### Chapter 14 JavaFX Basics

## Motivations

JavaFX is a new framework for developing Java GUI programs.

The JavaFX API is an excellent example of how the object-oriented principle is applied.

This chapter serves two purposes.

First, it presents the basics of JavaFX programming.

Second, it uses JavaFX to demonstrate OOP.

Specifically, this chapter introduces the framework of JavaFX and discusses JavaFX GUI components and their relationships.

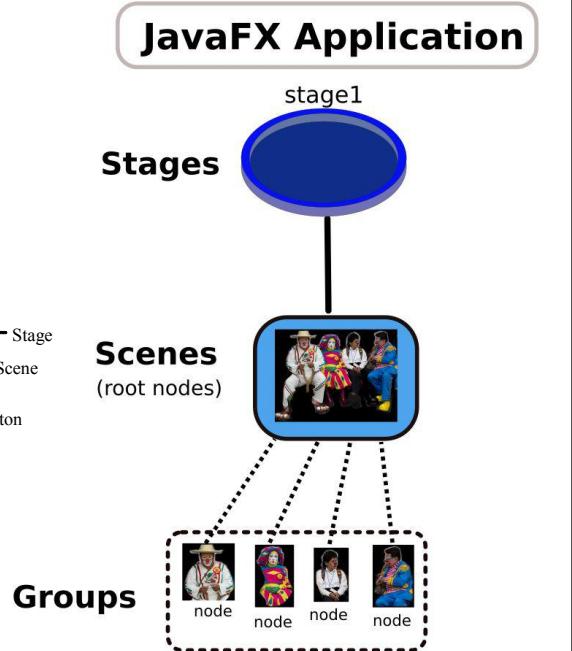

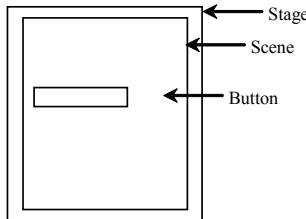

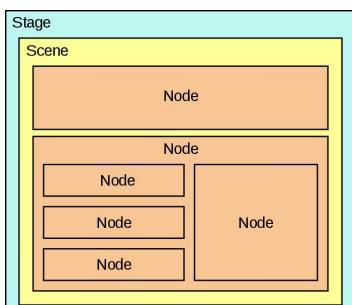

# JavaFX vs Swing and AWT

- ❖ When Java was introduced, the GUI classes were bundled in a library known as the **Abstract Windows Toolkit (AWT)**.
- ❖ AWT is fine for developing simple graphical user interfaces, but not for developing comprehensive GUI projects.
- ❖ In addition, AWT is prone to platform-specific bugs. The AWT user-interface components were replaced by a more robust, versatile, and flexible library known as Swing components.
- ❖ Swing components are painted directly on canvases using Java code. Swing components **depend less on the target platform** and use less of the native GUI resource. With the release of Java 8, Swing is replaced by a completely new GUI platform known as **JavaFX**.
- ❖ Swing and AWT are replaced by the JavaFX platform for developing **rich Internet applications**.

3

## Basic Structure of JavaFX

- Application
- Override the start(Stage) method
- Stage, Scene, and Nodes

```

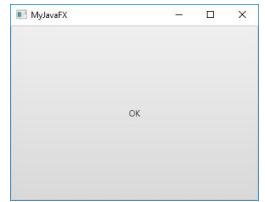

import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.control.Button;
import javafx.stage.Stage;

public class MyJavaFX extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a button and place it in the scene
        Button btOK = new Button('OK');
        Scene scene = new Scene(btOK, 200, 250);
        primaryStage.setTitle('MyJavaFX'); // Set the stage title
        primaryStage.setScene(scene); // Place the scene in the stage
        primaryStage.show(); // Display the stage

        //add second stage add code here
    }

    public static void main(String[] args) {
        launch(args);
    }
}

