**: *Diarrhea*, *constipation*, anorexia, abdominal pain
- **Other**: Muscle cramp, increase in total bilirubin, sexual impotence

Nursing considerations

Assessment

- **History**: Allergy to famotidine; renal failure; lactation, pregnancy, hepatic impairment
- **Physical**: Skin lesions; liver evaluation, abdominal examination, normal output; renal function tests, serum bilirubin

Interventions

- If using one dose a day, administer drug at bedtime.
- Decrease doses with renal failure.
- Arrange for administration of concurrent antacid therapy to relieve pain.
- Reserve IV use for hospitalized patients not able to take oral medications; switch to oral medication as soon as possible.

Teaching points

- Take this drug at bedtime (or in the morning and at bedtime). Therapy may continue for 4–6 weeks or longer. Place rapidly disintegrating tablet on tongue and swallow with or without water.
- If needed, take antacid exactly as prescribed, being careful of the times of administration.
- Have regular medical follow-up while on this drug to evaluate your response.
- Take over-the-counter drug 1 hour before eating to prevent indigestion. Do not take more than two per day.
- You may experience these side effects: Constipation or diarrhea; loss of libido or impotence (reversible); headache (adjust lights, temperature, noise levels).
- Report sore throat, fever, unusual bruising or bleeding, severe headache, muscle or joint pain.

fat emulsion, intravenous

Intralipid 20%, 30%; Liposyn II 10%, 20%; Liposyn III 10%, 20%, 30%

PREGNANCY CATEGORY C

Drug classes

Caloric drug
Nutritional drug

Therapeutic actions

A preparation from soybean or safflower oil that provides neutral triglycerides, mostly unsaturated fatty acids; these are used as a source of energy, causing an increase in heat production, decrease in respiratory quotient, and increase in oxygen consumption.

Indications

- Source of calories and essential fatty acids for patients requiring parenteral nutrition for extended periods
- Essential fatty acid deficiency

Contraindications and cautions

- Contraindicated with disturbance of normal fat metabolism (hyperlipemia, lipoid nephrosis, acute pancreatitis), allergy to eggs.
- Use cautiously with severe liver damage, pulmonary disease, anemia, blood coagulation disorders, pregnancy, jaundiced or premature infants.

Available forms

Injection—10% (100, 200, 500 mL), 20% (50, 100, 250, 500 mL); 30% (500 mL)

Dosages

Adults

- *Parenteral nutrition*: Should not constitute more than 60% of total calorie intake. **10%**: Infuse IV at 1 mL/min for the first 15–30 min; may be increased to 2 mL/min. Infuse only 500 mL the first day, and increase the following day. Do not exceed 2.5 g/kg/day. **20%**: Infuse at 0.5 mL/min for the first 15–30 min; infuse only 250 mL *Liposyn II* or 500 mL *Intralipid* the first day, and increase the following day. Do not exceed 3 g/kg/day. **30%**: Infuse at 1 mL/min (0.1 g fat/min) for first 15–30 min; do not exceed 2.5 g/kg/day.
- *Fatty acid deficiency*: Supply 8%–10% of the caloric intake by IV fat emulsion.

Pediatric patients

- *Parenteral nutrition*: Should not constitute more than 60% of total calorie intake. **10%**: Initial IV infusion rate is 0.1 mL/min for the first 10–15 min. **20%**: Initial infusion rate is 0.05 mL/min for the first 10–15 min. If no untoward reactions occur, increase rate to 1 g/kg in 4 hr. Do not exceed 3 g/kg/day. **30%**: Initial infusion, 0.1 mL/min (0.01 g fat/min) for first 10–15 min; do not exceed 3 g/kg/day.

Pharmacokinetics

Route	Onset
IV	Rapid

Metabolism: Hepatic and tissue; $T_{1/2}$: Varies

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: ⊗ **Warning** Supplied in single-dose containers; do not store partially used bottles; do not resterilize for later use; do not use with filters; do not use any bottle in which there appears to be separation from the emulsion.

Infusion: Infusion rate is 1 mL/min for 10% solution, monitor for 15–30 min; if no adverse reaction occurs, may be increased to 2 mL/min; 0.5 mL/min for 20% solution; 1 mL/min for 30%; may be increased if no adverse reactions. May be infused simultaneously with amino acid-dextrose mixtures by means of Y-connector located near the infusion site using separate flow rate; keep the lipid solution higher than the amino acid-dextrose line.

Incompatibilities: Do not mix or inject at Y site with amikacin, tetracycline. Monitor electrolyte and acid content; fat emulsion separates in acid solution.

Adverse effects

- **CNS:** *Headache*, flushing, fever, sweating, sleepiness, pressure over the eyes, dizziness
- **GI:** *Nausea*, vomiting
- **Hematologic:** **Thrombophlebitis**, **sepsis**, hyperlipidemia, hypercoagulability, **thrombocytopenia**, **leukopenia**, elevated liver enzymes
- **Other:** Irritation at infusion site, brown pigmentation in RES (IV fat pigment), cyanosis, infection

■ Nursing considerations

Assessment

- **History:** Disturbance of normal fat metabolism, allergy to eggs, severe liver damage, pulmonary disease, anemia, blood coagulation disorders, pregnancy, jaundiced or premature infants
- **Physical:** Skin color, lesions; T; orientation; P, BP, peripheral perfusion; CBC, plasma lipid profile (especially triglycerides), clotting factor levels, LFTs

Interventions

⊗ **Black box warning** Administer to preterm infants only if benefit clearly outweighs risk; deaths have occurred.

- Administer by IV route only.

⊗ **Warning** Inspect admixture for “breaking or oiling out” of the emulsion—seen as yellow streaking or accumulation of yellow droplets—or for the formation of any particulates; discard any admixture if these occur.

⊗ **Warning** Monitor patient carefully for fluid or fat overloading during infusion: Diluted serum electrolytes, overhydration, pulmonary edema, elevated jugular venous pressure, metabolic acidosis, impaired pulmonary diffusion capacity. Discontinue the infusion; reevaluate patient before restarting infusion at a lower rate.

- Monitor patient’s clinical response, serum lipid profile (obtain triglycerides every week), weight gain, improved nitrogen balance.
- Monitor patient for thrombosis or sepsis; use comfort and preventive measures (such as exercise, support stockings, ambulation, positioning).

Teaching points

- Report pain at infusion site, difficulty breathing, chest pain, calf pain, excessive sweating.

▽ febuxostat

(*feb bux’ ob stat*)

Uloric

PREGNANCY CATEGORY C

Drug classes

Antigout drug

Xanthine oxidase inhibitor

Therapeutic actions

Blocks xanthine oxidase, an important enzyme in the process of uric acid formation; not thought to affect other enzymes involved in purine or pyrimidine synthesis.

Indications

- Long-term management of hyperuricemia in patients with gout

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, concurrent treatment with azathioprine, mercaptopurine, or theophyllines.
- Use cautiously with severe renal or hepatic impairment, history of heart attack or stroke, pregnancy, lactation.

Available forms

Tablets—40, 80 mg

Dosages

Adults

Initially, 40 mg/day PO; if serum uric acid level is not less than 6 mg/dL in 2 weeks, dosage may be increased to 80 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

No dosage change required with mild to moderate impairment; use caution with severe impairment (Child-Pugh Class C).

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	1–1.5 hr

Metabolism: Hepatic; $T_{1/2}$: 5–8 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, feces

Adverse effects

- **CNS:** Dizziness
- **CV:** Thromboembolic events, MI, stroke
- **GI:** Nausea, liver function abnormalities
- **Other:** Arthralgia, rash, gout flares

Interactions

★ **Drug-drug** • Risk of decreased metabolism and increased serum levels of azathioprine, mercaptopurine, theophyllines when given with these drugs, causing toxicity; avoid these combinations; concurrent use is contraindicated

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, liver or renal dysfunction, heart attack or stroke, pregnancy, lactation
- **Physical:** Orientation, affect; skin—color, lesions; abdominal exam; serum uric acid level, liver and renal function tests, baseline ECG

Interventions

- Administer without regard to food. May be taken with antacids.
- Obtain baseline and periodic serum uric acid levels.
- Arrange for other medication if gout flare occurs.
- Monitor for signs and symptoms of heart attack or stroke; patient may be at increased risk.

Teaching points

- Take this drug once a day, with or without food. You may take this drug with antacids.
- Store this drug at room temperature, protected from light.
- If you miss a dose, take the next dose as soon as you remember.
- You may experience a flare-up of your gout symptoms when you start taking this drug. Do not stop taking the drug; contact your health care provider, who may give you other medications to handle the flare-up.
- You will be asked to have periodic blood tests to evaluate the effects of this drug on your body.
- It is not known how this drug affects a fetus. If you become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug affects a nursing baby. Discuss the risks and benefits with your health care provider if you are nursing a baby.
- You may experience these side effects: Dizziness (do not drive a car or engage in activities that require alertness if these effects occur); nausea, joint pain, rash (these may lessen over time; consult your health care provider if they become too uncomfortable).
- Report chest pain, difficulty breathing, numbness or tingling, changes in the color of urine or stool, yellowing of the eyes or skin.

felodipine OND*(fell oh' di peen)*Renedil (CAN) OND

PREGNANCY CATEGORY C

Drug classes

Antihypertensive

Calcium channel blocker

Therapeutic actions

Inhibits the movement of calcium ions across the membranes of cardiac and vascular smooth muscle cells; greater selectivity for vascular smooth muscle as compared to cardiac muscle; leads to arterial and coronary artery vasodilation and decreased peripheral vascular resistance.

Indications

- Essential hypertension, alone or in combination with other antihypertensives

Contraindications and cautions

- Contraindicated with allergy to felodipine or other calcium channel blockers, sick sinus syndrome, heart block (second or third degree), lactation.
- Use cautiously with pregnancy, impaired hepatic function.

Available formsER tablets OND—2.5, 5, 10 mg**Dosages****Adults**

Initially, 5 mg PO daily; dosage may be gradually increased over at least 14 days. Usual dose is 2.5–10 mg PO daily. Doses greater than 10 mg PO daily are associated with an increased risk of peripheral edema.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic impairment

Monitor carefully; begin with 2.5 mg daily, and do not exceed 10 mg daily PO.

Pharmacokinetics

Route	Onset	Peak
Oral	2–5 hr	2.5–5 hr

Metabolism: Hepatic; $T_{1/2}$: 11–16 hr**Distribution:** Crosses placenta; may enter breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** *Dizziness, light-headedness, headache, asthenia, fatigue, lethargy*
- **CV:** *Peripheral edema, arrhythmias*
- **Dermatologic:** *Flushing, rash*
- **GI:** *Nausea, abdominal discomfort, reflux, constipation*

Interactions

- *** Drug-drug** • Decreased serum levels with barbiturates, hydantoins, carbamazepine • Increased serum levels and toxicity with erythromycin, cimetidine, ranitidine, antifungals
- *** Drug-food** • Decreased metabolism and increased risk of toxic effects if taken with grapefruit juice; avoid this combination

■ Nursing considerations**Assessment**

- **History:** Allergy to felodipine, impaired hepatic function, sick sinus syndrome, heart block, lactation, pregnancy
- **Physical:** Skin lesions, color, edema; P, BP, baseline ECG, peripheral perfusion, auscultation, R, adventitious sounds; liver evaluation, GI normal output; LFTs, urinalysis

Interventions

- Have patient swallow tablet whole; do not chew or crush.
- Monitor patient carefully (BP, cardiac rhythm and output) while drug is being adjusted to therapeutic dose.
- Monitor cardiac rhythm regularly during stabilization of dosage and periodically during long-term therapy.
- Administer drug without regard to meals.

Teaching points

- Take this drug with meals if upset stomach occurs; swallow tablet whole, do not cut,

crush, or chew. Do not drink grapefruit juice while using this drug.

- You may experience these side effects: Nausea, vomiting (eat frequent small meals); headache (adjust lighting, noise, and temperature; medication may be ordered if severe).
- Report irregular heart beat, shortness of breath, swelling of the hands or feet, pronounced dizziness, constipation.

fenofibrate (*fee no fye' brate*)

Antara, Apo-Fenofibrate (CAN), Fenoglide, Gen-Fenofibrate (CAN), Lipofen, Lofibra, PMS-Fenofibrate (CAN), ratio-Fenofibrate MC (CAN), TriCor, Triglide

PREGNANCY CATEGORY C

Drug class

Antihyperlipidemic

Therapeutic actions

Inhibits triglyceride synthesis in the liver resulting in a reduction in VLDL released into circulation; may also stimulate the breakdown of triglyceride-rich lipoproteins.

Indications

- Adjunct to diet in treating adults with primary hypercholesterolemia or mixed dyslipidemia
- Adjunct to diet for treatment of adults with hypertriglyceridemia
- Unlabeled use: Hyperuricemia

Contraindications and cautions

- Contraindicated with allergy to fenofibrate, hepatic or severe renal impairment, primary biliary cirrhosis, gall bladder disease, pregnancy.
- Use cautiously with lactation and in the elderly.

Available forms

Tablets—40, 48, 50, 54, 120, 145, 160 mg; capsules—43, 50, 67, 100, 130, 134, 150, 200 mg

Dosages

Adults

- **Hypertriglyceridemia:** Initially, 48–145 mg (*TriCor*) or 67–200 mg (*Lofibra*) with a meal or 50–160 mg/day (*Triglide*) daily PO or 43–130 mg/day PO (*Antara*), or 50–150 mg/day PO (*Lipofen*), or 40–120 mg/day PO (*Fenoglide*)
- **Primary hypercholesterolemia or mixed dyslipidemia:** 145 mg/day PO (*TriCor*) or 200 mg/day (*Lofibra*) with a meal or 160 mg/day (*Triglide*) or 130 mg/day PO (*Antara*), or 150 mg/day PO (*Lipofen*), or 120 mg/day PO (*Fenoglide*)

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Initial dose, 48 mg/day PO (*TriCor*), 67 mg/day (*Lofibra*) with a meal or 50 mg/day (*Triglide*) or 43 mg/day PO (*Antara*), or 50 mg/day PO (*Lipofen*); adjust slowly with close monitoring.

Patients with renal impairment

Initiate therapy with 48 mg/day PO (*TriCor*), 67 mg/day (*Lofibra*) with a meal or 50 mg/day (*Triglide*) or 43 mg/day PO (*Antara*), or 50 mg/day PO (*Lipofen*), or 40 mg/day PO (*Fenoglide*); monitor renal function tests for 4–8 wk before increasing.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	6–8 hr	Wks

Metabolism: Hepatic; $T_{1/2}$: 20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CV:** Angina, arrhythmias, swelling, phlebitis, thrombophlebitis
- **Dermatologic:** Rash, alopecia, dry skin, dry and brittle hair, pruritus, urticaria
- **GI:** Nausea, vomiting, diarrhea, dyspepsia, flatulence, bloating, stomatitis, gastritis, **pancreatitis**, peptic ulcer, GI hemorrhage
- **GU:** Impotence, decreased libido, dysuria, hematuria, proteinuria, decreased urine output
- **Hematologic:** Leukopenia, anemia, eosinophilia, increased AST and ALT, increased CPK

- **Other:** *Myalgia, flulike symptoms*, arthralgia, weight gain, polyphagia, increased perspiration, systemic lupus erythematosus, blurred vision, gynecomastia

Interactions

★ **Drug-drug** • Increased bleeding tendencies if oral anticoagulants are given with fenofibrate; reduce dosage of anticoagulant • Possible rhabdomyolysis, acute renal failure if given with any statins; avoid this combination • Decreased absorption and effectiveness if given with bile acid sequestrants; administer at least 1 hr before or 4–6 hr after these drugs • Increased risk of renal toxicity if combined with immunosuppressants or other nephrotoxic drugs; use caution and monitor patient carefully

■ Nursing considerations

Assessment

- **History:** Allergy to fenofibrate, hepatic impairment, primary biliary cirrhosis, gall bladder disease, pregnancy, renal impairment, lactation
- **Physical:** Skin lesions, color, T; P, BP, auscultation, baseline ECG, peripheral perfusion, edema; bowel sounds, normal urine output, liver evaluation; lipid studies, CBC, LFTs, renal function tests, urinalysis

Interventions

- Differentiate between brand names used; dosage varies.
- Administer drug with meals (*Lofibra*, *Lipofen*, *Fenoglide*).
- Monitor patient carefully.
- Ensure that patient continues strict dietary restrictions and exercise program.
- Arrange for regular follow-up, including blood tests for lipids, liver function, and CBC during long-term therapy.
- Give frequent skin care to deal with rashes and dryness.
- Monitor patient for muscle weakness, aches, especially if patient takes *TriCor* in combination with other cholesterol-lowering drugs.

Teaching points

- Take the drug with meals (*Lofibra*, *Lipofen*, *Fenoglide*).

- Continue to follow strict dietary regimen and exercise program.
- Arrange to have regular follow-up visits to your health care provider, which will include blood tests.
- You may experience these side effects: Diarrhea, loss of appetite (ensure ready access to the bathroom if this occurs; frequent small meals may help).
- Report chest pain, shortness of breath, palpitations, myalgia, malaise, excessive fatigue, fever.

▽ fenofibric acid

(*feen oh fye' brick*)

Trilipix **ORC**

PREGNANCY CATEGORY C

Drug class

Antihyperlipidemic

Therapeutic actions

Activates peroxisome proliferator activated receptor alpha, leading to an increase in lipolysis and elimination of triglyceride-rich particles from the plasma by activating lipoprotein lipase and reducing the production of lipase inhibitors. The decrease in triglycerides results in the production of large, buoyant LDL particles, which have a greater affinity for cholesterol receptors and are broken down rapidly; HDL levels are also increased.

Indications

- In combination with a statin to reduce triglycerides and increase HDL in patients with mixed dyslipidemia and CAD or at high risk for CAD who could achieve LDL goals
- As monotherapy to reduce triglycerides in patients with severe hypertriglyceridemia
- As monotherapy to reduce elevated LDL, total cholesterol, triglycerides and ApoB and to increase HDL in patients with primary hyperlipidemia or mixed dyslipidemia

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug or to fenofibrate, severe re-

nal impairment, dialysis, active liver disease, gallbladder disease, lactation.

- Use cautiously with mild to moderate renal disease, history of liver dysfunction, pregnancy.

Available forms

DR capsules —45, 135 mg

Dosages

Adults

Mixed dyslipidemia: 135 mg/day PO.

Hypertriglyceridemia: 45–135 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

45 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 20 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache
- **GI:** Nausea, constipation, *abdominal pain*, pancreatitis, cirrhosis
- **Respiratory:** URI
- **Other:** Fatigue, myalgia, **rhabdomyolysis**, increased liver enzymes, renal toxicity, fever

Interactions

* **Drug-drug** • Increased risk of bleeding if combined with oral anticoagulants; monitor closely and adjust dosage of anticoagulant as needed • Risk of decreased effectiveness if taken with a bile acid sequestrant; fenofibric acid should be taken 1 hour before or 4 to 6 hours after these drugs • Possible increased risk of nephrotoxicity if combined with cyclosporine; monitor patient very closely; use of another lipid-lowering agent should be considered

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to components of drug, fenofibrate; renal or liver dysfunction, gallbladder disease; pregnancy, lactation
- **Physical:** Orientation, affect; abdominal exam; respiratory auscultation; liver and renal function tests

Interventions

- Encourage patient to continue diet and exercise as prescribed.
- Administer without regard to food.
- Check patient's complete drug list and consider timing of drugs that might be affected by GI effects of this drug. If patient is also taking a statin, the drugs can be taken at the same time.
- Do not cut, crush, or allow patient to chew capsule. Capsule should be swallowed whole.
- Advise patient who is nursing to select another method of feeding the baby.
- Arrange for regular monitoring of lipid profile and liver function.

Teaching points

- Take this drug once a day, with or without food.
- Continue the low-fat diet and exercise program you have been following.
- Do not cut, crush, or chew capsule. You should swallow the capsule whole. If you are also taking a statin, they may be taken at the same time.
- If you miss a dose, take the next dose as soon as you remember. If you remember you forgot a dose at about the same time you are scheduled for your next dose, just take the next dose. Do not double the doses. Do not take more than one dose a day.
- It is not known how this drug affects a fetus. If you become pregnant while taking this drug, consult your health care provider.
- It is not known how this drug affects a nursing baby. Because of the potential for serious adverse effects in an infant, you should use another method of feeding the baby while you are taking this drug.

- You may experience these side effects: Headache (consult your health care provider about potential treatment if it becomes uncomfortable); constipation, abdominal pain (these may lessen over time; consult your health care provider if they become too uncomfortable).
- You will need periodic blood tests to monitor the effects of this drug on your body.
- Report marked muscle weakness or pain, fever, abdominal pain accompanied by nausea and vomiting.

fenoprofen calcium

(*fen oh proe' fen*)

Nalfon

PREGNANCY CATEGORY B
(FIRST AND SECOND TRIMESTERS)

PREGNANCY CATEGORY D
(THIRD TRIMESTER)

Drug classes

Analgesic (nonopioid)

NSAID

Propionic acid derivative

Therapeutic actions

Analgesic, anti-inflammatory, and antipyretic activities largely related to inhibition of prostaglandin synthesis by inhibiting cyclooxygenase; exact mechanisms of action are not known.

Indications

- Acute and long-term treatment of rheumatoid arthritis and osteoarthritis
- Relief of mild to moderate pain
- Unlabeled uses: Treatment of juvenile rheumatoid arthritis; symptomatic treatment of sunburn, migraine headache

Contraindications and cautions

- Contraindicated with significant renal impairment, pregnancy, lactation, hypersensitivity to aspirin, fenoprofen, or other NSAIDs.

- Use cautiously with impaired hearing; hepatic, hypertension, and GI conditions.

Available forms

Capsules—200, 300, 400 mg; tablets—600 mg

Dosages

Do not exceed 3,200 mg/day.

Adults

- *Rheumatoid arthritis or osteoarthritis*: 400–600 mg PO tid or qid. Treatment for 2–3 wk may be required to see improvement.
- *Mild to moderate pain*: 200 mg every 4–6 hr PO, as needed.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	15–30 min	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

NSAIDs

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, tinnitus, ophthalmologic effects
- **Dermatologic:** *Rash*, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, constipation, flatulence, **ulcer, GI bleed**
- **GU:** Dysuria, **renal impairment** (fenoprofen is one of the most nephrotoxic NSAIDs)
- **Hematologic:** Bleeding, platelet inhibition with higher doses, **neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia**, decreased Hgb or Hct, **bone marrow depression**, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **anaphylactoid reactions to fatal anaphylactic shock**

Interactions

• **Drug-drug** • Increased risk of bleeding with anticoagulants, antiplatelet drugs • Decreased effect when used with phenobarbital

■ Nursing considerations

Assessment

- **History:** Renal impairment, impaired hearing, allergy to aspirin or NSAIDs, hepatic, CV, and GI conditions, lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV events, GI bleeding; monitor patient accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Arrange for periodic ophthalmologic examination during long-term therapy.

⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs.
- Take only the prescribed dosage.
- Do not take this drug during pregnancy; using contraceptives is advised.
- Dizziness or drowsiness can occur (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers; changes in vision; black, tarry stools, bleeding.

DANGEROUS DRUG

▷ fentanyl (fen' ta nil)

Actiq; Duragesic 12, 25, 50, 75, 100; Duragesic Patch 12.5; Fentora, lonsys, Onsolis, Sublimaze

PREGNANCY CATEGORY C

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic

Therapeutic actions

Acts at specific opioid receptors, causing analgesia, respiratory depression, physical depression, euphoria.

Indications

- Analgesic action of short duration during anesthesia and immediate postoperative period
- Analgesic supplement in general or regional anesthesia
- Administration with a neuroleptic as an anesthetic premedication, for induction of anesthesia, and as an adjunct in maintenance of general and regional anesthesia
- For use as an anesthetic drug with oxygen in selected high-risk patients
- Transdermal system: Management of chronic pain in patients requiring continuous opioid analgesia over an extended period of time who cannot be managed by other means and who are already receiving opioid therapy
- *Actiq, Fentora, Onsolis*: Treatment of breakthrough pain in cancer patients being treated with and tolerant to opioids for underlying cancer pain

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, diarrhea caused by poisoning, acute bronchial asthma, upper airway obstruction, pregnancy.
- Use cautiously with bradycardia, history of seizures, lactation, renal impairment; history of drug addiction.

Available forms

Lozenge on a stick (*Actiq*)—200, 400, 600, 800, 1,200, 1,600 mcg; transdermal—12.5, 25, 50, 75, 100 mcg/hr; injection—50 mcg/mL; buccal tablets—100, 200, 400, 600, 800 mcg; buccal soluble film—200, 400, 600, 800, 1,200 mcg; ionic delivery system—40 mcg/10 min

Dosages

Individualize dosage; monitor vital signs.

Adults**Parenteral**

- **Premedication:** 50–100 mcg IM 30–60 min before surgery.
- **Adjunct to general anesthesia:** Initial dosage is 2–20 mcg/kg. Maintenance dose, 2–50 mcg IV or IM; 25–100 mcg IV or IM when changes in vital signs indicate surgical stress or lightening of analgesia.
- **With oxygen for anesthesia:** Total high dose is 50–100 mcg/kg IV.
- **Adjunct to regional anesthesia:** 50–100 mcg IM or slowly IV over 1–2 min.
- **Postoperatively:** 50–100 mcg IM for the control of pain, tachypnea, or emergence delirium; repeat in 1–2 hr if needed.

Transdermal

Initiate therapy with 25 mcg/hr system; adjust dose as needed and tolerated. Apply to nonirritated and nonirradiated skin on a flat surface of the upper torso; may require replacement in 72 hr if pain has not subsided; do not use torn or damaged systems, serious overdose can occur.

Lozenges

- **Actiq:** Place unit in mouth between cheek and lower gum. Start with initial dose of 200 mcg. Until appropriate dose is reached, an additional dose can be used to treat an episode of breakthrough pain. Redosing may start 15 min after the previous lozenge has been completed. No more than two lozenges should be used for each breakthrough pain episode. Can consider increasing dose if requiring more than one lozenge for treatment of several consecutive breakthrough pain episodes. If more than four lozenges are needed daily, increase the dosage of long-acting opioid. *Actiq* should be sucked slowly over 15 min.
- **Buccal tablets:** Initially, 100-mcg tablet between cheek and gum for 14–25 min; may be repeated in 30 min if needed. Adjust slowly to control pain.
- **Buccal soluble film:** Remove film and place inside cheek; will dissolve within 5–30 min. Available only through FOCUS program.

Ionic delivery system

Apply to chest or upper, outer arm. With each activation, 40 mcg delivered over 10 min. Each system contains 80 doses. May use up to 3 units sequentially, if needed.

Pediatric patients 2–12 yr**Transdermal system**

Children 2 yr and older initiating therapy on 25 mcg/hr system should be opioid tolerant and receiving at least 60 mg oral morphine equivalents/day.

Parenteral

2–3 mcg/kg IV as vital signs indicate.

Pharmacokinetics

Route	Onset	Duration
IV	1–2 min	0.5–1 hr
IM	7–8 min	1–2 hr
Transdermal	Gradual	72 hr
Transmucosal	15 min	1 hr

Metabolism: Liver; $T_{1/2}$: 1.5–6 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: May be used undiluted or diluted with 250 mL of D₅W. Protect vials from light.

Infusion: Administer slowly by direct injection, each milliliter over at least 1 min, or into running IV tubing.

Incompatibilities: Do not mix with methohexital, pentobarbital, thiopental.

Adverse effects

- **CNS:** *Sedation, clamminess, sweating, headache, vertigo, floating feeling, dizziness, lethargy, confusion, light-headedness,* nervousness, unusual dreams, agitation, euphoria, hallucinations, delirium, insomnia, anxiety, fear, disorientation, impaired mental and physical performance, mood changes, coma, weakness, headache, tremor, seizures
- **CV:** Palpitation, increase or decrease in BP, circulatory depression, **cardiac arrest, shock,** tachycardia, bradycardia, arrhythmia, palpitations
- **Dermatologic:** Rash, hives, pruritus, flushing, warmth, sensitivity to cold
- **EENT:** Diplopia, blurred vision
- **GI:** *Nausea, vomiting,* dry mouth, anorexia, **constipation,** biliary tract spasm

- **GU:** Ureteral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Local:** Phlebitis following IV injection, pain at injection site; tissue irritation and induration (subcutaneous injection)
- **Respiratory:** Slow, shallow respiration, **apnea**, suppression of cough reflex, laryngospasm, bronchospasm
- **Other:** Physical tolerance and dependence, psychological dependence; local skin irritation with transdermal system

Interactions

- **Drug-drug** • Potentiation of effects when given with other CNS acting drugs or barbiturate anesthetics; decrease dose of fentanyl when co-administering • Potentiation of effects may occur when given with macrolide antibiotics, ketoconazole, itraconazole, and protease inhibitors • Do not administer an MAOI within 14 days of fentanyl (increased CNS effects) • Increased risk of adverse effects and toxicity if combined with alcohol
- **Drug-food** • Decreased metabolism and risk of toxic effects if taken with grapefruit juice; avoid this combination
- **Drug-lab test** • Elevated biliary tract pressure may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between fentanyl and sufentanil; use extreme caution.

Assessment

- **History:** Hypersensitivity to fentanyl or opioids, physical dependence on an opioid analgesic, pregnancy, labor, lactation, COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, renal or hepatic impairment
- **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; P, auscultation, BP; R, adventitious sounds; bowel

sounds, normal output; LFTs, renal function tests

Interventions

- Administer to women who are nursing a baby 4–6 hr before the next scheduled feeding to minimize the amount in milk.

⊗ **Black box warning** Keep opioid antagonist and facilities for assisted or controlled respiration readily available during parenteral administration; ensure appropriate use of drug because it is potentially dangerous. Respiratory depression and death can occur.

⊗ **Black box warning** Use caution when switching between forms of delivery; dosages vary.

- Prepare site for transdermal form by clipping (not shaving) hair at site; do not use soap, oils, lotions, alcohol; let skin dry completely before application. Apply immediately after removal from the sealed package; firmly press the transdermal system in place with the palm of the hand for 10–20 sec, making sure the contact is complete. Must be worn continually for 72 hr. Do not use any system that has been torn or damaged. Remove old patch before applying a new one.
- Note that the patch doesn't work quickly. It may take up to 12 hr to get the full therapeutic effect. Breakthrough medications may need to be used.
- Do not use *Actiq* in patients who never received opioids before; should be used only in opioid tolerant patients.
- Use caution with *Actiq* form to keep this drug out of the reach of children (it looks like a lollipop) and follow the distribution restrictions in place with this drug very carefully
- Use *Ionsys* only for hospitalized adults. Apply to intact, nonirritated skin on chest or upper arm. Patient presses button twice, firmly. System will deliver dose over 10 min. Up to 3 units may be used sequentially, if needed.
- Buccal soluble film is only available through FOCUS limited-access program. Dispose of unused films by removing from foil pack and flushing down toilet.

Teaching points

- Do not drink grapefruit juice while using this drug. If using the patch, do not use any patch that has been torn or damaged.

Remove old patch before applying a new one. If using buccal soluble film, remove from the foil pack and place inside your cheek; it will dissolve within 5 to 30 minutes. Dispose of unused films by removing them from the foil pack, depositing them in the toilet and then flushing the toilet.

- You may experience these side effects: Dizziness, sedation, drowsiness, impaired visual acuity (ask for assistance if you need to move); nausea, loss of appetite (lie quietly, eat frequent small meals); constipation (a laxative may help).
- Report severe nausea, vomiting, palpitations, shortness of breath, or difficulty breathing.

ferrous sulfate exsiccated

Feosol, Feratab, Ferodan (CAN), Slow Fe, Slow Release Iron

PREGNANCY CATEGORY A

Drug class

Iron preparation

Therapeutic actions

Elevates the serum iron concentration, and is then converted to Hgb or trapped in the reticuloendothelial cells for storage and eventual conversion to a usable form of iron.

Indications

- Prevention and treatment of iron deficiency anemias
- Dietary supplement for iron
- Unlabeled use: Supplemental use during epoetin therapy to ensure proper hematologic response to epoetin

Contraindications and cautions

- Contraindicated with allergy to any ingredient; sulfite allergy; hemochromatosis, hemosiderosis, hemolytic anemias.
- Use cautiously with normal iron balance; peptic ulcer, regional enteritis, ulcerative colitis.

Available forms

Tablets—aspartate—112 mg; sulfate, 324, 325 mg; sulfate exsiccated, 200, 300 mg; gluconate, 240, 325 mg; fumarate, 63, 200, 324, 325, 350 mg; timed-release capsules—sulfate exsiccated, 160 mg; timed-release tablets—sulfate exsiccated, 160 mg; syrup—fumarate (*Ferro-Sequels*), 150 mg; sulfate, 90 mg/5 mL; elixir—sulfate, 220 mg/5 mL; drops—sulfate, 75 mg/0.6 mL, 125 mg/mL; fumarate, 45 mg/0.6 mL; tablet, chewable—fumarate, 100 mg; suspension—fumarate, 100 mg/5 mL

Dosages

Adults

- *Daily requirements*: Men, 8–11 mg/day PO; women, 8–18 mg/day PO; pregnant and lactating women, 9–27 mg/day PO.
- *Replacement in deficiency states*: 150–300 mg/day (6 mg/kg/day) PO for approximately 6–10 mo may be required.

Pediatric patients

- *Daily requirement*: 7–11 mg/day PO.
- *Replacement*: 3–6 mg/kg/day PO.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	4 days	7–10 days	2–4 mo

Metabolism: Recycled for use; $T_{1/2}$: Not known

Distribution: Crosses placenta; enters breast milk

Excretion: Unknown

Adverse effects

- **CNS:** CNS toxicity, acidosis, **coma and death with overdose**
- **GI:** *GI upset, anorexia, nausea, vomiting, constipation*, diarrhea, dark stools, temporary staining of the teeth (liquid preparations)

Interactions

★ **Drug-drug** • Decreased anti-infective response to ciprofloxacin, norfloxacin, ofloxacin; separate doses by at least 2 hr • Decreased absorption with antacids, cimetidine • Decreased effects of levodopa if taken with iron • Increased serum iron levels with chloramphenicol • Decreased absorption of levothyroxine; separate doses by at least 2 hr

★ **Drug-food** • Decreased absorption with antacids, eggs or milk, coffee and tea; avoid concurrent administration of any of these

■ Nursing considerations

Assessment

- **History:** Allergy to any ingredient, sulfite; hemochromatosis, hemosiderosis, hemolytic anemias; normal iron balance; peptic ulcer, regional enteritis, ulcerative colitis
- **Physical:** Skin lesions, color; gums, teeth (color); bowel sounds; CBC, Hgb, Hct, serum ferritin and iron levels

Interventions

- Confirm that patient does have iron deficiency anemia before treatment.
- Give drug with meals (avoiding milk, eggs, coffee, and tea) if GI discomfort is severe; slowly increase to build up tolerance.
- Administer liquid preparations in water or juice to mask the taste and prevent staining of teeth; have the patient drink solution with a straw.
- Warn patient that stool may be dark or green.
- Arrange for periodic monitoring of Hct and Hgb levels.

⊗ **Black box warning** Warn patient to keep drug out of children's reach; leading cause of fatal poisoning in children younger than 6 yr.

Teaching points

- Take drug on an empty stomach with water. Take after meals if GI upset is severe (avoid milk, eggs, coffee, and tea).

- Take liquid preparations diluted in water or juice, and sip them through a straw to prevent staining of the teeth.
- Treatment may not be necessary if cause of anemia can be corrected. It may be needed for several months to reverse anemia.
- Have periodic blood tests during therapy to determine the appropriate dosage.
- Do not take this preparation with antacids or tetracyclines. If these drugs are needed, they will be prescribed.
- You may experience these side effects: GI upset, nausea, vomiting (take drug with meals); diarrhea or constipation; dark or green stools.
- Keep this drug out of the reach of children.
- Report severe GI upset, lethargy, rapid respirations, constipation.

▽ ferumoxylol

See Appendix U, *Less commonly used drugs*.

▽ fesoterodine fumarate

(*fess oh tear' oh deen*)

Toviaz ^{OND}

PREGNANCY CATEGORY C

Drug class

Antimuscarinic

Therapeutic actions

Competitively blocks muscarinic receptor sites: Bladder contraction is mediated by muscarinic receptors; blocking these receptors decreases bladder contraction and signs and symptoms of bladder overactivity.

Indications

- Treatment of overactive bladder with symptoms of urinary incontinence, urgency, and frequency in adults

Contraindications and cautions

- Contraindicated with known hypersensitivity to any component of the drug; urinary retention; gastric retention; uncontrolled narrow-angle glaucoma.

- Use cautiously with bladder outlet obstruction, decreased GI motility, controlled narrow-angle glaucoma, reduced hepatic function, myasthenia gravis, impaired renal function, pregnancy, lactation.

Available forms

ER tablets **o/mc**—4, 8 mg

Dosages

Adults

4 mg/day PO; may be increased to a maximum of 8 mg/day if needed and tolerated.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

No dosage adjustment needed in mild to moderate renal impairment. Limit dose to 4 mg/day PO in severe renal impairment.

Patients with hepatic impairment

Not recommended for patients with severe hepatic impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	5 hr

Metabolism: Hepatic; $T_{1/2}$: 7 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dry eyes, insomnia, drowsiness, blurred vision
- **CV:** Tachycardia
- **GI:** *Dry mouth, constipation*, dyspepsia, nausea, abdominal pain
- **GU:** Dysuria, urinary retention, UTI
- **Respiratory:** URI, cough, dry throat
- **Other:** Back pain, rash, decreased sweating

Interactions

• **Drug-drug** • Risk of increased serum levels and toxicity if given with any potent CYP3A4 inhibitor (ketoconazole, itraconazole, clarithromycin); dosage of fesoterodine should not exceed 4 mg/day and patient should be monitored closely

• **Drug-food** • Increased risk of drowsiness if combined with alcohol; advise patient to avoid this combination

Nursing considerations

Assessment

History: Hypersensitivity to any component of the drug, urinary retention, gastric retention, narrow-angle glaucoma, bladder outlet obstruction, decreased GI motility, reduced hepatic function, myasthenia gravis, impaired renal function, pregnancy, lactation

Physical: IOP reading; orientation; skin color and lesions; R, adventitious sounds; P; bowel sounds; urinary output, prostate palpation, LFT, renal function tests

Interventions

- Monitor IOP before and periodically during treatment if patient has glaucoma.
- Administer tablet with water. Ensure that tablet is swallowed whole, not cut, crushed, or chewed.
- Provide frequent mouth hygiene and sugarless lozenges if dry mouth is a problem.
- Provide frequent small meals if GI upset is a problem.
- Arrange for safety precautions if visual changes are a problem.
- Monitor bowel function and institute a bowel program if constipation becomes an issue.
- Monitor patient in hot environments; decreased ability to sweat can lead to heat prostration.

Teaching points

- Take this drug with water once a day as prescribed. Swallow the tablet whole; do not cut, crush, or chew it.
- You may experience these side effects: Dry mouth (sucking sugarless lozenges, frequent mouth care may help), constipation (ensure adequate fluid intake and fiber in the diet, consult your health care provider if this becomes a serious problem), dry eyes (this effect may pass with time; consult with your health care provider for possible treatment if this becomes severe), blurred

vision (avoid driving or operating dangerous machinery until you know how this drug will affect you), difficulty emptying the bladder (it may help to empty your bladder before taking each dose of the drug), decreased ability to sweat (use caution in hot environments, make sure you have plenty of fluids and take precautions to avoid overheating).

- Be aware that alcohol may increase the sedation effects of this drug. Avoid drinking alcohol while on this drug.
- Report tremors, restlessness, thoughts of suicide, increased depression, inability to stay alert, sudden behavioral changes.

fexofenadine hydrochloride

(*fecks oh fen' a deen*)

Allegra, Allegra ODT

PREGNANCY CATEGORY C

Drug class

Antihistamine (nonsedating type)

Therapeutic actions

Competitively blocks the effects of histamine at peripheral H₁-receptor sites; has no anticholinergic (atropine-like) or sedating effects.

Indications

- Symptomatic relief of symptoms associated with seasonal allergic rhinitis in adults and children 2 yr and older
- Chronic idiopathic urticaria in adults and children 6 mo and older

Contraindications and cautions

- Contraindicated with allergy to any antihistamines, pregnancy, lactation.
- Use cautiously with hepatic or renal impairment, in geriatric patients.

Available forms

Tablets—30, 60, 180 mg; suspension—6 mg/mL; orally disintegrating tablets—30 mg

Dosages

Adults and patients 12 yr and older

- *Allergic rhinitis*: 60 mg PO bid or 180 mg once daily.
- *Chronic idiopathic urticaria*: 60 mg PO bid or 180 mg PO once daily.

Pediatric patients 6–11 yr

- *Allergic rhinitis and chronic idiopathic urticaria*: 30 mg orally disintegrating tablet PO bid.

Pediatric patients 2–11 yr

- *Allergic rhinitis and chronic idiopathic urticaria*: 30 mg PO bid.

Pediatric patients 6 mo–2 yr

- *Chronic idiopathic urticaria*: 15 mg (2.5 mL) PO bid.

