## Declare/Create Two-dimensional Arrays

```
// Declare array ref var
dataType[][] refVar;

// Create array and assign its reference to variable
refVar = new dataType[10][10];

// Combine declaration and creation in one statement
dataType[][] refVar = new dataType[10][10];

// Alternative syntax
dataType refVar[][] = new dataType[10][10];
```

# Declaring Variables of Two-dimensional Arrays and Creating Two-dimensional Arrays

```
int[][] matrix = new int[10][10];  
or  
int matrix[][] = new int[10][10];  
matrix[0][0] = 3;  
  
for (int i = 0; i < matrix.length; i++)  
    for (int j = 0; j < matrix[i].length; j++)  
        matrix[i][j] = (int) (Math.random() * 1000);  
  
double[][] x;
```

3

## Two-dimensional Array Illustration

[0][1][2][3][4]				
[0]	0	0	0	0
[1]	0	0	0	0
[2]	0	0	0	0
[3]	0	0	0	0
[4]	0	0	0	0

matrix = new int[5][5];

(a)

matrix.length? 5

matrix[0].length? 5

[0][1][2][3][4]				
[0]	0	0	0	0
[1]	0	0	0	0
[2]	0	7	0	0
[3]	0	0	0	0
[4]	0	0	0	0

matrix[2][1] = 7;

(b)

[0][1][2]			
[0]	1	2	3
[1]	4	5	6
[2]	7	8	9
[3]	10	11	12

```
int[][] array = {  
    {1, 2, 3},  
    {4, 5, 6},  
    {7, 8, 9},  
    {10, 11, 12}  
};
```

(c)

array.length? 4

array[0].length? 3

4

## Declaring, Creating, and Initializing Using Shorthand Notations

You can also use an array initializer to declare, create and initialize a two-dimensional array. For example,

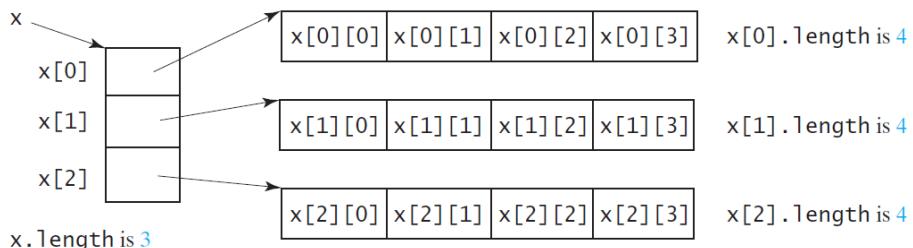

```
int[][] array = {  
    {1, 2, 3},  
    {4, 5, 6},  
    {7, 8, 9},  
    {10, 11, 12}  
};
```

Same as

```
int[][] array = new int[4][3];  
array[0][0] = 1; array[0][1] = 2; array[0][2] = 3;  
array[1][0] = 4; array[1][1] = 5; array[1][2] = 6;  
array[2][0] = 7; array[2][1] = 8; array[2][2] = 9;  
array[3][0] = 10; array[3][1] = 11; array[3][2] = 12;
```

## Lengths of Two-dimensional Arrays

```
int[][] x = new int[3][4];
```

## Lengths of Two-dimensional Arrays, cont.

```
int[][] array = {  
    {1, 2, 3},  
    {4, 5, 6},  
    {7, 8, 9},  
    {10, 11, 12}  
};
```

array.length  
array[0].length  
array[1].length  
array[2].length  
array[3].length

array[4].length      **ArrayIndexOutOfBoundsException**

7

## Ragged Arrays

Each row in a two-dimensional array is itself an array. So, the rows can have different lengths. Such an array is known as *a ragged array*. For example,

```
int[][] matrix = {  
    {1, 2, 3, 4, 5},  
    {2, 3, 4, 5},  
    {3, 4, 5},  
    {4, 5},  
    {5}  
};
```

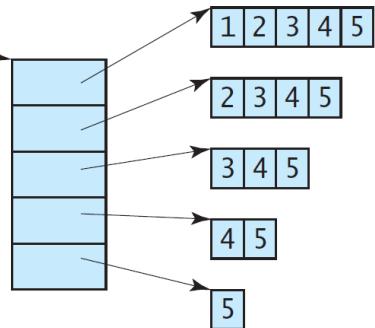

matrix.length is 5  
matrix[0].length is 5  
matrix[1].length is 4  
matrix[2].length is 3  
matrix[3].length is 2  
matrix[4].length is 1

Liang, Introduction to Java Programming, Tenth Edition, (c) 2013 Pearson Education, Inc. All rights reserved.

8

## Ragged Arrays, cont.

```
int[][] triangleArray = {  
    {1, 2, 3, 4, 5},  
    {2, 3, 4, 5},  
    {3, 4, 5},  
    {4, 5},  
    {5}  
};
```

## Processing Two-Dimensional Arrays

See the examples in the text.

1. (Initializing arrays with input values)
2. (Printing arrays)
3. (Summing all elements)
4. (Summing all elements by column)
5. (Which row has the largest sum)
6. (Finding the smallest index of the largest element)
7. (*Random shuffling*)

# Initializing arrays with input values

```
java.util.Scanner input = new Scanner(System.in);
System.out.println("Enter " + matrix.length + " rows and " +
matrix[0].length + " columns: ");
for (int row = 0; row < matrix.length; row++) {
    for (int column = 0; column < matrix[row].length; column++) {
        matrix[row][column] = input.nextInt();
    }
}
```

11

# Initializing arrays with random values

```
for (int row = 0; row < matrix.length; row++) {
    for (int column = 0; column < matrix[row].length; column++) {
        matrix[row][column] = (int)(Math.random() * 100);
    }
}
```

12

Liang, Introduction to Java Programming, Tenth Edition, (c) 2013 Pearson Education, Inc. All rights reserved.

## Printing arrays

```
for (int row = 0; row < matrix.length; row++) {  
    for (int column = 0; column < matrix[row].length; column++) {  
        System.out.print(matrix[row][column] + " ");  
    }  
  
    System.out.println();  
}
```

## Summing all elements

```
int total = 0;  
for (int row = 0; row < matrix.length; row++) {  
    for (int column = 0; column < matrix[row].length; column++) {  
        total += matrix[row][column];  
    }  
}
```

14

Liang, Introduction to Java Programming, Tenth Edition, (c) 2013 Pearson Education, Inc. All rights reserved.

## Summing elements by column

```
for (int column = 0; column < matrix[0].length; column++) {  
    int total = 0;  
    for (int row = 0; row < matrix.length; row++)  
        total += matrix[row][column];  
    System.out.println("Sum for column " + column + " is "  
        + total);  
}
```

Liang, Introduction to Java Programming, Tenth Edition, (c) 2013 Pearson Education, Inc. All rights reserved.

## Random shuffling

```
for (int i = 0; i < matrix.length; i++) {  
    for (int j = 0; j < matrix[i].length; j++) {  
        int i1 = (int)(Math.random() * matrix.length);  
        int j1 = (int)(Math.random() * matrix[i].length);  
        // Swap matrix[i][j] with matrix[i1][j1]  
        int temp = matrix[i][j];  
        matrix[i][j] = matrix[i1][j1];  
        matrix[i1][j1] = temp;  
    }  
}
```

# Multidimensional Arrays

Occasionally, you will need to represent n-dimensional data structures. In Java, you can create n-dimensional arrays for any integer n.

The way to declare two-dimensional array variables and create two-dimensional arrays can be generalized to declare n-dimensional array variables and create n-dimensional arrays for  $n \geq 3$ .
