

1.3 Error Analysis

6

Def Assume \tilde{p} is approximation to p , where $p \neq 0$. Then,

- The (absolute) error is $E_p = |p - \tilde{p}|$ and
- the relative error is $R_p = \frac{|p - \tilde{p}|}{|p|}$ which expresses the error as percentage of the true value.

Exp Find the error and relative error for the following cases:

① $x = 3.141592$ and $\tilde{x} = 3.14$

$$\text{Error} = E_x = |x - \tilde{x}| = |3.141592 - 3.14| = 0.001592$$

$$\text{Relative Error} = R_x = \frac{|x - \tilde{x}|}{|x|} = \frac{0.001592}{3.141592} = 0.000507$$

\tilde{x} is good approx. of x

② $y = 1000000$ and $\tilde{y} = 999996$

$$E_y = |y - \tilde{y}| = |1000000 - 999996| = 4$$

$$R_y = \frac{|y - \tilde{y}|}{|y|} = \frac{4}{1000000} = 4 \times 10^{-6} = 0.000004$$

\tilde{y} is good approx. of y

③ $z = 0.000012$ and $\tilde{z} = 0.000009$

$$E_z = |z - \tilde{z}| = |0.000012 - 0.000009| = 0.000003$$

$$R_z = \frac{|z - \tilde{z}|}{|z|} = \frac{0.000003}{0.000012} = 0.25$$

\tilde{z} is bad approx. of z

Remarks

① \tilde{x} is a good estimate for x since there is no much difference between E_x and R_x and so any of them could be used to determine the accuracy of \tilde{x} .

② \tilde{y} is good estimate for y since R_y is small (even if E_y is large since y is of magnitude 10^6)

③ \tilde{z} is bad approximation for z even that E_z is the smallest of the three cases. This because R_z is the largest.

Exp 0.000004321

3.10045

$2 \times 10^{-4} = 0.0002$

4 significant digits

6 significant digits

1 significant digits

Def The number \tilde{p} approximates p to d significant digits if d is the largest non-negative integer s.t. $R_p < 5 \times 10^{-d}$ 7

Exp ① $x = 3.141592$ and $\tilde{x} = \underline{3.14}$

$$R_x = 0.000507 < 0.005 = 5 \times 10^{-3} \Leftrightarrow d=3$$

② $y = 1000000$ and $\tilde{y} = \underline{999996}$

$$R_y = 0.000004 < 0.000005 = 5 \times 10^{-6} \Leftrightarrow d=6$$

③ $z = 0.000012$ and $\tilde{z} = \underline{0.000009}$

$$R_z = 0.25 < 0.5 = 5 \times 10^{-1} \Leftrightarrow d=1$$

Normalized decimal form

7.2

Any real number p can be written in normalized decimal form:

$$p = \pm 0.d_1 d_2 d_3 \dots d_k d_{k+1} \dots \times 10^n$$

where $d_1 \neq 0$ and $d_j \in \{0, 1, 2, \dots, 9\}$ for $j > 1$.

Exp • $0.01234 = 0.1234 \times 10^{-1}$

• $12.034 = 0.12034 \times 10^2$

• $0.000101 = 0.101 \times 10^{-3}$

Source of Error

Truncation Error

↓
Error results from estimating a formula by a formula

↓
TE is the difference between a truncated value \tilde{p} and the actual value p arises from executing a finite number of steps to approximate an infinite process.

Exp $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$
 $e^x \approx 1 + x + \frac{x^2}{2!}$

TE = Error

$$= \left| e^x - \left(1 + x + \frac{x^2}{2!} \right) \right|$$

Q. How does computer approximate operations?

8

A. A priority to 1) Brackets

2) Powers

3) \times, \div from left to right

4) $+, -$ from left to right

Exp Use 4-digits rounding to find $f(0.3456)$ if

$$f(x) = \frac{x - \sin \sqrt{x}}{2x^2 + x \cos x}$$

$$f(0.3456) = \frac{0.3456 - \sin(\sqrt{0.3456})}{2(0.3456)^2 + (0.3456) \cos(0.3456)}$$

$$= \frac{0.3456 - \sin(0.5879)}{2(0.1194) + (0.3456)(0.9409)}$$

$$= \frac{0.3456 - 0.5546}{0.2388 + 0.3252}$$

$$= \frac{-0.2090}{0.5640}$$

$$= -0.3706$$

Exp Determine the proper answer of $\frac{3}{7} + \frac{5}{8} + \frac{11}{5}$ 9
 using four significant digits of accuracy.