Geriatric patients or patients with renal impairment

For geriatric patients or adults with renal impairment, use 60 mg PO daily. For children 2–11 yr with renal impairment, use 30 mg PO daily. For children 6 mo–2 yr with renal impairment, use 15 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2.6 hr

Metabolism: Hepatic; T_{1/2}: 14.4 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Fatigue, drowsiness
- **GI:** Nausea, dyspepsia
- **Other:** Dysmenorrhea, flulike symptoms

Interactions

★ **Drug-drug** • Increased levels and possible toxicity with ketoconazole, itraconazole, erythromycin; fexofenadine dose may need to be decreased • Decreased effects when taken with antacids

■ Nursing considerations

Assessment

- **History:** Allergy to any antihistamines, renal impairment, pregnancy, lactation
- **Physical:** Mucous membranes, oropharynx, R, adventitious sounds; skin color,

lesions; orientation, affect; renal function tests

Interventions

- Arrange for use of humidifier if thickening of secretions, nasal dryness become bothersome; encourage adequate intake of fluids.
- Provide supportive care for flulike symptoms.

Teaching points

- Avoid excessive dosage; take as prescribed.
- Do not take at the same time as antacids.
- Place orally disintegrating tablet on tongue; let disintegrate and then swallow with or without water.
- To maximize effects, take this medication in the morning before exposure to allergens.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if driving or performing tasks that require alertness); thickening of bronchial secretions, dryness of nasal mucosa (use of a humidifier may help); menstrual irregularities; flulike symptoms (medication may be helpful).
- Report difficulty breathing, severe nausea, fever.

fibrinogen concentrate, human

See Appendix U, *Less commonly used drugs*.

filgrastim (granulocyte colony-stimulating factor, G-CSF)

(*fill grass' stim*)

Neupogen

PREGNANCY CATEGORY C

Drug class

Colony-stimulating factor

Therapeutic actions

Human granulocyte colony-stimulating factor produced by recombinant DNA technology; increases the production of neutrophils

within the bone marrow with little effect on the production of other hematopoietic cells.

Indications

- To decrease the incidence of infection in patients with nonmyeloid malignancies receiving myelosuppressive anticancer drugs associated with a significant incidence of severe neutropenia with fever
- To reduce the time to neutrophil recovery and duration of fever, following induction or consolidation chemotherapy treatment of acute myeloid leukemia
- To reduce the duration of neutropenia following bone marrow transplant
- Treatment of severe chronic neutropenia
- Mobilization of hematopoietic progenitor cells into the blood for leukapheresis collection
- Orphan drug uses: Treatment of myelodysplastic syndrome, aplastic anemia, graft failure after bone marrow transplant, hairy cell leukemia, AIDs—drug-induced neutropenias, neutropenic fever

Contraindications and cautions

- Contraindicated with hypersensitivity to *Escherichia coli* products.
- Use cautiously with lactation, pregnancy.

Available forms

Injection—300 mcg/mL; prefilled syringes—300 mcg/0.5 mL

Dosages

Adults

Starting dose is 5 mcg/kg/day subcutaneously or IV as a single daily injection. May be increased in increments of 5 mcg/kg for each chemotherapy cycle; 4–8 mcg/kg/day is usually effective.

- *Bone marrow transplant*: 10 mcg/kg/day IV or continuous subcutaneous infusion.
- *Severe chronic neutropenia*: 6 mcg/kg subcutaneously bid (congenital neutropenia); 5 mcg/kg/day subcutaneously as single injection (idiopathic or cyclic neutropenia).
- *Mobilization for harvesting*: 10 mcg/kg/day subcutaneously at least 4 days before first leukapheresis; continue to last leukapheresis.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Peak	Duration
Subcut.	8 hr	4 days
IV	2 hr	4 days

Metabolism: Unknown; $T_{1/2}$: 210–231 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: No special preparation required. Refrigerate; avoid shaking. Before injection, allow to warm to room temperature. Discard vial after one use, and do not reenter vial; discard any vial that has been at room temperature longer than 24 hr.

Infusion: Inject directly IV slowly over 15–30 min, or inject slowly into tubing of running IV over 4–24 hr.

Incompatibilities: Do not mix in solutions other than D₅W. Incompatible with numerous drugs in solution; check manufacturer's details before any combination.

Adverse effects

- **CNS:** Headache, fever, generalized weakness, fatigue
- **Dermatologic:** Alopecia, rash, mucositis
- **GI:** Nausea, vomiting, stomatitis, anorexia, diarrhea, constipation
- **Other:** Bone pain, generalized pain, sore throat, cough

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to *E. coli* products, pregnancy, lactation
- **Physical:** Skin color, lesions, hair; T; abdominal examination, status of mucous membranes; CBC with differential, platelets

Interventions

- Obtain CBC and platelet count before and twice weekly during therapy; doses may be increased after chemotherapy cycles according to the duration and severity of bone marrow suppression.

⊗ **Warning** Do not give within 24 hr before and after chemotherapy.

- Give daily for up to 2 wk until the neutrophil count is 10,000/mm³; discontinue therapy if this number is exceeded.
- Store in refrigerator; allow to warm to room temperature before use; if vial is at room temperature for longer than 24 hr, discard. Use each vial for one dose; do not reenter the vial. Discard any unused drug.
- Do not shake vial before use. If subcutaneous dose exceeds 1 mL, consider using two sites.

Teaching points

- Store drug in refrigerator; do not shake vial. Each vial can be used only once; do not reuse syringes or needles (proper container for disposal will be provided). Another person should be instructed in the proper administration technique. Use sterile technique.
- Avoid exposure to infection while you are receiving this drug (avoid crowds and people known to have infections).
- Keep appointments for frequent blood tests to evaluate effects of drug on your blood count.
- You may experience these side effects: Bone pain (analgesia may be ordered), nausea and vomiting (eat frequent small meals), loss of hair (it is very important to cover head in extreme temperatures).
- Report fever, chills, severe bone pain, sore throat, weakness, pain or swelling at injection site.

finasteride
(fin as' teb ride)

Propecia, Proscar

PREGNANCY CATEGORY X

Drug class

Androgen hormone inhibitor

Therapeutic actions

Inhibits the intracellular enzyme that converts testosterone into a potent androgen (DHT); does not affect androgen receptors in the body;

the prostate gland depends on DHT for its development and maintenance.

Indications

- **Proscar:** Treatment of symptomatic BPH; most effective with long-term use; reduces the need for prostate surgery and reduces the risk of urinary retention; with doxazosin, to reduce the risk of progression of BPH symptoms
- **Propecia:** Prevention of male pattern baldness (androgenetic alopecia) in patients with family history or early signs of loss
- Unlabeled uses: Adjuvant monotherapy following radical prostatectomy; prevention of the progression of first-stage prostate cancer; hirsutism; male chronic pelvic pain syndrome

Contraindications and cautions

- Contraindicated with allergy to finasteride or any component of the product, pregnancy, lactation.
- Use cautiously with hepatic impairment.

Available forms

Tablets—1 mg (*Propecia*), 5 mg (*Proscar*)

Dosages

Adults

- **BPH:** 5 mg daily PO with or without meals; may take 6–12 mo for response (*Proscar*).
- **Male pattern baldness:** 1 mg/day PO for 3 mo or more before benefit is observed (*Propecia*).

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with hepatic insufficiency

No dosage adjustment is needed.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	8 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; may enter breast milk (not used in women)

Excretion: Feces, urine

Adverse effects

- **GI:** Abdominal upset
- **GU:** *Impotence, decreased libido*, decreased volume of ejaculation
- **Other:** Gynecomastia

Interactions

- **Drug-lab test** • Decreased PSA levels when measured; false decrease does not mean patient is free of risk of prostate cancer

Nursing considerations

Assessment

- **History:** Allergy to finasteride or any component, hepatic impairment, pregnancy, lactation
- **Physical:** Liver evaluation, abdominal examination; renal function tests, normal urine output, prostate examination

Interventions

- Confirm that problem is BPH, and other disorders (prostate cancer, infection, strictures, hypotonic bladder) have been ruled out.
- Administer without regard to meals; protect container from light.
- Arrange for regular follow-up, including prostate examination, PSA levels, and evaluation of urine flow.
- Monitor urine flow and output; increase in urine flow may not occur in all situations.
- **⊗ Warning** Do not allow pregnant women to handle crushed or broken tablets because of risk of inadvertent absorption, adversely affecting the fetus.
- Alert patient that libido may be decreased as well as the volume of ejaculate; usually reversible when the drug is stopped.

Teaching points

- Take this drug once a day without regard to meals; protect from light.
- Have regular medical follow-up to evaluate your response. Your health care provider will monitor your liver and kidney function as well as prostate-specific antigen levels.
- This drug has serious adverse effects on unborn babies. Do not allow a pregnant woman to handle the tablet if it is crushed or broken.

- You may experience these side effects: Loss of libido, impotence, decreased amount of ejaculate (usually reversible when the drug is stopped); breast enlargement, tenderness.
- Report inability to void, groin pain, sore throat, fever, weakness.

▷ **fingolimod**

See Appendix U, *Less commonly used drugs*.

▷ **flavoxate hydrochloride** (*fla vox' ate*)

Urispas

PREGNANCY CATEGORY B

Drug classes

Parasympathetic blocker
Urinary antispasmodic

Therapeutic actions

Counteracts smooth muscle spasm of the urinary tract by relaxing the detrusor and other muscles through action at the parasympathetic receptors; has local anesthetic and analgesic properties.

Indications

- Symptomatic relief of dysuria, urgency, nocturia, suprapubic pain, frequency and incontinence due to cystitis, prostatitis, urethritis, urethrocystitis, urethrotrigonitis

Contraindications and cautions

- Contraindicated with allergy to flavoxate, pyloric or duodenal obstruction, obstructive intestinal lesions or ileus, achalasia, GI hemorrhage, obstructive uropathies of the lower urinary tract.
- Use cautiously with glaucoma, pregnancy, lactation.

Available forms

Tablets—100 mg

Dosages

Adults and patients 12 yr and older

100–200 mg PO tid or qid. Reduce dose when symptoms improve. Use up to 1,200 mg/day in severe urinary urgency following pelvic radiotherapy.

Pediatric patients younger than 12 yr

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Duration
Oral	Slow	6 hr

Metabolism: $T_{1/2}$: 2–3 hr

Distribution: May cross placenta

Excretion: Feces, urine

Adverse effects

- **CNS:** *Nervousness, vertigo, headache, drowsiness*, mental confusion, hyperpyrexia, *blurred vision*, increased ocular tension, disturbance in accommodation
- **CV:** Tachycardia, palpitations
- **Dermatologic:** Urticaria, dermatoses
- **GI:** *Nausea, vomiting, dry mouth*
- **GU:** Dysuria
- **Hematologic:** **Eosinophilia, leukopenia**

Interactions

★ **Drug-drug** • Risk of toxic effects if combined with anticholinergic drugs • Loss of effectiveness of cholinergic drugs such as Alzheimer's disease drugs if combined

■ **Nursing considerations**

Assessment

- **History:** Allergy to flavoxate, pyloric or duodenal obstruction, obstructive intestinal lesions or ileus, achalasia, GI hemorrhage, obstructive uropathies of the lower urinary tract, glaucoma, pregnancy, lactation
- **Physical:** Skin color, lesions; T; orientation, affect, reflexes, ophthalmic examination, ocular pressure measurement; P; bowel sounds, oral mucous membranes; CBC, stool guaiac

Interventions

- Arrange for definitive treatment of UTIs causing the symptoms being managed by flavoxate.
- Arrange for ophthalmic examination before and during therapy.

Teaching points

- Take drug three or four times a day.
- This drug is meant to relieve the symptoms you are experiencing; other medications will be used to treat the cause.
- You may experience these side effects: Dry mouth, GI upset (suck on sugarless lozenges and use frequent mouth care); drowsiness, blurred vision (avoid driving or performing tasks requiring alertness).
- Report blurred vision, fever, rash, nausea, vomiting.

flecainide acetate (fle ka' nide)

Tambacor

PREGNANCY CATEGORY C

Drug class

Antiarrhythmic

Therapeutic actions

Type 1c antiarrhythmic: Acts selectively to depress fast sodium channels, decreasing the height and rate of rise of cardiac action potentials and slowing conduction in all parts of the heart.

Indications

- Prevention and treatment of life-threatening ventricular arrhythmias, such as sustained ventricular tachycardia (not recommended for less severe ventricular arrhythmias)
- Prevention of paroxysmal atrial fibrillation or flutter (PAF) associated with symptoms and paroxysmal supraventricular tachycardias (PSVT), including atrioventricular nodal and atrioventricular reentrant tachycardia; other supraventricular tachycardias of unspecified mechanism with disabling symp-

oms in patients without structural heart disease

Contraindications and cautions

- Contraindicated with allergy to flecainide; heart failure; cardiogenic shock; cardiac conduction abnormalities (heart blocks of any kind, unless an artificial pacemaker is present to maintain heartbeat); MI; sick sinus syndrome; lactation, pregnancy.
- Use cautiously with endocardial pacemaker (permanent or temporary—stimulus parameters may need to be increased); heart failure; hepatic or renal disease; potassium imbalance.

Available forms

Tablets—50, 100, 150 mg

Dosages

Evaluation with close monitoring of cardiac response necessary for determining the correct dosage.

Adults

- *PSVT and PAF*: Starting dose of 50 mg every 12 hr PO; may be increased in increments of 50 mg bid every 4 days until efficacy is achieved; maximum dose is 300 mg/day.
- *Sustained ventricular tachycardia*: 100 mg every 12 hr PO. Increase in 50-mg increments twice a day every fourth day until efficacy is achieved. Maximum dose is 400 mg/day.
- *Heart failure*: Initial dose of no more than 100 mg every 12 hr PO. May increase in 50-mg increments bid every fourth day to a maximum of 200 mg/day; higher doses associated with increased heart failure.
- *Transfer to flecainide*: Allow at least 2–4 plasma half-lives to elapse after other antiarrhythmic drugs discontinued before starting flecainide. Consider hospitalization because withdrawal of a previous antiarrhythmic is likely to produce life-threatening arrhythmias.

Pediatric patients

Safety and efficacy in patients younger than 18 yr have not been established.

Patients with renal impairment

Initial dose, 100 mg daily PO or 50 mg every 12 hr. Wait about 4 days to reach a steady state, then increase dose cautiously.

Geriatric patients

Elimination may be slower. Usual dose should be used in patients up to 80 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	30–60 min	3 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 20 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Dizziness, fatigue, drowsiness, visual changes, headache, tinnitus, paresthesias*
- **CV:** *Cardiac arrhythmias, heart failure, slowed cardiac conduction, palpitations, chest pain*
- **GI:** *Nausea, vomiting, abdominal pain, constipation, diarrhea*
- **GU:** Polyuria, urinary retention, decreased libido
- **Other:** *Dyspnea, sweating, hot flashes, night sweats, leukopenia*

Interactions

★ **Drug-drug** ⊗ **Warning** Risk of marked drop in cardiac output if combined with disopyramide or verapamil; avoid these combinations if possible.

• Risk of increased flecainide levels if combined with amiodarone, cimetidine, propranolol

■ Nursing considerations

Assessment

- **History:** Allergy to flecainide, heart failure, MI, cardiogenic shock, cardiac conduction abnormalities, sick sinus syndrome, endocardial pacemaker, hepatic or renal disease, potassium imbalance, lactation, pregnancy
- **Physical:** Weight; orientation, reflexes, vision; P, BP, auscultation, ECG, edema, R, adventitious sounds; bowel sounds, liver evaluation; urinalysis, CBC, serum electrolytes, LFTs, renal function tests

Interventions

⊗ **Black box warning** In patients with recent MI or chronic atrial fibrillation, treatment increases risk of nonfatal cardiac arrest and death.

- Monitor patient response carefully, especially when beginning therapy.
- Reduce dosage in patients with renal disease or hepatic failure.
- Check serum K^+ levels before giving.

⊗ **Black box warning** Monitor cardiac rhythm carefully; risk of potentially fatal proarrhythmias.

⊗ **Warning** Evaluate for therapeutic serum levels of 0.2–1 mcg/mL.

⊗ **Warning** Keep life support equipment, including pacemaker, readily available in case serious CVS, CNS effects occur—also keep dopamine, dobutamine, isoproterenol, or other positive inotropics nearby.

Teaching points

- You will need frequent monitoring of cardiac rhythm.
- Do not stop taking this drug for any reason without checking with your health care provider. Drug is taken at 12-hour intervals; work out a schedule so you take the drug as prescribed without waking up at night.
- Return for regular follow-up visits to check your heart rhythm and have a blood test to check your blood levels of this drug.
- You may experience these side effects: Drowsiness, dizziness, numbness, visual disturbances (avoid driving or using dangerous machinery); nausea, vomiting (frequent small meals may help); diarrhea, polyuria; sweating, night sweats, hot flashes, loss of libido (reversible after stopping the drug); palpitations.
- Report swelling of ankles or fingers, palpitations, fainting, chest pain.

▽ floxuridine

See Appendix U, *Less commonly used drugs*.

▽ fluconazole

(*floo kon' a zole*)

Apo-Fluconazole (CAN), Diflucan, Gen-Fluconazole (CAN), PMS-Fluconazole (CAN)

PREGNANCY CATEGORY C

Drug class

Antifungal

Therapeutic actions

Binds to sterols in the fungal cell membrane, changing membrane permeability; fungicidal or fungistatic depending on concentration and organism.

Indications

- Treatment of oropharyngeal, esophageal, vaginal, and systemic candidiasis, UTI and peritonitis caused by *Candida*
- Treatment of cryptococcal meningitis
- Prophylaxis of candidiasis in bone marrow transplants

Contraindications and cautions

- Contraindicated with hypersensitivity to fluconazole, lactation.
- Use cautiously with renal or hepatic impairment.

Available forms

Tablets—50, 100, 150, 200 mg; powder for oral suspension—10, 40 mg/mL; injection—2 mg/mL

Dosages

Individualize dosage; same for oral or IV routes because of rapid and almost complete absorption.

Adults

- *Oropharyngeal candidiasis*: 200 mg PO or IV on the first day, followed by 100 mg daily. Continue treatment for at least 2 wk to decrease likelihood of relapse.
- *Esophageal candidiasis*: 200 mg PO or IV on the first day, followed by 100 mg daily. Dosage up to 400 mg/day may be used in severe cases. Treat for a minimum of 3 wk; at least 2 wk after resolution.
- *Vaginal candidiasis*: 150 mg PO as a single dose.
- *Systemic candidiasis*: 400 mg PO or IV daily.
- *Candida UTI and peritonitis*: 50–200 mg/day PO.
- *Cryptococcal meningitis*: 400 mg PO or IV on the first day, followed by 200 mg daily. 400 mg daily may be needed. Continue treat-

ment for 10–12 wk after cultures of CSF become negative.

- *Suppression of cryptococcal meningitis in AIDS patients*: 200 mg daily PO or IV.
- *Prevention of candidiasis in bone marrow transplants*: 400 mg PO daily for several days before onset of neutropenia and for 7 days after neutrophil count rises above 1,000 cells/mm³.

Pediatric patients

Maximum daily dosage for children is 600 mg/day.

- *Oropharyngeal candidiasis*: 6 mg/kg PO or IV on the first day, followed by 3 mg/kg once daily for at least 2 wk.
- *Esophageal candidiasis*: 6 mg/kg PO or IV on the first day, followed by 3 mg/kg once daily. Treat for a minimum of 3 wk; at least 2 wk after resolution.
- *Systemic Candida infections*: Daily doses of 6–12 mg/kg/day PO or IV.
- *Cryptococcal meningitis*: 12 mg/kg PO or IV on the first day, followed by 6 mg/kg once daily. Continue treatment for 10–12 wk after cultures of CSF become negative.
- *Suppression of cryptococcal meningitis in children with AIDS*: 6 mg/kg daily PO or IV.

Patients with renal impairment

Initial dose of 50–400 mg PO or IV. If creatinine clearance is greater than 50 mL/min, use 100% of recommended dose; for creatinine clearance less than or equal to 50 mL/min, use 50% of recommended dose; for patients on hemodialysis, use one full dose after each dialysis.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Slow	1–2 hr	2–4 days
IV	Rapid	1 hr	2–4 days

Metabolism: Hepatic; $T_{1/2}$: 30 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: Do not remove overwrap until ready for use. Inner bag maintains sterility of product. Do not use plastic containers in series connections. Tear overwrap down side at slit, and remove solution container. Some

opacity of plastic may occur; check for minute leaks, squeezing bag firmly. Discard solution if any leaks are found.

Infusion: Infuse at a maximum rate of 200 mg/hr given as a continuous infusion.

Incompatibilities: Do not add any supplementary medications.

Adverse effects

- **CNS:** Headache
- **GI:** Nausea, vomiting, diarrhea, abdominal pain, AST/ALT elevations
- **Other:** Rash

Interactions

★ **Drug-drug** • Increased serum levels and therefore therapeutic and toxic effects of cyclosporine, phenytoin, benzodiazepines, oral hypoglycemics, warfarin anticoagulants, zidovudine • Decreased serum levels with rifampin, cimetidine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to fluconazole and other azoles, renal impairment, lactation, pregnancy
- **Physical:** Skin color, lesions; T; injection site; orientation, reflexes, affect; bowel sounds; LFTs, renal function tests; CBC and differential; culture of area involved

Interventions

- Culture infection before therapy; begin treatment before lab results are returned.
- Decrease dosage in cases of renal failure.
- Infuse IV only; not intended for IM or subcutaneous use.
- Do not add supplement medication to fluconazole.
- Administer through sterile equipment at a maximum rate of 200 mg/hr given as a continuous infusion.

⊗ **Warning** Monitor renal function tests weekly, discontinue or decrease dosage of drug at any sign of increased renal toxicity. Monitor liver function tests monthly during therapy.

Teaching points

- Drug may be given orally or IV as needed. The drug will need to be taken for the full course and may need to be taken long term.

- Use hygiene measures to prevent reinfection or spread of infection.
- Arrange for frequent follow-up while you are taking this drug. Be sure to keep all appointments, including those for blood tests.
- You may experience these side effects: Nausea, vomiting, diarrhea (frequent small meals may help); headache (analgesics may be ordered).
- Report rash, changes in stool or urine color, difficulty breathing, increased tears or salivation.

▽ **flucytosine**
(5-FC, 5-fluorocytosine)
(floo sye' toe seen)

Ancobon

PREGNANCY CATEGORY C

Drug class

Antifungal

Therapeutic actions

Affects cell membranes of susceptible fungi to cause fungus death; exact mechanism of action is not understood.

Indications

- Treatment of serious infections caused by susceptible strains of *Candida*, *Cryptococcus*

Contraindications and cautions

- Contraindicated with allergy to flucytosine, pregnancy, lactation.
- Use cautiously with renal impairment (drug accumulation and toxicity may occur), hepatic impairment, bone marrow depression.

Available forms

Capsules—250, 500 mg

Dosages

Adults

50–150 mg/kg/day PO at 6-hr intervals.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

Adjust dosing interval based on creatinine clearance: maintain blood levels below 100 mcg/mL.

CrCl (mg/mL)	Dosing Interval
20–40	Every 12 hr
10–20	Every 24 hr
Less than 10	Every 24–48 hr

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2 hr	10–12 hr

Metabolism: Not significantly metabolized; $T_{1/2}$: 2–5 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** Confusion, hallucinations, headache, sedation, vertigo
- **CV: Cardiac arrest**, chest pain
- **Dermatologic:** *Rash*
- **GI:** *Nausea, vomiting, diarrhea*
- **Hematologic:** *Anemia, leukopenia, thrombopenia*, elevation of liver enzymes, BUN, creatinine
- **Respiratory:** **Respiratory arrest**, shortness of breath

■ Nursing considerations**Assessment**

- **History:** Allergy to flucytosine, renal impairment, bone marrow depression, lactation, pregnancy
- **Physical:** Skin color, lesions; orientation, reflexes, affect; bowel sounds, liver evaluation; LFTs, renal function tests; CBC and differential; serum flucytosine levels (in patients with renal impairment)

Interventions

- Administer capsules a few at a time over a 15-min period to decrease the GI upset and diarrhea.
- Monitor LFTs, renal function tests and hematologic function periodically throughout treatment.

⊗ Black box warning Monitor serum flucytosine levels in patients with renal impairment (levels higher than 100 mcg/mL associated with toxicity).

Teaching points

- Take the capsules a few at a time over a 15-minute period to decrease GI upset.
- You may experience these side effects: Nausea, vomiting, diarrhea (take capsules a few at a time over 15 minutes); sedation, dizziness, confusion (avoid driving or performing tasks that require alertness).
- Report rash, severe nausea, vomiting, diarrhea, fever, sore throat, unusual bleeding or bruising.

DANGEROUS DRUG**fludarabine phosphate**

(floo *dar'* a been)

Fludara, Oforta **DMC**

PREGNANCY CATEGORY D

Drug classes

Antimetabolite
Antineoplastic

Therapeutic actions

Inhibits DNA polymerase alpha, ribonucleotide reductase and DNA primase, which inhibits DNA synthesis and prevents cell replication.

Indications

- Chronic lymphocytic leukemia (CLL); unresponsive B-cell CLL or no progress during treatment with at least one standard regimen that contains an alkylating drug

Contraindications and cautions

- Contraindicated with allergy to fludarabine or any component, lactation, pregnancy, severe bone marrow depression.
- Use cautiously with renal impairment.

Available forms

Tablets **DMC**—10 mg; powder for reconstitution—50 mg; injection—25 mg/mL

Dosages

Adults

40 mg/m² PO or 25 mg/m² IV over 30 min for 5 consecutive days. Begin each 5-day course every 28 days. Recommendation is to use three additional cycles after a maximal response is achieved, then to discontinue drug.

Patients with renal impairment

Creatinine clearance of 30–70 mL/min, reduce dosage by 20%; creatinine clearance of less than 30 mL/min, do not administer IV form, and reduce dose by 50% for oral doses.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	1–2 hr

Metabolism: Hepatic; T_{1/2}: 10 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Reconstitute with 2 mL of sterile water for injection; the solid cake should dissolve in less than 15 sec; each mL of resulting solution will contain 25 mg fludarabine; may be further diluted in 100 or 125 mL of 5% dextrose injection or 0.9% sodium chloride; use within 8 hr of reconstitution; discard after that time. Store unconstituted drug in refrigerator.

Infusion: Infuse slowly over no less than 30 min.

Adverse effects

- **CNS:** *Weakness, paresthesia, headache, visual disturbance*, hearing loss, sleep disorder, depression, **CNS toxicity including blindness, coma, death**
- **CV:** *Edema*, angina
- **Dermatologic:** *Rash, pruritus*, seborrhea
- **GI:** *Diarrhea, anorexia, nausea, vomiting, stomatitis*, esophagopharyngitis, GI bleeding, mucositis
- **GU:** *Dysuria*, urinary infection, hematuria, **renal failure**
- **Hematologic:** *Bone marrow toxicity*, **autoimmune hemolytic anemia**

- **Respiratory:** *Cough, pneumonia, dyspnea, sinusitis*, URI, epistaxis, bronchitis, hypoxia, **pulmonary toxicity**
- **Other:** *Fever, chills, fatigue, infection, pain, malaise*, diaphoresis, hemorrhage, myalgia, arthralgia, osteoporosis, **tumor lysis syndrome**

Interactions

★ **Drug-drug** • Risk of fatal pulmonary toxicity with pentostatin; avoid this combination

Nursing considerations

Assessment

- **History:** Allergy to fludarabine or any component, lactation, pregnancy, severe bone marrow depression, renal impairment
- **Physical:** Weight; T; skin lesions, color, edema; hair; vision, speech, orientation, reflexes, sensation; R, adventitious sounds; mucous membranes, liver evaluation, abdominal examination; CBC, differential; Hgb, Hct, uric acid, LFTs, renal function tests; urinalysis, chest X-ray

Interventions

- Evaluate hematologic status before therapy and before each dose.
- ⊗ **Black box warning** Discontinue therapy if any sign of toxicity occurs (CNS complaints, stomatitis, esophagopharyngitis, rapidly falling WBC count, intractable vomiting, diarrhea, GI ulceration and bleeding, thrombocytopenia, hemorrhage); serious to life-threatening infections have occurred. Consult physician.
- Do not crush tablets. Avoid direct contact with skin or mucous membranes.
- Caution patient to avoid pregnancy while taking this drug.

Teaching points

- Prepare a calendar of treatment days.
- If using oral form, do not cut or crush tablets. Avoid direct contact of skin or mucous membranes with tablets. If contact occurs, wash with soap and water; if eyes are involved, wash with flowing water for at least 15 minutes. Consult health care provider for proper disposal of unused drug.
- Use birth control while taking this drug; may cause birth defects or miscarriages.

- Have frequent, regular medical follow-up visits, including blood tests.
- You may experience these side effects: Nausea, vomiting, loss of appetite (medication; eat frequent small meals; maintain your nutrition while you are taking this drug); headache, fatigue, malaise, weakness, lethargy (avoid driving or operating dangerous machinery); mouth sores (practice frequent mouth care); diarrhea; increased susceptibility to infection (avoid crowds, exposure to infection; report any sign of infection—fever, fatigue).
- Report black, tarry stools; fever; chills; sore throat; unusual bleeding or bruising; chest pain; mouth sores; changes in vision; dizziness.

fludrocortisone acetate

See Appendix U, *Less commonly used drugs*.

flumazenil (floo maz' eh nil)

Anexate (CAN), Romazicon

PREGNANCY CATEGORY C

Drug classes

Antidote

Benzodiazepine receptor antagonist

Therapeutic actions

Antagonizes the actions of benzodiazepines on the CNS and inhibits activity at GABA-benzodiazepine receptor sites.

Indications

- Complete or partial reversal of the sedative effects of benzodiazepines when general anesthesia has been induced or maintained with them, and when sedation has been produced for diagnostic and therapeutic procedures
- Management of benzodiazepine overdose

Contraindications and cautions

- Contraindicated with hypersensitivity to flumazenil or benzodiazepines; patients who have been given benzodiazepines to control potentially life-threatening conditions; patients showing signs of serious cyclic antidepressant overdose.
- Use cautiously with history of seizures, hepatic impairment, panic disorders, head injury, history of drug or alcohol dependence, pregnancy, lactation.

Available forms

Injection—0.1 mg/mL

Dosages

Use smallest effective dose possible.

Adults

- *Reversal of conscious sedation or in general anesthesia:* Give initial dose of 0.2 mg (2 mL) IV over 15 sec then wait 45 sec; if ineffectual, repeat dose at 60-sec intervals. Maximum cumulative dose of 1 mg (10 mL).
- *Management of suspected benzodiazepine overdose:* Give initial dose of 0.2 mg IV over 30 sec; repeat with 0.3 mg IV every 30 sec; can give further doses of 0.5 mg over 30 sec at 1-min intervals, up to a maximum cumulative dose of 3 mg.

Pediatric patients younger than 1 yr

Safety and efficacy not established.

Pediatric patients older than 1 yr

- *Reversal of conscious sedation with benzodiazepines:* 0.01 mg/kg (up to 0.2 mg) IV over 15 sec; if ineffectual after 45 sec, repeat dose at 60-sec intervals. Maximum cumulative dose, 0.05 mg/kg or 1 mg, whichever is lowest.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	6–10 min	72 hr

Metabolism: Hepatic; $T_{1/2}$: 54 min

Distribution: Crosses placenta; may enter breast milk

Excretion: Unknown

IV FACTS

Preparation: Can be drawn into syringe with D₅W, lactated Ringer's, and normal saline solutions. Discard within 24 hr if mixed in solution. Do not remove from vial until ready for use.

Infusion: Infuse slowly over 15 sec for general anesthesia, over 30 sec for overdose. To reduce pain of injection, administer through a freely running IV infusion in a large vein.

Compatibilities: Stable with aminophylline, dobutamine, cimetidine, famotidine, ranitidine, heparin, lidocaine, procainamide.

Adverse effects

- **CNS:** *Dizziness, vertigo*, agitation, nervousness, dry mouth, tremor, palpitations, emotional lability, confusion, crying, vision changes, seizures
- **CV:** Vasodilation, flushing, arrhythmias, chest pain
- **GI:** *Nausea, vomiting*, hiccups
- **Other:** *Pain at injection site, increased sweating*

Interactions

★ **Drug-food** • Ingestion of food during IV infusion decreases serum levels and effectiveness

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to flumazenil or benzodiazepines; use of benzodiazepines for control of potentially life-threatening conditions; signs of serious cyclic antidepressant overdose, history of seizures, hepatic impairment, panic disorders, head injury, history of drug or alcohol dependence, pregnancy, lactation
- **Physical:** Skin color, lesions; T, orientation, reflexes, affect; P, BP, peripheral perfusion; serum drug levels

Interventions

- Administer by IV route only.
- ⊗ **Warning** Have emergency equipment ready, secure airway during administration.
- ⊗ **Black box warning** Drug may increase the risk of seizures, especially in patients on long-term benzodiazepine therapy and pa-

tients with serious cyclic antidepressant overdose; take appropriate precautions.

- Monitor clinical response carefully to determine effects of drug and need for repeated doses.
- Inject into running IV in a large vein to decrease pain of injection.
- Provide patient with written information after use; amnesia may be long-term, and teaching may not be remembered, including safety measures.

Teaching points

- Do not use any alcohol or over-the-counter drugs for 18–24 hours after use of this drug.
- Drug may cause changes in vision, dizziness, changes in alertness (avoid driving or operating hazardous machinery for at least 18–24 hours after drug use).
- Report difficulty breathing, pain at IV site, changes in vision, severe headache.

▽ flunisolide (floo niss' ob lide)

AeroBid-M, AeroSpan, AeroSpan HFA, Apo-Flunisolide (CAN), Nasarel, ratio-Flunisolide (CAN)

PREGNANCY CATEGORY C

Drug classes

Corticosteroid
Glucocorticoid
Hormone

Therapeutic actions

Anti-inflammatory effect; local administration into lower respiratory tract or nasal passages maximizes beneficial effects while decreasing possible adverse effects from systemic absorption.

Indications

- Intranasal: Relief and management of nasal symptoms of seasonal or perennial allergic rhinitis
- Inhalation: Maintenance treatment of asthma

Contraindications and cautions

- Contraindicated with systemic fungal infections, untreated local nasal infections, epistaxis, nasal trauma, septal ulcers, recent nasal surgery.
- Use cautiously with pregnancy, lactation, status asthmaticus.

Available forms

Intranasal solution, spray—25 mcg/actuation; inhalation—80 mcg/actuation, 250 mcg/actuation

Dosages

Intranasal

Each actuation of the inhaler delivers 25 mcg.

Adults

Initial dosage, two sprays (50 mcg) in each nostril bid (total dose 200 mcg/day); may be increased to two sprays in each nostril tid (total dose 300 mcg/day). Maximum daily dose, eight sprays in each nostril (400 mcg/day).

Pediatric patients 6–14 yr

Initial dosage, one spray in each nostril tid or two sprays in each nostril bid (total dose 150–200 mcg/day). Maximum daily dose, four sprays in each nostril (200 mcg/day). For maintenance dosage, reduce to smallest effective dose. Discontinue therapy after 3 wk if no significant symptomatic improvement.

Pediatric patients younger than 6 yr

Not recommended.

Inhalation

Each actuation of the inhaler delivers either 80 or 250 mcg.

Adults

Two inhalations by mouth bid. Maximum *AeroBid* dosage 2 mg/day; maximum *AeroSpan* dosage 640 mcg.

Pediatric patients

- *AeroBid*: For 6–15 yr, dosage same as for adults. Maximum dosage 1 mg/day.
- *AeroSpan*: For 12 yr and older, dosage same as for adults. For 6–11 yr, one inhalation bid. Maximum, 160 mcg bid. For younger than 6 yr, not recommended.

Pharmacokinetics

Route	Onset	Peak	Duration
Intranasal	Slow	10–30 min	4–6 hr
Inhalation	Fast	Unknown	Unknown

Metabolism: Hepatic; $T_{1/2}$: 1–2 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache*
- **Dermatologic:** Urticaria
- **Endocrine:** HPA suppression, Cushing's syndrome with overdosage
- **GI:** Nausea
- **Local:** *Nasal irritation, fungal infection*
- **Respiratory:** *Epistaxis, rebound congestion*, perforation of the nasal septum, anosmia

■ Nursing considerations

Assessment

- **History:** Systemic fungal infections, untreated local nasal infections, epistaxis, nasal trauma, septal ulcers, recent nasal surgery, lactation
- **Physical:** Weight, T; BP, P, auscultation, R, adventitious sounds, examination of nares

Interventions

- Do not use during an acute asthmatic attack or to manage status asthmaticus.
- **⊗ Black box warning** Taper systemic steroids carefully during transfer to inhalational steroids; deaths from adrenal insufficiency have occurred.
- Use decongestant nose drops to facilitate penetration if edema or excessive secretions are present.

Teaching points

- Do not use this drug more often than prescribed. Do not use this drug during an acute asthmatic attack.
- Do not stop using this drug without consulting your health care provider.
- Use decongestant nose drops first if nasal passages are blocked when using intranasal form.

- After using the inhaler, rinse your mouth with water or mouthwash to prevent oral candidiasis.
- You may experience these side effects: Local irritation (make sure you are using your device correctly), headache.
- Report sore mouth, sore throat.

DANGEROUS DRUG

fluorouracil
(5-fluorouracil, 5-FU)
(flure ob yoor' a sill)

Adrucil, Carac, Efudex, Fluoroplex

PREGNANCY CATEGORY D

Drug classes

Antimetabolite
 Antineoplastic

Therapeutic actions

Inhibits thymidylate synthetase, leading to inhibition of DNA synthesis and cell death.

Indications

- Parenteral: Palliative management of carcinoma of the colon, rectum, breast, stomach, pancreas in selected patients considered incurable by surgery or other means
- Topical treatment of multiple actinic or solar keratoses
- Topical treatment of superficial basal cell carcinoma
- Orphan drug uses: In combination with interferon alfa 2-a recombinant for esophageal and advanced colorectal carcinoma; with leucovorin for colon or rectum metastatic adenocarcinoma
- Unlabeled use: Topical treatment of condylomata acuminata

Contraindications and cautions

- Contraindicated with allergy to 5-FU; poor nutritional status; serious infections; lactation.
- Use cautiously with hematopoietic depression secondary to radiation or chemotherapy; impaired liver function; pregnancy.

Available forms

Injection—50 mg/mL; cream—0.5%, 1%, 5%; topical solution—2%, 5%

Dosages

IV

Adults

Initial dosage, 12 mg/kg IV daily for 4 successive days; do not exceed 800 mg/day. If no toxicity occurs, give 6 mg/kg on the days 6, 8, 10, and 12, with no drug therapy on days 5, 7, 9, and 11. Discontinue therapy at end of day 12, even if no toxicity.

- *For patients without toxicity:* Repeat dosage every 30 days after the last day of the previous treatment.
- *For patients with toxicity:* Give 10–15 mg/kg/wk as a single dose after signs of toxicity subside. Do not exceed 1 g/wk. Adjust dosage based on patient response; therapy may be prolonged (12–60 mo).

Poor-risk or undernourished patients

6 mg/kg/day IV for 3 days. If no toxicity develops, give 3 mg/kg on the days 5, 7, and 9. No drug is given on days 4, 6, and 8. Do not exceed 400 mg/day.

Patients with hepatic failure

If serum bilirubin exceeds 5 mg/dL, do not administer 5-FU. For maintenance therapy, continue therapy on appropriate schedules.

Topical

Adults

- *Actinic or solar keratoses:* Apply bid to cover lesions. Usually, 0.5% and 1% preparations are used on head, neck, and chest while 2% and 5% preparations are used on hands. Continue until inflammatory response reaches erosion, necrosis, and ulceration stage, then discontinue. Usual course of therapy is 2–4 wk. Complete healing may not be evident for 1–2 mo after cessation of therapy.
- *Superficial basal cell carcinoma:* Apply 5% strength bid in an amount sufficient to cover the lesions. Continue treatment for at least 3–6 wk. Treatment may be required for 10–12 wk.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	1–2 hr	6 hr

Metabolism: Hepatic; $T_{1/2}$: 18–20 min

Distribution: Crosses placenta; enters breast milk

Excretion: Lungs, urine

IV FACTS

Preparation: Store vials at room temperature; solution may discolor during storage with no adverse effects. Protect ampule from light. Precipitate may form during storage, heat to 60° C, and shake vigorously to dissolve. Cool to body temperature before administration. No dilution is required.

Infusion: Infuse slowly over 24 hr; inject into tubing of running IV to avoid pain on injection; direct injection over 1–3 min.

Incompatibilities: Do not mix with IV additives or other chemotherapeutic drugs.

Y-site incompatibility: Do not inject with droperidol.

