

The Degree of Precision (DP)

146

- Recall that the quadrature formula:

$$\int_a^b f(x) dx = Q[f] + E[f]$$

- To derive the truncation error $E[f]$ for any quadrature formula $Q[f]$, we first study the Degree of Precision (DP) for this quadrature formula $Q[f]$.

Def. The DP of a quadrature formula $Q[f]$ is a positive integer n s.t. $Q[f]$ is exact " $E[f]=0$ " for $f_k = x^k$ where $k=0, 1, 2, \dots, n$

• That is: $E[f_0] = E[x^0] = E[1] = \int_a^b dx - Q[1] = 0$

$$E[f_1] = E[x] = \int_a^b x dx - Q[x] = 0$$

$$E[f_2] = E[x^2] = \int_a^b x^2 dx - Q[x^2] = 0$$

⋮

$$E[f_n] = E[x^n] = \int_a^b x^n dx - Q[x^n] = 0$$

But $E[f_{n+1}] = E[x^{n+1}] = \int_a^b x^{n+1} dx - Q[x^{n+1}] \neq 0$

- In this case we have $n = \text{DP of } Q[f]$

- We use n to find the truncation error $E[f]$ which has the general form:

* ... $E[f] = K f^{(n+1)}(c)$ where $c \in [a, b]$ and

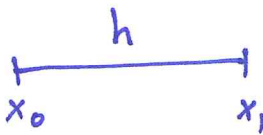

K is a constant that depends on the $\text{DP} = n$ and h .

Exp Determine the DP of the Trapezoidal Rule and use it to find the truncation error.

147

• Recall that the Trapezoidal Rule is:

$$\int_a^b f(x) dx = Q[f] + E[f]$$

$$= \frac{h}{2} [f_0 + f_1] + \frac{-h^3 f''(c)}{12}$$

• It will be enough to apply Trapezoidal Rule over the interval

$$[0, 1] \Rightarrow \int_0^1 f(x) dx = \frac{1}{2} [f(0) + f(1)] + \frac{-h^3 f''(c)}{12}$$

• $\int_0^1 dx = 1 = \frac{1}{2} [1 + 1]$ with $E[1] = 0$ since $f = 1$

• $\int_0^1 x dx = \frac{1}{2} = \frac{1}{2} [0 + 1]$ with $E[x] = 0$ since $f = x$

• $\int_0^1 x^2 dx = \frac{1}{3} \neq \frac{1}{2} [0 + 1]$ with $E[x^2] = \frac{1}{3} - \frac{1}{2} = -\frac{1}{6} \neq 0$ since $f = x^2$

• Hence the DP = $n = 1$ for the Trapezoidal Rule.

• And so, by * we have $E = K f^{(n+1)}(c) = K f''(c)$

• Now to find K , we consider $f(x) = (x - x_0)^{n+1} = (x - x_0)^2$

$$\Rightarrow f'(x) = 2(x - x_0) \Rightarrow f''(x) = 2 \Rightarrow \boxed{E = 2K} \text{ (1)}$$

• But $E = \text{True} - \text{Estimate} = \int_{x_0}^{x_1} (x - x_0)^2 dx - \frac{h}{2} (f(x_0) + f(x_1))$

$$= \frac{x - x_0}{3} \Big|_{x_0}^{x_1} - \frac{h}{2} (0 + (x_1 - x_0)^2)$$

$$= \frac{h^3}{3} - \frac{h^3}{2}$$

$$\boxed{E = \frac{-h^3}{6}} \text{ (2)}$$

From (1) and (2) we have $2K = \frac{-h^3}{6}$

$$\Leftrightarrow \boxed{K = \frac{-h^3}{12}}$$

and hence, $E = K f''(c)$

$$= \frac{-h^3}{12} f''(c)$$

Exp Determine the DP of the Simpson's Rule and use it to find the truncation error.

148

• Recall that the Simpson's Rule is:

$$\int_a^b f(x) dx = \int_{x_0}^{x_2} f(x) dx = \frac{h}{3} [f_0 + 4f_1 + f_2] + \frac{h^5}{90} f^{(4)}(c)$$

• It will be enough to apply Simpson's Rule over the interval $[0, 2] \Rightarrow$

$$\int_0^2 f(x) dx = \frac{1}{3} [f(0) + 4f(1) + f(2)] - \frac{h^5}{90} f^{(4)}(c)$$

• $\int_0^2 dx = 2 = \frac{1}{3} [1 + 4 + 1]$ with $E[1] = 0$ since $f = 1$

$\int_0^2 x dx = 2 = \frac{1}{3} [0 + 4 + 2]$ with $E[x] = 0$ since $f = x$

$\int_0^2 x^2 dx = \frac{8}{3} = \frac{1}{3} [0 + 4 + 4]$ with $E[x^2] = 0$ since $f = x^2$

$\int_0^2 x^3 dx = 4 = \frac{1}{3} [0 + 4 + 8]$ with $E[x^3] = 0$ since $f = x^3$

$\int_0^2 x^4 dx = \frac{32}{5} \neq \frac{1}{3} [0 + 4 + 16] = \frac{20}{3}$ with $E[x^4] = \frac{32}{5} - \frac{20}{3} \neq 0$ since $f = x^4$

• Hence, the DP = $n = 3$ for the Simpson's Rule.