```

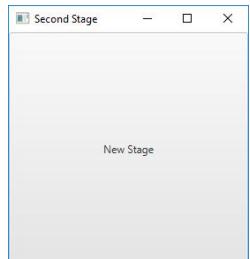

5

```

Stage stage = new Stage(); // Create a new stage
stage.setTitle('Second Stage'); // Set the stage title
// Set a scene with a button in the stage
stage.setScene(new Scene(new Button('New Stage'), 200, 250));
stage.show(); // Display the stage

```

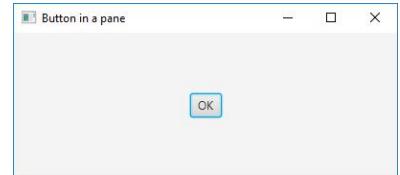

6

**StackPane** is a container which can contain different interface components, subcomponents stacked up to others, and at a certain moment, you can only see the subcomponent lying on the top of Stack.

```
import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.control.Button;
import javafx.scene.layout.StackPane;
import javafx.stage.Stage;

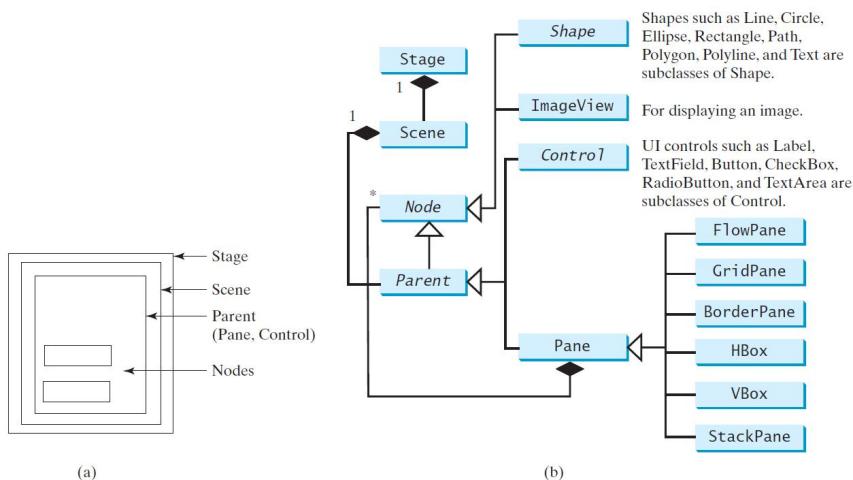

public class ButtonInPane extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a scene and place a button in the scene
        StackPane pane = new StackPane();
        pane.getChildren().add(new Button("OK"));
        //getChildren method is used to get the children components(such as checkboxes, buttons) in a container
        Scene scene = new Scene(pane, 400, 150);
        primaryStage.setTitle("Button in a pane"); // Set the stage title
        primaryStage.setScene(scene); // Place the scene in the stage
        primaryStage.show(); // Display the stage
    }

    public static void main(String[] args) {
        launch(args);
    }
}
```

7

## Panes, UI Controls, and Shapes

8

# Layout Panes

JavaFX provides many types of panes for organizing nodes in a container.