Adverse effects

Parenteral

- **CNS:** *Letargy, malaise, weakness*, euphoria, acute cerebellar syndrome, photophobia, lacrimation, decreased vision, nystagmus, diplopia
- **CV:** Myocardial ischemia, angina
- **Dermatologic:** *Alopecia, dermatitis, maculopapular rash, photosensitivity*, nail changes including nail loss, dry skin, fissures
- **GI:** *Diarrhea, anorexia, nausea, vomiting, cramps, enteritis, duodenal ulcer, duodenitis, gastritis, glossitis, stomatitis*, pharyngitis, esophagopharyngitis
- **Hematologic:** **Leukopenia, thrombocytopenia**, elevations in alkaline phosphatase, serum transaminase, serum bilirubin, lactate dehydrogenase
- **Other:** Fever, epistaxis

Topical

- **Hematologic:** Leukocytosis, **thrombocytopenia, toxic granulation**, eosinophilia
- **Local:** *Local pain, pruritus, hyperpigmentation, irritation, inflammation and burning at the site of application*, allergic contact dermatitis, scarring, soreness, tenderness, suppurative, scaling and swelling

Interactions

★ **Drug-lab test** • 5-HIAA urinary excretion may increase • Plasma albumin may decrease due to protein malabsorption

Nursing considerations

Assessment

- **History:** Allergy to 5-FU, poor nutritional status, serious infections, hematopoietic depression, impaired liver function, pregnancy, lactation
- **Physical:** Weight; T; skin lesions, color; hair; vision, speech, orientation, reflexes, sensation; R, adventitious sounds; mucous membranes, liver evaluation, abdominal examination; CBC, differential; LFTs, renal function tests; urinalysis, chest X-ray

Interventions

- Evaluate hematologic status before beginning therapy and before each dose.

⊗ **Black box warning** Discontinue drug therapy at any sign of toxicity (stomatitis, esophagopharyngitis, rapidly falling WBC count, intractable vomiting, diarrhea, GI ulceration and bleeding, thrombocytopenia, hemorrhage); serious to life-threatening reactions have occurred. Consult physician.

- Arrange for biopsies of skin lesions to rule out frank neoplasm before beginning topical therapy and in all patients who do not respond to topical therapy.

⊗ **Warning** Thoroughly wash hands immediately after application of topical preparations. Use caution in applying near the nose, eyes, and mouth.

- Avoid occlusive dressings with topical application; the incidence of inflammatory reactions in adjacent skin areas is increased with these dressings. Use porous gauze dressings for cosmetic reasons.

Teaching points

- Prepare a calendar of treatment days. If using the topical application, wash hands thoroughly after application. Do not use occlusive dressings; a porous gauze dressing may be used for cosmetic reasons.
- Have frequent, regular medical follow-up visits, including frequent blood tests to evaluate drug effects.

- You may experience these side effects: Nausea, vomiting, loss of appetite (request medication; frequent small meals may help; maintain nutrition); decreased vision, tearing, double vision, malaise, weakness, lethargy (reversible; avoid driving or operating dangerous machinery); mouth sores (practice frequent mouth care); diarrhea; loss of hair (obtain a wig or other head covering; keep the head covered in extremes of temperature); rash, sensitivity of skin and eyes to sun and ultraviolet light (avoid exposure to the sun; use a sunscreen and protective clothing. With topical application, ultraviolet light will increase the severity of the local reaction); birth defects or miscarriages (use birth control); unsightly local reaction to topical application (transient; use a porous gauze dressing to cover areas); pain, burning, stinging, swelling at local application.
- Report black, tarry stools; fever; chills; sore throat; unusual bleeding or bruising; chest pain; mouth sores; severe pain; tenderness; scaling at site of local application.

▷ fluoxetine hydrochloride
(floo ox' e teen)

Apo-Fluoxetine (CAN), Co-Fluoxetine (CAN), Gen-Fluoxetine (CAN), Novo-Fluoxetine (CAN), PMS-Fluoxetine (CAN), Prozac, Prozac Pulvules, Prozac Weekly, ratio-Fluoxetine (CAN), Sarafem, Selfemra

PREGNANCY CATEGORY C

Drug classes

Antidepressant
SSRI

Therapeutic actions

Acts as an antidepressant by inhibiting CNS neuronal uptake of serotonin; blocks uptake of serotonin with little effect on norepinephrine; little affinity for muscarinic, histaminergic, and alpha₁-adrenergic receptors.

Indications

- Treatment of depression; most effective in patients with major depressive disorder
- **NEW INDICATION:** Treatment of depressive episodes associated with bipolar I disorder in combination with olanzapine
- **NEW INDICATION:** Short-term treatment of treatment-resistant depression with olanzapine
- Treatment of OCD
- Treatment of bulimia
- Treatment of PMDD (*Sarafem*)
- Treatment of panic disorder with or without agoraphobia
- Unlabeled uses: Raynaud's phenomenon, alcoholism, borderline personality disorder, fibromyalgia, hot flashes, diabetic neuropathy, nocturnal enuresis, postherpetic neuralgia, PTSD, migraine prevention

Contraindications and cautions

- Contraindicated with hypersensitivity to fluoxetine, pregnancy.
- Use cautiously with impaired hepatic or renal function, diabetes mellitus, lactation, seizures; history of suicide attempts.

Available forms

Tablets—10, 15, 20 mg; capsules—10, 20, 40 mg; liquid—20 mg/5 mL; DR capsules—90 mg

Dosages

Adults

- **Antidepressant:** The full antidepressant effect may not be seen for up to 4–6 wk. Initially, 20 mg/day PO in the morning. If no clinical improvement is seen, increase dose after several weeks. Administer doses larger than 20 mg/day on a bid schedule or once a day in the morning. Do not exceed 80 mg/day. Once stabilized, may switch to 90-mg DR capsules once a week.
- **OCD:** Initially, 20 mg/day PO. If no clinical improvement is seen, increase the dose after several weeks. Usual dosage range is 20–60 mg/day PO; may require up to 5 wk for effectiveness. Do not exceed 80 mg/day.
- **Bulimia:** 60 mg/day PO in the morning.
- **PMDD (*Sarafem*):** 20 mg/day PO or 20 mg/day PO starting 14 days before the anticipated beginning of menses and continuing

through the first full day of menses, then no drug until 14 days before next menses; do not exceed 80 mg/day.

- **Panic disorder:** 10 mg/day PO for the first week; increase to 20 mg/day if needed. Maximum dose, 60 mg/day.
- **Depressive episodes of bipolar I disorder:** 20 mg/day PO with 5 mg olanzapine.
- **Treatment of treatment-resistant depression:** 20–50 mg/day PO with 5–20 mg olanzapine.

Pediatric patients 8–18 yr

- **Major depressive disorder:** 10 mg/day PO; may be increased to 20 mg/day after 1 wk or after several weeks for low-weight children.

Adolescents and higher-weight children

- **OCD:** Initially, 10 mg/day PO. After 2 wk increase to 20 mg/day. Suggested range, 20–60 mg/day PO.

Adolescents and lower-weight children

- **OCD:** Initially, 10 mg/day PO. Range, 20–30 mg/day.

Pediatric patients younger than 7 yr

Safety and efficacy not established.

Geriatric patients or patients with hepatic impairment

Give a lower or less frequent dose. Monitor response to guide dosage.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 9 days

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, light-headedness*, agitation, sedation, abnormal gait, **seizures**
- **CV:** Hot flashes, palpitations
- **Dermatologic:** *Sweating, rash, pruritus*, acne, alopecia, contact dermatitis
- **GI:** *Nausea, vomiting, diarrhea, dry mouth, anorexia, dyspepsia, constipation,*

taste changes, flatulence, gastroenteritis, dysphagia, gingivitis

- **GU:** *Painful menstruation, sexual dysfunction, frequency*, cystitis, impotence, urgency, vaginitis
- **Respiratory:** *URIs, pharyngitis*, cough, dyspnea, bronchitis, rhinitis
- **Other:** *weight changes, asthenia, fever*

Interactions

* **Drug-drug** ☒ **Warning** Possible fatal reactions with MAOIs; do not administer together; 2-wk washout period needed.

- Increased therapeutic and toxic effects of TCAs
- Do not use with thioridazine (increased levels of thioridazine)
- Decreased effectiveness if taken while smoking
- Increased toxicity of lithium; avoid this combination
- Additive CNS effects if combined with benzodiazepines, alcohol; avoid these combinations
- Avoid administration with other serotonergic drugs; may lead to serotonin syndrome

* **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort therapy

Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Sarafem* (fluoxetine) and *Serophene* (clomiphene); use caution.

Assessment

- **History:** Hypersensitivity to fluoxetine, impaired hepatic or renal function, diabetes mellitus, lactation, pregnancy, seizures
- **Physical:** Weight, T; skin rash, lesions; reflexes, affect; bowel sounds, liver evaluation; P; peripheral perfusion; urinary output, LFTs, renal function tests

Interventions

- Arrange for lower or less frequent doses in elderly patients and patients with hepatic impairment.

☒ **Black box warning** Establish suicide precautions for severely depressed patients. Limit quantity of capsules dispensed; high risk

of suicidality in children, adolescents, and young adults.

- Administer drug in the morning.
- Monitor patient for response to therapy for up to 4 wk before increasing dose.
- Switch to once a week therapy by starting weekly dose 7 days after last 20 mg/day dose. If response is not satisfactory, reconsider daily dosing.

⊗ **Warning** If discontinuing drug, dosage should be tapered gradually to avoid withdrawal syndrome.

Teaching points

- It may take up to 4 weeks before the full effect occurs. Take in the morning. If you feel sleepy or tired, you may take it at night. If you are taking the once-weekly capsule, mark calendar with reminders of drug day.
- Do not stop taking this drug without consulting your health care provider.
- Do not take this drug during pregnancy. If you think that you are pregnant or wish to become pregnant, consult your health care provider.
- Keep this drug, and all medications, out of the reach of children.
- You may experience these side effects: Dizziness, drowsiness, nervousness, insomnia (avoid driving or performing hazardous tasks); nausea, vomiting, weight loss (eat small frequent meals; monitor your weight loss); sexual dysfunction; flulike symptoms.
- Report rash, mania, seizures, severe weight loss, thoughts of suicide.

▷ fluphenazine

(floo fen' a zeen)

fluphenazine decanoate

Injection: Modecate Concentrate (CAN)

fluphenazine hydrochloride

Oral tablets, concentrate, elixir, injection: Apo-Fluphenazine (CAN)

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dopaminergic blocker
Phenothiazine

Therapeutic actions

Mechanism not fully understood: Antipsychotic drugs block postsynaptic dopamine receptors in the brain, depress the RAS, including the parts of the brain involved with wakefulness and emesis; anticholinergic, antihistaminic (H_1), and alpha-adrenergic blocking activity also may contribute to some of its therapeutic (and adverse) actions.

Indications

- Management of manifestations of psychotic disorders; the longer acting parenteral dosage forms, fluphenazine enanthate and fluphenazine decanoate, indicated for management of patients (chronic schizophrenics) who require prolonged parenteral therapy
- Fluphenazine decanoate: Long-term or parenteral neuroleptic therapy
- **NEW INDICATION:** Unlabeled use: Postherpetic neuralgia

Contraindications and cautions

- Contraindicated with hypersensitivity to fluphenazine, other phenothiazines, thiazine, or aspirin; coma or severe CNS depression; bone marrow depression; blood dyscrasia; circulatory collapse; subcortical brain damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; pregnancy.
- Use cautiously with respiratory disorders ("silent pneumonia"); glaucoma, prostatic hypertrophy (anticholinergic effects may exacerbate glaucoma and urinary retention); epilepsy or history of epilepsy (drug lowers seizure threshold); breast cancer (elevations in prolactin may stimulate a prolactin-dependent tumor); thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or myelography scheduled within 48 hr; exposure to heat or phosphorous insecticides; pregnancy; lactation; children younger than 12 yr, especially those with chickenpox, CNS infections (children

are especially susceptible to dystonias that may confound the diagnosis of Reye's syndrome).

Available forms

Tablets—1, 2.5, 5, 10 mg; injection—25 mg/mL (decanoate); 2.5 mg/mL (hydrochloride); oral elixir—2.5 mg/5 mL; solution (concentrate)—5 mg/mL

Dosages

Full clinical effects may require 6 wk–6 mo of therapy. Patients who have never taken phenothiazines, poor-risk patients (those with disorders that predispose to undue reactions) should be treated initially with this shorter acting dosage form and then switched to the longer acting parenteral forms, fluphenazine enanthate or decanoate.

The duration of action of the esterified forms of fluphenazine is markedly longer than those of fluphenazine hydrochloride; the duration of action of fluphenazine enanthate is estimated to be 1–3 wk; the duration of action of fluphenazine decanoate is estimated to be 4 wk. No precise formula is available for the conversion of fluphenazine hydrochloride dosage to fluphenazine decanoate dosage, but one study suggests that 20 mg of fluphenazine hydrochloride daily was equivalent to 25 mg decanoate every 3 wk.

Adults

fluphenazine hydrochloride

Individualize dosage; begin with low dosage, and gradually increase.

Oral

2.5–10 mg/day in divided doses every 6–8 hr; usual maintenance dose is 1–5 mg/day, often as a single dose. Oral concentrate solution should be diluted in 60 mL of a suitable diluent that does not contain caffeine, tannic acid (eg, tea), or pectinates (eg, apple juice). Give daily doses greater than 20 mg with caution. When symptoms are controlled, gradually reduce dosage.

IM

Average starting dose is 1.25 mg (range 2.5–10 mg), divided and given every 6–8 hr; parenteral dose is one-third to one-half the oral dose. Give daily doses greater than 10 mg with caution.

fluphenazine decanoate

IM or subcutaneous: Initial dose, 12.5–25 mg IM or subcutaneously; determine subsequent doses and dosage interval based on patient response. If doses above 50 mg are needed, increase cautiously in 12.5-mg increments. Dose should not exceed 100 mg.

Pediatric patients

Generally not recommended for children younger than 12 yr.

Geriatric patients

Oral

Initial oral dose is 1–2.5 mg/day.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	2 hr	6–8 hr
IM (HCl)	1 hr	1–2 hr	6–8 hr
IM (decanoate)	24–72 hr	Unknown	1–6 wk

Metabolism: Hepatic; $T_{1/2}$: 4.5–15.3 hr (fluphenazine hydrochloride), 6.8–9.6 days (fluphenazine decanoate)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, flushed facies, sweating, constipation, paralytic ileus, urinary retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition, male impotence
- **CNS:** *Drowsiness*, insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, **seizures**, exacerbation of psychotic symptoms, extrapyramidal syndromes (*pseudoparkinsonism*); *dystonias*; *akathisia*, tardive dyskinesias, potentially irreversible, **neuroleptic malignant syndrome**, hyperthermia, **autonomic disturbances** (rare, but 20% fatal)
- **CV:** Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, **cardiac arrest**, heart failure, cardiomegaly, **refractory arrhythmias**, pulmonary edema
- **Endocrine:** Lactation, breast engorgement in females, galactorrhea; SIADH; amenorrhea, menstrual irregularities;

gynecomastia in males; changes in libido; hyperglycemia or **hypoglycemia**; glycosuria; hyponatremia; pituitary tumor with hyperprolactinemia; inhibition of ovulation, infertility, pseudopregnancy; reduced urinary levels of gonadotropins, estrogens, progestins

- **Hematologic: Eosinophilia, leukopenia, leukocytosis, anemia; aplastic anemia; hemolytic anemia; thrombocytopenic or nonthrombocytopenic purpura; pancytopenia**
- **Hypersensitivity:** Urticaria, angioneurotic edema, **laryngeal edema**, photosensitivity, eczema, asthma, **anaphylactoid reactions**, exfoliative dermatitis
- **Respiratory: Bronchospasm, laryngospasm**, dyspnea; suppression of cough reflex and potential for aspiration (**sudden death related to asphyxia or cardiac arrest has been reported**)

Interactions

• **Drug-drug** • Additive CNS depression with alcohol, barbiturates, or other sedatives • Additive anticholinergic effects and possibly decreased antipsychotic efficacy with anticholinergic drugs • Increased likelihood of seizures with metrizamide (contrast agent used in myelography)

• **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used)

■ Nursing considerations

Assessment

- **History:** Coma or severe CNS depression; bone marrow depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; respiratory disorders; glaucoma, prostatic hypertrophy; epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or myelography scheduled within 48 hr; exposure to heat or phosphorous insecticides; age younger than 12 yr; chickenpox; CNS infections; pregnancy
- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output,

liver evaluation; urinary output, prostate size; CBC, urinalysis, thyroid, LFTs, renal function tests

Interventions

- Oral concentrate solution should be diluted in 60 mL of a suitable diluent that does not contain caffeine, tannic acid (eg, tea), or pectinates (eg, apple juice).
- Arrange for discontinuation of drug if serum creatinine or BUN become abnormal or if WBC count is depressed.
- Monitor elderly patients for dehydration; institute remedial measures promptly. Sedation and decreased sensation of thirst related to CNS effects can lead to severe dehydration.
- Consult physician regarding appropriate warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about dosage reduction, use of anticholinergic antiparkinsonian drugs (controversial) if extrapyramidal effects occur.

Teaching points

- Take drug exactly as prescribed.
- Avoid driving or engaging in other dangerous activities if drowsiness, weakness, tremor, extrapyramidal symptoms, or vision changes occur.
- Avoid prolonged exposure to sun; use a sunscreen or cover skin if exposure is unavoidable.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark urine (pink or reddish brown urine is expected), pale stools, yellowing of skin or eyes.

 **flurazepam hydrochloride**
(*flur az' e pam*)

Apo-Flurazepam (CAN)

PREGNANCY CATEGORY X

CONTROLLED SUBSTANCE C-IV

Drug classesBenzodiazepine
Sedative-hypnotic**Therapeutic actions**

Exact mechanisms not understood; acts mainly at subcortical levels of the CNS, leaving the cortex relatively unaffected; potentiates the effects of GABA, an inhibitory neurotransmitter.

Indications

- Insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings, or early morning awakening
- Recurring insomnia or poor sleeping habits
- Acute or chronic medical situations requiring restful sleep

Contraindications and cautions

- Contraindicated with hypersensitivity to benzodiazepines, psychoses, acute narrow-angle glaucoma, shock, coma, acute alcoholic intoxication with depression of vital signs, pregnancy (risk of congenital malformations, neonatal withdrawal syndrome), labor and delivery (“floppy infant” syndrome), lactation (infants become lethargic and lose weight).
- Use cautiously in the elderly or with impaired liver or renal function, debilitation, depression, suicidal tendencies.

Available forms

Capsules—15, 30 mg

Dosages

Individualize dosage.

Adults

30 mg PO at bedtime; 15 mg may suffice.

Pediatric patients

Not for use in patients younger than 15 yr.

Geriatric patients or patients with debilitating disease

Initially, 15 mg PO; adjust as needed.

Pharmacokinetics

Route	Onset	Peak
Oral	Fast	30–60 min

Metabolism: Hepatic; $T_{1/2}$: 47–100 hr**Distribution:** Crosses placenta; enters breast milk**Excretion:** Urine**Adverse effects**

- **CNS:** *Transient, mild drowsiness initially; sedation, depression, lethargy, apathy, fatigue, lightheadedness, disorientation, restlessness, asthenia, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, difficulty in concentration, vivid dreams, psychomotor retardation, extrapyramidal symptoms; mild paradoxical excitatory reactions during first 2 wk of treatment* (psychiatric patients, aggressive children, with high dosage), visual and auditory disturbances, diplopia, nystagmus, depressed hearing, nasal congestion, complex sleep disorders
- **CV:** *Bradycardia, tachycardia, CV collapse*, hypertension and hypotension, palpitations, edema
- **Dependence:** *Drug dependence with withdrawal syndrome* when drug is discontinued (common with abrupt cessation of high dosage used more than 4 mo)
- **Dermatologic:** Urticaria, pruritus, rash, dermatitis
- **GI:** *Constipation, diarrhea, dyspepsia*, dry mouth, salivation, nausea, anorexia, vomiting, difficulty in swallowing, gastric disorders, elevations of blood enzymes: LDH, alkaline phosphatase, AST, ALT, hepatic impairment, jaundice
- **GU:** *Incontinence, urine retention, changes in libido*, menstrual irregularities
- **Hematologic:** Decreased Hct, blood dyscrasias
- **Other:** **Anaphylaxis, angioedema**, hiccups, fever, diaphoresis, paresthesias, muscular disturbances, gynecomastia

Interactions

★ **Drug-drug** • Increased CNS depression with alcohol, phenothiazines, opioids, barbiturates, TCAs • Increased pharmacologic effects of flurazepam with cimetidine, disulfiram, hormonal contraceptives, SSRIs • Decreased sedative effects of flurazepam with theophylline, aminophylline, rifampin

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to benzodiazepines; psychoses; acute narrow-angle glaucoma; shock; coma; acute alcoholic intoxication; pregnancy; labor; lactation; impaired liver or renal function, debilitation, depression, suicidal tendencies
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect, ophthalmologic examination; P, BP; R, adventitious sounds; liver evaluation, abdominal examination, bowel sounds, normal output; CBC, LFTs, renal function tests

Interventions

- Monitor liver and renal function and CBC during long-term therapy.
- ⊗ **Warning** Taper dosage gradually after long-term therapy, especially in epileptic patients.
- Do not administer to pregnant women.

Teaching points

- Take drug exactly as prescribed.
- In long-term therapy, do not stop taking without consulting your health care provider.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised.
- You may experience these side effects: Drowsiness, dizziness (may lessen; avoid driving or engaging in other dangerous activities); GI upset (take with water); depression, dreams, emotional upset, crying; nocturnal sleep disturbance (may be prolonged after drug cessation).
- Report severe dizziness, weakness, drowsiness that persists, rash or skin lesions, palpitations, swelling of the extremities, visual changes, difficulty voiding.

▷ flurbiprofen (flure *bi*' proe fen)

Ophthalmic solution: Ocufen

Oral: Ansaid, Apo-Flurbiprofen (CAN)

**PREGNANCY CATEGORY B (ORAL),
C (OPHTHALMIC)**

Drug classes

Analgesic (nonopioid)

Anti-inflammatory

NSAID

Therapeutic actions

Analgesic, anti-inflammatory, and antipyretic activities largely related to inhibition of cyclooxygenase and prostaglandin synthesis; exact mechanisms of action are not known.

Indications

- Oral: Acute or long-term treatment of the signs and symptoms of rheumatoid arthritis and osteoarthritis
- **NEW INDICATION:** Relief of moderate to mild pain
- Ophthalmic solution: Inhibition of intraoperative miosis
- Unlabeled uses of ophthalmic solution: Topical treatment of cystoid macular edema, inflammation after cataract surgery and uveitis syndromes; oral—juvenile rheumatoid arthritis, sunburn, migraine headache

Contraindications and cautions

- Contraindicated with allergy to aspirin, flurbiprofen, or other NSAIDs, significant renal impairment, pregnancy, lactation.
- Use cautiously with impaired hearing, allergies, hepatic, CV, and GI conditions.

Available forms

Tablets—50, 100 mg; ophthalmic solution—0.03%

Dosages

Adults

Oral

Initial recommended daily dose of 200–300 mg PO, give in divided doses bid, tid, or qid. Largest recommended single dose is 100 mg. Doses above 300 mg/day PO are not recommended. Taper to lowest possible dose.

Ophthalmic solution

Instill 1 drop approximately every 30 min, beginning 2 hr before surgery (total of 4 drops).

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Oral	30–60 min	90 min

Metabolism: Hepatic; $T_{1/2}$: 5.7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects**Oral**

- **CNS:** *Headache, dizziness, somnolence, insomnia*, fatigue, tiredness, dizziness, tinnitus, ophthalmologic effects
- **CV:** Hypertension, heart failure
- **Dermatologic:** Rash, pruritus, sweating, dry mucous membranes, stomatitis
- **GI:** *Nausea, dyspepsia, GI pain*, diarrhea, vomiting, *constipation*, flatulence, **ulcer**
- **GU:** Dysuria, **renal impairment**
- **Hematologic:** **Bleeding**, platelet inhibition with higher doses, **neutropenia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia**, decreased Hgb or Hct, **bone marrow depression**, menorrhagia
- **Respiratory:** Dyspnea, hemoptysis, pharyngitis, **bronchospasm**, rhinitis
- **Other:** Peripheral edema, **fatal anaphylactic shock**

Ophthalmic solution

- **Local:** *Transient stinging and burning on instillation, ocular irritation*

■ Nursing considerations**Assessment**

- **History:** Renal impairment; impaired hearing; allergies; hepatic, CV, and GI conditions; lactation, pregnancy
- **Physical:** Skin color and lesions; orientation, reflexes, ophthalmologic and audiometric evaluation, peripheral sensation; P, edema; R, adventitious sounds; liver evaluation; CBC, clotting times, LFTs, renal function tests; serum electrolytes, stool guaiac

Interventions

⊗ **Black box warning** Be aware that patient may be at increased risk for CV event, GI bleeding; monitor accordingly.

- Administer drug with food or after meals if GI upset occurs.
- Assess patient receiving ophthalmic solutions for systemic effects because absorption does occur.
- Arrange for periodic ophthalmologic examinations during long-term therapy.
- ⊗ **Warning** If overdose occurs, institute emergency procedures—gastric lavage, induction of emesis, supportive therapy.

Teaching points

- Take drug with food or meals if GI upset occurs; take only the prescribed dosage.
- Avoid use during pregnancy, serious adverse effects could occur. Using barrier contraceptives is advised.
- Dizziness or drowsiness can occur (avoid driving or using dangerous machinery).
- Report sore throat, fever, rash, itching, weight gain, swelling in ankles or fingers, changes in vision, black or tarry stools, bleeding.

DANGEROUS DRUG

▽ **flutamide**
(floo' ta mide)

Euflex (CAN), Novo-Flutamide (CAN)

PREGNANCY CATEGORY D

Drug classes

Antiandrogen
Antineoplastic

Therapeutic actions

Exerts potent antiandrogenic activity by inhibiting androgen uptake or by inhibiting nuclear binding of androgen in target tissues.

Indications

- Treatment of locally advanced and metastatic prostatic carcinoma in combination with LH-RH agonistic analogues (leuprolide acetate, goserelin)
- Unlabeled use: Treatment of hirsutism in women (250 mg/day)

Contraindications and cautions

- Contraindicated with hypersensitivity to flutamide or any component of the prepara-

tion, severe hepatic impairment, pregnancy, lactation.

- Use cautiously with smoking, G6PD deficiencies.

Available forms

Capsules—125 mg; tablets—250 mg (CAN)

Dosages

Adults

- *Locally advanced or metastatic prostatic cancer:* 250 mg PO tid. Treatment should begin at same as initiation of therapy with LH-RH analogue.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	2 hr	72 hr

Metabolism: Hepatic; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Drowsiness, confusion, depression, anxiety, nervousness
- **Dermatologic:** *Rash*, photosensitivity
- **Endocrine:** *Gynecomastia, hot flashes*
- **GI:** *Nausea, vomiting, diarrhea, GI disturbances*, jaundice, **hepatitis, hepatic necrosis**, elevated AST, ALT
- **GU:** *Impotence, loss of libido*
- **Hematologic:** *Anemia, leukopenia*, thrombocytopenia
- **Other:** Carcinogenesis, mutagenesis

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to flutamide or any component of the preparation, hepatic impairment, smoking, G6PD deficiencies, pregnancy, lactation
- **Physical:** Skin color, lesions; reflexes, affect; urinary output; bowel sounds, liver evaluation; CBC, Hct, electrolytes, LFTs, PSA

Interventions

- Give flutamide with other drugs used for medical castration (LH-RH analogue).

⊗ **Black box warning** Arrange for periodic monitoring of liver function tests during long-term therapy; severe hepatic toxicity can occur.

Teaching points

- Take this drug with other drugs to treat your problem. Do not interrupt dosing or stop taking these medications without consulting your health care provider.
- Periodic blood tests will be needed to monitor the drug effects. Keep appointments for these tests.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or performing hazardous tasks); nausea, vomiting, diarrhea (maintain nutrition, consult dietitian); impotence, loss of libido (reversible); sensitivity to light (use sunscreen or protective clothing).
- Report change in stool or urine color, yellow skin, difficulty breathing, malaise.

fluvastatin sodium (*flue va sta' tin*)

Lescol, Lescol XL DMC

PREGNANCY CATEGORY X

Drug classes

Antihyperlipidemic
Statin

Therapeutic actions

Inhibits the enzyme HMG-CoA that catalyzes the first step in the cholesterol synthesis pathway, resulting in a decrease in serum cholesterol, serum LDL (associated with increased risk of CAD), and either an increase or no change in serum HDL (associated with decreased risk of CAD).

Indications

- Adjunct to diet in the treatment of elevated total cholesterol and LDL cholesterol with primary hypercholesterolemia and mixed dyslipidemia (types IIa and IIb) where response to dietary restriction of saturated fat and cholesterol and other nonpharmacologic measures has not been adequate

- To slow progression of coronary atherosclerosis in patients with CAD, along with diet and exercise
- Reduction of the risk of undergoing coronary revascularization procedures in patients with CAD
- Treatment of heterozygous familial hypercholesterolemia in children 9–16 yr

Contraindications and cautions

- Contraindicated with allergy to fluvastatin, allergy to fungal byproducts, pregnancy, lactation.
- Use cautiously with impaired hepatic function, cataracts, myopathy.

Available forms

Capsules—20, 40 mg; extended-release tablets —80 mg

Dosages

Adults

Initial dosage, 40 mg/day PO administered in the evening. Maintenance doses, 20–80 mg/day PO; give 80 mg/day as two 40-mg doses, or use 80-mg ER form.

Pediatric patients 9–16 yr

Initial dose, 20 mg/day PO. Adjust every 6 wk to a maximum dose of 40 mg bid or 80 mg of ER form PO once a day.

Pharmacokinetics

Route	Onset	Peak
Oral	Slow	4–6 wk

Metabolism: Hepatic; $T_{1/2}$: 3–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, feces

Adverse effects

- **CNS:** *Headache, blurred vision*, dizziness, insomnia, fatigue, muscle cramps, cataracts
- **GI:** *Flatulence, abdominal pain, cramps, constipation, nausea*, dyspepsia, heartburn
- **Hematologic:** Elevations of CPK, alkaline phosphatase, and transaminases
- **Other:** **Rhabdomyolysis**

Interactions

★ **Drug-drug** ⊗ **Warning** Possible severe myopathy or rhabdomyolysis if taken with cyclosporine, erythromycin, gemfibrozil, niacin, other statins.

• Increased levels of phenytoin

★ **Drug-food** • Decreased metabolism and increased risk of toxic effects if taken with grapefruit juice; avoid this combination

■ Nursing considerations

Assessment

- **History:** Allergy to fluvastatin, fungal byproducts; impaired hepatic function; cataracts (use caution); pregnancy; lactation
- **Physical:** Orientation, affect, ophthalmologic examination; liver evaluation; lipid studies, LFTs, muscle pain, CPK

Interventions

- Give in the evening; highest rates of cholesterol synthesis are between midnight and 5 AM. Doses of 80 mg/day of immediate-release product should be taken as two 40-mg doses.
- Before administering, ensure that patient is not pregnant and understands need to avoid pregnancy.
- Do not cut or crush ER tablets; ensure that patient swallows tablets whole.
- Arrange for regular follow-up during long-term therapy, including liver function tests.
- Arrange for periodic ophthalmologic examination to check for cataract development.

Teaching points

- Take drug in the evening. Do not drink grapefruit juice while taking this drug. Do not cut, crush, or chew tablets.
- Institute dietary changes, and maintain a low-cholesterol diet while taking this drug.
- This drug cannot be taken during pregnancy; using barrier contraceptives is advised.
- Arrange to have periodic ophthalmic examinations while you are taking this drug.
- You may experience these side effects: Nausea (eat frequent small meals); headache, muscle and joint aches and pains (may lessen).

- Report severe GI upset, changes in vision, unusual bleeding or bruising, dark urine or light-colored stools, muscle pain, fever.

▶ fluvoxamine maleate (floo vox' a meen)

Apo-Fluvoxamine (CAN),
CO Fluvoxamine (CAN),
Luvox, Luvox CR **OND**,
PMS-Fluvoxamine (CAN),
ratio-Fluvoxamine (CAN)

PREGNANCY CATEGORY C

Drug classes

Antidepressant
SSRI

Therapeutic actions

Selectively inhibits CNS neuronal uptake of serotonin; blocks uptake of serotonin with weak effect on norepinephrine; little affinity for muscarinic, histaminergic, and α_1 -adrenergic receptors.

Indications

- Treatment of OCD
- Treatment of social anxiety disorder (CR capsules)
- Unlabeled uses: Treatment of depression, bulimia nervosa, panic disorder, PTSD, migraine prevention

Contraindications and cautions

- Contraindicated with hypersensitivity to fluvoxamine, lactation.
- Use cautiously with impaired hepatic or renal function, suicidal tendencies, seizures, mania, ECT therapy, CV disease, labor and delivery, pregnancy.

Available forms

Tablets—25, 50, 100 mg; CR capsules **OND**—100, 150 mg

Dosages

Adults

Initially, 50 mg PO at bedtime. Increase in 50-mg increments at 4–7 day intervals. Usual range, 100–300 mg/day. Divide doses over 100 mg/day; give larger dose at bedtime. If

symptoms do not improve within 10–12 wk, form of treatment should be reconsidered. CR capsules: 100–300 mg/day PO.

Pediatric patients 8–17 yr

Initially, 25 mg PO at bedtime. Increase dose by 25 mg/day every 4–7 days to achieve desired effect. Divide doses over 50 mg/day and give larger dose at bedtime. Maximum dose for children up to age 11 yr is 200 mg/day.

Geriatric patients or patients with hepatic impairment

Give a reduced dose (25 mg PO at bedtime), adjust more slowly.

Pharmacokinetics

Route	Onset	Peak
Oral	3–10 wk	2–8 hr

Metabolism: Hepatic; $T_{1/2}$: 15–20 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, light-headedness, agitation, sedation, abnormal gait, seizures*
- **Dermatologic:** *Sweating, rash, pruritus, acne, alopecia, contact dermatitis*
- **GI:** *Nausea, vomiting, diarrhea, dry mouth, anorexia, dyspepsia, constipation, taste changes, flatulence, gastroenteritis, dysphagia, gingivitis*
- **GU:** *Sexual dysfunction, frequency, cystitis, impotence, urgency, vaginitis*
- **Respiratory:** *URIs, pharyngitis, cough, dyspnea, bronchitis, rhinitis*

Interactions

- *** Drug-drug** • Do not administer with MAOIs (during or within 14 days) • Increased effects of triazolam, alprazolam, warfarin, carbamazepine, methadone, beta blockers, statins, diltiazem, TCAs, theophylline, clozapine; reduced dosages of these drugs will be needed
- Decreased effects due to increased metabolism in cigarette smokers
- Increased risk of serotonin syndrome if combined with other serotonergic drugs

• **Drug-alternative therapy** • Increased risk of severe reaction if combined with St. John's wort therapy

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to fluvoxamine; lactation; impaired hepatic function; suicidal tendencies; seizures; mania; CV disease; labor and delivery; pregnancy
- **Physical:** Weight; T; skin rash, lesions; reflexes; affect; bowel sounds; liver evaluation; P, peripheral perfusion; LFTs, renal function tests

Interventions

- Give lower or less frequent doses in elderly patients and with hepatic or renal impairment.
- ⊗ **Black box warning** Establish suicide precautions for severely depressed patients, children, adolescents, and young adults. Limit quantity of tablets dispensed. Risk of suicidal ideation and behavior is increased.
- Administer drug at bedtime. If dose exceeds 100 mg, divide dose and administer the largest dose at bedtime.
- Ensure that patient does not cut, crush, or chew CR capsules.
- Monitor patient for therapeutic response for up to 4–7 days before increasing dose.
- Monitor patient for serotonin hypertension syndrome, elevated fever, severe anxiety, rigidity.
- ⊗ **Warning** When discontinuing the drug, taper dose by 50 mg/day every 5–7 days.

Teaching points

- Take this drug at bedtime; if a large dose is needed, the dose may be divided but take the largest dose at bedtime. Do not cut, crush, or chew controlled-release capsules.
- Do not stop taking this drug abruptly; it should be discontinued slowly.
- You may experience these side effects: Dizziness, drowsiness, nervousness, insomnia (avoid driving or performing hazardous tasks), nausea, vomiting, weight loss (eat frequent small meals), sexual dysfunction (reversible).

- Report rash, mania, seizures, severe weight loss, suicidal thoughts.

▽ folic acid (folate)

(foe' lik)

Folville

PREGNANCY CATEGORY A

Drug classes

Folic acid
Vitamin supplement

Therapeutic actions

Required for nucleoprotein synthesis and maintenance of normal erythropoiesis.

Indications

- Treatment of megaloblastic anemias due to sprue, nutritional deficiency, pregnancy, infancy, and childhood

Contraindications and cautions

- Contraindicated with allergy to folic acid preparations; pernicious, aplastic, normocytic anemias.
- Use cautiously during lactation.

Available forms

Tablets—0.4, 0.8, 1 mg; injection—5 mg/mL

Dosages

Administer orally unless patient has severe intestinal malabsorption.

Adults

- **Therapeutic dose:** Up to 1 mg/day PO, IM, IV, or subcutaneously. Larger doses may be needed in severe cases.
- **Maintenance dose:** 0.4 mg/day.
- **Pregnancy and lactation:** 0.8 mg/day.

Pediatric patients

- **Maintenance dose:**
Infants: 0.1 mg/day.
Younger than 4 yr: Up to 0.3 mg/day.
Older than 4 yr: 0.4 mg/day.

Pharmacokinetics

Route	Onset	Peak
Oral, IM, Subcut., IV	Varies	30–60 min

Metabolism: Hepatic; $T_{1/2}$: Unknown

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Solution is yellow to yellow-orange; may be added to hyperalimentation solution or dextrose solutions.

Infusion: Infuse at rate of 5 mg/min by direct IV injection; may be diluted in hyperalimentation for continuous infusion.

Adverse effects

- **Hypersensitivity:** Allergic reactions
- **Local:** Pain and discomfort at injection site

Interactions

* **Drug-drug** • Decrease in serum phenytoin and increase in seizure activity with folic acid preparations • Decreased absorption with sulfasalazine, aminosalicic acid

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between folinic acid (leucovorin) and folic acid; use extreme caution.

Assessment

- **History:** Allergy to folic acid preparations; pernicious, aplastic, normocytic anemias; lactation
- **Physical:** Skin lesions, color; R, adventitious sounds; CBC, Hgb, Hct, serum folate levels, serum vitamin B₁₂ levels, Schilling test

Interventions

- Administer orally if at all possible. With severe GI malabsorption or very severe disease, give IM, IV, or subcutaneously.
- Test using Schilling test and serum vitamin B₁₂ levels to rule out pernicious anemia. Therapy may mask signs of pernicious ane-

mia while the neurologic deterioration continues.

⊗ **Warning** Use caution when giving the parenteral preparations to premature infants. These preparations contain benzyl alcohol and may produce a fatal gasping syndrome in premature infants.

⊗ **Warning** Monitor patient for hypersensitivity reactions, especially if drug previously taken. Keep supportive equipment and emergency drugs readily available in case of serious allergic response.

Teaching points

- When the cause of megaloblastic anemia is treated or passes (infancy, pregnancy), there may be no need for folic acid because it normally exists in sufficient quantities in the diet.
- Report rash, difficulty breathing, pain or discomfort at injection site.

▽ follitropin alfa

See Appendix U, *Less commonly used drugs*.

▽ follitropin beta

See Appendix U, *Less commonly used drugs*.

▽ fomepizole

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▽ fondaparinux

(*fon dah pear' ab nucks*)

Arixtra

PREGNANCY CATEGORY B

Drug classes

Antithrombotic
Factor Xa inhibitor

Therapeutic actions

Blocks naturally occurring factor Xa, leading to an alteration in the clot formation process; decreasing the risk of clot and thrombus formation.

Indications

- Prevention of venous thromboembolic events (including DVT and pulmonary emboli) in patient undergoing surgery for hip fracture, hip replacement, knee replacement or undergoing abdominal surgery
- Extended prophylaxis of DVT, which may lead to pulmonary embolism in patients undergoing hip fracture surgery
- Treatment of acute DVT in conjunction with warfarin
- Treatment of acute pulmonary embolism when administered in conjunction with warfarin when initial therapy is administered in the hospital

Contraindications and cautions

- Contraindicated with hypersensitivity to fondaparinux, severe renal impairment, adults weighing less than 50 kg, active major bleeding, bacterial endocarditis, thrombocytopenia.
- Use cautiously with pregnancy or lactation, mild to moderate renal impairment, adults older than 65 yr, bleeding disorders, history of heparin-induced thrombocytopenia, uncontrolled arterial hypertension, GI ulcers, diabetic retinopathy, spinal puncture, neuroaxial anesthesia.

Available forms

Prefilled syringes—2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL

Dosages

Adults

2.5 mg/day subcutaneously starting 6–8 hr following surgical closure and continuing for 5–9 days. An additional 24 days may be added after the initial course for patients undergoing hip fracture surgery.

- *Treatment of DVT, acute pulmonary embolism in conjunction with warfarin:*

Weight less than 50 kg: 5 mg/day subcutaneously for 5–9 days.

Weight 50–100 kg: 7.5 mg/day subcutaneously for 5–9 days.

Weight more than 100 kg: 10 mg/day subcutaneously for 5–9 days.

Warfarin therapy should begin within 72 hr.

Pediatric patients

Safety and efficacy not established.