• And so, by * the truncation error is

$$E = K f^{(n+1)}(c) = K f^{(4)}(c)$$

• Now to find K , we consider $f(x) = (x-x_0)^{n+1}$

$$\Rightarrow \hat{f}'(x) = 4(x-x_0)^3$$

$$\hat{f}''(x) = 12(x-x_0)^2$$

$$\hat{f}'''(x) = 24(x-x_0)$$

$$= (x-x_0)^4$$

(4)

$$\Rightarrow f^{(4)}(x) = 4!$$

$$\Rightarrow f^{(4)}(c) = 4!$$

• Hence, $E = K f^{(4)}(c)$

$$E = 24K \quad \text{--- (1)}$$

• But $E = \int_{x_0}^{x_2} (x-x_0)^4 dx - \frac{h}{3} [f(x_0) + 4f(x_1) + f(x_2)]$

$$= \frac{(x-x_0)^5}{5} \Big|_{x_0}^{x_2} - \frac{h}{3} [0 + 4(x_1-x_0)^4 + (x_2-x_0)^4]$$

$$= \frac{(x_2-x_0)^5}{5} - \frac{h}{3} [0 + 4h^4 + (2h)^4]$$

$$= \frac{(2h)^5}{5} - \frac{h}{3} (4h^4 + 16h^4)$$

$$= \frac{32h^5}{5} - \frac{20h^5}{3}$$

$$E = \frac{-4h^5}{15} \quad \text{--- (2)}$$

• From (1) and (2) we get $24K = \frac{-4h^5}{15} \Rightarrow K = \frac{-h^5}{90}$

• Hence, $E = K f^{(4)}(c)$
 $= \frac{-h^5 f^{(4)}(c)}{90}$ ✓

Exp Determine the DP of the Simpson's $\frac{3}{8}$ Rule and use it to find the truncation error.

150

• Recall that the Simpson's $\frac{3}{8}$ Rule is:

$$\int_{x_0}^{x_3} f(x) dx = \frac{3h}{8} [f_0 + 3f_1 + 3f_2 + f_3] + \frac{-3h^5 f^{(4)}(c)}{80}$$

• It will be enough to apply Simpson's $\frac{3}{8}$ Rule over the interval $[0, 3] \Rightarrow$

$$\int_0^3 f(x) dx = \frac{3}{8} [f(0) + 3f(1) + 3f(2) + f(3)] - \frac{3h^5 f^{(4)}(c)}{80}$$

$$\int_0^3 dx = 3 = \frac{3}{8} [1 + 3 + 3 + 1] \text{ with } E[1] = 0 \text{ since } f = 1$$

$$\int_0^3 x dx = \frac{9}{2} = \frac{3}{8} [0 + 3 + 6 + 3] \text{ with } E[x] = 0 \text{ since } f = x$$

$$\int_0^3 x^2 dx = 9 = \frac{3}{8} [0 + 3 + 12 + 9] \text{ with } E[x^2] = 0 \text{ since } f = x^2$$

$$\int_0^3 x^3 dx = \frac{81}{4} = \frac{3}{8} [0 + 3 + 24 + 27] \text{ with } E[x^3] = 0 \text{ since } f = x^3$$

$$\int_0^3 x^4 dx = \frac{243}{5} \neq \frac{3}{8} [0 + 3 + 48 + 81] = \frac{99}{2} \text{ with } E[x^4] = \frac{243}{5} - \frac{99}{2} \neq 0 \text{ since } f = x^4$$

• Hence, the DP = $n = 3$ for the Simpson's $\frac{3}{8}$ Rule.