$$\left. \begin{aligned} \frac{3}{7} &= 0.428571... \approx 0.4286 \\ \frac{5}{8} &= 0.625 = 0.6250 \\ \frac{11}{5} &= 2.2 = 2.200 \end{aligned} \right\} \begin{aligned} \frac{\left(\frac{3}{7} + \frac{5}{8}\right) + \frac{11}{5}}{21} &= \frac{0.4286 + 0.6250 + 2.200}{21} \\ &= \frac{1.0536 + 2.200}{21} \\ &= \frac{1.054 + 2.200}{21} \\ &= \frac{3.254}{21} = 0.1550 \end{aligned}$$

\swarrow
0.15495

Loss of Significance

- Let $p = 3.1415926536$ and $q = 3.1415957341$ with 11 decimal digits
- Note that $p - q = -0.0000030805$ has 5 decimal digits
- We have loss of 6 digits (which are the first 6 digits in p and q)
- This is called loss of significance or subtractive cancellation.

Exp Let $f(x) = x(\sqrt{x+1} - \sqrt{x})$ and $g(x) = \frac{x}{\sqrt{x+1} + \sqrt{x}}$
 Use 6 digits and rounding to compare $f(500)$ with $g(500)$.

$$\begin{aligned} f(500) &= 500(\sqrt{501} - \sqrt{500}) = 500(22.3830 - 22.3607) \\ &= 500(0.0223) \quad \text{loss of 3 digits} \\ &= 11.1500 \end{aligned}$$

$$g(500) = \frac{500}{\sqrt{501} + \sqrt{500}} = \frac{500}{22.3830 + 22.3607} = \frac{500}{44.7437} = 11.1748$$

- True value is $11.1747553...$ $E_f = 0.0247$ and $E_g = 0$
- Note that $g(500)$ involves less error and becomes true value to the 6 digits. so g is a better approximation than f

although $f(x) = x(\sqrt{x+1} - \sqrt{x}) \frac{\sqrt{x+1} + \sqrt{x}}{\sqrt{x+1} + \sqrt{x}} = \frac{x(x+1-x)}{\sqrt{x+1} + \sqrt{x}} = \frac{x}{\sqrt{x+1} + \sqrt{x}} = g(x)$

we solve this problem by finding $g(x)$

هذا بسبب عملية الطرح

How to solve this function to avoid loss of significantants:

9.1

$$\textcircled{1} f(x) = \ln x - \ln(x+1)$$

$$P(x) = \ln \left(\frac{x}{x+1} \right)$$

• $\textcircled{2} f(x) = \frac{x - \sin x}{\ln(x+2)}$. Find $f\left(\frac{7}{12}\right)$ using 6 digits rounding.

$$\begin{aligned} \bullet f\left(\frac{7}{12}\right) &= f(0.583333) = \frac{0.583333 - \sin(0.583333)}{\ln(0.583333 + 2)} \\ &= \frac{0.583333 - 0.550809}{0.949080} \\ &= \frac{0.0325240}{0.949080} = 0.0342690 \end{aligned}$$

$$\bullet P(x) = \frac{x - \sin x}{\ln(x+2)} \cdot \frac{x + \sin x}{x + \sin x} = \frac{x^2 - \sin^2 x}{[\ln(x+2)][x + \sin x]}$$

$$\begin{aligned} P(0.583333) &= \frac{(0.583333)^2 - \sin^2(0.583333)}{[\ln(0.583333+2)][0.583333 + \sin(0.583333)]} \\ &= \frac{0.340277 - 0.303391}{(0.949080)(1.13414)} \\ &= \frac{0.0368860}{1.07639} \\ &= 0.0342682 \end{aligned}$$

we compare
with the
true value

Exp Compare the results of calculating $f(0.01)$ and $P(0.01)$ 10
using 6 digits rounding arithmetic for

$$f(x) = \frac{e^x - 1 - x}{x^2} \quad \text{and} \quad P(x) = \frac{1}{2} + \frac{x}{6} + \frac{x^2}{24}$$

loss 1 digit loss 2 digits

$$\begin{aligned} \bullet f(0.01) &= \frac{e^{0.01} - 1 - 0.01}{(0.01)^2} = \frac{1.01005 - 1 - 0.01}{0.0001} = \frac{0.01005 - 0.01}{0.0001} \\ &= \frac{0.00005}{0.0001} = 0.5 \quad \Rightarrow E_f = 0.001671 \end{aligned}$$

$$\bullet P(0.01) = \frac{1}{2} + \frac{0.01}{6} + \frac{(0.01)^2}{24}$$

P solves the problem and it is easy to find it

$E_P = 0$

$$= 0.5 + 0.00166667 + 0.00000416670 = 0.501671$$

• Note that $P(x)$ is Taylor polynomial of degree 2 for $f(x)$ at $x=0$.

That is, $f(x) = P_2(x) + R_2(x)$.