Geriatric patients or patients with renal impairment

Contraindicated with severe renal impairment. Use caution with moderate renal impairment and with elderly patients. Monitor patient closely and discontinue drug if renal impairment increases or severe bleeding occurs.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Rapid	3 hr

Metabolism: $T_{1/2}$: 17–21 hr

Distribution: May cross placenta; may enter breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** Insomnia, dizziness, confusion, headache
- **CV:** Edema, hypotension
- **GI:** *Nausea*, constipation, diarrhea, vomiting, dyspepsia
- **GU:** UTI, urinary retention
- **Hematologic:** **Hemorrhage;** *bruising;* thrombocytopenia; *anemia*
- **Hypersensitivity:** Chills, fever, urticaria, asthma
- **Metabolic:** Elevated AST, ALT levels; hypokalemia
- **Renal:** Impaired renal functions
- **Other:** *Fever;* pain; local irritation, hematoma, erythema at site of injection, rash

Interactions

- **Drug-drug** • Increased bleeding tendencies with oral anticoagulants, salicylates, penicillins, cephalosporins, NSAIDs
- **Drug-alternative therapy** • Increased bleeding with high dose of vitamin E, garlic, ginkgo

Nursing considerations

Assessment

- **History:** Recent surgery or injury; sensitivity to fondaparinux; renal impairment; pregnancy, lactation; recent bleeding, throm-

bocytopenia, bacterial endocarditis, spinal puncture

- **Physical:** Weight, peripheral perfusion, R, stool guaiac test, PTT or other tests of blood coagulation, platelet count, CBC, renal function tests

Interventions

- Arrange to give drug 6–8 hr following surgical closure; continue for 5–9 days. An additional 24-day course may be added for patients undergoing hip fracture surgery.

⊗ **Black box warning** Carefully monitor patients receiving spinal/epidural anesthesia; risk of spinal hematoma and neurologic damage.

- Give deep subcutaneous injections; do not give by IM injection.
- To administer by deep subcutaneous injection, patient should be lying down, and alternate administration between the left and right anterolateral and left and right posterolateral abdominal wall. Introduce the whole length of the needle into a skinfold held between the thumb and forefinger; hold the skinfold throughout the injection.
- Apply pressure to all injection sites after needle is withdrawn; inspect injection sites for signs of hematoma.
- Do not massage injection sites.
- Do not mix with other injections or infusions.
- Store at room temperature; fluid should be clear, colorless to pale yellow.
- Provide for safety measures (electric razor, soft toothbrush) to prevent injury to patient who is at risk for bleeding.
- Check patient for signs of bleeding; monitor blood tests.

Teaching points

- This drug must be given by subcutaneous injection; it is not taken orally. You and a significant other will be instructed in how to administer the drug if you are being discharged with it. Arrange for proper disposal of syringes and needles.
- Arrange for periodic blood tests that will be needed to monitor your response to this drug.
- Be careful to avoid injury while taking this drug: Use an electric razor; avoid activities that might lead to injury.

- Report nose bleed, bleeding of the gums, unusual bruising, black or tarry stools, cloudy or dark urine, abdominal or lower back pain, severe headache.

▽ formoterol fumarate

(for *mob' te rol*)

Foradil Aerolizer, Performomist

PREGNANCY CATEGORY C

F

Drug classes

Antiasthmatic
Beta₂ agonist

Therapeutic actions

Long-acting agonist that binds to beta₂ receptors in the lungs causing bronchodilation; may also inhibit the release of inflammatory mediators in the lung, blocking swelling and inflammation.

Indications

- Long-term maintenance treatment of asthma in adults and children 5 yr and older
- Prevention of exercise-induced bronchospasm in adults and children 12 yr and older when used on an occasional, as-needed basis
- Long-term maintenance treatment of bronchoconstriction in patients with COPD

Contraindications and cautions

- Contraindicated with hypersensitivity to adrenergics, amines, or to formoterol, acute asthma attack, acute airway obstruction.
- Use cautiously in the elderly and with pregnancy, lactation.

Available forms

Inhalation powder in capsules—12 mcg; inhalation solution—20 mcg/2 mL

Dosages

Adults

- *Maintenance treatment of COPD:* Oral inhalation of contents of 1 capsule (12 mcg) using *Aerolizer Inbaler* every 12 hr; do not exceed a total daily dose of 24 mcg. Or, one 20-mcg/2 mL vial by oral inhalation using a jet nebulizer connected to an air com-

pressor twice daily, morning and evening; do not exceed 40 mcg/day.

Adults and pediatric patients 12 yr and older

• **Prevention of exercise-induced bronchospasm:** Oral inhalation of contents of one capsule (12 mcg) using the *Aerolizer Inhaler* 15 min before exercise. Use on an occasional, as-needed basis.

Adults and pediatric patients 5 yr and older

• **Maintenance treatment of asthma:** Oral inhalation of contents of 1 capsule (12 mcg) using the *Aerolizer Inhaler* every 12 hr. Do not exceed 1 capsule every 12 hr.

Pharmacokinetics

Route	Onset	Peak	Duration
Inhalation	1–3 min	1–3 hr	8–20 hr

Metabolism: Hepatic; $T_{1/2}$: 10–14 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Tremor, dizziness, insomnia, dysphonia, *headache, nervousness*
- **CV:** Hypertension, tachycardia, chest pain
- **GI:** Nausea, dyspepsia, abdominal pain, *irritation of the throat and mouth*
- **Respiratory:** Bronchitis, respiratory infection, dyspnea, tonsillitis
- **Other:** *Viral infection* (most likely in children)

Interactions

* **Drug-drug** • Beta blockers and formoterol may inhibit each other's effects; avoid use together • Risk of prolonged QTc interval if combined with other drugs that prolong QTc interval; use with extreme caution

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Foradil* (formoterol) and *Toradol* (ketorolac); use extreme caution.

Assessment

- **History:** Hypersensitivity to adrenergics, amines, or formoterol, acute asthma attack, acute airway obstruction, pregnancy, lactation
- **Physical:** R, adventitious sounds, P, BP, ECG, orientation, reflexes

Interventions

⊗ **Black box warning** Long-acting beta-agonists may increase risk of asthma-related deaths; use only if clearly warranted.

- Instruct patient in the proper use of *Aerolizer Inhaler*. Ensure that patient does not swallow the capsule.
- Monitor use of inhaler. Patient should not wash the inhaler but should keep it dry; it should not be used for delivering any other medication. If a bronchodilator is needed between doses, consult with health care provider. Do not use more often than every 12 hr.
- Use a jet nebulizer connected to an air compressor for oral inhalation.
- Encourage patient who experiences exercise-induced asthma to use drug 15 min before activity, and to reserve this drug for occasional, as-needed use.
- Ensure that patient continues with appropriate use of corticosteroids or other drugs used to block bronchospasm, as appropriate.
- Arrange for periodic evaluation of respiratory condition during therapy.
- Arrange for analgesics as appropriate for headache.
- Establish safety precautions if tremor becomes a problem.

Teaching points

- This medication should not be used to relieve acute symptoms. For that purpose, use a short-acting beta₂-agonist.
- Use the *Aerolizer Inhaler* as instructed. This is the only inhaler that can be used with this drug.
- Use only twice a day. Do not wash the inhaler; keep it dry at all times. Do not use this inhaler to deliver any other drugs. Check the “use by” date on your drug and discard any capsules that have expired.
- For oral inhalation formulation, use a jet nebulizer connected to an air compressor.

- If drug is to be used periodically for exercise-induced asthma, use 15 minutes before activity.
- Arrange for periodic evaluation of your respiratory problem while using this drug; continue to use any other therapies that have been prescribed to control your asthma.
- You may experience these side effects: Headache (appropriate analgesics may be ordered); tremors (use care in performing dangerous tasks if this occurs); fast heartbeat, palpitations (monitor activity if this occurs, rest frequently).
- Report severe headache, irregular heartbeat, worsening of asthma, difficulty breathing.

fosamprenavir calcium

(foss am 'pren' ab ver)

Lexiva

PREGNANCY CATEGORY C

Drug classes

Antiviral

Protease inhibitor

Therapeutic actions

Antiviral activity; inhibits HIV protease activity, leading to the formation of immature, non-infectious virus particles.

Indications

- Treatment of HIV infection in adults in combination with other antiretrovirals (the use of fosamprenavir with ritonavir is not recommended for protease inhibitor-experienced patients)

Contraindications and cautions

- Contraindicated with allergy to any component of the drug or to amprenavir; concurrent use of drugs dependent on the CYP3A4 system for clearance, lactation; if used with ritonavir, use of flecainide and propafenone is contraindicated.
- Use cautiously with pregnancy, hepatic impairment, diabetes mellitus, lipid abnormalities, hemophilia, sulfonamide allergy.

Available forms

Tablets—700 mg; suspension—50 mg/mL

Dosages

Adults

1,400 mg PO bid.

- *With ritonavir:* 1,400 mg/day PO plus ritonavir 100 mg/day PO, 1,400 mg/day PO plus ritonavir 200 mg/day PO, or 700 mg PO bid with ritonavir 100 mg PO bid.
- *Protease-experienced patients:* 700 mg PO bid with ritonavir 100 mg PO bid.

Pediatric patients

- *Therapy-naïve children 2–5 yr:* 30 mg/kg oral suspension PO bid; do not exceed 1,400 mg bid.
- *Therapy-naïve children 6 yr and older:* 30 mg/kg oral suspension PO bid; do not exceed 1,400 mg bid. Or, 18 mg/kg oral suspension PO with ritonavir 3 mg/kg PO bid; do not exceed 700 mg fosamprenavir plus 100 mg ritonavir bid.
- *Therapy-experienced children 2–5 yr:* Safety and efficacy not established.
- *Therapy-experienced children 6 yr and older:* 18 mg/kg oral suspension with 3 mg/kg ritonavir PO bid; do not to exceed 700 mg fosamprenavir with 100 mg ritonavir bid.

Patients with hepatic impairment

- *Child Pugh score 5–6:* 700 mg PO bid without ritonavir (therapy-naïve patients) or 700 mg PO bid plus 100 mg/day ritonavir (therapy-naïve or protease-inhibitor-experienced patients).
- *Child Pugh score 7–9:* 700 mg PO bid without ritonavir (therapy naïve) or 450 mg PO bid with 100 mg/day ritonavir PO.
- *Child Pugh score 10–15:* 350 mg PO bid without ritonavir (therapy naïve) or 300 mg PO bid with ritonavir 100 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1.5–4 hr

Metabolism: Hepatic; $T_{1/2}$: 7.7 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, oral paresthesias, depression, mood disorders
- **CV: MI**, dyslipidemia
- **Dermatologic:** Rash, **Stevens-Johnson syndrome**, pruritus
- **GI:** Nausea, vomiting, diarrhea, anorexia, abdominal pain, elevated liver enzymes
- **Hematologic:** Hyperglycemia, hypercholesterolemia, hypertriglyceridemia, neutropenia
- **Other:** Fatigue, redistribution of body fat (buffalo hump, thinning of arms and legs)

Interactions

★ **Drug-drug** ☒ **Warning** Potentially large increases in the serum concentration of flecainide, piroxicam, propafenone, rifabutin, simvastatin, lovastatin, midazolam, triazolam, dihydroergotamine, ergotamine, ergonovine, methylergonovine, pimozide, when taken with fosamprenavir. Potential for serious arrhythmias, seizure, rhabdomyolysis and fatal reactions. Do not administer fosamprenavir with any of these drugs.

- Potentially large increases in the serum concentration of the following: Antiarrhythmics—amiodarone, lidocaine, quinidine—monitor patient closely and adjust antiarrhythmic dosage as needed; antifungals—ketoconazole, itraconazole—reduced dosage of antifungals may be needed; rifabutin—reduce dosage to half recommended dose and monitor for neutropenia weekly; calcium channel blockers—diltiazem, felodipine, nifedipine, nicardipine, nimodipine, verapamil, amlodipine, nisoldipine, isradipine—increases calcium channel blocker concentrations; monitor patient very closely and use caution; atorvastatin—suggest use of a different HMG-CoA inhibitor; immunosuppressants—cyclosporine, tacrolimus—monitor serum concentration carefully and consider need for dosage reduction; sildenafil, vardenafil—reduce dosage and monitor patient carefully for adverse effects; TCAs—amitriptyline, imipramine—monitor serum concentrations closely and consider need for dosage reduction • Risk of decreased antiviral effectiveness when used with saquinavir, carbamazepine, phenobarbital, phenytoin, rifampin,

delavirdine, efavirenz, nevirapine, lopinavir and ritonavir—check that appropriate dosage changes have been made; if any of these drugs are used together; monitor patient for progression of disease, adverse effects • Risk of decreased effectiveness of hormonal contraceptives; advise patient to use barrier contraceptives ★ **Drug-alternative therapy** • Loss of virologic response if combined with St. John's wort; avoid this combination

Nursing considerations**Assessment**

- **History:** Allergy to any component of the drug or to amprenavir; concurrent use of drugs dependent on the CYP3A4 system for clearance, lactation, pregnancy, hepatic impairment, diabetes mellitus, lipid abnormalities, hemophilia, sulfonamide allergy
- **Physical:** Orientation, affect, reflexes; bowel sounds; skin color, perfusion; LFTs, CBC, serum triglycerides and cholesterol

Interventions

☒ **Warning** Do not administer with any of the drugs listed as contraindications. Check all other drugs in drug regimen for potential interaction and arrange for appropriate monitoring or dosage adjustment as needed.

- Use cautiously with any history of sulfonamide allergy; cross-reactivity may occur.
- Administer this drug with other antiretrovirals.
- Administer tablets without regard to food. Adults should take suspension without food; children should take suspension with food.
- Redose oral suspension if vomiting occurs within 30 min of dose.
- Be aware of increased risk of dyslipidemia, MI; monitor patient accordingly.
- Monitor liver function and blood glucose levels before and periodically during therapy.
- Monitor patient for skin rash; arrange to discontinue drug if severe skin reaction occurs.

Teaching points

- Take this drug without regard to meals. Adults should take suspension without food; children should take suspension with food.

- Take the full course of therapy as prescribed; do not take double doses if one is missed; if you forget to take a dose for more than 4 hours, wait and take the next dose at the regular time; if you miss a dose by less than 4 hours, take your missed dose right away and your next dose at the regular time.
- Shake suspension vigorously before each use. Drug may be stored in refrigerator or at room temperature.
- Do not change dosage without consulting your health care provider. Take this drug with other antivirals as prescribed.
- This drug does not cure HIV infection; long-term effects are not yet known. Continue to take precautions as the risk of transmission is not reduced by this drug.
- Do not take other prescription or over-the-counter drugs without consulting your health care provider. This drug interacts with many other drugs; serious problems can occur.
- Consider using barrier contraceptives while taking this drug; hormonal contraceptives may not be effective.
- Use caution if taking sildenafil (*Viagra*), tadalafil (*Cialis*), or vardenafil (*Levitra*). There is an increased risk of adverse effects; consult your health care provider if adverse effects occur.
- Some diabetic patients may have changes in blood glucose while taking this drug; check your blood sugar often and consult your health care provider if control becomes a problem.
- Do not use St. John's wort while you are using this drug; consult your health care provider before using any herbal therapies.
- You may experience these side effects: Nausea, vomiting, diarrhea, abdominal pain (eat frequent small meals); headache, numbness and tingling (use caution if driving or operating dangerous machinery); redistribution of body fat with thinning of arms and legs, development of a buffalo hump (it may help to know that this is a drug effect).
- Report severe diarrhea, severe nausea, rash, changes in the color of urine or stool; increased thirst or urination.

fosfomycin tromethamine

(foss foe my' sin
troh meth' ab meen)

Monurol

PREGNANCY CATEGORY B

Drug classes

Antibacterial
Urinary tract anti-infective

Therapeutic actions

Bactericidal; interferes with bacterial cell wall synthesis, blocks adherence of bacteria to uroepithelial cells.

Indications

- Uncomplicated UTIs in women caused by susceptible strains of *Escherichia coli* and *Enterococcus faecalis*; not indicated for the treatment of pyelonephritis or perinephric abscess

Contraindications and cautions

- Contraindicated with allergy to fosfomycin.
- Use cautiously with pregnancy, lactation.

Available forms

Granule packet—3 g

Dosages

Adults

1 packet dissolved in water PO.

Pediatric patients younger than 12 yr

Not recommended.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 5.7 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, back pain, asthenia

- **GI:** *Nausea*, abdominal cramps, dyspepsia, diarrhea
- **GU:** Vaginitis, dysmenorrhea
- **Other:** Rhinitis, rash

Interactions

★ **Drug-drug** • Lowered serum concentration and urinary tract excretion with metoclopramide

■ Nursing considerations

Assessment

- **History:** Allergy to fosfomycin, pregnancy, lactation
- **Physical:** Skin color, lesions; orientation, reflexes; urine for analysis

Interventions

- Arrange for culture and sensitivity tests.
- Administer drug with food if GI upset occurs.
- ⊗ **Warning** Do not administer dry; mix a single dose packet in 90–120 mL of water and stir to dissolve; do not use hot water. Administer immediately.
- Monitor clinical response; if no improvement is seen or a relapse occurs, send urine for repeat culture and sensitivity tests.
- Encourage patient to observe other measures (avoid bubble baths, alkaline ash foods, sexual intercourse; drink lots of fluids) to decrease risk of UTI.

Teaching points

- This drug is meant to be a one-dose treatment for urinary tract infection; improvement should be seen in 2–3 days. If no improvement occurs, consult your health care provider.
- Take drug with food if GI upset occurs. Do not take in the dry form; mix a single dose packet in 90–120 milliliters of water and stir to dissolve; do not use hot water. Drink immediately after mixing.
- You may experience these side effects: Nausea, abdominal pain (eat frequent small meals; take the drug with meals); dizziness (observe caution if driving or using dangerous equipment).
- Report rash, visual changes, severe GI problems, weakness, tremors, worsening of urinary tract symptoms.

▽ fosinopril sodium

(*foh sin' oh pril*)

Monopril

PREGNANCY CATEGORY C
(FIRST TRIMESTER)

PREGNANCY CATEGORY D
(SECOND AND THIRD TRIMESTERS)

Drug classes

ACE inhibitor
Antihypertensive

Therapeutic actions

Renin, synthesized by the kidneys, is released into the circulation where it acts on a plasma precursor to produce angiotensin I, which is converted by ACE to angiotensin II, a potent vasoconstrictor that also causes release of aldosterone from the adrenals; fosinopril blocks the conversion of angiotensin I to angiotensin II, leading to decreased BP, decreased aldosterone secretion, an increase in serum potassium levels, and sodium and fluid loss; increased prostaglandin synthesis may be involved in the antihypertensive action.

Indications

- Treatment of hypertension, alone or in combination with thiazide-type diuretics
- Management of heart failure as adjunctive therapy

Contraindications and cautions

- Contraindicated with allergy to fosinopril or other ACE inhibitors; pregnancy.
- Use cautiously with impaired renal or hepatic function, hyperkalemia, salt or volume depletion, lactation.

Available forms

Tablets—10, 20, 40 mg

Dosages

Adults

- **Hypertension:** Initial dose, 10 mg PO daily. Maintenance dose, 20–40 mg/day PO as

a single dose or two divided doses. In patients receiving diuretic therapy, begin fosinopril therapy with 10 mg. Do not exceed maximum dose of 80 mg.

- **Heart failure:** Initially, 10 mg/day PO; observe for 2 hr for hypotension. If patient has moderate to severe renal failure, 5 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1 hr	3 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 12 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CV:** Angina pectoris, orthostatic hypotension in salt- or volume-depleted patients, palpitations
- **Dermatologic:** Rash, pruritus, diaphoresis, flushing
- **GI:** Nausea, abdominal pain, vomiting, diarrhea
- **Respiratory:** Cough, asthma, bronchitis, dyspnea, sinusitis
- **Other:** Angioedema, asthenia, myalgia, arthralgia, hyperkalemia

Interactions

- **Drug-drug** • Decreased effectiveness if combined with indomethacin or other NSAIDs
- Risk of lithium toxicity if combined with ACE inhibitors
- Risk of increased potassium levels if taken with potassium-sparing diuretics
- Decreased absorption when given with antacids; separate by at least 2 hr

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between fosinopril and lisinopril; use caution.

tion, hyperkalemia, salt or volume depletion, lactation, pregnancy

- **Physical:** Skin color, lesions, turgor; T, P, BP, peripheral perfusion; mucous membranes, bowel sounds, liver evaluation; urinalysis, LFTs, renal function tests, CBC, and differential

Interventions

⊗ **Warning** Alert surgeon and mark the patient's chart with notice that fosinopril is being taken; the angiotensin II formation subsequent to compensatory renin release during surgery will be blocked; hypotension may be reversed with volume expansion.

⊗ **Black box warning** Suggest use of a contraceptive. Pregnancy should be avoided; fetal damage can occur; arrange to switch to a different drug if pregnancy occurs.

- Monitor patient closely for a drop in BP secondary to reduction in fluid volume (excessive perspiration and dehydration, vomiting, diarrhea); excessive hypotension may occur.

Teaching points

- Do not stop taking the medication without consulting your health care provider.
- Avoid pregnancy while taking this drug; using barrier contraceptives is advised.
- Be careful with any conditions that may lead to a drop in blood pressure (such as diarrhea, sweating, vomiting, dehydration); if light-headedness or dizziness occurs, consult your health care provider.
- You may experience these side effects: GI upset, loss of appetite (these may be transient); lightheadedness (transient; change position slowly and limit activities to those that do not require alertness and precision); dry cough (not harmful).
- Report mouth sores; sore throat, fever, chills; swelling of the hands, feet; irregular heart-beat, chest pains; swelling of the face, eyes, lips, tongue, difficulty breathing, persistent cough.

Assessment

- **History:** Allergy to fosinopril and other ACE inhibitors, impaired renal or hepatic func-

fosphenytoin sodium*(faws fen' i toe in)*

Cerebyx

PREGNANCY CATEGORY D

Drug classes

Antiepileptic

Hydantoin

Therapeutic actions

A prodrug that is converted to phenytoin; has antiepileptic activity without causing general CNS depression; stabilizes neuronal membranes and prevents hyperexcitability caused by excessive stimulation; limits the spread of seizure activity from an active focus.

Indications

- Short-term control of general convulsive status epilepticus
- Prevention and treatment of seizures occurring during or following neurosurgery
- Short-term substitute for oral phenytoin

Contraindications and cautions

- Contraindicated with hypersensitivity to hydantoins, sinus bradycardia, sinoatrial block, second- or third-degree AV heart block, Stokes-Adams syndrome, pregnancy (data suggest an association between use of anti-epileptic drugs by women with epilepsy and an elevated incidence of birth defects in children born to these women; however, do not discontinue antiepileptic therapy in pregnant women who are receiving therapy to prevent major seizures—this is likely to precipitate status epilepticus, with attendant hypoxia and risk to both mother and unborn child), lactation.
- Use cautiously with hypotension, severe myocardial insufficiency, porphyria, hepatic dysfunction.

Available forms

Injection—150-mg (100 mg phenytoin equivalents [PE]), 750-mg (500 mg PE) vial

Dosages

Dosage is given as PEs to facilitate transfer from phenytoin.

Adults

- *Status epilepticus*: Loading dose of 15–20 mg PE/kg administered at 100–150 mg PE/min IV.
- *Neurosurgery (prophylaxis)*: Loading dose of 10–20 mg PE/kg IM or IV; maintenance dose of 4–6 mg PE/kg/day.
- *Substitution for oral phenytoin therapy*: Substitute IM or IV at the same total daily dose as phenytoin, for short-term use only.

Pediatric patients

Not recommended.

Patients with renal or hepatic impairment

Use caution and monitor for early signs of toxicity—changes in the metabolism of the drug may result in increased risk of adverse effects.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	End of infusion

Metabolism: Hepatic; $T_{1/2}$: 15 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute in 5% dextrose or 0.9% saline solution to a concentration of 1.5–25 mg PE/mL. Refrigerate; stable at room temperature for less than 48 hr.

Infusion: Infuse for status epilepticus at rate of 100–150 mg PE/min; never administer at a rate that exceeds 150 mg PE/min.

Adverse effects

- **CNS:** *Nystagmus, ataxia, dizziness, somnolence, drowsiness, insomnia, transient nervousness, motor twitchings, fatigue, irritability, depression, numbness, tremor, headache, photophobia, diplopia, asthenia, back pain, suicidal ideation*
- **CV:** *Hypotension, vasodilation, tachycardia*
- **Dermatologic:** *Pruritus*

- **GI:** *Nausea*, vomiting, dry mouth, taste perversion
- **Other:** Lymph node hyperplasia, sometimes progressing to frank malignant lymphoma, monoclonal gammopathy and multiple myeloma (prolonged therapy), polyarthropathy, osteomalacia, weight gain, chest pain, periarteritis nodosa

Interactions

No specific drug interactions have been reported, but since fosphenytoin is a metabolite of phenytoin, documented interactions with that drug should be considered.

• **Drug-drug** • Increased pharmacologic effects of hydantoin with chloramphenicol, cimetidine, disulfiram, phenacemide, phenylbutazone, sulfonamides, trimethoprim; reduced fosphenytoin dose may be needed • Complex interactions and effects when phenytoin and valproic acid are given together; phenytoin toxicity with apparently normal serum phenytoin levels; decreased plasma levels of valproic acid given with phenytoin; breakthrough seizures when the two drugs are given together • Increased pharmacologic effects and toxicity when primidone, amiodarone, chloramphenicol, flucanazole, isoniazid are given with hydantoin • Decreased pharmacologic effects of the following with hydantoin: Corticosteroids, cyclosporine, dicumarol, disopyramide, doxycycline, estrogens, furosemide, levodopa, methadone, metyrapone, mexiletine, hormonal contraceptives, quinidine, atracurium, pancuronium, tubocurarine, vecuronium, carbamazepine, diazoxide

• **Drug-lab test** • Interference with metyrapone and 1-mg dexamethasone tests for at least 7 days

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *Cerebyx* (fosphenytoin), *Celebrex* (celecoxib), *Celexa* (citalopram), and *Xanax* (alprazolam); use caution.

Assessment

- **History:** Hypersensitivity to hydantoin; sinus bradycardia, sinoatrial block, second- or third-degree AV heart block, Stokes-Adams

syndrome, pregnancy, lactation, hepatic failure, severe myocardial insufficiency, porphyria

- **Physical:** T; skin color, lesions; orientation, affect, reflexes, vision examination; P, BP; bowel sounds, normal output, liver evaluation; LFTs, CBC and differential, EEG and ECG

Interventions

- Continue supportive measures, including use of an IV benzodiazepine, until drug becomes effective against seizures.

- Possible increased risk of suicidal ideation; monitor patient accordingly.

⊗ **Warning** Administer IV slowly to prevent severe hypotension; margin of safety between full therapeutic and toxic doses is small. Continually monitor cardiac rhythm and check BP frequently and regularly during IV infusion and for 10–20 min after infusion.

- Monitor infusion site carefully—drug solutions are very alkaline and irritating.

- This drug is recommended for short-term use only (up to 5 days); switch to oral phenytoin as soon as possible.

⊗ **Black box warning** Suggest use of a contraceptive. Pregnancy should be avoided; fetal damage can occur.

Teaching points

- This drug can only be given IV and will be stopped as soon as you are able to take an oral drug.
- Use of a contraceptive is advised; drug should not be used during pregnancy.
- You may experience these side effects: Drowsiness, dizziness, GI upset.
- Report rash, severe nausea or vomiting, drowsiness, slurred speech, impaired coordination (ataxia), sore throat, unusual bleeding or bruising, persistent headache, malaise, pain at injection site, thoughts of suicide.

▽ fospropofol disodium (foss *prob'* pob fall)

Lusedra

PREGNANCY CATEGORY B

Drug class

Sedative-hypnotic

Therapeutic actions

Thought to increase sensitivity to GABA, leading to inhibition of neurotransmission and CNS depression.

Indications

- Monitored anesthesia care sedation in adults undergoing diagnostic and therapeutic procedures

Contraindications and cautions

- Contraindicated in hypersensitivity to components of drug.
- Use cautiously in elderly patients; severe systemic diseases, dehydration, decreased myocardial function or reduced vascular tone; pregnancy, lactation.

Available forms

Single-use vial—35 mg/mL

Dosages**Adults**

6.5 mg/kg IV bolus followed by 1.6 mg/kg IV to maintain desired sedation. Bolus should not exceed 16.5 mL and IV infusion should not exceed 4 mL.

Pediatric patients

Safety and efficacy not established.

Geriatric patients and patients with severe systemic disease

75% of the standard dose is recommended.

IV FACTS

Preparation: Drug is ready to use and does not require further reconstitution. May be given with 5% dextrose, 5% dextrose with 0.2% or 0.45% sodium chloride injection; 0.9% sodium chloride injection; lactated Ringer's solution; lactated Ringer's with 5% dextrose; 0.45% sodium chloride injection; 5% dextrose, 0.45% sodium chloride, and 20 mEq potassium chloride, USP. Does not need to be protected from light or infused through a filter. Solution should be clear, with no particulate matter. Discard vial after withdrawing drug.

Infusion: Administer through a freely flowing IV using a compatible solution. Flush line

with normal saline before and after administering drug.

Incompatibilities: Do not mix with other drugs or solutions; physically incompatible with midazolam, meperidine.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	4–13 min

Metabolism: Hepatic; $T_{1/2}$: 0.8–0.9 hr

Distribution: May cross placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Headache, *paresthesia* (burning, tingling) *in perianal region*, **loss of responsiveness**
- **CV:** Hypotension
- **GI:** Nausea, vomiting
- **Respiratory:** **Hypoxemia, respiratory depression**
- **Other:** *Perianal pruritus*

Interactions

★ **Drug-drug** • Risk of increased cardiac or respiratory depression if combined with other sedative-hypnotics (benzodiazepines, opioid analgesics)

Nursing considerations**Assessment**

- **History:** Systemic diseases, pregnancy, lactation
- **Physical:** Orientation, affect; R, adventitious sounds; BP, ECG, state of hydration, skin lesions

Interventions

- Drug should only be administered by persons trained in administration of anesthesia who can continually monitor patient and are not involved in the diagnostic procedure or treatment being performed.
- Patient will require oxygen administration and continuous monitoring of pulse oximetry, ECG, and frequent blood pressure checks.
- Patients weighing more than 90 kg should be dosed as if they weigh 90 kg; patients less

than 60 kg should be dosed as if they weigh 60 kg.

- Emergency equipment should be readily available.
- Patient should be escorted after the procedure; driving is not advised.
- Alert patient that perianal burning, stinging, and tingling are common after injection of the drug and that these symptoms will pass and no treatment is required.

Teaching points

- You will be very relaxed and unaware during the procedure; you will require an escort at discharge because no driving is permitted immediately after the use of this drug.
- You may experience perianal burning, stinging, tingling, and rash, which are common effects when the drug is given. These symptoms are usually mild, last only a short time, and do not require treatment.

frovatriptan succinate

(frow vah tript' tan)

Frova

PREGNANCY CATEGORY C

Drug classes

Antimigraine drug
Serotonin selective agonist
Triptan

Therapeutic actions

Binds to serotonin receptors to cause vascular constrictive effects on cranial blood vessels, causing the relief of migraine in selective patients.

Indications

- Treatment of acute migraines with or without aura in adults

Contraindications and cautions

- Contraindicated with allergy to frovatriptan, active CAD, ischemic heart disease, Prinzmetal's angina, peripheral or cerebral vascular syndromes, uncontrolled hypertension, hemo-

plegic or basilar migraine, use of an ergot compound or other triptan within 24 hr.

- Use cautiously with hepatic or renal impairment, risk factors for CAD, lactation, pregnancy.

Available forms

Tablets—2.5 mg

Dosages

Adults

2.5 mg PO as a single dose at first sign of migraine; if headache returns, may be repeated after 2 hr. Do not use more than 3 doses/24 hr. Safety of treating more than four headaches/30 days has not been established.

Pediatric patients

Safety and efficacy not established for patients younger than 18 yr.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 26 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Dizziness, headache, anxiety, malaise, fatigue, weakness, myalgia, somnolence, paresthesia (tingling, burning, prickling, itching sensation), loss of sensation, abnormal vision, tinnitus
- **CV:** Palpitations, tightness or pressure in chest, flushing, **MI, cerebrovascular events, ventricular arrhythmias**
- **GI:** Vomiting, diarrhea, abdominal pain, dry mouth, dyspepsia, nausea
- **Musculoskeletal:** Skeletal pain
- **Other:** Warm or hot sensations, cold sensation, pain, increased sweating, rhinitis

Interactions

* **Drug-drug** ⊗ **Warning** Increased risk of weakness, hyperreflexia, CNS effects if combined with an SSRI (fluoxetine, fluvoxamine, paroxetine, sertraline); if combined with these drugs, appropriate safety precautions should be observed and patient monitored closely.

• Prolonged vasoactive reactions when taken concurrently with ergot-containing drugs or other triptans; space these drugs at least 24 hr apart

■ Nursing considerations

Assessment

- **History:** Allergy to frovatriptan, active coronary artery disease, Prinzmetal's angina, pregnancy, lactation, peripheral or cerebral vascular syndromes, uncontrolled hypertension, hemiplegic or basilar migraine, use of an ergot compound or other triptan within 24 hr, risk factors for CAD
- **Physical:** Skin color and lesions, orientation, reflexes, peripheral sensation, P, BP, LFTs, ECG

Interventions

- Ensure that the patient has been diagnosed with migraine headaches.
- Administer to relieve acute migraine, not as a prophylactic measure.
- Ensure that the patient has not taken an ergot-containing compound or other triptan within 24 hr.
- Do not administer more than three doses in a 24-hr period; space them at least 2 hr apart.
- Establish safety measures if CNS or visual disturbances occur.
- Provide environmental (lighting, temperature) control as appropriate to help relieve migraine.
- ⊗ **Warning** Monitor BP of patients with possible CAD; discontinue at any sign of angina, prolonged high BP, tachycardia, chest pain.

Teaching points

- Take drug exactly as prescribed, at the onset of headache or aura. Do not take this drug to prevent a migraine; it is only used to treat migraines that are occurring. If the headache persists after you take this drug, you may repeat the dose after 2 hours have passed.
- Do not take more than three doses in a 24-hour period. Do not take any other migraine medication while you are taking this drug. If the headache is not relieved, call your health care provider.
- This drug should not be taken during pregnancy; if you suspect that you are pregnant,

contact your health care provider and refrain from using the drug.

- Maintain any procedures you usually use during a migraine (such as controlling lighting and noise).
- Contact your health care provider immediately if you experience chest pain or pressure that is severe or does not go away.
- You may experience these side effects: Dizziness, drowsiness (avoid driving or the use of dangerous machinery while taking this drug); numbness, tingling, feelings of tightness or pressure.
- Report feelings of heat, flushing, tiredness, feelings of sickness, swelling of lips or eyelids.

DANGEROUS DRUG

 **fulvestrant**
(*full ves' trant*)

Faslodex

PREGNANCY CATEGORY D

Drug classes

Antineoplastic

Estrogen receptor antagonist

Therapeutic actions

Binds to estrogen receptors, has anti-estrogen effects; and inhibits growth of estrogen receptor–positive breast cancer cell lines.

Indications

- Treatment of hormone receptor-positive breast cancer in postmenopausal women with disease progression following anti-estrogen therapy

Contraindications and cautions

- Contraindicated with allergy to any component of the drug, pregnancy.
- Use cautiously with bleeding disorders, thrombocytopenia, hepatic impairment, lactation.

Available forms

Injection—50 mg/mL

Dosages

Adults

250 mg IM each month in the buttock as a single 5-mL injection or two concomitant 2.5-mL injections.

Pharmacokinetics

Route	Onset	Peak
IM	Slow	7 days

Metabolism: Hepatic; $T_{1/2}$: 40 days

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces

Adverse effects

- **CNS:** Depression, light-headedness, dizziness, *headache*, hallucinations, vertigo, insomnia, paresthesia, anxiety, *asthenia*
- **CV:** Chest pain, *vasodilation*
- **Dermatologic:** *Hot flashes*, skin rash
- **GI:** *Nausea*, *vomiting*, food distaste, constipation, *diarrhea*, anorexia, *abdominal pain*
- **GU:** UTI, *pelvic pain*
- **Respiratory:** *Dyspnea*, *increased cough*
- **Other:** Peripheral edema, fever, pharyngitis, injection site reactions, pain, flulike symptoms, *increased sweat*, *anemia*, *back pain*, *bone pain*, *arthritis*

Interactions

★ **Drug-drug** • Increased risk of bleeding if taken with oral anticoagulants

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the drug; pregnancy, lactation; hepatic impairment, bleeding disorders, thrombocytopenia
- **Physical:** Skin color, lesions, turgor; pelvic examination; orientation, affect, reflex; BP, peripheral pulses, edema; LFTs

Interventions

- Ensure that the patient is not pregnant before administering drug.
- Counsel patient about the need to use contraceptives to avoid pregnancy while taking this drug. Inform patient that serious fetal harm could occur.

- Suggest an alternate method of feeding the baby if this drug is prescribed for a nursing mother.
- Mark a calendar for dates for monthly injections; periodically monitor injection sites if patient is self-administering drug.
- Provide comfort measures to help patient deal with drug effects: Hot flashes (environmental temperature control); headache, depression (monitoring light and noise); vaginal bleeding (hygiene measures); nausea, food distaste (eat frequent small meals).

Teaching points

- You and a significant other should learn the proper technique for administering an intramuscular injection; proper disposal of needles and syringes is important and should be reviewed.
- Mark your calendar with the date of your injection. If you are not able to self-administer the injection, mark your calendar with the dates to return to your health care provider for injections.
- This drug can cause serious fetal harm and must not be taken during pregnancy. Use contraceptives while you are taking this drug. If you become pregnant or decide that you would like to become pregnant, consult your health care provider immediately.
- You may experience these side effects: Hot flashes (staying in cool environment may help); nausea, vomiting (eat frequent small meals); weight gain; dizziness, headache, light-headedness (use caution if driving or performing tasks that require alertness if these occur).
- Report marked weakness, sleepiness, mental confusion, changes in color of urine or stool, pregnancy.

▽ furosemide

(*fur ob' se mide*)

Apo-Furosemide (CAN), Furosemide Special (CAN), Lasix

PREGNANCY CATEGORY C

Drug class

Loop diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride from the proximal and distal tubules and ascending limb of the loop of Henle, leading to a sodium-rich diuresis.

Indications

- Oral, IV: Edema associated with heart failure, cirrhosis, renal disease
- IV: Acute pulmonary edema
- Oral: Hypertension

Contraindications and cautions

- Contraindicated with allergy to furosemide, sulfonamides; allergy to tartrazine (in oral solution); anuria, severe renal failure; hepatic coma; pregnancy; lactation.
- Use cautiously with SLE, gout, diabetes mellitus.

Available forms

Tablets—20, 40, 80 mg; oral solution—10 mg/mL, 40 mg/5 mL; injection—10 mg/mL

Dosages

Adults

- **Edema:** Initially, 20–80 mg/day PO as a single dose. If needed, a second dose may be given in 6–8 hr. If response is unsatisfactory, dose may be increased in 20- to 40-mg increments at 6- to 8-hr intervals. Up to 600 mg/day may be given. Intermittent dosage schedule (2–4 consecutive days/wk) is preferred for maintenance, *or* 20–40 mg IM or IV (slow IV injection over 1–2 min). May increase dose in increments of 20 mg in 2 hr. High-dose therapy should be given as infusion at rate not exceeding 4 mg/min.
- **Acute pulmonary edema:** 40 mg IV over 1–2 min. May be increased to 80 mg IV given over 1–2 min if response is unsatisfactory after 1 hr.
- **Hypertension:** 40 mg bid PO. If needed, additional antihypertensives may be added.

Pediatric patients

Premature infants, **do not exceed 1 mg/kg/day**. Stimulates prostaglandin E₂ synthesis and may increase incidence of patent ductus arteriosus and complicate RDS.

- **Edema:** Initially, 2 mg/kg/day PO. If needed, increase by 1–2 mg/kg in 6–8 hr. **Do not exceed 6 mg/kg**. Adjust maintenance dose to lowest effective level.
- **Pulmonary edema:** 1 mg/kg IV or IM. May increase by 1 mg/kg in 2 hr until the desired effect is seen. **Do not exceed 6 mg/kg**.

Patients with renal impairment

Up to 4 g/day has been tolerated. IV bolus injection should not exceed 1 g/day given over 30 min.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	60 min	60–120 min	6–8 hr
IV, IM	5 min	30 min	2 hr

Metabolism: Hepatic; T_{1/2}: 30–60 min

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Store at room temperature; exposure to light may slightly discolor solution.

Infusion: Inject directly or into tubing of actively running IV; inject slowly over 1–2 min.

Incompatibilities: Do not mix with acidic solutions. Isotonic saline, lactated Ringer's injection, and 5% dextrose injection may be used after pH has been adjusted (if necessary); precipitates form with gentamicin, milrinone in 5% dextrose, 0.9% sodium chloride.