• And so, by * the truncation error is

$$E = K f^{(n+1)}(c) = K f^{(4)}(c)$$

- Now to find K , we consider $f(x) = (x-x_0)^{n+1}$
 $\Rightarrow f^{(4)}(c) = 4!$

151

- Hence, $E = K f^{(4)}(c)$

$$E = 24K \quad \text{--- (1)}$$

- But $E = \text{True Value} - \text{Estimated Value}$

$$\begin{aligned} &= \int_{x_0}^{x_3} (x-x_0)^4 dx - \frac{3}{8}h [f_0 + 3f_1 + 3f_2 + f_3] \\ &= \left. \frac{(x-x_0)^5}{5} \right|_{x_0}^{x_3} - \frac{3h}{8} [f(x_0) + 3f(x_1) + 3f(x_2) + f(x_3)] \\ &= \frac{(x_3-x_0)^5}{5} - \frac{3h}{8} [0 + 3(x_1-x_0)^4 + 3(x_2-x_0)^4 + (x_3-x_0)^4] \\ &= \frac{(3h)^5}{5} - \frac{3h}{8} [3h^4 + 3(2h)^4 + (3h)^4] \\ &= \frac{243h^5}{5} - \frac{99h^5}{2} \end{aligned}$$

$$E = \frac{-9h^5}{10} \quad \text{--- (2)}$$

- From (1) and (2) we get $24K = \frac{-9h^5}{10} \Rightarrow K = \frac{-3h^5}{80}$

- Hence, $E = K f^{(4)}(c)$
 $= \frac{-3h^5 f^{(4)}(c)}{80}$

Exp Given the following quadrature formula:

152

$$\int_0^{3h} f(x) dx \approx Q[f] = \frac{3h}{4} [3f(h) + f(3h)].$$

Find its DP and its truncation error $E[f]$.

$$\int_0^3 f(x) dx \approx \frac{3}{4} [3f(1) + f(3)]$$

• $\int_0^3 dx = 3 = \frac{3}{4} [3+1]$ with $E[1] = 0$ since $f=1$

$\int_0^3 x dx = \frac{9}{2} = \frac{3}{4} [3+3]$ with $E[x] = 0$ since $f=x$

$\int_0^3 x^2 dx = 9 = \frac{3}{4} [3+9]$ with $E[x^2] = 0$ since $f=x^2$

$\int_0^3 x^3 dx = \frac{81}{4} \neq \frac{3}{4} [3+27] = \frac{90}{4}$ with $E[x^3] = \frac{81}{4} - \frac{90}{4} = \frac{-9}{4} \neq 0$ since $f=x^3$

• Hence, DP = $n=2$ and therefore, $E = K f^{(n+1)} = K f^{(3)}$

• Take $f(x) = x^3 \xrightarrow{\text{since } x_0=0} f''(c) = 3! = 6 \Rightarrow$ so $E = 6K$ — ①

• But $E = \text{True} - \text{Estimate} = \int_0^{3h} x^3 dx - \frac{3h}{4} [3f(h) + f(3h)]$

$$= \frac{x^4}{4} \Big|_0^{3h} - \frac{3h}{4} [3h^3 + 27h^3]$$

$$= \frac{81h^4}{4} - \frac{90h^4}{4}$$

$$E = \frac{-9h^4}{4} \text{ — ②}$$

$$6K = \frac{-9h^4}{4} \Rightarrow K = \frac{-3h^4}{8}$$

Hence, $E = K f''(c)$

$$= \frac{-3h^4 f''(c)}{8} \checkmark$$

• From ① and ② we get

Exp Given the following quadrature formula:

153

$$\int_{-1}^1 f(x) dx \approx Q[f] = \frac{1}{2} [f(-1) + 3f(\frac{1}{3})]$$

Find its DP and its truncation error $E[f]$.

• $\int_{-1}^1 dx = 2 = \frac{1}{2} [1+3]$ with $E[1] = 0$ since $f=1$

• $\int_{-1}^1 x dx = 0 = \frac{1}{2} [-1+1]$ with $E[x] = 0$ since $f=x$

• $\int_{-1}^1 x^2 dx = \frac{2}{3} = \frac{1}{2} [1+\frac{1}{3}]$ with $E[x^2] = 0$ since $f=x^2$

• $\int_{-1}^1 x^3 dx = 0 \neq \frac{1}{2} [-1+\frac{1}{9}] = -\frac{4}{9}$ with $E[x^3] = 0 - \frac{4}{9} = \frac{4}{9} \neq 0$ since $f=x^3$

• Hence, DP = $n=2$ and therefore $E = K f^{(n+1)}(c) = K f^{(3)}(c)$

• Now Take $f(x) = (x-x_0)^3 = (x+1)^3 \Rightarrow f^{(3)}(c) = 3! = 6$
 $\Rightarrow E = 6K$ ①

• But $E = \int_{-1}^1 (x+1)^3 dx - \frac{1}{2} [f(-1) + 3f(\frac{1}{3})]$
 $= \frac{(x+1)^4}{4} \Big|_{-1}^1 - \frac{1}{2} [0 + 3(\frac{1}{3}+1)^3]$
 $= 4 - \frac{32}{3}$

$E = \frac{4}{9}$ ②

$6K = \frac{4}{9}$

$K = \frac{2}{27}$

Hence, $E = K f^{(3)}(c)$

$= \frac{2 f^{(3)}(c)}{27}$

• From ① and ② we get