• Now $P(0.01)$ contains less error and becomes same as true answer 0.50167084168057542... when rounding

Order of Approximation $O(h^n)$

Def • Assume $f(h)$ is approximated by the function $p(h)$.

• Assume \exists a real constant $M > 0$
and \exists a positive integer n so that

*
$$\frac{|f(h) - p(h)|}{|h^n|} \leq M \quad \text{for sufficiently small } h.$$

• In this case, we say $p(h)$ approximates $f(h)$ with order of approximation $O(h^n)$ and we write this as

$$f(h) = p(h) + O(h^n)$$

Note: if we write * as $|f(h) - p(h)| \leq M |h^n|$, then we see that $O(h^n)$ stands in place of the error bound $M |h^n|$.

Th • Assume $f(h) = p(h) + o(h^n)$ and $g(h) = q(h) + o(h^m)$ where n, m are positive integers. 11

• Then $f(h) + g(h) = p(h) + q(h) + o(h^r)$

and $f(h)g(h) = p(h)q(h) + o(h^r)$

and $\frac{f(h)}{g(h)} = \frac{p(h)}{q(h)} + o(h^r)$, $g(h) \neq 0$ and $q(h) \neq 0$

where $r = \min\{n, m\}$

Exp If $f(h) = p(h) + o(h^5)$ and $g(h) = q(h) + o(h^3)$, then $f(h)g(h) = p(h)q(h) + o(h^3)$

Remark • If $p(x)$ is the n^{th} Taylor polynomial approximation of $f(x)$, then by Taylor formula

$$f(x) = p(x) + R(x)$$

Truncation Error Term

the remainder $R(x)$ is simply $o(h^{n+1})$. That is

$$E = o(h^{n+1}) \approx M h^{n+1} \approx \frac{f^{(n+1)}(c)}{(n+1)!} h^{n+1}, \quad h \text{ small.}$$

$c \in (x_0, x)$

Th (Taylor's Th) Assume $f \in C^{n+1}[a, b]$. Then for $x_0, x \in [a, b] \Rightarrow$

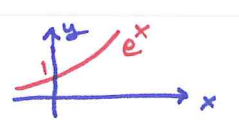

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(x_0)}{n!} (x-x_0)^n + o(h^{n+1}), \quad h = x - x_0$$

Remark ① If $k \geq n$ then $h^k + o(h^n) = o(h^n)$

Exp $h^3 + o(h^3) = o(h^3)$ since $h^3 + o(h^3) = h^3 + ch^3 = (1+c)h^3 = ch^3 = o(h^3)$

Exp $h^4 + o(h^3) = o(h^3)$

② If $f(h) = p(h) + o(h^n)$ with $n > m$, then $p(h)$ is a better approximation for $f(h)$.

Exp $e^h = 1 + h + \frac{h^2}{2!} + \frac{h^3}{3!} + \frac{h^4}{4!} + \dots$  12

• $e^h \approx 1 + h + o(h^2)$ where $E = o(h^2) \approx \frac{h^2}{2!} = \text{Error}$

$e^{0.1} = 1.105170918$ true value ↑
order of approximation

$e^{0.1} \approx 1 + 0.1 = 1.1$ with error $= Mh^2 = M(0.1)^2 = M(0.01) < 10^{-2}$

where $M = \frac{f^{(n+1)}(c)}{(n+1)!} = \frac{e^c}{2!}$, $c \in (0, 0.1)$

$\Rightarrow 0 < c < 0.1 \Rightarrow 1 < e^c < e^{0.1} < 2 \Rightarrow M < 1$

• $e^h = 1 + h + \frac{h^2}{2} + o(h^3) \Rightarrow \text{Error} = o(h^3) = Mh^3$

$e^{0.1} = 1 + 0.1 + \frac{0.01}{2} = 1.105 \Rightarrow \text{Error} \approx M(0.1)^3 = M(0.001) < 10^{-3}$
since $M < 1$

Exp $\sinh h = h - \frac{h^3}{3!} + \frac{h^5}{5!} - \dots$

$\sinh h \approx h$ with error $= o(h^3)$

$\Leftrightarrow \sin(0.1) \approx 0.1$

$\sinh h \approx h - \frac{h^3}{3!}$ with error $= o(h^5)$

$\Leftrightarrow \sin(0.1) \approx 0.1 - \frac{(0.1)^3}{3!}$
 ≈ 0.0998

Exp Suppose $e^h = 1 + h$ (Error $= o(h^2)$)

and $\sinh h = h - \frac{h^3}{3!}$ (Error $= o(h^5)$)

Then $e^h + \sinh h = 1 + 2h - \frac{h^3}{3!} + o(h^2) + o(h^5)$ الأصغر هي التي تؤثر
 $\approx 1 + 2h + o(h^2)$