Adverse effects

- **CNS:** *Dizziness, vertigo, paresthesias, xanthopsia, weakness, headache, drowsiness, fatigue, blurred vision, tinnitus, irreversible hearing loss*
- **CV:** *Orthostatic hypotension, volume depletion, cardiac arrhythmias, thrombophlebitis*
- **Dermatologic:** *Photosensitivity, rash, pruritus, urticaria, purpura, exfoliative dermatitis, erythema multiforme*

- **GI:** *Nausea, anorexia, vomiting, oral and gastric irritation, constipation, diarrhea, acute pancreatitis, jaundice*
- **GU:** Polyuria, nocturia, glycosuria, *urinary bladder spasm*
- **Hematologic:** *Leukopenia, anemia, thrombocytopenia*, fluid and electrolyte imbalances, hyperglycemia, hyperuricemia
- **Other:** *Muscle cramps and muscle spasms*

Interactions

★ **Drug-drug** • Increased risk of cardiac arrhythmias with cardiac glycosides (due to electrolyte imbalance) • Increased risk of ototoxicity with aminoglycoside antibiotics, cisplatin • Decreased absorption of furosemide with phenytoin • Decreased natriuretic and antihypertensive effects with indomethacin, ibuprofen, other NSAIDs • Decreased GI absorption with charcoal • May reduce effect of insulin or oral antidiabetics because blood glucose levels can become elevated

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between furosemide and torsemide; use extreme caution.

Assessment

- **History:** Allergy to furosemide, sulfonamides, tartrazine; electrolyte depletion anuria, severe renal failure; hepatic coma; SLE; gout; diabetes mellitus; lactation, pregnancy
- **Physical:** Skin color, lesions, edema; orientation, reflexes, hearing; pulses, baseline ECG, BP, orthostatic BP, perfusion; R, pattern, adventitious sounds; liver evaluation, bowel sounds; urinary output patterns; CBC, serum electrolytes (including calcium), blood sugar, LFTs, renal function tests, uric acid, urinalysis, weight

Interventions

- ⊗ **Black box warning** Profound diuresis with water and electrolyte depletion can occur; careful medical supervision is required.
- Administer with food or milk to prevent GI upset.

- Reduce dosage if given with other antihypertensives; readjust dosage gradually as BP responds.
- Give early in the day so that increased urination will not disturb sleep.
- Avoid IV use if oral use is at all possible.
- ⊗ **Warning** Do not mix parenteral solution with highly acidic solutions with pH below 3.5.
- Do not expose to light, which may discolor tablets or solution; do not use discolored drug or solutions.
- Discard diluted solution after 24 hr.
- Refrigerate oral solution.
- Measure and record weight to monitor fluid changes.
- Arrange to monitor serum electrolytes, hydration, liver and renal function.
- Arrange for potassium-rich diet or supplemental potassium as needed.

Teaching points

- Record intermittent therapy on a calendar or dated envelopes. When possible, take the drug early so increased urination will not disturb sleep. Take with food or meals to prevent GI upset.
- Weigh yourself on a regular basis, at the same time and in the same clothing, and record the weight on your calendar.
- Blood glucose levels may become temporarily elevated in patients with diabetes after starting this drug.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes; hazardous activities, like driving; and consumption of alcohol); sensitivity to sunlight (use sunglasses, wear protective clothing, or use a sunscreen); increased thirst (suck on sugarless lozenges; use frequent mouth care); loss of body potassium (a potassium-rich diet or potassium supplement will be needed).
- Report loss or gain of more than 1.5 kg in 1 day, swelling in your ankles or fingers, unusual bleeding or bruising, dizziness, trembling, numbness, fatigue, muscle weakness or cramps.

gabapentin

(gab ah **pen'** tin)

Apo-Gabapentin (CAN), CO
Gabapentin (CAN), Gen-Gabapentin
(CAN), Neurontin, Novo-Gabapentin
(CAN), PMS Gabapentin (CAN),
ratio-Gabapentin (CAN)

PREGNANCY CATEGORY C

Drug class

Antiepileptic

Therapeutic actions

Mechanism of action not understood; anti-epileptic activity may be related to its ability to inhibit polysynaptic responses and block posttetric potentiation.

Indications

- Adjunctive therapy in the treatment of partial seizures with and without secondary generalization in adults and children 3–12 yr with epilepsy
- Orphan drug use: Treatment of amyotrophic lateral sclerosis
- Management of postherpetic neuralgia or pain in the area affected by herpes zoster after the disease has been treated
- Unlabeled uses: Hot flashes, neuropathic pain

Contraindications and cautions

- Contraindicated with hypersensitivity to gabapentin.
- Use cautiously with pregnancy, lactation.

Available forms

Capsules—100, 300, 400 mg; tablets—100, 300, 400, 600, 800 mg; oral solution—250 mg/5 mL

Dosages

Adults

- *Epilepsy*: Starting dose is 300 mg PO tid, then titrated up as needed. *Maintenance*: 900–1,800 mg/day PO in divided doses tid PO; maximum interval between doses should not exceed 12 hr. Up to 2,400–3,600 mg/day has been used

- *Postherpetic neuralgia*: Initial dose of 300 mg/day PO; 300 mg bid PO on day 2; 300 mg tid PO on day 3.

Pediatric patients 3–12 yr

Initially, 10–15 mg/kg/day PO in three divided doses; adjust upward over about 3 days to 25–35 mg/kg daily in three divided doses in children 5 yr and older, and up to 40 mg/kg/day in three divided doses in children 3–4 yr.

Geriatric patients or patients with renal impairment

CrCl

CrCl (mL/min)	Dosage (mg/day)
More than 60	900–3,600 in three divided doses
More than 30–59	400–1,400 in two divided doses
More than 15–29	200–700 in one dose
Less than 15	100–300 in one dose

Postdialysis supplemental dosing, 125–350 mg PO following each 4 hr of dialysis.

Pharmacokinetics

Route	Onset	Duration
Oral	Varies	6–8 hr

Metabolism: Hepatic; $T_{1/2}$: 5–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** *Dizziness*, *insomnia*, nervousness, fatigue, *somnolence*, *ataxia*, diplopia, tremor
- **Dermatologic:** Pruritus, abrasion
- **GI:** Dyspepsia, vomiting, nausea, constipation, dry mouth, diarrhea
- **Respiratory:** Rhinitis, pharyngitis
- **Other:** Weight gain, facial edema, cancer, impotence, suicidal ideation

Interactions

- **Drug-drug** • Decreased serum levels with antacids
- **Drug-lab test** • False-positives may occur with *Ames N-Multistix SG* dipstick test for protein in the urine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to gabapentin; lactation, pregnancy
- **Physical:** Weight; T; skin color, lesions; orientation, affect, reflexes; P; R, adventitious sounds; bowel sounds, normal output

Interventions

- Give drug with food to prevent GI upset.
- Be aware that patient may be at increased risk for suicidality; monitor accordingly.
- Arrange for consultation with support groups for people with epilepsy.
- ⊗ **Warning** If overdose occurs, hemodialysis may be an option.

Teaching points

- Take this drug exactly as prescribed; do not discontinue abruptly or change dosage, except on the advice of your health care provider.
- Wear a medical alert ID at all times so that any emergency medical personnel will know that you have epilepsy and are taking antiepileptic medication.
- You may experience these side effects: Dizziness, blurred vision (avoid driving or performing other tasks requiring alertness or visual acuity); GI upset (take drug with food or milk, eat frequent small meals); headache, nervousness, insomnia; fatigue (periodic rest periods may help).
- Report severe headache, sleepwalking, rash, severe vomiting, chills, fever, difficulty breathing, thoughts of suicide.

▷ galantamine hydrobromide

(gab lan' tab meen)

Razadyne, Razadyne ER ORIG

PREGNANCY CATEGORY B

Drug classes

Alzheimer's disease drug
Cholinesterase inhibitor

Therapeutic actions

Centrally acting, selective, long-acting, reversible cholinesterase inhibitor; causes ele-

vated acetylcholine levels in the cortex, which is thought to slow the neuronal degradation that occurs in Alzheimer's disease.

Indications

- Treatment of mild to moderate dementia of the Alzheimer's type
- Unlabeled use: Vascular dementia

Contraindications and cautions

- Contraindicated with allergy to galantamine, severe hepatic impairment, severe renal impairment.
- Use cautiously with moderate renal or hepatic impairment, GI bleeding, seizures, asthma, COPD, pregnancy, lactation, and CV conditions.

Available forms

Tablets—4, 8, 12 mg; oral solution with dosing syringe—4 mg/mL; ER capsules ORIG—8, 16, 24 mg

Dosages

Adults

Initially, 4 mg PO bid. If well tolerated after 4 wk, increase to 8 mg PO bid. If well tolerated after 4 more wk, increase to 12 mg PO bid. Range: 16–32 mg/day in two divided doses; ER capsules—initial dose, 8 mg/day PO; titrate to 16–24 mg/day PO.

Pediatric patients

Safety and efficacy not established.

Patients with hepatic or renal impairment

Do not exceed 16 mg/day. Contraindicated if creatinine clearance less than 9 mL/min or if Child-Pugh score is 10–15.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1 hr	8 hr

Metabolism: Hepatic; $T_{1/2}$: 7 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Insomnia*, tremor, *dizziness*, fatigue, sedation, somnolence, tremor, headache
- **CV:** Bradycardia, syncope

- **GI:** *Nausea, vomiting, diarrhea, dyspepsia, anorexia, abdominal pain*, weight loss
- **GU:** UTI, hematuria

Interactions

• *** Drug-drug** • Increased galantamine concentration with drugs that are potent inhibitors of CYP2D6 or CYP3A4 • Increased effects and risk of galantamine toxicity if combined with cimetidine, ketoconazole, paroxetine, erythromycin, succinylcholine, or bethanechol; if any of these combinations are used, monitor patient closely and adjust dosage as needed

■ Nursing considerations

CLINICAL ALERT!

Because of name confusion, the manufacturer has changed the drug name *Reminyl* to *Razadyne*.

Assessment

- **History:** Allergy to galantamine, pregnancy, lactation, impaired renal or hepatic function, GI bleeding, seizures, asthma, COPD, CV conditions
- **Physical:** Orientation, affect, reflexes, BP, P, abdominal examination, LFTs, renal function tests

Interventions

- Establish baseline functional profile to allow evaluation of drug effectiveness.
- Ensure at least 4 wk at each dosage level to establish effectiveness and tolerance of adverse effects.
- Administer with food in the morning and evening to decrease GI discomfort.
- Mix solution with water, fruit juice, or soda to improve compliance.
- Ensure that patient swallows ER capsules whole; do not cut, crush, or allow patient to chew capsule. Capsule can be opened and contents sprinkled over soft food.
- Monitor patient for weight loss, diarrhea, and arrhythmias before use and periodically with prolonged use.
- Provide frequent small meals if GI upset is severe; antiemetics may be used if necessary.
- Provide patient safety measures if CNS effects occur.

⊗ **Warning** Notify surgeon that patient takes galantamine; exaggerated muscle relaxation may occur if succinylcholine-type drugs are used.

Teaching points

- Take drug exactly as prescribed, with food, in the morning and evening to decrease GI upset.
- Switch to oral solution if swallowing becomes difficult; mix with water, fruit juice, or soda to improve taste.
- Swallow capsules whole; do not cut, crush, or chew. Contents can be sprinkled over soft food if swallowing is difficult.
- This drug does not cure the disease but is thought to slow the degeneration associated with the disease.
- Dosage changes may be needed to achieve the best effects. If the drug is stopped for more than a few days, consult your health care provider; it should be restarted at the original, lower dose.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); insomnia, fatigue, confusion (use caution if driving or performing tasks that require alertness).
- Report severe nausea, vomiting, changes in stool or urine color, diarrhea, changes in neurologic functioning, palpitations.

▽ galsulfase

See Appendix U, *Less commonly used drugs*.

▽ ganciclovir sodium (DHPG)

(*gan sye' kloev vir*)

Cytovene ^{OND}, Vitrasert

PREGNANCY CATEGORY C

Drug class

Antiviral

Therapeutic actions

Antiviral activity; inhibits viral DNA replication in cytomegalovirus (CMV).

Indications

- IV and implant: Treatment of CMV retinitis in immunocompromised patients, including patients with AIDS
- IV: Prevention of CMV disease in transplant recipients at risk for CMV disease
- Oral: Alternative to IV for maintenance treatment of CMV retinitis
- Oral: Prevention of CMV disease in individuals with advanced HIV infection at risk of developing CMV disease
- Unlabeled use: Treatment of other CMV infections in immunocompromised patients

Contraindications and cautions

- Contraindicated with hypersensitivity to ganciclovir or acyclovir, lactation.
- Use cautiously with cytopenia, history of cytopenic reactions, impaired renal function, pregnancy.

Available forms

Capsules **GENC**—250, 500 mg; powder for injection—500 mg/vial; ocular implant—4.5 mg

Dosages

Adults

- *CMV retinitis*: Initial dose, 5 mg/kg given IV at a constant rate over 1 hr, every 12 hr for 14–21 days. For maintenance, 5 mg/kg given by IV infusion over 1 hr once daily, 7 days/wk or 6 mg/kg once daily, 5 days/wk; or 1,000 mg PO tid with food or 500 mg PO 6 times per day every 3 hr with food while awake. Implant surgically placed in affected eye every 5–8 mo.
- *Prevention of CMV disease in transplant recipients*: 5 mg/kg IV over 1 hr every 12 hr for 7–14 days; then 5 mg/kg/day once daily for 7 days/wk, or 6 mg/kg/day once daily for 5 days/wk. Prophylactic oral dose is 1,000 mg tid with food. Duration depends on duration and degree of immunosuppression.
- *Prevention of CMV disease with advanced AIDS*: 1,000 mg PO tid with food.

Pediatric patients

Safety and efficacy not established. Use only if benefit outweighs potential carcinogenesis and reproductive toxicity.

Patients with renal impairment

Initial IV dose

CrCl (mL/min)	Dose IV (mg/kg)	Dosing Intervals
70 or more	5 mg/kg	12 hr
50–69	2.5	12 hr
25–49	2.5	24 hr
10–24	1.25	24 hr
< 10	1.25	Three times/wk following hemodialysis

Maintenance

CrCl (mL/min)	Dose IV (mg/kg)	Dosing Intervals
70 or more	5 mg/kg	24 hr
50–69	2.5	24 hr
25–49	1.25	24 hr
10–24	0.625	24 hr
< 10	0.625	Three times/wk following hemodialysis

Oral dose

CrCl (mL/min)	Dose PO (mg)
70 or more	1,000 mg tid or 500 mg every 3 hr six times/day
50–69	1,500 daily or 500 tid
25–49	1,000 daily or 500 bid
10–24	500 daily
< 10	500 three times/wk following dialysis

Pharmacokinetics

Route	Onset	Peak
IV	Slow	1 hr
Oral	Slow	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr (IV), 4.8 hr (PO)

Distribution: Crosses placenta; may enter breast milk

Excretion: Feces, urine

IV FACTS

Preparation: Reconstitute vial by injecting 10 mL of sterile water for injection into vial; do not use bacteriostatic water for injection; shake vial to dissolve the drug. Discard vial if any particulate matter or discoloration is seen. Reconstituted solution in the vial is stable at

room temperature for 12 hr. Do not refrigerate reconstituted solution. Drug is stable for 14 days after mixing with 0.9% normal saline.

Infusion: Infuse slowly over 1 hr.

Compatibilities: Compatible with 0.9% sodium chloride, 5% dextrose, Ringer's injection, and lactated Ringer's injection.

Y-site incompatibilities: Do not combine with foscarnet, ondansetron.

Adverse effects

- **CNS:** Dreams, ataxia, coma, confusion, dizziness, headache
- **CV:** Arrhythmia, hypertension, hypotension
- **Dermatologic:** *Rash*, alopecia, pruritus, urticaria
- **GI:** *Abnormal liver function tests*, nausea, vomiting, anorexia, diarrhea, abdominal pain
- **Hematologic:** *Granulocytopenia, thrombocytopenia, anemia*, neutropenia
- **Local:** *Pain, inflammation at injection site*, phlebitis
- **Other:** *Fever*, chills, **cancer**, sterility

Interactions

* **Drug-drug** ⊗ **Warning** Use with extreme caution with cytotoxic drugs because the accumulation effect could cause severe bone marrow depression and other GI and dermatologic problems.

- Increased effects if taken with probenecid
- Increased risk of seizures with imipenem-cilastatin
- Extreme drowsiness and risk of bone marrow depression with zidovudine

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to ganciclovir or acyclovir; cytopenia; impaired renal function; lactation, pregnancy
- **Physical:** Skin color, lesions; orientation; BP, P, auscultation, perfusion, edema; R, adventitious sounds; urinary output; CBC, Hct, BUN, creatinine clearance, LFTs

Interventions

- Give by IV infusion only. Do not give IM or subcutaneously; drug is very irritating to tissues.
- Do not exceed the recommended dosage, frequency, or infusion rates.

- Monitor infusion carefully; infuse at concentrations no greater than 10 mg/mL.
- Decrease dosage in patients with impaired renal function.

- Give oral doses with food.

⊗ **Black box warning** Obtain CBC before therapy, every 2 days during daily dosing, and at least weekly thereafter. Consult with physician and arrange for reduced dosage if WBC or platelet counts fall.

⊗ **Warning** Consult with pharmacy for proper disposal of unused solution. Precautions are required for disposal of nucleoside analogues.

⊗ **Warning** Avoid direct contact with skin or mucous membranes.

⊗ **Warning** Do not open or crush capsules.

- Provide patient with a calendar of drug days, and arrange convenient times for the IV infusion in outpatients.
- Advise patients having surgical implant of ganciclovir that procedure will need to be repeated every 5–8 mo.
- Arrange for periodic ophthalmic examinations. Drug is not a cure for the disease, and deterioration may occur.
- Advise patients that ganciclovir can decrease sperm production and cause birth defects in fetuses. Advise the patient to use contraception during ganciclovir therapy. Men receiving ganciclovir therapy should use barrier contraception during and for at least 90 days after ganciclovir therapy.
- Advise patient that ganciclovir has caused cancer in animals and that risk is possible in humans.

Teaching points

- Appointments will be made for you if you are an outpatient on IV therapy. Long-term therapy is frequently needed. Take the oral drug with food; do not open, crush, cut, or chew capsules. Surgical implant of drug will need to be repeated every 5–8 months.
- Frequent blood tests will be necessary to determine drug effects on your blood count and to adjust drug dosage. Keep appointments for these tests.
- Arrange for periodic ophthalmic examinations during therapy to evaluate progress of the disease. This drug is not a cure for your retinitis.

- If you also are receiving zidovudine, the two drugs cannot be given at the same time; severe adverse effects may occur.
- You may experience these side effects: Rash, fever, pain at injection site; decreased blood count leading to susceptibility to infection (frequent blood tests will be needed; avoid crowds and exposure to disease); birth defects and decreased sperm production (drug must not be taken during pregnancy; if pregnant or intending to become pregnant, consult your health care provider; use some form of contraception during therapy; male patients should use barrier contraception during therapy and for at least 90 days after therapy).
- Report bruising, bleeding, pain at injection site, fever, infection.
- In combination with cisplatin as the first-line treatment of inoperable, locally advanced or metastatic non–small-cell lung cancer
- First-line therapy for metastatic breast cancer after failure of other adjuvant chemotherapy with an anthracycline, with paclitaxel
- In combination with carboplatin for the treatment of advanced ovarian cancer that has relapsed at least 6 mo after completion of a platinum-based therapy
- Unlabeled uses: Treatment of biliary cancer, bladder cancer, relapsed or refractory testicular cancer, squamous cell carcinoma of the head and neck

Contraindications and cautions

- Contraindicated with hypersensitivity to gemcitabine.
- Use cautiously with bone marrow suppression, renal or hepatic impairment, pregnancy, lactation.

Available forms

Powder for injection—200 mg/1 g

Dosages

Adults

- **Pancreatic cancer:** 1,000 mg/m² IV over 30 min given once weekly for up to 7 wk or until bone marrow suppression requires withholding treatment; subsequent cycles of once weekly for 3 out of 4 consecutive weeks can be given after 1-wk rest from treatment. For a patient who has completed the 7-wk course of initial therapy, the dose may be increased by 25% provided there is no significant hematologic toxicity.
- **Non–small-cell lung cancer:** 1,000 mg/m² IV over 30 min, days 1, 8, and 15 of each 28-day cycle with 100 mg/m² cisplatin on day 1 after gemcitabine infusion, *or* 1,250 mg/m² IV over 30 min, days 1 and 8 of each 21-day cycle with 100 mg/m² cisplatin on day 1 after gemcitabine infusion.
- **Metastatic breast cancer:** 1,250 mg/m² IV given over 30 min on days 1 and 8 of each 21-day cycle; with 175 mg/m² paclitaxel IV as a 3-hr infusion given before gemcitabine on day 1 of the cycle. Adjust dosage based on total granulocyte and

▷ ganirelix acetate

See Appendix W, *Less commonly used drugs*.

▷ gefitinib

See Appendix W, *Less commonly used drugs*.

DANGEROUS DRUG

▷ gemcitabine hydrochloride

(*jem site' ab ben*)

Gemzar

PREGNANCY CATEGORY D

Drug classes

Antimetabolite
Antineoplastic
Pyrimidine analogue

Therapeutic actions

Cytotoxic: A nucleoside analogue that is cell cycle S–specific; causes cell death by disrupting and inhibiting DNA synthesis.

Indications

- First-line treatment of locally advanced or metastatic adenocarcinoma of pancreas; indicated for patients who have previously received 5-FU

platelet counts taken on day 8 of the cycle for that dose.

- **Advanced ovarian cancer:** 1,000 mg/m² IV given over 30 min on days 1 and 8 of each 21-day cycle. Carboplatin is given on day 1 after gemcitabine.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	30 min

Metabolism: Hepatic; T_{1/2}: 42–70 min; half-life is linearly dependent on infusion time

Distribution: Crosses placenta; may enter breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Use 0.9% sodium chloride injection as diluent for reconstitution of powder; 5 mL of 0.9% sodium chloride injection added to the 200-mg vial or 25 mL added to the 1-g vial. This will yield a concentration of 38 mg/mL; higher concentrations may lead to inadequate dissolution of powder. Resultant drug can be injected as reconstituted or further diluted in 0.9% sodium chloride injection. Stable for 24 hr at room temperature after reconstitution.

Infusion: Infuse slowly over 30 min; do not allow prolonged infusion; toxicity increases with length of infusion.

Adverse effects

- **CNS:** Somnolence, paresthesias
- **GI:** *Nausea, vomiting, diarrhea, constipation, mucositis, GI bleeding, stomatitis, hepatic impairment*
- **Hematologic:** **Bone marrow depression, infections**
- **Hepatic:** Elevated ALT
- **Pulmonary:** Dyspnea, **interstitial pneumonitis**
- **Renal:** Hematuria, proteinuria, elevated BUN and creatinine
- **Other:** *Fever, alopecia, pain, rash, edema, flulike symptoms*

Nursing considerations

Assessment

- **History:** Hypersensitivity to gemcitabine; bone marrow depression; renal or hepatic impairment; pregnancy, lactation
- **Physical:** T; skin color, lesions; R, adventitious sounds; abdominal examination, mucous membranes; LFTs, renal function tests, CBC with differential, urinalysis

Interventions

⊗ **Warning** Infuse over 30 min; longer infusions (more than 60 min) cause increased half-life and severe toxicity.

⊗ **Warning** Follow CBC, LFTs, and renal function tests carefully before and frequently during therapy; dosage adjustment may be needed if myelosuppression becomes severe or hepatic or renal impairment occurs.

- Protect patient from exposure to infection; monitor occurrence of infection at any site and arrange for appropriate treatment.
- Provide medication, frequent small meals for severe nausea and vomiting; monitor nutritional status.

Teaching points

- This drug must be given IV over 30 minutes once a week or as protocol dosing. Mark calendar with days to return for treatment. Regular blood tests will be needed to evaluate the effects of treatment.
- You may experience these side effects: Nausea and vomiting (may be severe; antiemetics may be helpful; eat frequent small meals); increased susceptibility to infection (avoid crowds and situations that may expose you to diseases); loss of hair (arrange for a wig or other head covering; keep the head covered at extremes of temperature).
- Report severe nausea and vomiting, fever, chills, sore throat, unusual bleeding or bruising, changes in color of urine or stool.

gemfibrozil

(jem'fi' broe zil)

Apo-Gemfibrozil (CAN),
Gen-Gemfibrozil (CAN), Lopid,
PMS-Gemfibrozil (CAN)

PREGNANCY CATEGORY C

Drug class

Antihyperlipidemic

Therapeutic actions

Inhibits peripheral lipolysis and decreases the hepatic excretion of free fatty acids; this reduces hepatic triglyceride production; inhibits synthesis of VLDL carrier apolipoprotein; decreases VLDL production; increases HDL concentration.

Indications

- As adjunct to diet and exercise for hypertriglyceridemia in adult patients with very high elevations of triglyceride levels (type IV and V hyperlipidemia) at risk of pancreatitis unresponsive to diet therapy
- As adjunct to diet and exercise in reduction of coronary heart disease risk in patients who have not responded to diet, exercise, and other drugs and have low HDL levels in addition to high LDL and triglyceride levels

Contraindications and cautions

- Contraindicated with allergy to gemfibrozil, hepatic or renal impairment, primary biliary cirrhosis, gallbladder disease.
- Use cautiously with pregnancy, lactation, cholelithiasis, and renal impairment.

Available forms

Tablets—600 mg

Dosages

Adults

⊗ **Warning** 1,200 mg/day PO in two divided doses, 30 min before morning and evening meals. Caution: Use only if strongly indicated and lipid studies show a definite response; hepatic tumorigenicity occurs in laboratory animals.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment

Contraindicated with hepatic impairment or severe renal impairment. Use caution with mild to moderate renal impairment.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	1–2 hr

Metabolism: Hepatic; $T_{1/2}$: 90 min

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Headache, dizziness, blurred vision, vertigo, insomnia, paresthesia, tinnitus, fatigue, malaise, syncope*
- **Dermatologic:** *Eczema, rash, dermatitis, pruritus, urticaria*
- **GI:** *Abdominal pain, epigastric pain, diarrhea, nausea, vomiting, flatulence, dry mouth, constipation, anorexia, dyspepsia, cholelithiasis, elevated ALT and AST*
- **GU:** Impairment of fertility
- **Hematologic:** Anemia, **eosinophilia, leukopenia**, hypokalemia, liver function changes, hyperglycemia
- **Other:** Painful extremities, back pain, arthralgia, muscle cramps, myalgia, swollen joints, myopathy

Interactions

★ **Drug-drug** • Risk of rhabdomyolysis from 3 wk to several mo after therapy when combined with HMG-CoA reductase inhibitors (eg, lovastatin, simvastatin) • Risk of increased bleeding when combined with anticoagulants; monitor patient closely • Risk of hypoglycemia if combined with sulfonylureas and repaglinide; monitor closely

Nursing considerations

Assessment

- **History:** Allergy to gemfibrozil, hepatic or renal impairment, primary biliary cirrhosis, gallbladder disease, pregnancy, lactation
- **Physical:** Skin lesions, color, T; gait, range of motion; orientation, affect, reflexes; bowel sounds, normal output, liver evaluation;

lipid studies, CBC, LFTs, renal function tests, blood glucose

Interventions

- Administer drug with meals or milk if GI upset occurs.
- Ensure that patient continues diet and exercise programs.
- Arrange for regular follow-up visits, including blood tests for lipids, liver function, CBC, and blood glucose during long-term therapy.

Teaching points

- Take the drug with meals or with milk if GI upset occurs; changes in diet will be needed.
- Continue to follow diet and exercise recommendations for your high lipid levels.
- Have regular follow-up visits to your health care provider for blood tests to evaluate drug effectiveness.
- You may experience these side effects: Diarrhea, loss of appetite, flatulence (eat frequent small meals); muscular aches and pains, bone and joint discomfort; dizziness, faintness, blurred vision (use caution if driving or operating dangerous equipment).
- Report severe stomach pain with nausea and vomiting, fever and chills or sore throat, severe headache, vision changes.

gemifloxacin mesylate

(jem ah flox' a sin)

Active **ORC**

PREGNANCY CATEGORY C

Drug classes

Antibiotic
Fluoroquinolone

Therapeutic actions

Bactericidal; interferes with DNA replication, repair, transcription, and recombination in susceptible gram-negative and gram-positive bacteria, preventing cell reproduction and leading to cell death.

Indications

- Treatment of acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *H. parainfluenzae*, *Moraxella catarrhalis*
- Treatment of community-acquired pneumonia caused by *S. pneumoniae* (including multi-drug-resistant strains), *H. influenzae*, *Moraxella catarrhalis*, *Mycoplasma pneumoniae*, *Chlamydia pneumoniae*, *Klebsiella pneumoniae*

Contraindications and cautions

- Contraindicated with history of sensitivity to gemifloxacin or any fluoroquinolone antibiotic; history of tendinitis, tendon rupture; history of prolonged QTc interval; uncorrected hypokalemia or hypomagnesemia; use of quinidine, procainamide, amiodarone, or sotalol antiarrhythmics.
- Use cautiously with epilepsy or predisposition to seizures; pregnancy; lactation.

Available forms

Tablets **ORC**—320 mg

Dosages

Adults

- *Acute bacterial exacerbation of chronic bronchitis*: 320 mg/day PO for 5 days.
- *Community-acquired pneumonia*: 320 mg/day PO for 5 days for known or suspected *S. pneumoniae*, *H. influenzae*, *M. pneumoniae*, or *C. pneumoniae* and 7 days for known or suspected multi-drug-resistant *S. pneumoniae*, *K. pneumoniae*, or *M. catarrhalis*.

Pediatric patients

Safety and efficacy not established.

Patients with renal impairment

For creatinine clearance greater than 40 mL/min, use usual dose; for creatinine clearance of 40 mL/min or less, use 160 mg/day PO.

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–2 hr

Metabolism: Hepatic; $T_{1/2}$: 4–12 hr

Distribution: May cross the placenta; may enter breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** Headache, dizziness, anorexia, tremor, vertigo, nervousness, insomnia
- **CV:** Increased QTc interval
- **GI:** Diarrhea, **ulcerative colitis**, nausea, abdominal pain, vomiting, taste perversion, gastroenteritis, dry mouth, dyspepsia, flatulence, elevated ALT
- **GU:** Fungal infection, genital moniliasis, vaginitis
- **Respiratory:** Pharyngitis, pneumonia
- **Other:** Rash, fatigue, back pain, eczema, urticaria, myalgia, photosensitivity, ruptured tendons, tendinitis

Interactions

★ **Drug-drug** • Decreased absorption and serum levels if taken with calcium, sucralfate, iron, didanosine, aluminum- or potassium-containing antacids; take these drugs 3 hr before or 2 hr after taking gemifloxacin • Increased risk of prolonged QT interval if combined with quinidine, procainamide, amiodarone or sotalol, erythromycin, antipsychotics, antidepressants; avoid these combinations

■ Nursing considerations

Assessment

- **History:** Allergy to fluoroquinolones; prolonged QT interval, uncorrected hypokalemia or hypomagnesemia; use of quinidine, procainamide, amiodarone, or sotalol antiarrhythmics; epilepsy or predisposition to seizures, pregnancy, lactation
- **Physical:** Skin color, lesions; T; orientation, reflexes, affect; R, adventitious sounds; mucous membranes, bowel sounds; LFTs, renal function tests, ECG, serum electrolytes

Interventions

⊗ **Black box warning** There is a risk of tendinitis and tendon rupture with drug administration. Risk increases in patients older than 60 yr, with concurrent corticosteroid use, and with kidney, heart, or lung transplant. Monitor these patients accordingly.

- Arrange for culture and sensitivity tests before beginning therapy.
- Continue therapy as indicated for condition being treated.

- Ensure that the tablet is swallowed whole, not cut, crushed, or chewed.

⊗ **Warning** Administer drug 3 hr before or at least 2 hr after antacids, iron, multivitamins, didanosine, or sucralfate.

⊗ **Warning** Discontinue drug at any sign of hypersensitivity (rash, photophobia) or with severe diarrhea.

- Discontinue drug and monitor ECG if palpitations or dizziness occurs.
- Monitor clinical response; if no improvement or a relapse occurs, repeat culture and sensitivity tests.

Teaching points

- Take drug once a day, at the same time each day, for the period prescribed, even if you are feeling much better. Swallow the tablet whole; do not cut, crush, or chew the tablet.
- If antacids, iron, multivitamins, sucralfate, or didanosine are being taken, you should take gemifloxacin 3 hours before or at least 2 hours after these drugs.
- Do not save tablets to self-treat other infections because this drug is very specific for the infection you have now.
- Drink plenty of fluids while you are taking this drug.
- Find another method of feeding your baby if you are nursing; the effects of this drug on the baby are not known.
- Stop the drug and notify your health care provider immediately if you experience acute pain or tenderness in a muscle or tendon; if you develop severe or bloody diarrhea or a severe rash.
- You may experience these side effects: Nausea, vomiting, abdominal pain (eat frequent small meals); diarrhea or constipation (consult your health care provider if this occurs); drowsiness, blurring of vision, dizziness (use caution if driving or using dangerous equipment); sensitivity to the sun (avoid exposure or use a sunscreen).
- Report palpitations, severe diarrhea, rash, fainting spells.

gentamicin sulfate*(jen ta mye' sin)***Parenteral, intrathecal:** Alcomycin (CAN), Pediatric Gentamicin Sulfate**Topical dermatologic cream, ointment:** Garamycin**Ophthalmic:** Garamycin, Gentak, Genoptic**PREGNANCY CATEGORY D****PREGNANCY CATEGORY C (OPHTHALMIC)****Drug class**

Aminoglycoside

Therapeutic actions

Bactericidal: Inhibits protein synthesis in susceptible strains of gram-negative bacteria; appears to disrupt functional integrity of bacterial cell membrane, causing cell death.

Indications**Parenteral**

- Serious infections caused by susceptible strains of *Pseudomonas aeruginosa*, *Proteus* species, *Escherichia coli*, *Klebsiella-Enterobacter-Serratia* species, *Citrobacter*, *Staphylococcus* species
- Serious infections when causative organisms are not known (often in conjunction with a penicillin or cephalosporin)
- Unlabeled use: With clindamycin as alternative regimen in PID

Intrathecal

- Gram-negative infections
- Serious CNS infections, such as meningitis, ventriculitis, infections caused by susceptible *Pseudomonas* species

Ophthalmic preparations

- Treatment of superficial ocular infections due to strains of microorganisms susceptible to gentamicin

Topical dermatologic preparation

- Infection prophylaxis in minor skin abrasions and treatment of superficial infections

of the skin due to susceptible organisms amenable to local treatment

Contraindications and cautions

- Contraindicated with allergy to any aminoglycosides.
- Use cautiously with renal or hepatic disease; sulfite sensitivity; preexisting hearing loss; active infection with herpes, vaccinia, varicella, fungal infections, mycobacterial infections (ophthalmic preparations); myasthenia gravis; parkinsonism; infant botulism; burn patients; lactation, pregnancy.

Available forms

Injection—10, 40 mg/mL; injection in 0.9% sodium chloride—0.8, 0.9, 1, 1.2, 1.4, 1.6 mg/mL; ophthalmic solution—3 mg/mL; ophthalmic ointment—3 mg/g; topical ointment—0.1%; topical cream—0.1%; ointment—1 mg; cream—1 mg

Dosages

Dosage should be based on estimated lean body mass.

Parenteral**Adults**

3 mg/kg/day in three equal doses every 8 hr IM or IV. Up to 5 mg/kg/day in three to four equal doses in severe infections, usually for 7–10 days. For IV use, a loading dose of 1–2 mg/kg may be infused over 30–60 min.

- **PID:** 2 mg/kg IV followed by 1.5 mg/kg tid plus clindamycin 600 mg IV qid. Continue for at least 4 days and at least 48 hr after patient improves, then continue clindamycin 450 mg orally qid for 10–14 days total therapy.
- **Surgical prophylaxis regimens:** Several complex, multidrug prophylaxis regimens are available for preoperative use; consult manufacturer's instructions.

Pediatric patients

2–2.5 mg/kg every 8 hr IM or IV.

Infants and neonates: 2.5 mg/kg every 8 hr.
Premature or full-term neonates: 2.5 mg/kg every 12 hr.

Geriatric patients or patients with renal failure

Reduce dosage or extend dosage intervals, and carefully monitor serum drug levels and renal function tests.

Ophthalmic solution**Adults and pediatric patients**

1–2 drops into affected eye or eyes every 4 hr; use up to 2 drops hourly in severe infections.

Ophthalmic ointment**Adults and pediatric patients**

Apply about ½" to affected eye bid–tid.

Dermatologic preparations**Adults and pediatric patients**

Apply tid–qid. Cover with sterile bandage if needed.

Pharmacokinetics

Route	Onset	Peak
IM, IV	Rapid	30–90 min

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Dilute single dose in 50–200 mL of sterile isotonic saline or D₅W. Do not mix in solution with any other drugs.

Infusion: Infuse over 30–120 min.

Incompatibilities: Do not mix in solution with any other drugs.

Adverse effects

- **CNS:** Ototoxicity—*tinnitus*, *dizziness*, vertigo, deafness (partially reversible to irreversible), vestibular paralysis, confusion, disorientation, depression, lethargy, nystagmus, visual disturbances, headache, *numbness*, *tingling*, tremor, paresthesias, muscle twitching, **seizures**, muscular weakness, **neuromuscular blockade**
- **CV:** Palpitations, hypotension, hypertension
- **GI:** Hepatic toxicity, *nausea*, *vomiting*, *anorexia*, weight loss, stomatitis, increased salivation
- **GU:** **Nephrotoxicity**
- **Hematologic:** *Leukemoid reaction*, **agranulocytosis**, **granulocytosis**, **leukopenia**, leukocytosis, **thrombocytopenia**, **eosinophilia**, **pancytopenia**, anemia, hemolytic anemia, increased or decreased reticulocyte count, electrolyte disturbances
- **Hypersensitivity:** *Purpura*, *rash*, urticaria, exfoliative dermatitis, itching

- **Local:** *Pain*, *irritation*, *arachnoiditis* at IM injection sites

- **Other:** Fever, **apnea**, splenomegaly, joint pain, *superinfections*

Ophthalmic preparations

- **Local:** *Transient irritation*, *burning*, *stinging*, *itching*, angioneurotic edema, urticaria, vesicular and maculopapular dermatitis, bacterial and fungal corneal ulcers

Topical dermatologic preparations

- **Local:** *Photosensitization*, *superinfections*

Interactions

★ **Drug–drug** • Increased ototoxic, nephrotoxic, neurotoxic effects with other aminoglycosides, potent diuretics, cephalosporins, vancomycin, methoxyflurane, enflurane • Increased neuromuscular blockade and muscular paralysis with anesthetics, nondepolarizing neuromuscular blocking drugs, succinylcholine, citrate-anticoagulated blood • Potential inactivation of both drugs if mixed with beta-lactam-type antibiotics (space doses with concomitant therapy) • Increased bactericidal effect with penicillins, cephalosporins (to treat some gram-negative organisms and enterococci), carbenicillin, ticarcillin (to treat *Pseudomonas* infections)

Nursing considerations**Assessment**

- **History:** Allergy to any aminoglycosides; renal or hepatic disease; preexisting hearing loss; active infection with herpes, varicella, varicella, fungal infections, mycobacterial infections (ophthalmic preparations); myasthenia gravis; parkinsonism; infant botulism; lactation, pregnancy
- **Physical:** Site of infection; skin color, lesions; orientation, reflexes, eighth cranial nerve function; P, BP; R, adventitious sounds; bowel sounds, liver evaluation; urinalysis, BUN, serum creatinine, serum electrolytes, LFTs, CBC

Interventions

- Monitor serum concentrations when feasible to avoid potentially toxic levels. Peak levels should not exceed 12 mcg/mL (6–8 mcg/mL is usually adequate for most infections). Trough levels should not exceed 2 mcg/mL.

- Give by IM route if at all possible; give by deep IM injection.
- Culture infected area before therapy.
- Use 2 mg/mL intrathecal preparation without preservatives, for intrathecal use.
- Avoid long-term therapies because of increased risk of toxicities. Reduction in dose may be clinically indicated.
- Patients with edema or ascites may have lower peak concentrations due to expanded extracellular fluid volume.
- Cleanse area before application of dermatologic preparations.
- Ensure adequate hydration of patient before and during therapy.

⊗ **Black box warning** Monitor hearing with long-term therapy; ototoxicity can occur.

⊗ **Black box warning** Monitor renal function tests, CBC, and serum drug levels during long-term therapy. Consult with prescriber to adjust dosage as needed.

Teaching points

- Apply ophthalmic preparations by tilting head back; place medications into conjunctival sac and close eye; apply light pressure on lacrimal sac for 1 minute.
- Cleanse area before applying dermatologic preparations; area may be covered if necessary.
- You may experience these side effects: Ringing in the ears, headache, dizziness (reversible; use safety measures if severe); nausea, vomiting, loss of appetite (eat frequent small meals, perform frequent mouth care); burning, blurring of vision with ophthalmic preparations (avoid driving or performing dangerous activities if visual effects occur); photosensitization with dermatologic preparations (wear sunscreen and protective clothing).
- Report pain at injection site, severe headache, dizziness, loss of hearing, changes in urine pattern, difficulty breathing, rash or skin lesions; itching or irritation (ophthalmic preparations); worsening of the condition, rash, irritation (dermatologic preparation).

▷ glatiramer acetate

See Appendix U, *Less commonly used drugs*.

