

5.4 The Fundamental Theorem of Calculus + 5.5 (103)

Theorem (The Mean Value Theorem for Definite Integrals)

If f is continuous on $[a, b]$, then at some point $c \in [a, b]$, we have: $f(c) = \frac{1}{b-a} \int_a^b f(x) dx$

* $f(c)$ is the average height "Mean" of f on $[a, b]$

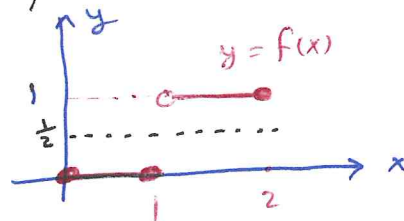

The area of the rectangle = area under f

$$f(c)(b-a) = \int_a^b f(x) dx$$

* If f is discontinuous, then f may never equals its average value

$$av(f) = \frac{1}{2-0} \int_0^2 f(x) dx = \frac{1}{2} \int_0^2 f(x) dx = \frac{1}{2}(1) = \frac{1}{2}$$

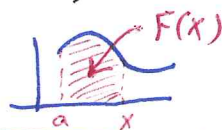

but $\nexists c \in [0, 2]$ s.t. $f(c) = \frac{1}{2}$

Th¹ (The fundamental Theorem of Calculus)

If f is continuous on $[a, b]$, then $F(x) = \int_a^x f(t) dt$ is continuous on $[a, b]$ and differentiable on (a, b) with

$$F'(x) = \frac{d}{dx} \int_a^x f(t) dt = f(x)$$

Example: Find $\frac{dy}{dx}$ for

$$\textcircled{1} y = \int_3^x (t^2 - 5t) dt \Rightarrow x^2 - 5x$$

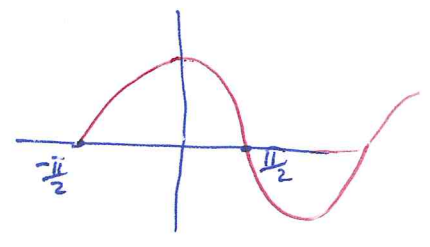

$$\textcircled{2} y = \int_5^x (t^2 - 5t) dt \Rightarrow x^2 - 5x$$

$$\textcircled{3} y = \int_a^x (t^2 - 5t) dt \Rightarrow x^2 - 5x$$

$$\textcircled{4} y = \int_x^5 (t^2 - 5t) dt \Rightarrow - \int_5^x (t^2 - 5t) dt = -(x^2 - 5x) = 5x - x^2$$

⑤ $y = \int_x^0 \sqrt{1+t^2} dt \Rightarrow -\sqrt{1+x^2}$

⑥ $y = \int_0^{\sin x} \frac{dt}{\sqrt{1-t^2}}, |x| < \frac{\pi}{2}$

$y' = \frac{\cos x}{\sqrt{1-\sin^2 x}} = \frac{\cos x}{\sqrt{\cos^2 x}} = \frac{\cos x}{\cos x} = 1$

⑦ $y = \int_3^{x^3} \sin t dt \Rightarrow 3x^2 \sin x^3$

$u = x^3$
 $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$

$= \int_{27}^4 \sin t dt \Leftrightarrow y' = \left(\int_{27}^4 \sin t dt \right)' u' = \sin u (3x^2) = 3x^2 \sin x^3$

Th ② (The Fundamental Theorem of Calculus)

If f is continuous on $[a,b]$ and F is any antiderivative of f on $[a,b]$, then

$\int_a^b f(x) dx = F(b) - F(a)$

Example: Evaluate the integrals:

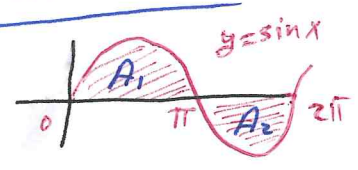

① $\int_{-2}^0 (2x+5) dx = x^2 + 5x \Big|_{-2}^0 = -[4-10] = 6$

② $\int_0^{\pi/4} \sec^2 x dx = \tan x \Big|_0^{\pi/4} = \tan \frac{\pi}{4} - \tan 0 = 1$

* To Find the area between the graph of $y=f(x)$ and the x -axis over the interval $[a,b]$:

- Find the zeros of f on $[a,b]$
- Divid $[a,b]$ at the zeros of f .
- Integrate f over each subinterval in absolute value.

Example: let f be as defined in the graph:

(a) Find the definite integral of f on $[0, 2\pi]$

$\int_0^{2\pi} \sin x dx = -\cos x \Big|_0^{2\pi} = -[\cos 2\pi - \cos 0] = -[1-1] = 0$

(b) Find the area between f and the x -axis on $[0, 2\pi]$

Area = $|A_1| + |A_2|$

where $A_1 = \int_0^{\pi} \sin x \, dx = -\cos x \Big|_0^{\pi} = -[\cos \pi - \cos 0] = -[-1 - 1] = 2$ (105)

$$A_2 = \int_{\pi}^{2\pi} \sin x \, dx = -\cos x \Big|_{\pi}^{2\pi} = -[\cos 2\pi - \cos \pi] = -[1 + 1] = -2$$

$$\text{Area} = |A_1| + |A_2| = |2| + |-2| = 4$$

Th (The Net Change Theorem)

The net change in the function $F(x)$ on $[a, b]$ is the integral of its rate of change: $F(b) - F(a) = \int_a^b F'(x) \, dx$

* If $c(x)$ is the cost for producing x units, then $\dot{c}(x)$ is the marginal cost and

$$\int_{x_1}^{x_2} \dot{c}(x) \, dx = c(x_2) - c(x_1) \text{ is the cost of increasing the production from } x_1 \text{ units to } x_2 \text{ units.}$$

* If $s(t)$ is the position of an object, then $\dot{s}(t) = v(t)$ is its velocity and

$$\int_{t_1}^{t_2} \underset{\text{velocity}}{v(t)} \, dt = s(t_2) - s(t_1) \text{ is the } \underline{\text{displacement}} \text{ over } [t_1, t_2] \text{ and}$$

$$\int_{t_1}^{t_2} \overset{\text{speed}}{|v(t)|} \, dt \text{ is the } \underline{\text{total distance traveled}} \text{ on } [t_1, t_2]$$

$$* \quad \begin{array}{ccc} F(b) & = & F(a) + \int_a^b F'(x) \, dx \\ \downarrow & & \downarrow \\ \text{Final} & & \text{initial} \\ \text{value} & & \text{value} \\ & & \underbrace{\hspace{2cm}} \\ & & \text{Net change} \end{array}$$