Exp $\cosh h = 1 - \frac{h^2}{2!} + \frac{h^4}{4!} - \frac{h^6}{6!} + \frac{h^8}{8!} - \dots$

$\cosh h \approx 1 - \frac{h^2}{2!} + \frac{h^4}{4!}$ with $E = o(h^6) = \text{constant} \cdot h^6$

Exp Consider the Taylor Polynomial expansions

13

$$e^h = 1 + h + \frac{h^2}{2!} + \frac{h^3}{3!} + o(h^4) \quad \text{and}$$

$$\cosh h = 1 - \frac{h^2}{2!} + \frac{h^4}{4!} + o(h^6).$$

Determine the order of approximation for their sum and product.

$$e^h + \cosh h = 1 + h + \frac{h^2}{2!} + \frac{h^3}{3!} + o(h^4) + 1 - \frac{h^2}{2!} + \frac{h^4}{4!} + o(h^6)$$

$$= 2 + h + \frac{h^3}{3!} + o(h^4) + \frac{h^4}{4!} + o(h^6)$$

But $o(h^4) + \frac{h^4}{4!} = o(h^4)$ and

$o(h^4) + o(h^6) = o(h^4)$

$$= 2 + h + \frac{h^3}{3!} + o(h^4) \quad \text{with order of approximation } o(h^4).$$

$$e^h \cosh h = \left(1 + h + \frac{h^2}{2!} + \frac{h^3}{3!} + o(h^4)\right) \left(1 - \frac{h^2}{2!} + \frac{h^4}{4!} + o(h^6)\right)$$

or $1 - \frac{h^2}{2!} + h - \frac{h^3}{2!} + \frac{h^2}{2!} + \frac{h^3}{3!} + o(h^4)$

$$= \left(1 + h + \frac{h^2}{2!} + \frac{h^3}{3!}\right) \left(1 - \frac{h^2}{2!} + \frac{h^4}{4!}\right) + \left(1 + h + \frac{h^2}{2!} + \frac{h^3}{3!}\right) o(h^6)$$

$$+ o(h^4) o(h^6) + \left(1 - \frac{h^2}{2!} + \frac{h^4}{4!}\right) o(h^4)$$

error term

$$= 1 + h - \frac{h^3}{3} - \frac{5h^4}{24} - \frac{h^5}{24} + \frac{h^6}{48} + \frac{h^7}{144} + o(h^6)$$

$$+ o(h^4) o(h^6) + o(h^4)$$

But $o(h^4) o(h^6) = o(h^{10})$ and so

$$-\frac{5}{24}h^4 - \frac{h^5}{24} + \frac{h^6}{48} + \frac{h^7}{144} + o(h^6) + o(h^{10}) + o(h^4) = o(h^4)$$

Hence, $e^h \cosh h = 1 + h - \frac{h^3}{3} + o(h^4)$ and the order of approximation is $o(h^4)$.

Def (order of convergence of a sequence)

14

• Suppose that $\lim_{n \rightarrow \infty} x_n = x$ and $\lim_{n \rightarrow \infty} r_n = 0$

• We say x_n converges to x with order of convergence $O(r_n)$

if \exists a constant $K > 0$ s.t

$$\frac{|x_n - x|}{|r_n|} \leq K \quad \text{for } n \text{ sufficiently large}$$

and we write $x_n = x + O(r_n)$

Exp show that [1] $x_n = \frac{\cos n}{n^2}$ converges to 0 with rate of convergence $O(\frac{1}{n^2})$.

$$\frac{|x_n - x|}{|r_n|} = \frac{|\frac{\cos n}{n^2}|}{|\frac{1}{n^2}|} = |\cos n| \leq 1 \quad \text{for all } n$$

[2] $p(h) = 1+h$ estimate $f(h) = e^h$ with order $O(h^2)$

$$\frac{|f(h) - p(h)|}{|r_h|} = \frac{|e^h - (1+h)|}{h^2} = \frac{\cancel{1+h} + \frac{h^2}{2!} + \frac{h^3}{3!} + \dots - \cancel{(1+h)}}{h^2}$$

$$= \frac{1}{2!} + \frac{h}{3!} + \frac{h^2}{4!} + \frac{h^3}{5!} + \dots = \sum_{n=2}^{\infty} \frac{h^{n-2}}{n!}$$

Apply Ratio Test to see $\sum_{n=2}^{\infty} \frac{h^{n-2}}{n!}$ converges to some K

$$\lim_{n \rightarrow \infty} \frac{h^{n-1}}{(n+1)!} \frac{n!}{h^{n-2}} = \lim_{n \rightarrow \infty} \frac{h}{n+1} = 0 < 1 \quad \text{for all } h$$

[3] $\sinh = h - \frac{h^3}{3!} + O(h^5)$ Exercise