⚠ DANGEROUS DRUG

▷ glimepiride

(*gbye meeb' per ide*)

Amaryl, CO-Glimepiride (CAN),
ratio-Glimepiride (CAN)

PREGNANCY CATEGORY C

Drug classes

Antidiabetic

Sulfonylurea (second generation)

Therapeutic actions

Stimulates insulin release from functioning beta cells in the pancreas; may improve binding between insulin and insulin receptors or increase the number of insulin receptors; thought to be more potent in effect than first-generation sulfonylureas.

Indications

- As an adjunct to diet to lower blood glucose in patients with type 2 diabetes mellitus whose hypoglycemia cannot be controlled by diet and exercise alone
- In combination with metformin or insulin to better control glucose as an adjunct to diet and exercise in patients with type 2 diabetes mellitus

Contraindications and cautions

- Contraindicated with allergy to sulfonylureas; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is indicated in these conditions); type 1 or juvenile diabetes, serious hepatic or renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; labor and delivery—if glimepiride is used during pregnancy, discontinue drug at least 1 mo before delivery; lactation, safety not established.
- Use cautiously with pregnancy.

Available forms

Tablets—1, 2, 4 mg

Dosages

Dose conservatively in elderly patients, debilitated or malnourished patients, and patients with renal or hepatic impairment.

Adults

Usual starting dose is 1–2 mg PO once daily with breakfast or first meal of the day; usual maintenance dose is 1–4 mg PO once daily, depending on patient response and glucose levels. Do not exceed 8 mg/day.

- **Combination with insulin therapy:** 8 mg PO daily with first meal of the day with low-dose insulin.
- **Transfer from other hypoglycemics:** No transition period is necessary.

Pediatric patients

Safety and efficacy not established.

Patients with renal or hepatic impairment; elderly, debilitated, malnourished patients; adrenal or pituitary insufficiency

Usual starting dose is 1 mg PO once daily; adjust dose carefully, lower maintenance doses may be sufficient to control blood sugar.

Pharmacokinetics

Route	Onset	Peak
Oral	1 hr	2–3 hr

Metabolism: Hepatic; $T_{1/2}$: 5.5–7 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** Drowsiness, asthenia, nervousness, tremor, insomnia, blurred vision
- **CV: Increased risk of CV mortality** (possible)
- **Endocrine:** *Hypoglycemia*, SIADH
- **GI:** *Anorexia, nausea, vomiting, epigastric discomfort, heartburn, diarrhea*
- **Hematologic:** **Leukopenia, thrombocytopenia**, anemia
- **Hypersensitivity:** *Allergic skin reactions, eczema, pruritus, erythema, urticaria, photosensitivity, fever, eosinophilia, jaundice*
- **Other:** Diuresis, tinnitus, fatigue, weight gain, hyponatremia

Interactions

★ **Drug-drug** • Increased risk of hypoglycemia with androgens, anticoagulants, azole antifungals, beta blockers, chloramphenicol, clofibrate, fluconazole, gemfibrozil, histamine-2 blockers, magnesium salts, MAOIs, methyl-dopa, probenecid, salicylates, sulfapyrazone, sulfonamides, TCAs, urinary acidifiers • Decreased effectiveness of both glimepiride and diazoxide if taken concurrently • Increased risk of hyperglycemia with rifampin, thiazides • Risk of hypoglycemia and hyperglycemia with ethanol; “disulfiram reaction” has also been reported • Possible decreased hypoglycemic effect with calcium channel blockers, cholestyramine, corticosteroids, diazoxide, estrogens, hydantoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, rifampin, sympathomimetics, thiazide diuretics, thyroid drugs, urinary alkalinizers

★ **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery

Nursing considerations

Assessment

- **History:** Allergy to sulfonylureas; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is indicated in these conditions); type 1 or juvenile diabetes, serious hepatic or renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, serum creatinine, LFTs, blood glucose, CBC

Interventions

- Monitor serum glucose levels frequently to determine effectiveness of drug and dosage being used.
- ⊗ **Warning** Transfer to insulin therapy during periods of high stress (eg, infections, surgery, trauma).
- Use IV glucose if severe hypoglycemia occurs as a result of overdose.

- Arrange for consultation with dietician to establish weight-loss program and dietary control.
- Arrange for thorough diabetic teaching program, including disease, dietary control, exercise, signs and symptoms of hypoglycemia and hyperglycemia, avoidance of infection, hygiene.

Teaching points

- Take this drug once a day with breakfast or the first main meal of the day.
- Do not discontinue this drug without consulting your health care provider.
- Continue with diet and exercise program for diabetes control.
- Monitor blood for glucose and ketones as prescribed.
- Do not use this drug if you are pregnant.
- Avoid alcohol while taking this drug.
- Report fever, sore throat, unusual bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions.

DANGEROUS DRUG

 **glipiZIDE**
(glip' i zide)

Glucotrol, Glucotrol XL **OR**

PREGNANCY CATEGORY C

Drug classes

Antidiabetic

Sulfonylurea (second generation)

Therapeutic actions

Stimulates insulin release from functioning beta cells in the pancreas; may improve binding between insulin and insulin receptors or increase the number of insulin receptors; more potent in effect than first-generation sulfonylureas.

Indications

- Adjunct to diet and exercise to lower blood glucose with type 2 diabetes mellitus

Contraindications and cautions

- Contraindicated with allergy to sulfonylureas, diabetes with ketoacidosis, sole therapy of

type 1 diabetes or diabetes complicated by pregnancy; diabetes complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is indicated); type 1 diabetes, serious hepatic impairment, serious renal impairment.

- Use cautiously with uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; labor and delivery (if glipizide is used during pregnancy, discontinue drug at least 1 mo before delivery); lactation; pregnancy.

Available forms

Tablets—5, 10 mg; ER tablets **OR**—2.5, 5, 10 mg

Dosages

Dose conservatively in elderly patients, debilitated or malnourished patients, and patients with renal or hepatic impairment.

Give approximately 30 min before breakfast to achieve greatest reduction in postprandial hyperglycemia; if using extended-release form, give with breakfast.

Adults

- **Initial therapy:** 5 mg PO before breakfast. Adjust dosage in increments of 2.5–5 mg as determined by blood glucose response. At least several days should elapse between adjustments. Maximum once-daily dose should not exceed 15 mg; above 15 mg, divide dose, and administer before meals. Do not exceed 40 mg/day. ER tablets: 5 mg/day. Adjust dosage in 5-mg increments every 3 mo; maximum dose—20 mg/day.
- **Maintenance therapy:** Total daily doses above 15 mg PO should be divided; total daily doses above 30 mg are given in divided doses bid.
- **ER form:** 5 mg/day with breakfast, may be increased to 10 mg/day after 3 mo if indicated.

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Geriatric patients tend to be more sensitive to the drug. Start with initial dose of 2.5 mg/day PO. Monitor for 24 hr and gradually increase dose after several days as needed.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–1.5 hr	1–3 hr	10–24 hr
Oral (ER)	2–3 hr	6–12 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 2–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** Drowsiness, asthenia, nervousness, tremor, insomnia, tinnitus, fatigue, headache
- **CV: Increased risk of CV mortality,** syncope, blurred vision
- **Endocrine:** *Hypoglycemia*, SIADH
- **GI:** *Anorexia, nausea, vomiting, epigastric discomfort, heartburn, diarrhea*, flatulence
- **Hematologic: Leukopenia, thrombocytopenia,** anemia
- **Hypersensitivity:** *Allergic skin reactions, eczema, pruritus, erythema, urticaria*, photosensitivity, fever, eosinophilia, jaundice
- **Other:** Weight gain, arthralgia, leg cramps, hyponatremia

Interactions

• **Drug-drug** • Increased risk of hypoglycemia with sulfonamides, chloramphenicol, salicylates, clofibrate, beta blockers • Decreased effectiveness of glipizide and diazoxide if taken concurrently • Increased risk of hyperglycemia with rifampin, thiazides • Risk of hypoglycemia and hyperglycemia with ethanol; “disulfiram reaction” also has been reported

• **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery, karela

■ Nursing considerations

Assessment

- **History:** Allergy to sulfonylureas; diabetes mellitus with complications; type 1 diabetes mellitus, serious hepatic or renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel

sounds; urinalysis, BUN, serum creatinine, LFTs, blood glucose, CBC

Interventions

- Give drug 30 min before breakfast; if severe GI upset occurs or more than 15 mg/day is required, dose may be divided and given before meals.
- Ensure that patient swallows ER tablets whole; do not allow patient to cut, crush, or chew them.
- Monitor serum glucose levels frequently to determine drug effectiveness and dosage.
- ⊗ **Warning** Transfer to insulin therapy during periods of high stress (eg, infections, surgery, trauma).
- ⊗ **Warning** Use IV glucose if severe hypoglycemia occurs as a result of overdose.

Teaching points

- Take this drug 30 minutes before breakfast for best results.
- Do not discontinue this drug without consulting your health care provider.
- Monitor blood for glucose and ketones.
- If taking ER tablets, swallow them whole; do not crush, chew, or divide tablets. The empty tablet may appear in your stool.
- Continue the prescribed diet and exercise regimen.
- Do not use this drug during pregnancy; consult your health care provider.
- Avoid alcohol while using this drug.
- Report fever, sore throat, unusual bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions.

▷ glucagon (rDNA origin) (gloo' ka gon)

GlucaGen Diagnostic Kit,
GlucaGen HypoKit,
Glucagon Emergency Kit

PREGNANCY CATEGORY B

Drug classes

Diagnostic agent
Glucose-elevating drug
Hormone

Therapeutic actions

Accelerates the breakdown of glycogen to glucose (glycogenolysis) in the liver, causing an increase in blood glucose level; relaxes smooth muscle of the GI tract and increases the force of contraction of the heart.

Indications

- Hypoglycemia: Counteracts severe hypoglycemic reactions in diabetic patients treated with insulin
- Diagnostic aid in the radiologic examination of the stomach, duodenum, small bowel, or colon when a hypotonic state is advantageous
- Unlabeled uses: Treatment of beta blocker and calcium channel blocker overdose and in anaphylactic reactions

Contraindications and cautions

- Contraindicated with hypersensitivity, pheochromocytoma, insulinoma.
- Use cautiously with pregnancy, lactation, insulinoma.

Available forms

Powder for injection—1 mg

Dosages

Adults and pediatric patients weighing more than 20 kg

- *Hypoglycemia*: 0.5–1.0 mg IV, IM, or subcutaneously; severe hypoglycemia: 1 mL IV, IM, or subcutaneously. Response is usually seen in 5–20 min. If response is delayed, dose may be repeated one to two times. Use IV if possible.
- *Diagnostic aid*: Suggested dose, route, and timing of dose vary with the segment of GI tract to be examined and duration of effect needed. Carefully check manufacturer's literature before use. Usual dose is 0.25–2 mg IV or 1–2 mg IM.

Pediatric patients weighing less than 20 kg

0.5 mg IM, IV, or subcutaneously, or a dose equivalent to 20–30 mcg/kg.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1 min	15 min	9–20 min
IM	8–10 min	20–30 min	19–32 min

Metabolism: Hepatic; $T_{1/2}$: 3–10 min

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

IV FACTS

Preparation: Reconstitute with vial provided. Use immediately; refrigerated solution stable for 48 hr. If doses higher than 2 mg, reconstitute with sterile water for injection and use immediately.

Infusion: Inject directly into the IV tubing of an IV drip infusion, each 1 mg over 1 min.

Incompatibilities: Compatible with dextrose solutions, but precipitates may form in solutions of sodium chloride, potassium chloride, or calcium chloride.

Adverse effects

- **CV:** Hypotension, hypertension, tachycardia
- **GI:** *Nausea, vomiting*
- **Hematologic:** Hypokalemia in overdose
- **Hypersensitivity:** Urticaria, **respiratory distress**, hypotension

Interactions

- **Drug-drug** • Increased anticoagulant effect and risk of bleeding with oral anticoagulants

Nursing considerations Assessment

- **History:** Insulinoma, pheochromocytoma, lactation, pregnancy
- **Physical:** Skin color, lesions, T; orientation, reflexes; P, BP, peripheral perfusion; R; liver evaluation, bowel sounds; blood and urine glucose, serum potassium

Interventions

- **Warning** • Arouse hypoglycemic patient as soon as possible after drug injection, and provide supplemental carbohydrates to restore liver glycogen and prevent secondary hypoglycemia.

- Arrange for evaluation of insulin dosage in cases of hypoglycemia as a result of insulin overdosage; insulin dosage may need to be adjusted.

Teaching points

- You and significant others should learn to administer the drug subcutaneously in case of hypoglycemia, and know when to notify your health care provider.

DANGEROUS DRUG

glyBURIDE (glye' byoor ide)

Apo-Glyburide (CAN), DiaBeta, Gen-Glybe (CAN), Glibenclamide, Glynase PresTab, Novo-Glyburide (CAN), PMS-Glyburide (CAN), ratio-Glyburide (CAN)

PREGNANCY CATEGORY B
(GLYNASE)

PREGNANCY CATEGORY C
(DIABETA)

Drug classes

Antidiabetic
Sulfonylurea

Therapeutic actions

Stimulates insulin release from functioning beta cells in the pancreas; may improve binding between insulin and insulin receptors or increase the number of insulin receptors; more potent in effect than first-generation sulfonylureas.

Indications

- Adjunct to diet to lower blood glucose with type 2 diabetes mellitus

Contraindications and cautions

- Contraindicated with allergy to sulfonylureas; diabetes mellitus with ketoacidosis, sole therapy of type 1 diabetes mellitus or diabetes mellitus complicated by pregnancy, serious hepatic or renal impairment, uremia; diabetes mellitus complicated by fever, severe infections, severe trauma, major surgery, ketosis, acidosis, coma (insulin is contraindicated).

- Use cautiously with pregnancy, lactation, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease; labor and delivery (if glyburide is used during pregnancy, discontinue drug at least 1 mo before delivery).

Available forms

Tablets—1.25, 2.5, 5 mg; micronized tablets—1.5, 3, 4.5, 6 mg

Dosages

Adults

- *Initial therapy:* 2.5–5 mg PO with breakfast (*DiaBeta*); 1.5–3 mg/day PO (*Glynase*).
- *Maintenance therapy:* 1.25–20 mg/day PO given as a single dose or in divided doses. Increase in increments of no more than 2.5 mg (1.5 mg micronized) at weekly intervals based on patient's blood glucose response (*DiaBeta*); 0.75–12 mg/day PO (*Glynase*).

Debilitated or malnourished patients

Start with 1.25 mg daily (nonmicronized) or 0.75 mg daily (micronized).

Pediatric patients

Safety and efficacy not established.

Geriatric patients

Geriatric patients tend to be more sensitive to the drug; start with initial dose of 1.25 mg/day PO (*DiaBeta*); 0.75 mg/day PO (*Glynase*). Monitor for 24 hr, and gradually increase dose after at least 1 wk as needed.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral			
Micronized	1 hr	2–3 hr	12–24 hr
Nonmicronized	2–4 hr	4 hr	12–24 hr

Metabolism: Hepatic; $T_{1/2}$: 4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

- **CNS:** Drowsiness, tinnitus, fatigue, asthenia, nervousness, tremor, insomnia
- **CV: Increased risk of CV mortality**
- **Endocrine: Hypoglycemia**

- **GI:** *Anorexia, nausea, vomiting, epigastric discomfort, heartburn, diarrhea, weight gain*
- **Hematologic:** **Leukopenia, thrombocytopenia, anemia**
- **Hypersensitivity:** *Allergic skin reactions, eczema, pruritus, erythema, urticaria, photosensitivity, fever, eosinophilia, jaundice*
- **Other:** Blurred vision

Interactions

- * **Drug-drug** • Increased risk of hypoglycemia with sulfonamides, chloramphenicol, salicylates, clofibrate • Decreased effectiveness of glyburide and diazoxide if taken concurrently • Increased risk of hyperglycemia with rifampin, thiazides • Risk of hypoglycemia and hyperglycemia with ethanol; “disulfiram reaction” has been reported
- * **Drug-alternative therapy** • Increased risk of hypoglycemia if taken with juniper berries, ginseng, garlic, fenugreek, coriander, dandelion root, celery, karela

■ Nursing considerations

CLINICAL ALERT!

Name confusion has occurred between *DiaBeta* (glyburide) and *Zebeta* (bisoprolol); use caution.

Assessment

- **History:** Allergy to sulfonylureas; diabetes with complications; type 1 diabetes, serious hepatic or renal impairment, uremia, thyroid or endocrine impairment, glycosuria, hyperglycemia associated with primary renal disease, pregnancy
- **Physical:** Skin color, lesions; T; orientation, reflexes, peripheral sensation; R, adventitious sounds; liver evaluation, bowel sounds; urinalysis, BUN, serum creatinine, LFTs, blood glucose, CBC

Interventions

- Give drug before breakfast. If severe GI upset occurs, dose may be divided and given before meals.
- Monitor serum glucose levels frequently to determine drug effectiveness and dosage.
- Monitor dosage carefully if switching to or from *Glyrase*.

⊗ **Warning** Transfer to insulin therapy during periods of high stress (eg, infections, surgery, trauma).

⊗ **Warning** Use IV glucose if severe hypoglycemia occurs as a result of overdose.

Teaching points

- Do not discontinue this medication without consulting your health care provider.
- Monitor blood for glucose and ketones; continue diet and exercise regimen for your diabetes.
- Do not use this drug during pregnancy; consult your health care provider.
- Avoid alcohol while using this drug.
- Report fever, sore throat, unusual bleeding or bruising, rash, dark urine, light-colored stools, hypoglycemic or hyperglycemic reactions.

▽ glycerin (glycerol) (gli' ser in)

Colace Liquid, Colace Suppositories, Fleet Babylax, Osmoglyn, Sani-Supp

PREGNANCY CATEGORY C

Drug classes

Hyperosmolar laxative
Ophthalmic hyperosmolar preparation
Osmotic diuretic

Therapeutic actions

Elevates the osmolarity of the glomerular filtrate, thereby hindering the reabsorption of water and leading to a loss of water, sodium, and chloride; creates an osmotic gradient in the eye between plasma and ocular fluids, thereby reducing IOP; causes the local absorption of sodium and water in the stool, leading to a more liquid stool and local intestinal movement.

Indications

- *Osmoglyn*: For glaucoma, to interrupt acute attacks, or when a temporary drop in IOP is required
- *Osmoglyn*: Before ocular surgery performed under local anesthetic when a reduction in IOP is indicated

- Temporary relief of constipation
- Before rectal or bowel surgeries
- IV, unlabeled use (with proper preparation): To lower intracranial pressure or IOP

Contraindications and cautions

- Contraindicated with hypersensitivity to glycerin; symptoms of appendicitis, nausea, vomiting, fecal impaction, undiagnosed abdominal pain, intestinal obstruction; contraindicated as an osmotic diuretic with established anuria, severe dehydration, frank or impending acute pulmonary edema, severe cardiac decompensation.
- Use cautiously in the elderly; with hypervolemia, heart failure, confused mental states, severe dehydration, senility, diabetes, lactation, pregnancy.

Available forms

Oral solution—50% (0.6 mg/mL); liquid—4 mL/applicator; suppositories

Dosages

Adults

Oral

- *Reduction of IOP:* 2–3 mL of glycerin per kg of body weight (approximately 4–6 oz) given PO only, 1 hr–90 min before surgery (*Osmoglym*).

Rectal

- *Laxative:* Insert one suppository high in rectum and retain 15–30 min; for rectal liquid, insert stem with tip pointing toward navel; squeeze unit until nearly all liquid is expelled, then remove.

Pediatric patients 2–6 yr

1 unit or as directed by physician.

Pediatric patients younger than 2 yr

Consult physician.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral (<i>Osmoglym</i>)	Varies	1 hr	5 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Confusion, headache, syncope*, disorientation
- **CV:** Cardiac arrhythmias
- **Endocrine:** **Hyperosmolar nonketotic coma**
- **GI:** *Nausea, vomiting, diarrhea*
- **Other:** Severe dehydration, weight gain with continued use, local irritation ophthalmically, local irritation (suppository)

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to glycerin, hypervolemia, heart failure, confused mental states, severe dehydration, elderly, senility, diabetes, lactation, pregnancy
- **Physical:** Skin color, edema; orientation, reflexes, muscle strength, pupillary reflexes; P, BP, perfusion; R, pattern, adventitious sounds; urinary output patterns; serum electrolytes, urinalysis

Interventions

- Give *Osmoglym* orally only; it is not for injection.
- Give laxative as follows: Insert one suppository high in rectum, and have patient retain 15–30 min; for rectal liquid, insert stem with tip pointing toward navel; squeeze unit until nearly all liquid is expelled, then remove.
- Place a child on left side with knees bent and arms resting comfortably. Or use knee-chest position: Have child kneel and then lower head and chest until left side of face is resting on the surface with left arm folded comfortably.
- May give local anesthetic before ophthalmic use because of local irritation that may occur.
- Monitor urinary output carefully.
- Monitor BP regularly.

Teaching points

- Take laxative as follows: Insert one suppository high in the rectum and retain for 15 minutes; for rectal liquid, insert stem with tip pointing toward navel; squeeze unit until nearly all liquid is expelled, then remove the unit. Some liquid will be left in the unit.

- You may experience these side effects: Increased urination, GI upset (eat frequent small meals), dry mouth (suck sugarless lozenges), headache, blurred vision (use caution when moving around; ask for assistance).
- Report severe headache, chest pain, confusion, rapid respirations, violent diarrhea.

glycopyrrolate (*glye koe pye' roe late*)

Cuvposa, Robinul, Robinul Forte

PREGNANCY CATEGORY B

Drug classes

Anticholinergic (quaternary)
Antimuscarinic
Antispasmodic
Parasympatholytic

Therapeutic actions

Competitively blocks the effects of acetylcholine at receptors that mediate the effects of parasympathetic postganglionic impulses; depresses salivary and bronchial secretions; dilates the bronchi; inhibits vagal influences on the heart; relaxes the GI and GU tracts; inhibits gastric acid secretion.

Indications

- Oral: Adjunctive therapy in the treatment of peptic ulcer
- Oral solution: Treatment of chronic, severe drooling caused by neurologic disorders in children 3–16 yr
- Parenteral: Reduction of salivary, tracheo-bronchial, and pharyngeal secretions preoperatively; reduction of the volume and free acidity of gastric secretions; and blocking of cardiac vagal inhibitory reflexes during induction of anesthesia and intubation; may be used intraoperatively to counteract drug-induced or vagal traction reflexes with the associated arrhythmias
- Parenteral: Protection against the peripheral muscarinic effects (eg, bradycardia, excessive secretions) of cholinergics (neostigmine, pyridostigmine) that are used to

reverse the neuromuscular blockade produced by nondepolarizing neuromuscular junction blockers

Contraindications and cautions

- Contraindicated with glaucoma; adhesions between iris and lens; stenosing peptic ulcer; pyloroduodenal obstruction; paralytic ileus; intestinal atony; severe ulcerative colitis; toxic megacolon; symptomatic prostatic hypertrophy; bladder neck obstruction; bronchial asthma; COPD; cardiac arrhythmias; tachycardia; myocardial ischemia; lactation; impaired metabolic, liver, or kidney function; myasthenia gravis.
- Use cautiously in the elderly and with Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism, pregnancy.

Available forms

Tablets—1, 2, mg; injection—0.2 mg/mL; oral solution—1 mg/5 mL

Dosages

Adults

Oral

1 mg tid or 2 mg bid–tid. For maintenance, 1 mg bid. Maximum daily dose is 8 mg PO.

Parenteral

- *Peptic ulcer*: 0.1–0.2 mg IM or IV tid–qid.
- *Preanesthetic medication*: 0.004 mg/kg IM 30–60 min before anesthesia.
- *Intraoperative*: 0.1 mg IV; repeat as needed at 2- to 3-min intervals.
- *Reversal of neuromuscular blockade*: With neostigmine, pyridostigmine: 0.2 mg for each 1 mg neostigmine or 5 mg pyridostigmine; administer IV simultaneously.

Pediatric patients

Not recommended for children younger than 12 yr for peptic ulcer.

Oral

Pediatric patients 3–16 yr

- *Chronic, severe drooling*: Initially, 0.02 mg/kg PO tid; titrate in 0.02-mg increments every 5–7 days. Maximum dose, 0.1 mg/kg PO tid; do not exceed 1.5–3 mg/dose.

Parenteral

- *Preanesthetic medication*:
1 mo–2 yr: Up to 0.009 mg/kg may be needed.

2 yr and older: 0.004 mg/kg IM 30 min to 1 hr before anesthesia.

Younger than 12 yr: 0.002–0.004 mg/kg IM.

Pediatric patients older than 1 mo

- **Intraoperative:** 0.004 mg/kg IV, not to exceed 0.1 mg in a single dose. May be repeated at 2- to 3-min intervals.
- **Reversal of neuromuscular blockade:** 0.2 mg for each 1 mg neostigmine or 5 mg pyridostigmine. Give IV simultaneously.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	60 min	60 min	8–12 hr
IM, Subcut.	15–30 min	30–45 min	2–7 hr
IV	1 min	End of infusion	Unknown

Metabolism: Hepatic; $T_{1/2}$: 2.5 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: No additional preparation required.

Infusion: Administer slowly into tubing of a running IV, each 0.2 mg over 1–2 min.

Incompatibilities: Do not combine with methylprednisolone; sodium succinate. May be incompatible with drugs that have more alkaline pH (greater than 6); eg, barbiturates, diazepam, lactated Ringer's solution.

Adverse effects

- **CNS:** Headache, flushing, nervousness, drowsiness, fever, mental confusion
- **CV:** Palpitations, tachycardia
- **GI:** Dry mouth, altered taste perception, nausea, vomiting, dysphagia, heartburn, constipation, bloated feeling, paralytic ileus, gastroesophageal reflux
- **GU:** Urinary hesitancy and retention, impotence
- **Local:** Irritation at site of IM injection
- **Ophthalmic:** Blurred vision, mydriasis, cycloplegia, photophobia, increased IOP
- **Other:** Decreased sweating and predisposition to heat prostration, suppression of lactation, nasal congestion

Interactions

• **Drug-drug** • Decreased antipsychotic effectiveness of haloperidol with anticholinergic drugs • Increased anticholinergic side effects (dry mouth, constipation, urinary retention) with amantadine and TCAs • Decreased antipsychotic effects and increased anticholinergic effects with phenothiazines • Risk of increased digoxin level with oral glycopyrrolate; monitor patient closely • Increased toxic effects with amantadine; dosage may need to be decreased

Nursing considerations Assessment

- **History:** Glaucoma; adhesions between iris and lens, stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, COPD, cardiac arrhythmias, myocardial ischemia, impaired metabolic, liver or kidney function, myasthenia gravis; lactation; Down syndrome, brain damage, spasticity, hypertension, hyperthyroidism, pregnancy
- **Physical:** Bowel sounds, normal output; normal urinary output, prostate palpation; R, adventitious sounds; P, BP; IOP, vision; bilateral grip strength, reflexes; hepatic palpation, LFTs, renal function tests; skin color, lesions, texture

Interventions

- Ensure adequate hydration; provide environmental control (temperature) to prevent hyperpyrexia.
- Check pediatric dosage carefully; may be in mg/lb or mg/kg.
- Have patient void before each dose if urinary retention is a problem.

Teaching points

- Take this drug exactly as prescribed.
- Avoid hot environments (you will be heat-intolerant; dangerous reactions may occur).
- You may experience these side effects: Constipation (ensure adequate fluid intake, proper diet); dry mouth (suck sugarless lozenges, use frequent mouth care; this effect may lessen); blurred vision, sensitivity to light (reversible; avoid tasks that require acute

- vision; wear sunglasses in bright light); impotence (reversible); difficulty in urination (empty bladder immediately before taking each dose).
- Report rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, palpitations, headache, abdominal distention, hallucinations, severe or persistent dry mouth, difficulty swallowing, difficulty urinating, severe constipation, sensitivity to light.

▷ gold sodium thiomalate

See Appendix U, *Less commonly used drugs*.

▷ golimumab (gob *lim'* yoo mab)

Simponi

PREGNANCY CATEGORY B

Drug classes

Antiarthritic
Monoclonal antibody
Tumor necrosis factor inhibitor

Therapeutic actions

Tumor necrosis factor antibody that binds to tumor necrosis factor, blocking an important mediator in the inflammatory response seen in chronic inflammatory diseases, such as rheumatoid arthritis, psoriatic arthritis, and ankylosing spondylitis.

Indications

- Treatment of moderately to severely active rheumatoid arthritis in adults in combination with methotrexate
- Treatment of active psoriatic arthritis in adults, as monotherapy or in combination with methotrexate
- Treatment of ankylosing spondylitis in adults

Contraindications and cautions

- Contraindicated with hypersensitivity to components of drug, active infection, active tuberculosis, lactation.

- Use cautiously with heart failure, history of exposure to fungal infections, hepatitis B, malignancies, demyelinating disorders such as multiple sclerosis, pregnancy.

Available forms

Single-use prefilled syringe—50 mg/0.5 mL; single-use autoinjector—50 mg/0.5 mL

Dosages

Adults

50 mg by subcutaneous injection once a month.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow	2–6 days

Metabolism: Hepatic; $T_{1/2}$: 2 wk

Distribution: May cross placenta; may enter breast milk

Excretion: Tissues

Adverse effects

- **CNS:** Dizziness, **increased risk of demyelinating disorders**
- **CV:** Hypertension, heart failure
- **Respiratory:** *URI, nasopharyngitis*, bronchitis, sinusitis, rhinitis
- **Other:** Fever, injection-site reaction, **risk of infection**, psoriasis

Interactions

★ **Drug-drug** • Increased risk of potentially serious infection if combined with anakinra, abatacept, rituximab, other TNF blockers (infliximab, adalimumab, etanercept, certolizumab); avoid this combination • Risk of infection if live vaccines are given while patient is taking this drug; avoid this combination

■ Nursing considerations Assessment

- **History:** Tuberculosis, malignancy, heart failure, multiple sclerosis, travel exposure to invasive fungal infections, hepatitis B, pregnancy, lactation
- **Physical:** T, orientation; R, adventitious sounds; BP

Interventions

⊗ **Black box warning** Potentially serious infections are possible with drug administration, including TB, sepsis, invasive fungal infections. Discontinue drug if patient develops infection or sepsis. Perform TB test before beginning therapy. If TB is present, start TB treatment and monitor patient carefully throughout therapy.

⊗ **Black box warning** There is increased risk of lymphoma and other cancers in children and adolescents being treated with golimumab.

- Store syringes in refrigerator. Allow prefilled syringe or autoinjector to sit at room temperature for 30 min before giving subcutaneous injection. Solution should be clear and free of particles. Discard unused solution.
- Rotate injection sites; do not inject into areas that are bruised, red, or hard. Monitor sites for infection.
- Monitor patient with history of hepatitis B for possible reactivation; if reactivation occurs, stop golimumab and begin antiviral therapy.
- Monitor patient for possible demyelinating disorders.
- Do not administer live vaccines to patient taking this drug.
- Monitor patient for signs and symptoms of infection and discontinue drug if infection occurs.
- Protect patient from exposure to infections and ensure regular physical exams and monitoring for infections or cancer development.

Teaching points

- You will need to have a TB test before beginning therapy with this drug.
- Take this drug exactly as prescribed, once a month by subcutaneous injection. Mark your calendar with the injection dates. This drug does not cure your rheumatic disease, and you may be taking other drugs to help with the signs and symptoms.
- You and a significant other should learn how to administer subcutaneous injections. Store the syringes in the refrigerator. Let the syringe sit at room temperature for 30 minutes before injecting drug. Make sure the solution is clear and free of particles. Discard any leftover solution. Consult your health

care provider about the proper disposal of needles and syringes.

- Arrange for periodic medical follow-up to evaluate the effects of the drug on your body.
- This drug may appear in breast milk and cause adverse effects in a nursing baby; if you are nursing a baby, you should use another method of feeding the baby.
- You should not receive live vaccines while you are taking this drug.
- You may experience these side effects: dizziness (avoid driving or operating hazardous machinery if this occurs); upper respiratory infection, runny nose (consult your health care provider for potential treatments if this becomes uncomfortable); increased susceptibility to infections (avoid people who might have infections and crowded areas; use strict hand-washing technique and good hygiene).
- Report fever, rash, chills, lethargy, swelling, numbness, tingling, worsening of arthritis symptoms, difficulty breathing.

G

▽ gonadorelin hydrochloride

See Appendix U, *Less commonly used drugs*.

⚠ DANGEROUS DRUG

▽ goserelin acetate (*goe' se rel in*)

Zoladex, Zoladex LA (CAN)

PREGNANCY CATEGORY X

PREGNANCY CATEGORY D
(IN BREAST CANCER)

Drug classes

Antineoplastic
Hormone

Therapeutic actions

An analogue of LH-RH or gonadotropin-releasing hormone; potent inhibitor of pituitary gonadotropin secretion; initial administration causes an increase in FSH and LH and resultant increase in testosterone levels;

with long-term administration, these hormone levels fall to levels normally seen with surgical castration within 2–4 wk, as pituitary is inhibited. In women this leads to a decrease in serum estradiol levels and therefore a reduction in ovarian size and function, uterus and mammary gland size, and a repression of sex hormone-responsive tumors.

Indications

- Palliative treatment of advanced prostatic cancer when orchiectomy or estrogen administration is not indicated or is unacceptable
- Stage B₂–C prostatic cancer with flutamide for locally confined T2b–T4 carcinoma
- Management of endometriosis, including pain relief and reduction of endometriotic lesions
- Palliative treatment of advanced breast cancer in premenopausal and perimenopausal women
- Endometrial thinning drug before endometrial ablation

Contraindications and cautions

- Contraindicated with pregnancy, lactation, hypersensitivity to LH-RH or any component, undiagnosed vaginal bleeding.
- Use cautiously with hypercalcemia, high lipid levels.

Available forms

Implant—3.6, 10.8 mg

Dosages

Adults

3.6 mg subcutaneously every 28 days or 10.8 mg every 3 mo into the upper abdominal wall.

- *Prostatic or breast carcinoma*: Long-term use of 3.6 mg.
- *Endometriosis*: Continue therapy with 3.6 mg for 6 mo.
- *Endometrial thinning*: One to two 3.6-mg subcutaneous depots 4 wk apart; surgery should be done 4 wk after first dose—within 2–4 wk after second depot if two are used.
- *Stage B₂–C prostatic cancer*: Start therapy 8 wk before initiating radiation therapy

and continue during radiation therapy. Treatment regimen is one 3.6 mg depot 8 wk before radiation followed by one 10.8-mg depot 28 days later. Or, four injections of 3.6-mg depot at 28-day intervals, two depots preceding and two during radiotherapy.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak
Subcut.	Slow (men) 8–22 days (women)	12–15 days (men) 8–22 days (women)

Metabolism: Hepatic; T_{1/2}: 4.2 hr (men), 2.3 hr (women)

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS**: Insomnia, dizziness, lethargy, anxiety, depression, headache, emotional lability
- **CV**: Heart failure, edema, hypertension, arrhythmia, chest pain, vasodilation, hypotension
- **GI**: Nausea, anorexia
- **GU**: *Hot flashes, sexual dysfunction, dysmenorrhea, decreased erections, lower urinary tract symptoms, vaginitis, gynecocomastia*
- **Other**: Rash, sweating, cancer, pain, breast atrophy, peripheral edema

Nursing considerations

Assessment

- **History**: Pregnancy, lactation
- **Physical**: Skin T, lesions; reflexes, affect; BP, P; urinary output; pregnancy test if appropriate, calcium levels, lipid levels

Interventions

- ⊗ **Warning** Ensure that patient is not pregnant before use; advise patient to use barrier contraceptives.
- Use syringe provided. Discard if package is damaged. Remove sterile syringe immediately before use. Use a local anesthetic before injection to decrease pain and discomfort.

- Administer using aseptic technique under the supervision of a physician familiar with the implant technique.
- Bandage area after injection of implant.
- Repeat injection in 28 days; keep as close to this schedule as possible.

Teaching points

- This drug will be implanted into your upper abdomen every 28 days or 3 months as appropriate. It is important to keep to this schedule. Mark a calendar of injection dates.
- Do not take this drug if you are pregnant; if you think you are pregnant or wish to become pregnant, consult your health care provider.
- You may experience these side effects: Hot flashes (keep environment cool); sexual dysfunction—regression of sex organs, impaired fertility, decreased erections; pain at injection site (a local anesthetic will be used; if discomfort is severe, analgesics may be ordered).
- Report chest pain, increased signs and symptoms of your cancer, difficulty breathing, dizziness, severe pain at injection site.

▽ granisetron hydrochloride

(gran iz' e tron)

Kytril, Sancuso

PREGNANCY CATEGORY B

Drug classes

Antiemetic

5-HT₃ receptor antagonist

Therapeutic actions

Selectively binds to serotonin (5-HT₃) receptors in the CTZ, blocking the nausea and vomiting caused by the release of serotonin by mucosal cells during chemotherapy, which stimulates the CTZ and causes nausea and vomiting.

Indications

- Prevention and treatment of nausea and vomiting associated with emetogenic chemotherapy and radiation

- Prevention and treatment of postoperative nausea and vomiting (injection)
- Unlabeled uses: Postanesthetic shivering, cancer-related pruritus

Contraindications and cautions

- Contraindicated with history of hypersensitivity, concurrent use of apomorphine.
- Use cautiously with colitis, hepatic or renal impairment, pregnancy, lactation.

Available forms

Tablets—1 mg; injection—0.1, 1 mg/mL; oral solution—1 mg/5 mL; transdermal system—3.1 mg/24 hr

Dosages

Adults and patients 2 yr and older IV

- *Chemotherapy-induced nausea and vomiting*: 10 mcg/kg IV over 5 min starting within 30 min of chemotherapy; only on days of chemotherapy.
- *Postoperative nausea and vomiting*: 1 mg IV over 30 seconds before induction or reversal of anesthesia.

Oral

1 mg PO bid or 2 mg/day as 1 dose, beginning up to 1 hr before chemotherapy and second dose 12 hr after chemotherapy; only on days of chemotherapy.

- *Radiation therapy*: 2 mg once daily taken 1 hr before radiation.

Transdermal

Apply 1 patch to clean, dry skin on the upper, outer arm 24–48 hr before chemotherapy. Keep patch in place a minimum of 24 hr after completion of chemotherapy and then remove it. Patch may be left in place for up to 7 days.

Pediatric patients younger than 18 yr

Safety and efficacy of transdermal use not established.

Pediatric patients younger than 2 yr

Oral and IV use not recommended.

Pharmacokinetics

Route	Onset	Peak
IV	Rapid	30–45 min
Oral	Moderate	60–90 min

Metabolism: Hepatic; $T_{1/2}$: 5 hr (IV), 6.2 hr (oral)

Distribution: Crosses placenta; enters breast milk, protein-bound

Excretion: Urine

IV FACTS

Preparation: Dilute in 0.9% sodium chloride or 5% dextrose to a total volume of 20–50 mL; stable up to 24 hr refrigerated; protect from light.

Infusion: Inject slowly over 5 min.

Incompatibilities: Do not mix in solution with other drugs.

Adverse effects

- **CNS:** *Headache*, asthenia, somnolence, dizziness, insomnia
- **CV:** Hypertension, angina
- **GI:** Diarrhea or constipation, nausea, abdominal pain, vomiting, decreased appetite, dyspepsia
- **Other:** Fever, chills, shivering, increased AST and ALT, alopecia

■ Nursing considerations

Assessment

- **History:** Allergy to granisetron, pregnancy, lactation, liver or renal impairment, colitis
- **Physical:** Orientation, reflexes, affect; BP; bowel sounds; T

Interventions

- Provide mouth care and sugarless lozenges to suck to help alleviate nausea.
- Give drug only on days of chemotherapy, or before radiation therapy, or before surgery or reversal of anesthesia.

Teaching points

- This drug may be given IV, orally, or as a transdermal patch when you are receiving your chemotherapy; it will help decrease nausea and vomiting.
- If using the transdermal patch, apply one patch to clean, dry skin on the upper, outer arm 24–48 hr before chemotherapy. Keep patch in place a minimum of 24 hr after completion of chemotherapy and then re-

move it. Patch may be left in place for up to 7 days.

- You may experience these side effects: Lack of sleep, drowsiness (use caution if driving or performing tasks that require alertness); diarrhea or constipation; headache (ask for medication).
- Report severe headache, fever, numbness or tingling, severe diarrhea or constipation.

▽ guaifenesin (glyceryl guaiacolate)

(*guye fen' e sin*)

Allfen; Altarussin; Diabetic Tussin; Ganidin NR; Guiatuss; Liquibid; Mucinex **OTC**; Naldecon Senior Ex; Organidin NR; Robitussin; Scot-Tussin Expectorant; Siltussin DAS, Siltussin SA

PREGNANCY CATEGORY C

Drug class

Expectorant

Therapeutic actions

Enhances the output of respiratory tract fluid by reducing adhesiveness and surface tension, facilitating the removal of viscous mucus.

Indications

- Symptomatic relief of respiratory conditions characterized by dry, nonproductive cough and when there is mucus in the respiratory tract

Contraindications and cautions

- Contraindicated with allergy to guaifenesin.
- Use cautiously with pregnancy, lactation, and persistent coughs.