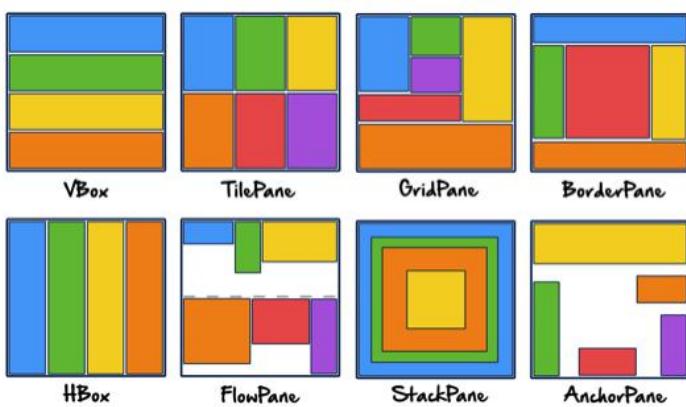

Class	Description
<b>Pane</b>	Base class for layout panes. It contains the <code>getChildren()</code> method for returning a list of nodes in the pane.
<b>StackPane</b>	Places the nodes on top of each other in the center of the pane.
<b>FlowPane</b>	Places the nodes row-by-row horizontally or column-by-column vertically.
<b>GridPane</b>	Places the nodes in the cells in a two-dimensional grid.
<b>BorderPane</b>	Places the nodes in the top, right, bottom, left, and center regions.
<b>HBox</b>	Places the nodes in a single row.
<b>VBox</b>	Places the nodes in a single column.

9

## Example 1-1 Create a Border Pane

```
BorderPane border = new BorderPane();
HBox hbox = addHBox()
border.setTop(hbox);
border.setLeft(addVBox());
addStackPane(hbox);    // Add stack to HBox in top region

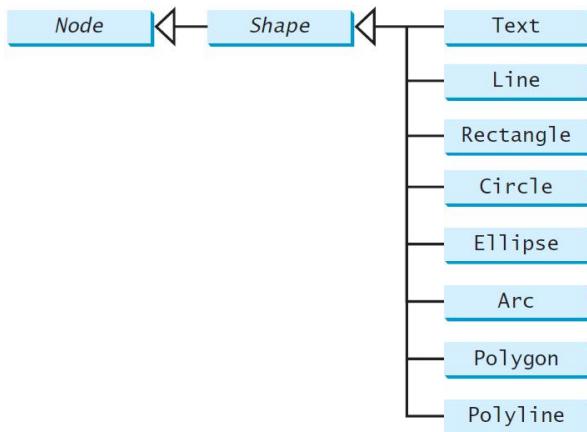

border.setCenter(addGridPane());
border.setRight(addFlowPane());
```

10

# Shapes

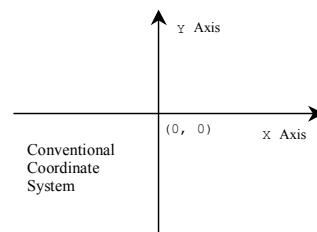

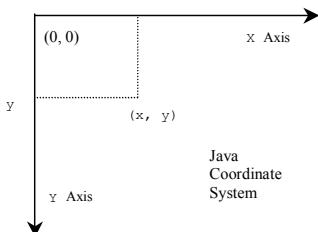

JavaFX provides many shape classes for drawing texts, lines, circles, rectangles, ellipses, arcs, polygons, and polylines.

11

# Display a Shape

This example displays a circle in the center of the pane.

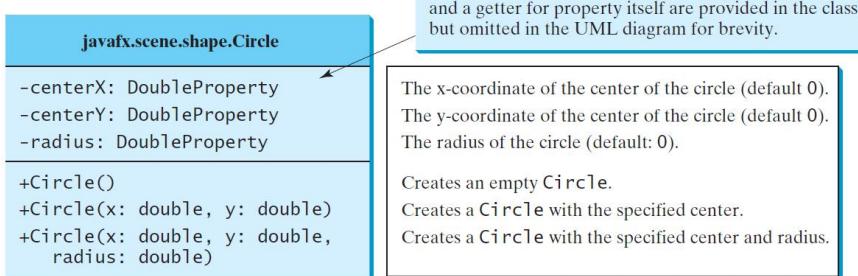

ShowCircle

Run

12

# Circle

13

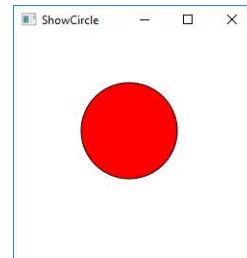

```
import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.layout.Pane;
import javafx.scene.paint.Color;
import javafx.scene.shape.Circle;
import javafx.stage.Stage;

public class ShowCircle extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a circle and set its properties
        Circle circle = new Circle();
        circle.setCenterX(120);
        circle.setCenterY(100);
        circle.setRadius(50);
        circle.setStroke(Color.BLACK);
        circle.setFill(Color.RED);

        // Create a pane to hold the circle
        Pane pane = new Pane();
        pane.getChildren().add(circle);

        // Create a scene and place it in the stage
        Scene scene = new Scene(pane, 250, 250);
        primaryStage.setTitle("ShowCircle"); // Set the stage title
        primaryStage.setScene(scene); // Place the scene in the stage
        primaryStage.show(); // Display the stage
    }

    public static void main(String[] args) {
        launch(args);
    }
}
```