Available forms

Syrup—100 mg/5 mL; liquid—100, 200 mg/5 mL; capsules—200 mg; tablets—100, 200, 400 mg; ER tablets **OTC**—600, 1,200 mg; granules—50, 100 mg per packet

Dosages

Adults and patients older than 12 yr

200–400 mg PO every 4 hr; do not exceed 2.4 g/day. For 600-mg ER tablets, 1–2 tablets every 12 hr; do not exceed 2.4 g/day.

Pediatric patients 6–12 yr

100–200 mg PO every 4 hr. Do not exceed 1.2 g/day or 600 mg (ER) PO every 12 hr.

Pediatric patients 2–6 yr

50–100 mg PO every 4 hr. Do not exceed 600 mg/day.

Pharmacokinetics

Route	Onset	Duration
Oral	30 min	4–6 hr

Metabolism: Not known; $T_{1/2}$: 1 hr

Distribution: Not known

Excretion: Urine

Adverse effects

- **CNS:** Headache, dizziness
- **Dermatologic:** Rash, urticaria
- **GI:** Nausea, vomiting, GI discomfort

Interactions

★ **Drug-lab test** • Color interference and false results of 5-HIAA and VMA urinary determinations

■ Nursing considerations

CLINICAL ALERT!

Name confusion has been reported between *Mucinex* (guaifenesin) and *Mucomyst* (acetylcysteine); use caution.

Assessment

- **History:** Allergy to guaifenesin; persistent cough due to smoking, asthma, or emphysema; very productive cough; pregnancy
- **Physical:** Skin lesions, color; T; orientation, affect; R, adventitious sounds

Interventions

⊗ **Warning** Monitor reaction to drug; persistent cough for longer than 1 wk, fever, rash, or persistent headache may indicate a more serious condition.

Teaching points

- Some extended-release formulations may be cut in half but cannot be crushed or chewed. *Mucinex* cannot be crushed, chewed, or cut.
- Do not take for longer than 1 week; if fever, rash, or headache occur, consult your health care provider.
- You may experience these side effects: Nausea, vomiting (eat frequent small meals); dizziness, headache (avoid driving or operating dangerous machinery).
- Report fever, rash, severe vomiting, persistent cough.

▶ guanabenz acetate (*gwahn' a benz*)

Wytensin

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Sympatholytic (centrally acting)

Therapeutic actions

Stimulates CNS α_2 -adrenergic receptors, reduces sympathetic nerve impulses from the vasomotor center to the heart and blood vessels, decreases peripheral vascular resistance, and lowers systemic BP.

Indications

- Management of hypertension, alone or in combination with a thiazide diuretic

Contraindications and cautions

- Contraindicated with hypersensitivity to guanabenz.
- Use cautiously with severe coronary insufficiency, recent MI, CV disease, severe renal or hepatic failure, pregnancy, lactation.

Available forms

Tablets—4, 8 mg

Dosages

Adults

Individualize dosage. Initial dose of 4 mg PO bid, alone or with a thiazide diuretic; increase

in increments of 4–8 mg/day every 1–2 wk. Maximum dose, 32 mg bid, but doses this high are rarely needed.

Pediatric patients

Safety and efficacy not established for children younger than 12 yr.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	45–60 min	2–5 hr	6–12 hr

Metabolism: Unknown; $T_{1/2}$: 6 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Feces, urine

Adverse effects

- **CNS:** *Sedation, weakness, dizziness, headache*, drowsiness
- **CV:** Chest pain, edema, **arrhythmias**
- **Dermatologic:** Rash, pruritus
- **GI:** *Dry mouth*

Interactions

* **Drug-drug** • Additive sedative effects seen with CNS depressants

■ Nursing considerations

Assessment

- **History:** Hypersensitivity to guanabenz; severe coronary insufficiency, cerebrovascular disease, severe renal or hepatic failure; lactation, pregnancy
- **Physical:** Orientation, affect, reflexes; P, BP, orthostatic BP, perfusion, auscultation; LFTs, renal function tests, ECG

Interventions

- Store tightly sealed, protected from light.
- ⊗ **Warning** Do not discontinue drug abruptly; discontinue therapy by reducing the dosage gradually over 2–4 days to avoid rebound hypertension, increased blood and urinary catecholamines, anxiety, nervousness, and other subjective effects.
- Assess compliance with drug regimen in a nonthreatening, supportive manner.

Teaching points

- Take this drug exactly as prescribed; do not miss doses. Do not discontinue unless in-

structed to do so by your health care provider. Do not discontinue abruptly. Store tightly sealed, protected from light.

- You may experience these side effects: Drowsiness, dizziness, light-headedness, headache, weakness (transient; use caution while driving or performing other tasks that require alertness or physical dexterity).
- Report persistent or severe drowsiness, dry mouth.

▽ guanfacine hydrochloride

(*gwahn' fa seen*)

Intuniv **ORV**, Tenex

PREGNANCY CATEGORY B

Drug classes

Antihypertensive

Sympatholytic (centrally acting)

Therapeutic actions

Stimulates central (CNS) α_2 -adrenergic receptors, reduces sympathetic nerve impulses from the vasomotor center to the heart and blood vessels, decreases peripheral vascular resistance, and lowers systemic BP.

Indications

- Management of hypertension, alone or with a thiazide diuretic
- Treatment of ADHD in patients 6–17 yr (ER tablets)
- Unlabeled use: Amelioration of symptoms in heroin withdrawal; reduced frequency of migraine headaches and reduced nausea and vomiting; Tourette syndrome

Contraindications and cautions

- Contraindicated with hypersensitivity to guanfacine, labor and delivery, lactation.
- Use cautiously with severe coronary insufficiency, recent MI, CV disease, chronic renal or hepatic failure, pregnancy.

Available forms

Tablets—1, 2 mg; ER tablets **OND**—1, 2, 3, 4 mg

Dosages**Adults and children 12 yr and older**

Recommended dose is 1 mg/day PO given at bedtime to minimize somnolence. If 1 mg/day does not give a satisfactory result after 3–4 wk of therapy, doses of 2 mg and then 3 mg may be given, although most of the drug's effect is seen at 1 mg. If BP rises toward the end of the dosing interval, divided dosage should be used. Higher daily doses (rarely up to 4 mg/day in divided doses) have been used, but adverse reactions increase with doses larger than 3 mg/day, and there is no evidence of increased efficacy. Taper ER form when discontinuing; decrease by no more than 1 mg every 3–7 days.

Pediatric patients 6–17 yr (ADHD)

1 mg/day PO (ER tablet); increase by 1 mg/day/week to maximum of 4 mg/day. Withdraw gradually.

Geriatric patients

Use with caution, starting at lower end of dosage range. Safety and efficacy of extended-release forms not established.

Patients with renal or hepatic impairment

Extended-release forms: Dosage may need adjustment; monitor patient closely.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2 hr	1–4 hr	24 hr

Metabolism: Hepatic; $T_{1/2}$: 10–30 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Sedation, weakness, dizziness, headache, insomnia, amnesia, confusion, depression, conjunctivitis, iritis, vision disturbance, malaise, paresthesia, paresis, taste perversion, tinnitus, hypokinesia, somnolence
- **CV:** Bradycardia, palpitations, substernal pain, hypotension

- **Dermatologic:** Dermatitis, pruritus, purpura, sweating
- **GI:** Dry mouth, constipation, abdominal pain, diarrhea, dyspepsia, dysphagia, nausea
- **GU:** Impotence, libido decrease, testicular disorder, urinary incontinence
- **Other:** Rhinitis, leg cramps, taste alterations, fatigue

■ Nursing considerations**Assessment**

- **History:** Hypersensitivity to guanfacine; severe coronary insufficiency, cerebrovascular disease; chronic renal or hepatic failure; pregnancy; lactation
- **Physical:** Skin color, lesions; orientation, affect, reflexes; ophthalmologic examination; P, BP, orthostatic BP, perfusion, auscultation; R, adventitious sounds; bowel sounds, normal output; normal urinary output, voiding pattern; LFTs, renal function tests, ECG

Interventions

- ⊗ **Warning** Do not discontinue drug abruptly; discontinue therapy by reducing the dosage gradually over 2–4 days to avoid rebound hypertension (much less likely than with clonidine; BP usually returns to pretreatment levels in 2–4 days without ill effects).
- Assess compliance with drug regimen in a nonthreatening, supportive manner.
- Ensure that patient does not cut, crush, or chew ER tablets. Administer extended-release tablets first thing in the morning.
- Administer immediate-release tablets at bedtime to minimize daytime somnolence.

Teaching points

- Take this drug exactly as prescribed; it is important that you do not miss doses. Swallow ER tablets whole with water, milk, or other liquid. Do not cut, crush, or chew tablets; take extended-release forms first thing in the morning. Do not discontinue the drug unless instructed to do so by your health care provider. Do not discontinue drug abruptly.
- If taking this drug for ADHD, continue all other therapies being used for this disorder.

- You may experience these side effects: Drowsiness, dizziness, light-headedness, headache, weakness (transient; observe caution while driving or performing other tasks that require alertness or physical dexterity); dry mouth (suck sugarless lozenges or ice chips); GI upset (eat frequent small meals); dizziness, light-headedness when you change position (get up slowly; use caution when climbing stairs); impotence, other sexual dysfunction, decreased libido; palpitations.
- Report urinary incontinence, changes in vision, rash.

haloperidol

(*ba loe per' i dole*)

haloperidol

Apo-Haloperidol (CAN),
Haldol, Haloperidol LA (CAN),
Novo-Peridol (CAN)

haloperidol decanoate

Haldol Decanoate, Haldol Decanoate
50, Haldol Decanoate 100

haloperidol lactate

PREGNANCY CATEGORY C

Drug classes

Antipsychotic
Dopaminergic blocker

Therapeutic actions

Mechanism not fully understood; antipsychotics block postsynaptic dopamine receptors in the brain, depress the RAS, including those parts of the brain involved with wakefulness and emesis; chemically resembles the phenothiazines.

Indications

- Management of manifestations of psychotic disorders
- Control of tics and vocalizations in Tourette syndrome in adults and children
- Behavioral problems in children with combative, explosive hyperexcitability that cannot be attributed to immediate provocation

- Short-term treatment of hyperactive children with excessive motor activity, mood lability
- Haloperidol decanoate: Prolonged parenteral therapy of chronic schizophrenia
- Unlabeled uses: Control of nausea and vomiting, treatment of intractable hiccoughs

Contraindications and cautions

- Contraindicated with hypersensitivity to typical antipsychotics, coma or severe CNS depression, bone marrow depression, blood dyscrasia, circulatory collapse, subcortical brain damage, Parkinson's disease, liver damage, cerebral arteriosclerosis, coronary disease, severe hypotension or hypertension, dementia-related psychosis.
- Use cautiously with pregnancy; lactation; respiratory disorders ("silent pneumonia"); glaucoma, prostatic hypertrophy (anticholinergic effects may exacerbate glaucoma and urinary retention); epilepsy or history of epilepsy (drug lowers seizure threshold); tardive dyskinesia; NMS; breast cancer (elevations in prolactin may stimulate a prolactin-dependent tumor); thyrotoxicosis; peptic ulcer; decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat or phosphorous insecticides; children younger than 12 yr, especially those with chickenpox, CNS infections (children are especially susceptible to dystonias that may confound the diagnosis of Reye's syndrome); allergy to aspirin if giving the 1-, 2-, 5-, and 10-mg tablets (these tablets contain tartrazine).

Available forms

Tablets—0.5, 1, 2, 5, 10, 20 mg; oral concentrate—2 mg/mL; injection—50, 100 mg/mL as decanoate, 5 mg/mL as lactate

Dosages

Full clinical effects may require 6 wk–6 mo of therapy. Children, debilitated and geriatric patients, and patients with a history of adverse reactions to neuroleptic drugs may require lower dosage.

Adults**Oral**

- **Psychiatric disorders, Tourette syndrome:** Initial dosage range, 0.5–2 mg bid–tid PO with moderate symptoms; 3–5 mg bid–tid PO for more resistant patients. Daily dosages up to 100 mg/day (or more) have been used, but safety of prolonged use has not been demonstrated. For maintenance, reduce dosage to lowest effective level.

IM, haloperidol lactate injection

2–5 mg (up to 10–30 mg) every 60 min or every 4–8 hr IM as necessary for prompt control of acutely agitated patients with severe symptoms. Switch to oral dosage as soon as feasible, using total IM dosage in previous 24 hr as a guide to total daily oral dosage.

IM, haloperidol decanoate injection

Maintenance, 10–15 times the daily oral dose in elderly patients stabilized on 10 mg/day or less; 20 times the daily oral dose in patients stabilized on high doses and tolerant to oral haloperidol. Do not exceed 3 mL per injection site; repeat at 4-wk intervals. Initial dose should not exceed 100 mg. If more than 100 mg is needed, divide into two doses of 100 mg on day 1 and give rest of dose 3–7 days later.

Pediatric patients 3–12 yr or 15–40 kg

Initial dose, 0.5 mg/day (25–50 mcg/kg/day) PO; may increase in increments of 0.5 mg every 5–7 days as needed. Total daily dose may be divided and given bid–tid.

- **Psychiatric disorders:** 0.05–0.15 kg/day PO given bid–tid. Severely disturbed psychotic children may require higher dosage.
- **Nonpsychotic and Tourette syndromes, behavioral disorders, hyperactivity:** 0.05–0.075 mg/kg/day PO given bid–tid. In severely disturbed nonpsychotic children, short-term administration may suffice. There is little evidence of improved effects at doses greater than 6 mg/day.

Geriatric patients

Use lower doses (0.5–2.0 mg bid–tid), and increase dosage more gradually than in younger patients.

Pharmacokinetics

Route	Onset	Peak
Oral	Varies	3–5 hr
IM	Rapid	20 min
IM, decanoate	Slow	6 days

Metabolism: Hepatic; $T_{1/2}$: 21–24 hr, 3 wk for decanoate

Distribution: Crosses placenta; enters breast milk

Excretion: Bile, urine

Adverse effects

Not all effects have been reported with haloperidol; however, because haloperidol has certain pharmacologic similarities to the phenothiazine class of antipsychotic drugs, all adverse effects associated with phenothiazine therapy should be kept in mind when haloperidol is used.

- **Autonomic:** Dry mouth, salivation, nasal congestion, nausea, vomiting, anorexia, fever, pallor, facial flushing, sweating, constipation, paralytic ileus, urinary retention, incontinence, polyuria, enuresis, priapism, ejaculation inhibition
- **CNS:** *Drowsiness*, insomnia, vertigo, headache, weakness, tremor, ataxia, slurring, cerebral edema, seizures, exacerbation of psychotic symptoms, extrapyramidal syndromes—*pseudoparkinsonism*; *chystonias*; *akathisia*, tardive dyskinesias, potentially irreversible (no known treatment), **NMS**—extrapyramidal symptoms, hyperthermia, autonomic disturbances
- **CV:** Hypotension, orthostatic hypotension, hypertension, tachycardia, bradycardia, **cardiac arrest**, cardiomegaly, **refractory arrhythmias**, pulmonary edema
- **Endocrine:** Lactation, breast engorgement in females, galactorrhea; SIADH; amenorrhea, menstrual irregularities; gynecomastia in males; changes in libido; hyperglycemia or hypoglycemia; glycosuria; hyponatremia; pituitary tumor with hyperprolactinemia; inhibition of ovulation, infertility, pseudo-pregnancy
- **Hematologic:** Eosinophilia, leukopenia, leukocytosis, anemia; aplastic anemia; hemolytic anemia; thrombocytopenic or non-thrombocytopenic purpura; pancytopenia

- **Hypersensitivity:** Jaundice, urticaria, angioneurotic edema, laryngeal edema, photosensitivity, eczema, asthma, **anaphylactoid reactions**, exfoliative dermatitis
- **Respiratory:** Bronchospasm, laryngospasm, dyspnea; **suppression of cough reflex and potential for aspiration**

Interactions

- * **Drug-drug** • Additive anticholinergic effects and possibly decreased antipsychotic efficacy with anticholinergic drugs • Increased risk of toxic side effects with lithium • Decreased effectiveness with carbamazepine
- * **Drug-lab test** • False-positive pregnancy tests (less likely if serum test is used) • Increase in PBI, not attributable to an increase in thyroxine
- * **Drug-alternative therapy** • With ginkgo biloba, increased drug effectiveness and decreased extrapyramidal effects of haloperidol

■ Nursing considerations

Assessment

- **History:** Severe CNS depression; bone marrow depression; blood dyscrasia; circulatory collapse; subcortical brain damage; Parkinson's disease; liver damage; cerebral arteriosclerosis; coronary disease; severe hypotension or hypertension; respiratory disorders; glaucoma, prostatic hypertrophy; epilepsy or history of epilepsy; breast cancer; thyrotoxicosis; peptic ulcer, decreased renal function; myelography within previous 24 hr or scheduled within 48 hr; exposure to heat or phosphorus insecticides; children younger than 12 yr, especially those with chickenpox, CNS infections; allergy to aspirin, pregnancy, lactation
- **Physical:** Weight, T; reflexes, orientation, IOP; P, BP, orthostatic BP; R, adventitious sounds; bowel sounds and normal output, liver evaluation; urinary output, prostate size, CBC, urinalysis, thyroid, LFTs, renal function tests

Interventions

- ⊗ **Black box warning** There is an increased risk of death in elderly patients with

dementia-related psychosis; drug is not approved for this use.

- Do not give children IM injections.
- Do not use haloperidol for IV injections.
- Note that dosing of haloperidol decanoate injection and haloperidol lactate injection is very different; use caution.
- ⊗ **Warning** Gradually withdraw drug when patient has been on maintenance therapy to avoid withdrawal-emergent dyskinesias.
- ⊗ **Warning** Discontinue drug if serum creatinine or BUN become abnormal or if WBC count is depressed.
- ⊗ **Warning** Monitor elderly patients for dehydration; institute remedial measures promptly; sedation and decreased thirst related to CNS effects can lead to severe dehydration.
- Consult physician regarding appropriate warning of patient or patient's guardian about tardive dyskinesias.
- Consult physician about reducing dosage and using anticholinergic antiparkinsonians (controversial) if extrapyramidal effects occur.

Teaching points

- Take this drug exactly as prescribed.
- Avoid driving or engaging in other dangerous activities if dizziness or drowsiness or vision changes occur.
- Avoid prolonged exposure to sun, or use a sunscreen or covering garments.
- Maintain fluid intake, and use precautions against heatstroke in hot weather.
- You may experience these side effects: dry mouth (sucking sugarless lozenges may help); urinary retention (empty your bladder before taking the drug), constipation (medication may be available to help).
- Report sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, impaired vision, dark-colored urine (pink or reddish brown urine is to be expected), pale stools, yellowing of the skin or eyes.

DANGEROUS DRUG**▷ heparin sodium***(hep' ab rin)***heparin sodium and 0.9% sodium chloride****heparin sodium and 0.45% sodium chloride****heparin sodium injection**

Hepalean (CAN), Heparin LEO (CAN)

heparin sodium lock flush solution

Hepalean-Lok (CAN), Hepflush-10, Hep-Lock, Hep-Lock U/P

PREGNANCY CATEGORY C

Drug class

Anticoagulant

Therapeutic actions

Heparin inactivates factor Xa, therefore inhibiting thrombus and clot formation by blocking the conversion of prothrombin to thrombin and fibrinogen to fibrin, the final steps in the clotting process. Heparin also inhibits the activation of factor XIII and thrombin-induced activation of factors V and VIII

Indications

- Prevention and treatment of venous thrombosis, pulmonary embolism, and peripheral arterial embolism
- Treatment of atrial fibrillation with embolization
- Diagnosis and treatment of DIC
- Prevention of clotting in blood samples and heparin lock sets and during dialysis procedures
- Unlabeled uses: Adjunct in therapy of coronary occlusion with acute MI, prevention of left ventricular thrombi and CVA post-MI, prevention of cerebral thrombosis in the evolving CVA

Contraindications and cautions

- Contraindicated with hypersensitivity to heparin; severe thrombocytopenia; uncontrolled bleeding; any patient who cannot be monitored regularly with blood coagulation tests; labor and immediate postpartum period.
- Use cautiously with pregnancy; women older than 60 yr who are at high risk for hemorrhaging, dysbetalipoproteinemia; recent surgery or injury.

Available forms

Injection—1,000, 2,000, 2,500, 5,000, 7,500, 10,000, 12,500, 20,000, 40,000 units/mL; also single-dose and unit-dose forms; lock flush solution—1, 10, 100 units/mL

Dosages

Adjust dosage according to coagulation tests. Dosage is adequate when WBCT = 2.5–3 times control—or aPTT = 1.5–2 times control value. The following are guidelines to dosage:

Adults**Subcutaneous (deep subcutaneous injection)**

- *For general anticoagulation:* IV loading dose of 5,000 units and then 10,000–20,000 units subcutaneously followed by 8,000–10,000 units every 8 hr or 15,000–20,000 units every 12 hr.
- *Prophylaxis of postoperative thromboembolism:* 5,000 units by deep subcutaneous injection 2 hr before surgery and every 8–12 hr thereafter for 7 days or until patient is fully ambulatory.

IV

- *Intermittent IV:* Initial dose of 10,000 units and then 5,000–10,000 units every 4–6 hr.
- *Continuous IV infusion:* Loading dose of 5,000 units and then 20,000–40,000 units/day.
- *Surgery of heart and blood vessels for patients undergoing total body perfusion:* Not less than 150 units/kg; guideline often used is 300 units/kg for procedures less than 60 min, 400 units/kg for longer procedures.
- *Clot prevention in blood samples:* 70–150 units/10–20 mL of whole blood.
- *Heparin lock and extracorporeal dialysis:* See manufacturer's instructions.

Pediatric patients

Initial IV bolus of 50 units/kg and then 100 units/kg IV every 4 hr, or 20,000 units/m² per 24 hr by continuous IV infusion.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	Minutes	2–6 hr
Subcut.	20–60 min	2–4 hr	8–12 hr

Metabolism: T_{1/2}: 30–180 min

Distribution: Does not cross placenta, does not enter breast milk; broken down in liver

Excretion: Urine

IV FACTS

Continuous infusion: Can be mixed in normal saline, D₅W, Ringer's; mix well; invert bottle numerous times to ensure adequate mixing. Monitor patient closely; infusion pump is recommended.

Single dose: Direct, undiluted IV injection of up to 5,000 units (adult) or 50 units/kg (pediatric), given over 60 seconds.

Monitoring: Blood should be drawn for coagulation testing 30 min before each intermittent IV dose or every 4–6 hr if patient is on continuous infusion pump.

Incompatibilities: Heparin should not be mixed in solution with any other drug unless specifically ordered; direct incompatibilities in solution and at Y-site seen with amikacin, codeine, chlorpromazine, cytarabine, diazepam, dobutamine, doxorubicin, droperidol, ergotamine, erythromycin, gentamicin, haloperidol, hydrocortisone, kanamycin, levorphanol, meperidine, methadone, methicillin, methotrimeprazine, morphine, netilmicin, pentazocine, phenytoin, polymyxin B, promethazine, streptomycin, tetracycline, tobramycin, vancomycin.

Adverse effects

- **Dermatologic:** Loss of hair
- **Hematologic:** Hemorrhage; bruising; thrombocytopenia; elevated AST, ALT levels, hyperkalemia
- **Hypersensitivity:** Chills, fever, urticaria, asthma

- **Other:** Osteoporosis, suppression of renal function (long-term, high-dose therapy), **white clot syndrome**

Interactions

• **Drug-drug** • Increased bleeding tendencies with oral anticoagulants, salicylates, penicillins, cephalosporins, low-molecular-weight heparins, platelet inhibitors • Decreased anticoagulation effects if taken concurrently with nitroglycerin

• **Drug-lab test** • Increased AST, ALT levels • Increased thyroid function tests • Altered blood gas analyses, especially levels of carbon dioxide, bicarbonate concentration, and base excess

• **Drug-alternative therapy** • Increased risk of bleeding if combined with chamomile, garlic, ginger, ginkgo, and ginseng therapy; high-dose vitamin E

Nursing considerations Assessment

- **History:** Recent surgery or injury; sensitivity to heparin; hyperlipidemia; pregnancy
- **Physical:** Peripheral perfusion, R, stool guaiac test, PTT or other tests of blood coagulation, platelet count, renal function tests

Interventions

- Adjust dose according to coagulation test results performed just before injection (30 min before each intermittent dose or every 4–6 hr if continuous IV dose). Therapeutic range aPTT: 1.5–2.5 times control.
- Always check compatibilities with other IV solutions.
- Use heparin lock needle to avoid repeated injections.
- Give deep subcutaneous injections; do not give heparin by IM injection.
- Do not give IM injections to patients on heparin therapy (heparin predisposes to hematoma formation).
- ⊗ **Warning** Apply pressure to all injection sites after needle is withdrawn; inspect injection sites for signs of hematoma; do not massage injection sites.
- Mix well when adding heparin to IV infusion.
- Do not add heparin to infusion lines of other drugs, and do not piggyback other drugs

into heparin line. If this must be done, ensure drug compatibility.

- Provide for safety measures (electric razor, soft toothbrush) to prevent injury from bleeding.
- Check for signs of bleeding; monitor blood tests.
- Alert all health care providers of heparin use.
- ⊗ **Warning** Have protamine sulfate (heparin antidote) readily available in case of overdose. Each mg of protamine neutralizes 100 USP heparin units. Give very slowly IV over 10 min, not to exceed 50 mg. Establish dose based on blood coagulation studies.

Teaching points

- This drug must be given by a parenteral route (cannot be taken orally).
- Frequent blood tests are needed to determine whether blood clotting time is within the correct range.
- Be careful to avoid injury: Use an electric razor, avoid contact sports, and avoid other activities that might lead to injury.
- You may experience loss of hair.
- Report nose bleed, bleeding of the gums, unusual bruising, black or tarry stools, cloudy or dark urine, abdominal or lower back pain, severe headache.

▷ hetastarch (hydroxyethyl starch, HES)

(*bet' a starch*)

Hespan, Voluven

PREGNANCY CATEGORY C

Drug class

Plasma expander

Therapeutic actions

Complex mixture of various sized molecules with colloidal properties that approximate those of human albumin and raise human plasma volume when administered IV; increases the erythrocyte sedimentation rate and improves the efficiency of granulocyte collection by centrifugal means.

Indications

- Adjunctive therapy for plasma volume expansion in shock due to hemorrhage, burns, surgery, sepsis, trauma
- Adjunctive therapy in leukapheresis to improve harvesting and increase the yield of granulocytes

Contraindications and cautions

- Contraindicated with allergy to hetastarch, severe bleeding disorders, severe cardiac failure, renal failure with anuria or oliguria.
- Use cautiously with hepatic impairment, pregnancy, lactation.

Available forms

Injection—6 g/100 mL in 500 mL IV infusion bottle

Dosages

Adults

- *Plasma volume expansion*: 500–1,000 mL IV. Do not usually exceed 1,500 mL/day. In acute hemorrhagic shock, rates approaching 20 mL/kg/hr are often needed (*Hespan*); up to 50 mL/kg/day *Voluven* injection.
- *Leukapheresis (Hespan)*: 250–700 mL hetastarch infused at a constant fixed ratio of 1:8 to 1:13 to venous whole blood. Safety of up to two procedures per week and a total of seven to ten procedures using hetastarch have been established.

Pediatric patients

Safety and efficacy not established.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	24 hr	24–36 hr

Metabolism: Renal; $T_{1/2}$: 17 days, then 48 days

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Use as prepared by manufacturer; store at room temperature; do not use if turbid deep brown or if crystalline precipitate forms.

Infusion: Rate of infusion should be determined by patient response; start at approximately

20 mL/kg, reduce rate to lowest possible needed to maintain hemodynamics.

Incompatibilities: Do not mix in solution with any other drug and do not add at Y-site with any other drugs.

Adverse effects

- **CNS:** *Headache*, muscle pain
- **GI:** *Vomiting, submaxillary and parotid glandular enlargement*
- **Hematologic:** Prolongation of PT, PTT; **bleeding and increased clotting times**
- **Hypersensitivity:** Periorbital edema, urticaria, wheezing
- **Other:** *Mild temperature elevations, chills, itching, mild influenza-like symptoms, peripheral edema of the lower extremities*

■ Nursing considerations

Assessment

- **History:** Allergy to hetastarch, severe bleeding disorders, severe cardiac congestion, renal failure or anuria; hepatic impairment; pregnancy, lactation
- **Physical:** T; submaxillary and parotid gland evaluation; P, BP, adventitious sounds, peripheral and periorbital edema; R, adventitious sounds; liver evaluation; urinalysis, LFTs, renal function tests, clotting times, PT, PTT, Hgb, Hct, CBC with differential

Interventions

- Administer by IV infusion only; monitor rates based on patient response.
- ⊗ **Warning** Keep life-support equipment readily available in cases of shock.
- ⊗ **Warning** Ensure that no other drugs are mixed with or added to hetastarch.

Teaching points

- This drug can only be given IV.
- Report difficulty breathing, headache, muscle pain, rash, unusual bleeding or bruising.

▷ histrelin implant

See Appendix U, *Less commonly used drugs*.

▷ hyaluronic acid derivatives

See Appendix U, *Less commonly used drugs*.

▷ hyaluronidase

See Appendix U, *Less commonly used drugs*.

▷ hydrALAZINE hydrochloride (*bye dral' a zeen*)

Apo-Hydralazine (CAN), Apresoline

PREGNANCY CATEGORY C

Drug classes

Antihypertensive
Vasodilator (peripheral)

Therapeutic actions

Acts directly on vascular smooth muscle to cause vasodilation, primarily arteriolar, decreasing peripheral resistance; maintains or increases renal and cerebral blood flow.

Indications

- Oral: Essential hypertension alone or in combination with other drugs
- Parenteral: Severe essential hypertension when drug cannot be given orally or when need to lower BP is urgent
- Unlabeled uses: Reducing afterload in the treatment of heart failure, severe aortic insufficiency, and after valve replacement (doses up to 800 mg tid)

Contraindications and cautions

- Contraindicated with hypersensitivity to hydralazine, tartrazine (in 100-mg tablets marketed as *Apresoline*); CAD, mitral valvular rheumatic heart disease (implicated in MI).
- Use cautiously with CVAs; increased intracranial pressure (drug-induced BP decrease increases risk of cerebral ischemia); severe hypertension with uremia; advanced renal damage; slow acetylators (higher plas-

ma levels may be achieved; lower dosage may be adequate); lactation, pregnancy, pulmonary hypertension.

Available forms

Tablets—10, 25, 50, 100 mg; injection—20 mg/mL

Dosages

Adults

Oral

Initiate therapy with gradually increasing dosages. Start with 10 mg qid PO for the first 2–4 days; increase to 25 mg qid PO for the first week. Second and subsequent weeks: 50 mg qid. For maintenance, adjust to lowest effective dosage; twice daily dosage may be adequate. Some patients may require up to 300 mg/day. Incidence of toxic reactions, particularly the lupus-like syndrome, is high in patients receiving large doses.

Parenteral

- **Hypertension:** Patient should be hospitalized. Give IV or IM. Use parenteral therapy only when drug cannot be given orally. Usual dose is 20–40 mg, repeated as necessary. Monitor BP frequently; average maximal decrease occurs in 10–80 min. Transfer to oral form as soon as possible.
- **Eclampsia:** 5–10 mg every 20 min via IV bolus; if no response after 20 mg, try another drug.

Pediatric patients

Although safety and efficacy have not been established by controlled clinical trials, hydralazine has been used in children.

Oral

0.75 mg/kg/day PO, given in divided doses every 6–12 hr. Dosage may be gradually increased over the next 3–4 wk to a maximum of 7.5 mg/kg/day PO in four divided doses or 200 mg/day PO.

Parenteral

1.7–3.5 mg/kg divided into 4–6 doses.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Rapid	1–2 hr	6–12 hr
IM, IV	Rapid	10–20 min	2–4 hr

Metabolism: Hepatic; $T_{1/2}$: 3–7 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

IV FACTS

Preparation: No further preparation required, use as provided.

Infusion: Inject slowly over 1 min, directly into vein or into tubing of running IV; monitor BP response continually.

Incompatibilities: Do not mix with aminophylline, ampicillin, chlorothiazide, edetate, hydrocortisone, nitroglycerin, phenobarbital, verapamil.

Y-site incompatibilities: Do not mix with aminophylline, ampicillin, diazoxide, furosemide.

Adverse effects

- **CNS:** *Headache*, peripheral neuritis, dizziness, tremors; psychotic reactions characterized by depression, disorientation, or anxiety
- **CV:** *Palpitations, tachycardia, angina pectoris*, hypotension, paradoxical pressor response, orthostatic hypotension
- **GI:** *Anorexia, nausea, vomiting, diarrhea*, constipation, paralytic ileus
- **GU:** Difficult micturition, impotence
- **Hematologic:** Blood dyscrasias
- **Hypersensitivity:** Rash, urticaria, pruritus; fever, chills, arthralgia, eosinophilia; rarely, hepatitis, obstructive jaundice
- **Other:** Nasal congestion, flushing, edema, muscle cramps, lymphadenopathy, splenomegaly, dyspnea, lupus-like syndrome, possible carcinogenesis, lacrimation, conjunctivitis

Interactions

- **Drug-drug** • Increased pharmacologic effects of beta-adrenergic blockers and hydralazine when given concomitantly; dosage of beta blocker may need adjustment
- **Drug-food** • Increased bioavailability of oral hydralazine given with food

Nursing considerations

Assessment

- **History:** Hypersensitivity to hydralazine, tartrazine; heart disease; CVA; increased intracranial pressure; severe hypertension;

advanced renal damage; slow acetylators; lactation, pregnancy

- **Physical:** Weight; T; skin color, lesions; lymph node palpation; orientation, affect, reflexes; examination of conjunctiva; P, BP, orthostatic BP, supine BP, perfusion, edema, auscultation; R, adventitious sounds, status of nasal mucous membranes; bowel sounds, normal output; voiding pattern, normal output; CBC with differential, lupus-like cell preparations, ANA determinations, renal function tests, urinalysis

Interventions

- Give oral drug with food to increase bioavailability (drug should be given in a consistent relationship to ingestion of food for consistent response to therapy).

⊗ **Warning** Use parenteral drug immediately after opening ampule. Use as quickly as possible after drawing through a needle into a syringe. Hydralazine changes color after contact with metal, and discolored solutions should be discarded.

⊗ **Warning** Withdraw drug gradually, especially from patients who have experienced marked BP reduction. Rapid withdrawal may cause a possible sudden increase in BP.

- Drug may cause a syndrome resembling SLE. Arrange for CBC, lupus erythematosus (LE) cell preparations, and ANA titers before and periodically during prolonged therapy, even in the asymptomatic patient. Discontinue if blood dyscrasias occur. Reevaluate therapy if ANA or LE tests are positive.

⊗ **Warning** Discontinue or reevaluate therapy if patient develops arthralgia, fever, chest pain, or continued malaise.

- Arrange for pyridoxine therapy if patient develops symptoms of peripheral neuritis.
- Monitor patient for orthostatic hypotension, which is most marked in the morning and in hot weather, and with alcohol or exercise.

Teaching points

- Take this drug exactly as prescribed. Take with food. Do not discontinue or reduce dosage without consulting your health care provider.
- You may experience these side effects: Dizziness, weakness (these are most likely when

changing position, in the early morning, after exercise, in hot weather, and when you have consumed alcohol; some tolerance may occur; avoid driving or engaging in tasks that require alertness; change position slowly; use caution in climbing stairs; lie down for a while if dizziness persists); GI upset (eat frequent small meals); constipation; impotence; numbness, tingling (vitamin supplements may ameliorate symptoms); stuffy nose.

- Report persistent or severe constipation; unexplained fever or malaise, muscle or joint aching; chest pain; rash; numbness, tingling,

▽ hydrochlorothiazide

(*bye droe klor oh **thye**' a zide*)

Apo-Hydro (CAN), Ezide, HydroDIURIL, Hydro-Par, Microzide Capsules

PREGNANCY CATEGORY B

Drug class

Thiazide diuretic

Therapeutic actions

Inhibits reabsorption of sodium and chloride in distal renal tubule, increasing the excretion of sodium, chloride, and water by the kidney.

Indications

- Adjunctive therapy in edema associated with heart failure, cirrhosis, corticosteroid, and estrogen therapy; renal impairment
- Hypertension as sole therapy or in combination with other antihypertensives
- Unlabeled uses: Calcium nephrolithiasis alone or with amiloride or allopurinol to prevent recurrences in hypercalciuric or normal calciuric patients; diabetes insipidus, especially nephrogenic diabetes insipidus; osteoporosis

Contraindications and cautions

- Contraindicated with allergy to thiazides, sulfonamides; fluid or electrolyte imbalance; renal disease (can lead to azotemia); liver disease (risk of hepatic coma); anuria.

- Use cautiously with gout (risk of attack); SLE; glucose tolerance abnormalities, diabetes mellitus; hyperparathyroidism; manic-depressive disorder (aggravated by hypercalcemia); pregnancy; lactation, elevated triglyceride levels.

Available forms

Tablets—12.5, 25, 50, 100 mg; capsules—12.5 mg

Dosages

Adults

- **Edema:** 25–100 mg daily PO until dry weight is attained. Then, 25–100 mg daily PO or intermittently, up to 200 mg/day.
- **Hypertension:** 12.5–50 mg PO; maximum dose, 50 mg/day.
- **Calcium nephrolithiasis:** 50 mg daily or bid PO.

Pediatric patients

General guidelines: 1–2 mg/kg/day PO in 1 or 2 doses.

Maximum dose:

2–12 yr: 100 mg/day in 2 doses.

6 mo–2 yr: 37.5 mg/day in 2 doses.

Younger than 6 mo: Up to 3 mg/kg/day in 2 doses.

Geriatric patients

Initiate with 12.5 mg/day; increase in 12.5-mg increments, monitoring patient closely.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	2 hr	4–6 hr	6–12 hr

Metabolism: Hepatic; $T_{1/2}$: 5.6–14.8 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** Dizziness, vertigo, paresthesias, weakness, headache, drowsiness, fatigue
- **CV:** Orthostatic hypotension, venous thrombosis, volume depletion, cardiac arrhythmias, chest pain
- **Dermatologic:** Photosensitivity, rash, purpura, exfoliative dermatitis, hives, alopecia
- **GI:** Nausea, anorexia, vomiting, dry mouth, diarrhea, constipation, jaundice, hepatitis, pancreatitis

- **GU:** Polyuria, nocturia, impotence, loss of libido, hyperuricemia
- **Hematologic:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, neutropenia
- **Other:** Muscle cramps and muscle spasms, fever, gouty attacks, flushing, weight loss, rhinorrhea, electrolyte imbalances, hyperglycemia

Interactions

- **Drug-drug** • Altered electrolytes with loop diuretics, amphotericin B, corticosteroids • Increased neuromuscular blocking effects and respiratory depression with non-depolarizing muscle relaxants • Decreased absorption with cholestyramine, colestipol • Increased risk of cardiac glycoside toxicity if hypokalemia occurs • Increased risk of lithium toxicity • Decreased effectiveness of antidiabetic drugs
- **Drug-lab test** • Decreased PBI levels without clinical signs of thyroid disturbance

Nursing considerations

Assessment

- **History:** Allergy to thiazides, sulfonamides; fluid or electrolyte imbalance; renal or liver disease; gout; SLE; glucose tolerance abnormalities, diabetes mellitus; hyperparathyroidism; manic-depressive disorders; lactation, pregnancy
- **Physical:** Skin color, lesions, edema; orientation, reflexes, muscle strength; pulses, baseline ECG, BP, orthostatic BP, perfusion; R, pattern, adventitious sounds; liver evaluation, bowel sounds, urinary output patterns; CBC, serum electrolytes, blood glucose, LFTs, renal function tests, serum uric acid, urinalysis

Interventions

- Give with food or milk if GI upset occurs.
- Mark calendars or provide other reminders of drug for alternate day or 3–5 days/wk therapy.
- Reduce dosage of other antihypertensives by at least 50% if given with thiazides; readjust dosages gradually as BP responds.
- Administer early in the day so increased urination will not disturb sleep.
- Measure and record weights to monitor fluid changes.

Teaching points

- Record intermittent therapy on a calendar, or use prepared, dated envelopes. Take drug early so increased urination will not disturb sleep. Drug may be taken with food or meals if GI upset occurs.
- Weigh yourself on a regular basis, at the same time and in the same clothing; Record weight on your calendar.
- You may experience these side effects: Increased volume and frequency of urination; dizziness, feeling faint on arising, drowsiness (avoid rapid position changes; hazardous activities, like driving; alcohol); sensitivity to sunlight (use sunglasses, wear protective clothing, or use a sunscreen); decrease in sexual function; increased thirst (sucking on sugarless lozenges and frequent mouth care may help); gout attack (report any sudden joint pain).
- Report weight change of more than 3 pounds in 1 day, swelling in your ankles or fingers, unusual bleeding or bruising, dizziness, trembling, numbness, fatigue, muscle weakness or cramps.

PREGNANCY CATEGORY C

Drug classes

Adrenocortical steroid
Corticosteroid (short-acting)
Glucocorticoid
Hormone

Therapeutic actions

Enters target cells and binds to cytoplasmic receptors; initiates many complex reactions that are responsible for its anti-inflammatory, immunosuppressive (glucocorticoid), and salt-retaining (mineralocorticoid) actions. Some actions may be undesirable, depending on drug use.

Indications

- Replacement therapy in adrenal cortical insufficiency
- Allergic states—severe or incapacitating allergic conditions
- Hypercalcemia associated with cancer
- Short-term inflammatory and allergic disorders, such as rheumatoid arthritis, collagen diseases (SLE), dermatologic diseases (pemphigus), status asthmaticus, and autoimmune disorders
- Hematologic disorders—thrombocytopenic purpura, erythroblastopenia
- Trichinosis with neurologic or myocardial involvement
- Ulcerative colitis, acute exacerbations of MS, and palliation in some leukemias and lymphomas
- Intra-articular or soft-tissue administration: Arthritis, psoriatic plaques
- Retention enema: For ulcerative colitis, proctitis

- Topical preparations: Minor skin irritation and rashes due to seborrheic dermatitis and psoriasis
- Dermatologic preparations: To relieve inflammatory and pruritic manifestations of dermatoses that are steroid responsive
- Anorectal cream, suppositories: To relieve discomfort of hemorrhoids and perianal itching or irritation

Ophthalmic

- Ophthalmic diseases: Acute and chronic severe allergic or inflammatory conditions including herpes zoster ophthalmicus, iritis, iridocyclitis, chorioretinitis, uveitis and chorioiditis, optic neuritis, sympathetic ophthalmia, allergic conjunctivitis, keratitis, allergic corneal marginal ulcers, anterior segment inflammation

Contraindications and cautions

Systemic administration

- Contraindicated with allergy to any component of the drug, fungal infections, amebiasis, hepatitis B, vaccinia, or varicella, and antibiotic-resistant infections, immunosuppression.
- Use cautiously with kidney disease (risk for edema); liver disease, cirrhosis, hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; recent GI surgery; active or latent peptic ulcer; inflammatory bowel disease (risks exacerbations or bowel perforation); hypertension, heart failure; thromboembolic tendencies, thrombophlebitis, osteoporosis, convulsive disorders, metastatic carcinoma, diabetes mellitus; TB; lactation.

Retention enemas, intrarectal foam

- Contraindicated with systemic fungal infections, recent intestinal surgery, extensive fistulas.
- Use cautiously with pregnancy.

Topical dermatologic administration

- Contraindicated with fungal, tubercular, herpes simplex skin infections; vaccinia, varicella; ear application when eardrum is perforated.
- Use cautiously with pregnancy, lactation.

Available forms

Tablets—5, 10, 20 mg; injection—25, 50 mg/mL, 100, 250, 500, 1,000 mg/vial; topical lotion—0.25%, 0.5%, 1%, 2%, 2.5%; topical liquid—1%; topical oil—1%; topical solution—1%; topical spray—1%; cream—0.2%, 0.5%, 1%, 2.5%; ointment—0.5%, 1%, 2.5%; topical gel—1%, 2%; stick, roll-on—1%; pump spray—1%

Dosages

Adults

Individualize dosage, based on severity and response. Give daily dose before 9 AM to minimize adrenal suppression. If long-term therapy is needed, alternate-day therapy should be considered. After long-term therapy, withdraw drug slowly to avoid adrenal insufficiency. For maintenance therapy, reduce initial dose in small increments at intervals until lowest clinically satisfactory dose is reached.

IM, IV (hydrocortisone sodium succinate)

100–500 mg initially and every 2, 4, or 6 hr, based on condition and response.

Pediatric patients

Individualize dosage based on severity and response rather than on formulae that correct adult doses for age or weight. Carefully observe growth and development in infants and children on prolonged therapy.

Adults and pediatric patients

IM, IV (hydrocortisone sodium succinate)

Reduce dose, based on condition and response, but give no less than 25 mg/day.

Retention enema (hydrocortisone)

100 mg nightly for 21 days.

Intrarectal foam (hydrocortisone acetate)

1 applicator daily or bid for 2 or 3 wk and every second day thereafter.

Topical dermatologic preparations

Apply sparingly to affected area bid–qid.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	1–2 hr	1–2 hr	1–1.5 days
IM	Rapid	4–8 hr	1–1.5 days
IV	Immediate	Unknown	1–1.5 days
Rectal	Slow	3–5 days	4–6 days

Metabolism: Hepatic; $T_{1/2}$: 80–120 min

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparation: Give directly or dilute in normal saline or D₅W. Administer within 24 hr of diluting.

Infusion: Inject slowly, directly or dilute, and infuse hydrocortisone phosphate at a rate of 25 mg/min; hydrocortisone sodium succinate at rate of each 500 mg over 30 sec–10 min.

Incompatibilities: Do not mix or inject at Y-site with amobarbital, ampicillin, bleomycin, dimenhydrinate, doxapram, doxorubicin, ephedrine, ergotamine, heparin, hydralazine, metaraminol, nafcillin, pentobarbital, phenobarbital, phenytoin, prochlorperazine, promethazine, secobarbital.

Adverse effects**Systemic**

- **CNS:** *Vertigo, headache*, paresthesias, insomnia, seizures, psychosis
- **CV:** *Hypotension, shock*, hypertension and heart failure secondary to fluid retention, thromboembolism, thrombophlebitis, fat embolism, cardiac arrhythmias secondary to electrolyte disturbances
- **Dermatologic:** *Thin, fragile skin; petechiae; ecchymoses*; purpura; striae; subcutaneous fat atrophy
- **EENT:** Cataracts, glaucoma (long-term therapy), increased IOP
- **Endocrine:** *Amenorrhea, irregular menses*, growth retardation, decreased carbohydrate tolerance and diabetes mellitus, cushingoid state (long-term therapy), HPA suppression systemic with therapy longer than 5 days, Cushing's syndrome, hyperglycemia
- **GI:** *Peptic or esophageal ulcer; pancreatitis*, abdominal distention, nausea, vom-

iting, increased appetite and weight gain (long-term therapy)

- **Hematologic:** *Na⁺ and fluid retention, hypokalemia*, hypocalcemia, increased blood sugar, increased serum cholesterol, decreased serum T₃ and T₄ levels
- **Hypersensitivity:** Anaphylactoid or hypersensitivity reactions
- **Musculoskeletal:** *Muscle weakness*, steroid myopathy and loss of muscle mass, osteoporosis, spontaneous fractures (long-term therapy)
- **Other:** *Immunosuppression, aggravation or masking of infections, impaired wound healing*

Adverse effects related to specific routes of administration

- **IM repository injections:** Atrophy at injection site
- **Intra-articular:** Osteonecrosis, tendon rupture, infection
- **Intralesional therapy, head and neck:** Blindness (rare)
- **Intraspinal:** Meningitis, adhesive arachnoiditis, conus medullaris syndrome
- **Intrathecal administration:** Arachnoiditis
- **Retention enema:** Local pain, burning; rectal bleeding; systemic absorption and adverse effects (see Systemic Adverse Effects)
- **Topical dermatologic ointments, creams, sprays:** Local burning, irritation, acneiform lesions, striae, skin atrophy

Interactions

- **Drug-drug** • Increased steroid blood levels with hormonal contraceptives, ketoconazole, estrogen • Decreased steroid blood levels with phenytoin, phenobarbital, rifampin, cholestyramine • Decreased serum level of salicylates • Decreased effectiveness of anticholinesterases (ambenonium, edrophonium, neostigmine, pyridostigmine); ketoconazole, estrogen • Use cautiously with anticoagulants; monitor PT/INR
- **Drug-lab test** • False-negative nitroblue tetrazolium test for bacterial infection (with systemic absorption) • Suppression of skin test

reactions • May decrease serum potassium levels, T₃, and T₄ levels

■ Nursing considerations

Assessment

- **History:** Infections; kidney disease; liver disease, hypothyroidism; ulcerative colitis with impending perforation; diverticulitis; recent GI surgery; active or latent peptic ulcer; inflammatory bowel disease; hypertension, heart failure; thromboembolic tendencies, thrombophlebitis, osteoporosis, seizure disorders, metastatic carcinoma, diabetes mellitus; lactation. **Retention enemas, intrarectal foam:** Systemic fungal infections; recent intestinal surgery, extensive fistulas. **Topical dermatologic administration:** Fungal, tubercular, herpes simplex skin infections; vaccinia, varicella; ear application when eardrum is perforated
- **Physical: Systemic administration:** Weight, T, reflexes, affect, bilateral grip strength, ophthalmologic examination; BP, P, auscultation, peripheral perfusion, discoloration, pain or prominence of superficial vesicles; R, adventitious sounds, chest X-ray; upper GI X-ray (history or symptoms of peptic ulcer), liver palpation; CBC, serum electrolytes, 2-hr postprandial blood glucose, urinalysis, thyroid function tests, serum cholesterol. **Topical, dermatologic preparations:** Affected area, integrity of skin

Interventions

Systemic administration

⊗ **Warning** Give daily before 9 AM to mimic normal peak diurnal corticosteroid levels and minimize HPA suppression.

- Space multiple doses evenly throughout the day.
- Do not give IM injections if patient has thrombocytopenic purpura.
- Rotate sites of IM repository injections to avoid local atrophy.
- Use minimal doses for minimal duration to minimize adverse effects.
- Taper doses when discontinuing high-dose or long-term therapy.
- Arrange for increased dosage when patient is subject to unusual stress.

- Ensure that adequate amount of Ca²⁺ is taken if prolonged administration of steroids.
- Use alternate-day maintenance therapy with short-acting corticosteroids whenever possible.

⊗ **Warning** Do not give live virus vaccines with immunosuppressive doses of hydrocortisone.

- Provide antacids between meals to help avoid peptic ulcer.

Topical dermatologic administration

- Use caution with occlusive dressings; tight or plastic diapers over affected area can increase systemic absorption.
- Avoid prolonged use, especially near eyes, in genital and rectal areas, on face, and in skin creases.

Teaching points

Systemic administration

- Take this drug exactly as prescribed. Do not stop taking this drug without notifying your health care provider; slowly taper dosage to avoid problems.
- Dosage reductions may create adrenal insufficiency. Report any fatigue, muscle and joint pains, anorexia, nausea, vomiting, diarrhea, weight loss, weakness, dizziness, or low blood sugar (if you monitor blood sugar).
- Take with meals or snacks if GI upset occurs.
- Take single daily or alternate-day doses before 9 AM; mark calendar or use other measures as reminder of treatment days.
- Do not overuse joint after intra-articular injections, even if pain is gone.
- Frequent follow-up visits to your health care provider are needed to monitor drug response and adjust dosage.
- Wear a medical alert ID (if you are using long-term therapy) so that any emergency medical personnel will know that you are taking this drug.
- You may experience these side effects: Increase in appetite, weight gain (some of gain may be fluid retention; monitor intake); heartburn, indigestion (eat frequent small meals, use of antacids may help); increased susceptibility to infection (avoid crowds during peak cold or flu seasons, and avoid anyone with a known infection); poor wound healing (if injured or wounded, consult

health care provider); muscle weakness, fatigue (frequent rest periods may help).

- Report unusual weight gain, swelling of lower extremities, muscle weakness, black or tarry stools, vomiting of blood, epigastric burning, puffing of face, menstrual irregularities, fever, prolonged sore throat, cold or other infection, worsening of symptoms.

Intra-articular, intralesional administration

- Do not overuse the injected joint even if the pain is gone. Adhere to rules of proper rest and exercise.

Topical dermatologic administration

- Apply sparingly, and rub in lightly.
- Avoid contacting your eye with the medication.
- Report burning, irritation, or infection of the site, worsening of the condition.
- Avoid prolonged use.

Anorectal preparations

- Maintain normal bowel function with proper diet, adequate fluid intake, and regular exercise.
- Use stool softeners or bulk laxatives if needed.
- Notify your health care provider if symptoms do not improve in 7 days or if bleeding, protrusion, or seepage occurs.

hydroflumethiazide

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

hydromorphone hydrochloride

(*hye droe mor' fone*)

Dilaudid, Dilaudid-HP, Exalgo **DMC**
Hydromorph Contin (CAN),
Hydromorph HP 10, 20, 50 (CAN),
Hydromorph HP Forte (CAN),
PMS-Hydromorphone (CAN)

PREGNANCY CATEGORY C

PREGNANCY CATEGORY D
(LABOR AND DELIVERY)

CONTROLLED SUBSTANCE C-II

Drug class

Opioid agonist analgesic (phenanthrene)

Therapeutic actions

Acts as agonist at specific mu-opioid receptors in the CNS to produce analgesia, euphoria, sedation; the receptors mediating these effects are thought to be the same as those mediating the effects of endogenous opioids (enkephalins, endorphins).

Indications

- Relief of moderate to severe pain, acute and chronic pain
- **NEW INDICATION:** Treatment of moderate to severe pain when round-the-clock analgesia is needed for an extended period (ER tablets)

Contraindications and cautions

- Contraindicated with hypersensitivity to opioids, tartrazine (2- and 4-mg tablets, *Dilaudid*); physical dependence on an opioid analgesic (drug may precipitate withdrawal); severe or acute bronchial asthma, upper airway obstruction. Liquid and tablets contraindicated in labor and delivery and status asthmaticus. Extended-release tablets contraindicated with paralytic ileus, impaired pulmonary function, narrowed or obstructed GI tract, opioid nontolerant patients, mild pain or pain not expected to persist.
- Use cautiously with pregnancy (readily crosses placenta; neonatal withdrawal if mother used drug during pregnancy); bronchial asthma, COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract disease, renal or hepatic impairment, lactation.

Available forms

Injection—1, 2, 4, 10 mg/mL; tablets—2, 4, 8 mg; ER tablets **DMC**—8, 12, 16 mg; suppositories—3 mg; powder for injection—250 mg/vial; oral solution—1 mg/mL; injection—1, 2, 4 mg/mL; injection concentrate—10 mg/mL

Dosages

Individualize to each patient.

Adults**Oral**

Tablet, 2–4 mg every 4–6 hr; more than 4 mg may be needed for severe pain. Liquid, 2.5–10 mg every 3–6 hr. ER tablets, 8–64 mg PO once a day, titrated to patient needs; for opioid-tolerant patients only.

Parenteral

1–2 mg IM, subcutaneously every 4–6 hr as needed. May be given by slow IV injection over 2–3 min if no other route is tolerated.

Rectal

3 mg every 6–8 hr.

Pediatric patients

Safety and efficacy not established. Contraindicated in premature infants.

Geriatric patients or patients with renal or hepatic impairment

Use caution; respiratory depression may occur in elderly, the very ill, those with respiratory problems. Reduced dosage may be necessary.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	30–60 min	4–5 hr
IM	15–30 min	30–60 min	4–5 hr

Metabolism: Hepatic; $T_{1/2}$: 2–3 hr; ER capsules, 18 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

IV FACTS

Preparations: Administer undiluted or diluted in normal saline or D₅W.

Infusion: Inject slowly, each 2 mg over 2–5 min, directly into vein or into tubing of running IV.

Adverse effects

- **CNS:** *Light-headedness, dizziness, sedation, euphoria, dysphoria, delirium, insomnia, agitation, anxiety, fear, hallucinations, disorientation, drowsiness, lethargy, impaired mental and physical performance, coma, mood changes, weakness, headache, tremor, seizures, miosis, visual disturbances, suppression of cough reflex*
- **CV:** Facial flushing, peripheral circulatory collapse, tachycardia, bradycardia, arrhyth-

mia, palpitations, chest wall rigidity, hypertension, hypotension, orthostatic hypotension, syncope

- **Dermatologic:** Pruritus, urticaria, laryngospasm, bronchospasm, edema, diaphoresis
- **GI:** *Nausea, vomiting, dry mouth, anorexia, constipation, biliary tract spasm; increased colonic motility in patients with chronic ulcerative colitis*
- **GU:** Urethral spasm, spasm of vesical sphincters, urinary retention or hesitancy, oliguria, antidiuretic effect, reduced libido or potency
- **Hypersensitivity:** Anaphylactoid reactions (IV administration)
- **Local:** Phlebitis following IV injection pain at injection site; tissue irritation and induration (subcutaneous injection)
- **Major hazards:** **Respiratory depression, apnea, circulatory depression, respiratory arrest, shock, cardiac arrest**
- **Other:** *Sweating, physical tolerance and dependence, psychological dependence*

Interactions

- **Drug-drug** • Potentiation of effects of hydromorphone with barbiturate anesthetics, alcohol; decrease dose of hydromorphone when coadministering • Opioid agonist/antagonists may reduce effects of hydromorphone; use caution • Extended-release tablets are not for use with MAOIs or within 14 days of their use • Increased urine retention or severe constipation if extended-release tablets are combined with anticholinergics; monitor patient closely
- **Drug-lab test** • Elevated biliary tract pressure (an effect of opioids) may cause increases in plasma amylase, lipase; determinations of these levels may be unreliable for 24 hr after administration of opioids

Nursing considerations**Assessment**

- **History:** Hypersensitivity to opioids, tartrazine; physical dependence on an opioid analgesic; pregnancy; lactation; COPD, respiratory depression, anoxia, increased intracranial pressure, acute MI, ventricular failure, coronary insufficiency, hypertension, biliary tract surgery, GI obstruction or narrowing, renal or hepatic impairment

• **Physical:** Orientation, reflexes, bilateral grip strength, affect; pupil size, vision; P, auscultation, BP; R, adventitious sounds; bowel sounds, normal output; thyroid, LFTs, renal function tests

Interventions

⊗ **Black box warning** Monitor dosage and intended use; it varies with form. Serious effects can occur. Drug can be abused or misused.

⊗ **Black box warning** Extended-release form is for opioid-tolerant patients only; fatal respiratory depression can occur. Extended-release form is not for use with acute or postoperative pain or as an as-needed drug. Extended-release tablets must be swallowed whole; broken, chewed, or crushed tablets allow rapid release of drug and could cause fatal overdose.

• Give to nursing women 4–6 hr before next scheduled feeding to minimize drug in milk.

⊗ **Warning** Ensure opioid antagonist and facilities for assisted or controlled respiration are readily available during parenteral administration.

⊗ **Warning** Use caution when injecting subcutaneously into chilled body areas or in patients with hypotension or in shock; impaired perfusion may delay absorption. With repeated doses, an excessive amount may be absorbed when circulation is restored.

• Refrigerate rectal suppositories.

• Ensure that patient swallows extended-release tablets whole; do not cut, crush, or dissolve tablets.

Teaching points

- Learn how to administer rectal suppositories; refrigerate suppositories.
- Take drug exactly as prescribed. Extended-release tablets are taken once a day and must be swallowed whole. Do not cut, crush, chew, or dissolve tablets.
- Avoid alcohol, antihistamines, sedatives, tranquilizers, and over-the-counter drugs.
- Do not take leftover medication; do not let anyone else take the prescription.
- You may experience these side effects: Nausea, loss of appetite (take drug with food,

lie quietly, eat frequent small meals); constipation (laxative may help); dizziness, sedation, drowsiness, impaired vision (avoid tasks that require alertness, visual acuity); difficulty voiding (empty your bladder before taking drug; notify your health care provider if this becomes a problem).

- Report severe nausea, vomiting, constipation, shortness of breath or difficulty breathing.

▽ hydroxocobalamin

See Appendix U, *Less commonly used drugs*.

▽ hydroxyethyl starch in sodium chloride

See Appendix U, *Less commonly used drugs*.

DANGEROUS DRUG

▽ hydroxyurea

(*hye drox ee yoor ee' a*)

Droxia **ONC**, Gen-Hydroxyurea (CAN) **ONC**, Hydrea **ONC**

PREGNANCY CATEGORY D

Drug class

Antineoplastic

Therapeutic actions

Cytotoxic: Inhibits an enzyme that is crucial for DNA synthesis, but exact mechanism of action is not fully understood.

Indications

- Melanoma
- Resistant chronic myelocytic leukemia
- Recurrent, metastatic, or inoperable ovarian cancer
- Concomitant therapy with irradiation for primary squamous cell carcinoma of the head and neck, excluding the lip
- Polycythemia vera
- Cervical cancer and, in combination with radiation therapy, brain tumors, cervical tumors, and head and neck tumors
- To reduce the frequency of painful crises and to reduce the need for blood transfusions

in adult patients with sickle cell anemia (*Droxia*)

- Unlabeled uses: Essential thrombocythemia, psoriasis, HIV treatment with didanosine

Contraindications and cautions

- Contraindicated in severe bone marrow suppression, allergy to hydroxyurea.
- Use cautiously in patients with impaired hepatic and renal functions, mild to moderate bone marrow suppression, pregnancy, lactation.

Available forms

Capsules **ORIG**—500 mg; *Droxia* capsules **ORIG**—200, 300, 400 mg

Dosages

Adults

⊗ **Warning** Base dosage on ideal or actual body weight, whichever is less. Interrupt therapy if WBC count falls below 2,500/mm³ or platelet count below 100,000/mm³. Recheck in 3 days and resume therapy when counts approach normal (*Hydrea*).

- **Solid tumors:** Intermittent therapy: 80 mg/kg PO as a single dose every third day. Continuous therapy: 20–30 mg/kg PO as a single daily dose.
- **Concomitant therapy with irradiation:** 80 mg/kg as a single daily dose every third day. Begin hydroxyurea 7 days before irradiation, and continue during and for a prolonged period after radiation therapy (*Hydrea*).
- **Resistant chronic myelocytic leukemia:** 20–30 mg/kg as a single daily dose (*Hydrea*).
- **Reduction of sickle cell anemia crises (*Droxia*):** 15 mg/kg/day PO as a single dose; may be increased by 5 mg/kg/day PO as a single dose; may be increased by 5 mg/kg/day every 12 wk until maximum tolerated dose or 35 mg/kg/day is reached. If blood levels become toxic, stop drug and resume at 2.5 mg/kg/day less than the dose that resulted in toxicity when blood levels return to normal. May increase every 12 wk in 2.5-mg/kg/day intervals if blood levels stay acceptable. (Acceptable levels are neutrophils, at least 2,500 cells/mm³; platelets, at least 95,000/mm³; hemoglobin, at least 5.3 g/dL, reticulocytes, at least 95,000/mm³ if hemoglobin concentration is less than 9 g/dL.)

Patients with renal impairment

Consider need to decrease dosage, and monitor patient closely.

Pediatric patients

Dosage regimen not established.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral	Varies	1–4 hr	18–20 hr

Metabolism: Hepatic; T_{1/2}: 3–4 hr

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Headache, dizziness*, disorientation, hallucinations
- **Dermatologic:** Maculopapular rash, facial erythema
- **GI:** *Stomatitis, anorexia, nausea, vomiting*, diarrhea, constipation, elevated hepatic enzymes
- **GU:** Impaired renal tubular function
- **Hematologic:** *Bone marrow depression*
- **Local:** Mucositis at the site, especially in combination with irradiation
- **Other:** Fever, chills, malaise, **cancer**, pulmonary reactions

Interactions

- **Drug-drug** • Uricosuric agents may increase uric acid levels; adjust dose of uricosuric agent
- **Drug-lab test** • Serum uric acid, BUN, and creatinine levels may increase with hydroxyurea therapy • Drug causes self-limiting abnormalities in erythrocytes that resemble those of pernicious anemia but are not related to vitamin B₁₂ or folate deficiency

Nursing considerations

Assessment

- **History:** Allergy to hydroxyurea, irradiation, leukopenia, impaired hepatic and renal function, lactation, pregnancy
- **Physical:** Weight; T; skin color, lesions; reflexes, orientation, affect; mucous membranes, abdominal examination; CBC, LFTs, renal function tests

Interventions

- Give in oral form only. Do not cut, crush, or allow patient to chew capsules. If patient is unable to swallow capsules, empty capsules into a glass of water, and give immediately (inert products may not dissolve).
- Encourage patient to drink 10–12 glasses of fluid each day.
- Check CBC before administration before therapy and every 2 wk.
- Caution patient to avoid pregnancy while using this drug; using barrier contraceptives is advised.

Teaching points

- Prepare a calendar for dates to return for diagnostic testing and treatment days. If you are unable to swallow the capsule, empty the capsule into a glass of water and take immediately (some of the material may not dissolve).
- This medication can cause serious adverse effects. Avoid handling it, store it safely away from children and pets, and dispose of it in a closed container.
- Avoid pregnancy while using this drug, fetal abnormalities have been reported; using barrier contraceptives is advised.
- Arrange for regular blood tests at least every 2 weeks to monitor the drug's effects.
- Drink at least 10–12 glasses of fluid each day while using this drug.
- You may experience these side effects: Loss of appetite, nausea, vomiting, mouth sores (frequent mouth care, frequent small meals may help; maintain good nutrition; an antiemetic may be ordered); constipation or diarrhea (a bowel program may be established); disorientation, dizziness, headache (take precautions to avoid injury); red face, rash (reversible).
- Report fever, chills, sore throat, unusual bleeding or bruising, severe nausea, vomiting, loss of appetite, sores in the mouth or on the lips, pregnancy (it is advisable to use birth control while on this drug).

 **hydrOXYzine**
(*hye drox' i zeen*)

hydrOXYzine hydrochloride

Oral preparations: Apo-Hydroxyzine (CAN), Vistaril

Parenteral preparations: Vistaril

hydrOXYzine pamoate

Oral preparation: Vistaril

PREGNANCY CATEGORY C

Drug classes

Antiemetic
Antihistamine
Anxiolytic

Therapeutic actions

Mechanisms of action not understood; actions may be due to suppression of subcortical areas of the CNS; has clinically demonstrated antihistaminic, analgesic, antispasmodic, antiemetic, mild antisecretory, and bronchodilator activity.

Indications

- Symptomatic relief of anxiety and tension associated with psychoneurosis; adjunct in organic disease states in which anxiety is manifested; alcoholism and asthma; before dental procedures
- Management of pruritus due to allergic conditions, such as chronic urticaria, atopic and contact dermatosis, and in histamine-mediated pruritus
- Sedation when used as premedication and following general anesthesia
- Control of nausea and vomiting and as adjunct to analgesia preoperatively and postoperatively (parenteral) to allow decreased opioid dosage
- IM administration: Management of the acutely disturbed or hysterical patient; the acute or chronic alcoholic with anxiety withdrawal symptoms or delirium tremens; as preoperative and postoperative adjunct to

permit reduction in opioid dosage, allay anxiety, and control emesis

Contraindications and cautions

- Contraindicated with allergy to hydroxyzine or cetirizine; pregnancy, lactation.
- Use cautiously with uncomplicated vomiting in children (may contribute to Reye's syndrome or unfavorably influence its outcome; extrapyramidal effects may obscure diagnosis of Reye's syndrome).

Available forms

Tablets—10, 25, 50 mg; syrup—10 mg/5 mL; capsules—25, 50, 100 mg; injection—25, 50 mg/mL

Dosages

Start patients on IM therapy when indicated; use oral therapy for maintenance. Adjust dosage to patient's response.

Adults

Oral

- *Symptomatic relief of anxiety:* 50–100 mg qid.
- *Management of pruritus:* 25 mg tid–qid.
- *Sedative (preoperative and postoperative):* 50–100 mg.

IM

- *Psychiatric and emotional emergencies:* 50–100 mg immediately and every 4–6 hr as needed.
- *Preoperative and postoperative sedation:* 50–100 mg.
- *Pruritus:* 25 mg tid–qid.

Pediatric patients

Oral

- *Anxiety, pruritus:*
Younger than 6 yr: 50 mg/day in divided doses.
Older than 6 yr: 50–100 mg/day in divided doses.
- *Sedative:* 0.6 mg/kg.

IM

- *Preoperative and postoperative sedation:* 0.6 mg/kg.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral, IM	15–30 min	3 hr	4–6 hr

Metabolism: Hepatic; $T_{1/2}$: 3 hr

Distribution: Crosses placenta; may enter breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Drowsiness*, involuntary motor activity, including tremor and seizures
- **GI:** *Dry mouth*, reflux, constipation
- **GU:** Urinary retention
- **Hypersensitivity:** Wheezing, dyspnea, chest tightness

Interactions

★ **Drug-drug** • Potentiating action when used concomitantly with CNS depressants (opioids, barbiturates)

Nursing considerations

Assessment

- **History:** Allergy to hydroxyzine or cetirizine, uncomplicated vomiting in children, lactation, pregnancy
- **Physical:** Skin color, lesions, texture; orientation, reflexes, affect; R, adventitious sounds

Interventions

- ⊗ **Warning** Determine and treat underlying cause of vomiting. Drug may mask signs and symptoms of serious conditions, such as brain tumor, intestinal obstruction, or appendicitis.
- ⊗ **Warning** Do not administer parenteral solution subcutaneously, IV, or intra-arterially; tissue necrosis has occurred with subcutaneous and intra-arterial injection, and hemolysis with IV injection.
- Give IM injections deep into a large muscle: In adults, use upper outer quadrant of buttocks or midlateral thigh; in children, use midlateral thigh muscles; use deltoid area only if well developed.

Teaching points

- Take as prescribed. Avoid excessive dosage.
- You may experience these side effects: Dizziness, sedation, drowsiness (use caution if performing tasks that require alertness); avoid alcohol, sedatives, sleep aids (serious overdose could result); dry mouth (mouth care, sucking sugarless lozenges may help).
- Report difficulty breathing, tremors, loss of coordination, sore muscles, or muscle spasm.

Symax-SR **ORC**

PREGNANCY CATEGORY C

Drug classes

Anticholinergic
Antimuscarinic
Antispasmodic
Belladonna alkaloid
Parasympatholytic

Therapeutic actions

Direct GI smooth muscle relaxant; competitively blocks the effects of acetylcholine at muscarinic cholinergic receptors that mediate the effects of parasympathetic postganglionic impulses, thus relaxing the GI tract. Also has antisecretory effects along the GI.

Indications

- Adjunctive therapy in IBS, peptic ulcer, spastic or functional GI disorders, cystitis, neurogenic bladder or bowel disorders, parkinsonism, biliary or renal colic
- Rhinitis and anticholinesterase poisoning
- Reduction of rigidity and tremors and control of sialorrhea and hyperhidrosis associated with parkinsonism
- Partial heart block associated with vagal activity
- Preoperatively to decrease secretions
- Parenterally to improve radiological imaging tests

Contraindications and cautions

- Contraindicated with hypersensitivity to anticholinergic drugs, glaucoma, adhesions be-

tween iris and lens, stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, bronchial asthma, COPD, myocardial ischemia, myasthenia gravis, tachycardia, renal disease.

- Use cautiously with high environmental temperatures, fever, diarrhea, hyperthyroidism, CV disease, hypertension, heart failure, arrhythmias, renal disease, hiatal hernia, pregnancy, lactation.

Available forms

Tablets—0.125 mg, 0.15 mg; sublingual tablets—0.125 mg; ER tablets **ORC**—0.375 mg; ER capsules **ORC**—0.375 mg; orally disintegrating tablets—0.125 mg; oral spray—0.125 mg/mL; elixir—0.125 mg/5 mL; solution—0.125 mg/mL; injection—0.5 mg/mL

Dosages

Adults

Oral or sublingual

0.125–0.25 mg 3–4 times per day.

Oral solution: 1–2 mL every 4 hr as needed; do not exceed 12 mL per day.

Oral spray: 1–2 sprays every 4 hr as needed; do not exceed 12 sprays per day.

Orally disintegrating tablets: ½–1 tablet 3–4 times per day 30 min–1 hr before meals and at bedtime.

Elixir: 1–2 teaspoons every 4 hr as needed; do not exceed 12 teaspoons per day.

ER

0.375–0.75 mg PO every 12 hr. May give 1 capsule every 8 hr if needed; do not exceed 4 capsules per day.

Parenteral

- *GI disorders:* 0.25–0.5 mg subcutaneously, IM, or IV 2–4 times per day as needed.
- *Preanesthetic:* 0.005 mg/kg IV or IM 30–60 min before induction.
- *Treatment of bradycardia:* 0.125 mg (0.25 mL) IV. Repeat as needed.
- *Reversal of neuromuscular blockade:* 0.2 mg IV, IM, or subcutaneously for every 1 mg neostigmine.

Pediatric patients

Regular and sublingual tablets, orally disintegrating tablets (except Mar-Spas)

12 yr and older: 1–2 tablets PO every 4 hr as needed; do not exceed 12 tablets in 24 hr.

2 yr to younger than 12 yr: ½–1 tablet PO every 4 hr as needed; do not exceed 6 tablets in 24 hr.

Mar-Spas orally disintegrating tablets

12 yr and older: ½–1 tablet PO tid–qid 30 min–1 hr before meals and at bedtime.

Younger than 12 yr: Not recommended.

Extended release and timed-release capsules

12 yr and older: 1–2 capsules PO every 12 hr; adjust to 1 capsule every 8 hr if needed. Do not exceed 4 capsules in 24 hr.

Oral solution

12 yr and older: 1–2 mL PO every 4 hr or as needed; do not exceed 12 mL in 24 hr.

2 yr to younger than 12 yr: 0.25–1 mL PO every 4 hr or as needed; do not exceed 6 mL in 24 hr.

Younger than 2 yr:

Weight (kg)	Dose (drops)	Maximum drops/day
3.4	4	24
5	5	30
7	6	36
10	8	48

Elixir

12 yr and older: 1–2 tsp PO every 4 hr or as needed; do not exceed 12 tsp in 24 hr.

2 yr to younger than 12 yr: Give dose based on weight every 4 hr as needed; do not exceed 6 tsp PO in 24 hr.

Weight (kg)	Dose (tsp)
10	0.25 (1.25 mL)
20	0.5 (2.5 mL)
40	0.75 (3.75 mL)
50	1 (5 mL)

Oral spray

12 yr and older: 1–2 sprays every 4 hr as needed.

Injectable

Older than 2 yr:

Preanesthetic: 5 mcg/kg IV 30–60 min before anesthesia.

Treatment of drug-induced bradycardia: 0.25 mL IV during surgery; repeat as needed. Reversal of neuromuscular blockade: 0.2 mg IV for every 1 mg neostigmine.

Pharmacokinetics

Route	Onset	Peak	Duration
Oral tablets	20–30 min	30–60 min	4 hr
Sublingual	5–20 min	30–60 min	4hr
ER	20–30 min	40–90 min	12 hr
Parenteral	2–3 min	15–30 min	4 hr

Metabolism: Hepatic; T_{1/2}: 9–10 hr (injection, 3.5 hr)

Distribution: Crosses placenta; enters breast milk

Excretion: Urine

Adverse effects

- **CNS:** *Dizziness*, blurred vision, dilated pupils confusion, *drowsiness*, psychosis, headache
- **CV:** *Palpitations*, hypertension, chest pain, tachycardia
- **GI:** *Nausea, dry mouth*, taste loss, *constipation*, vomiting
- **GU:** *Urinary hesitancy*, impotence
- **Other:** *Decreased sweating, fever, anaphylaxis, urticaria*, heat prostration

Interactions

★ **Drug-drug** • Additive effects with other anticholinergics, amantadine, haloperidol, phenothiazines, MAOIs, TCAs, or antihistamines; monitor patient closely and adjust dosages as needed • Decreased absorption if combined with antacids; space 2–4 hr apart

■ **Nursing considerations**
Assessment

- **History:** Glaucoma, adhesions between iris and lens, stenosing peptic ulcer, pyloroduodenal obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, symptomatic prostatic hypertrophy, bladder neck obstruction, bronchial asthma, COPD, myocardial ischemia, myasthenia gravis, fever, diarrhea, hyperthyroidism, CV disease, hypertension, heart failure, arrhythmias, renal disease, hiatal hernia, pregnancy, lactation

H

• **Physical:** Bowel sounds, normal output; normal urinary output, prostate palpation; R, adventitious sounds; P, BP; IOP, vision; bilateral grip strength, reflexes; liver palpation, LFTs, renal function tests; skin color, lesions, texture

Interventions

- Ensure adequate hydration; control environment (temperature) to prevent hyperpyrexia.
- Use caution in geriatric patients who may be more sensitive to anticholinergic effects.
- Encourage patient to void before each dose if urinary retention becomes a problem.
- Ensure ER forms are not cut, crushed, or chewed.
- Monitor lighting to minimize discomfort of photophobia.
- Establish safety precautions (side rails, assistance with ambulation, proper lighting) if visual effects occur.
- Provide sugarless lozenges, ice chips to suck (if permitted) if dry mouth occurs.
- Provide frequent small meals if GI upset is severe.

Teaching points

- Take drug exactly as prescribed; do not cut, crush, or chew ER tablets.
- Take 30–60 minutes before meals.
- Avoid hot environments while taking this drug (you will be heat-intolerant and dangerous reactions may occur).
- You may experience these side effects: Dry mouth (sugarless lozenges, frequent mouth care may help; this effect sometimes lessens over time); blurred vision, sensitivity to light (these effects will go away when you discontinue the drug; avoid tasks that require acute vision and wear sunglasses when in bright light); impotence (this effect will go away when you discontinue the drug; you may wish to discuss it with your health care provider); difficulty in urination (it may help to empty the bladder immediately before taking each dose).
- Report skin rash, flushing, eye pain, difficulty breathing, tremors, loss of coordination, irregular heartbeat, palpitations, headache, abdominal distention, halluci-

nations, difficulty swallowing, difficulty urinating.

ibandronate sodium (*eh ban' drow nate*)

Boniva 

PREGNANCY CATEGORY C

Drug classes

Bisphosphonate
Calcium regulator

Therapeutic actions

Inhibits osteoclast activity and reduces bone resorption and turnover, without inhibiting bone formation or mineralization.

Indications

- Treatment and prevention of osteoporosis in postmenopausal women
- Unlabeled use: Treatment of metastatic bone disease in breast cancer

Contraindications and cautions

- Contraindicated with known allergy to any component of the tablet, uncorrected hypocalcemia, inability to stand or sit upright for at least 60 minutes (oral form).
- Use caution with known upper GI abnormalities, pregnancy, lactation.

Available forms

Prefilled syringe—1 mg/mL; tablets —2.5, 150 mg

Dosages

Adults

One 2.5-mg tablet/day PO or one 150-mg tablet PO once per month on the same date each month or 3 mg IV, given over 15–30 sec, every 3 mo.

Pediatric patients

Safety and efficacy not established.

For patients with renal impairment

Not recommended with severe renal impairment (creatinine clearance less than 30 mL/min).

Pharmacokinetics

Route	Onset	Peak
Oral	Rapid	0.5–2 hr
IV	Rapid	Unknown

Metabolism: $T_{1/2}$: 37–157 hr

Distribution: May cross placenta; may pass into breast milk

Excretion: Urine, unchanged

Adverse effects

- **CNS:** *Headache*, dizziness, vertigo, nerve root lesion, asthenia, insomnia
- **CV:** Angina, *hypertension*
- **GI:** *Diarrhea, dyspepsia, abdominal pain*, constipation, vomiting, gastritis, tooth disorder, dysphagia, esophagitis, esophageal ulcers, gastric ulcers
- **Respiratory:** *URI, bronchitis, pneumonia*, pharyngitis
- **Other:** **Jaw osteonecrosis** (increased risk with cancer, chemotherapy, radiation therapy, preexisting dental disease), *back pain*, infection, *myalgia*, joint pain, hypercholesterolemia

Interactions

★ **Drug-drug** • Decreased absorption of ibandronate if taken at the same time as multivalent cations (aluminum, iron, magnesium), antacids

★ **Drug-food** • Milk or food; ibandronate should be taken on an empty stomach, first thing in the morning, 60 min before any food or other medications (patient may have water)

■ Nursing considerations

Assessment

- **History:** Allergy to any component of the tablet, uncorrected hypocalcemia, inability to stand or sit upright for at least 60 min, upper GI abnormalities, pregnancy, lactation
- **Physical:** Orientation, reflexes; BP; respiratory evaluation; abdominal examination, serum calcium levels, renal function tests

Interventions

⊗ **Warning** Administer in the morning with a full glass of water at least 60 min before the first beverage, food, or medication of the day.

Patient must stay upright for 60 min after taking the tablet to avoid potentially serious esophageal erosion.

- Monitor serum calcium levels before, during, and after therapy.
- Ensure adequate intake of vitamin D and calcium.
- Make calendar for patient using once-a-month or once every 3 mo dosing as a reminder to take drug.
- Provide comfort measures and possible analgesics for headache and pain.
- Encourage frequent small meals if GI effects are uncomfortable.

Teaching points

- Take this drug in the morning with a full glass of water, at least 60 minutes before any food, beverage, or other medications. You must stay upright for at least 60 minutes after taking the tablet to prevent potentially serious problems with your esophagus. If you are taking the once a month dose, be sure to mark your calendar as a reminder of when to take the drug. Swallow the tablet whole; do not suck on it or chew it. If taking once every 3 months IV, reschedule the missed dose as soon as possible. Subsequent injections should be rescheduled for once every 3 months from that month.
- If you miss a dose of the daily medication, do not take the dose later in the day. Return to your usual routine the next morning. Do not take more than 1 tablet each day. If you miss a dose of the monthly medication or if the next scheduled dose is more than 7 days away, take the 150-mg tablet the morning following the day that you remembered. Then return to taking the tablet every month on your original date. If your next scheduled dose is 1–7 days away, wait and take the tablet on the scheduled day, then every month on that same date as scheduled. Never take two 150-mg tablets in the same week.
- Take vitamin D and calcium to increase the effectiveness of this drug.
- You may need to have periodic bone density tests to evaluate the effects of this drug on your body.
- It is not known how this drug could affect a nursing baby. If you are nursing a baby, you

should choose another method of feeding the baby.