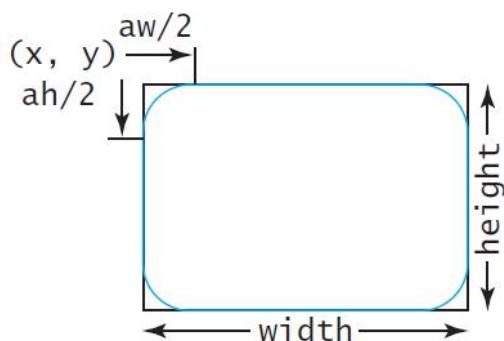

14

# Rectangle

15

## Rectangle Example

(a) `Rectangle(x, y, w, h)`

ShowRectangle

Run

16

```

public class ShowRectangle extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create rectangles
        Rectangle r1 = new Rectangle(25, 10, 60, 30);
        r1.setStroke(Color.BLACK);
        r1.setFill(Color.WHITE);
        Rectangle r2 = new Rectangle(25, 50, 60, 30);
        Rectangle r3 = new Rectangle(25, 90, 60, 30);
        r3.setArcWidth(15);
        r3.setArcHeight(25);

        // Create a group and add nodes to the group
        Group group = new Group();
        group.getChildren().addAll(new Text(10, 27, 'r1'), r1,
            new Text(10, 67, 'r2'), r2, new Text(10, 107, 'r3'), r3);
    }
}

```

17

```

for (int i = 0; i < 4; i++) {
    Rectangle r = new Rectangle(100, 50, 100, 30);
    r.setRotate(i * 360 / 8);
    r.setStroke(Color.color(Math.random(), Math.random(),
        Math.random()));
    r.setFill(Color.WHITE);
    group.getChildren().add(r);
}

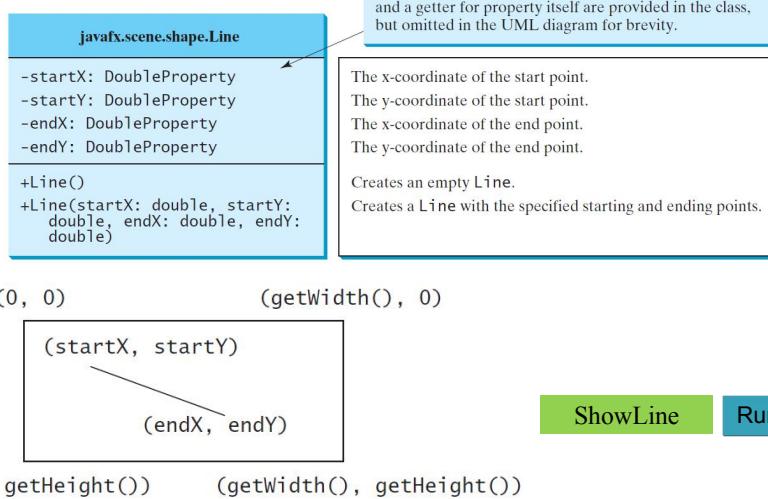

// Create a scene and place it in the stage
Scene scene = new Scene(new BorderPane(group), 250, 150);
primaryStage.setTitle("ShowRectangle"); // Set the stage title
primaryStage.setScene(scene); // Place the scene in the stage
primaryStage.show(); // Display the stage
}

public static void main(String[] args) {
    launch(args);
}
}

```

18

# Line

ShowLine Run

19

```
import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.layout.Pane;
import javafx.scene.paint.Color;
import javafx.stage.Stage;
import javafx.scene.shape.Line;

public class ShowLine extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a scene and place it in the stage
        Scene scene = new Scene(new LinePane(), 200, 200);
        primaryStage.setTitle('ShowLine'); // Set the stage title
        primaryStage.setScene(scene); // Place the scene in the stage
        primaryStage.show(); // Display the stage
    }
}
```

20

```

class LinePane extends Pane {
    public LinePane() {
        Line line1 = new Line(10, 10, 10, 10);
        line1.endXProperty().bind(widthProperty().subtract(10));
        line1.endYProperty().bind(heightProperty().subtract(10));
        line1.setStrokeWidth(5);
        line1.setStroke(Color.GREEN);
        getChildren().add(line1);

        Line line2 = new Line(10, 10, 10, 10);
        line2.startXProperty().bind(widthProperty().subtract(10));
        line2.endYProperty().bind(heightProperty().subtract(10));
        line2.setStrokeWidth(5);
        line2.setStroke(Color.GREEN);
        getChildren().add(line2);
    }
}

```

21

## Ellipse

<b>javafx.scene.shape.Ellipse</b>	The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.
-centerX: DoubleProperty -centerY: DoubleProperty -radiusX: DoubleProperty -radiusY: DoubleProperty	The x-coordinate of the center of the ellipse (default 0). The y-coordinate of the center of the ellipse (default 0). The horizontal radius of the ellipse (default: 0). The vertical radius of the ellipse (default: 0).
+Ellipse() +Ellipse(x: double, y: double) +Ellipse(x: double, y: double, radiusX: double, radiusY: double)	Creates an empty Ellipse. Creates an Ellipse with the specified center. Creates an Ellipse with the specified center and radiiuses.

ShowEllipse

Run

22

# Arc

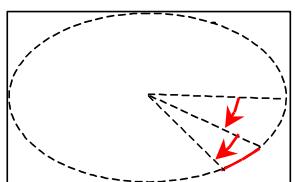

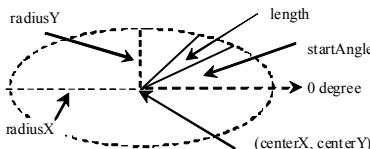

javafx.scene.shape.Arc
<p>-centerX: DoubleProperty -centerY: DoubleProperty -radiusX: DoubleProperty -radiusY: DoubleProperty -startAngle: DoubleProperty -length: DoubleProperty -type: ObjectProperty&lt;ArcType&gt;</p> <p>+Arc() +Arc(x: double, y: double, radiusX: double, radiusY: double, startAngle: double, length: double)</p>

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

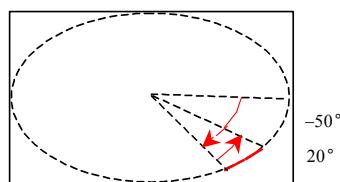

The x-coordinate of the center of the ellipse (default 0).  
The y-coordinate of the center of the ellipse (default 0).  
The horizontal radius of the ellipse (default: 0).  
The vertical radius of the ellipse (default: 0).  
The start angle of the arc in degrees.  
The angular extent of the arc in degrees.  
The closure type of the arc (ArcType.OPEN, ArcType.CHORD, ArcType.ROUND).  
Creates an empty Arc.  
Creates an Arc with the specified arguments.

23

## Arc Examples

(a) Negative starting angle  $-30^\circ$  and negative spanning angle  $-20^\circ$

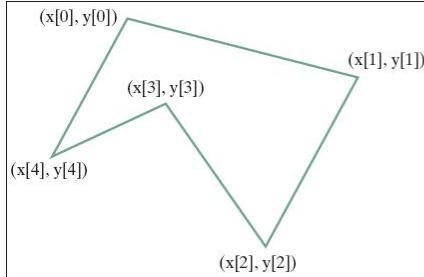

(b) Negative starting angle  $-50^\circ$  and positive spanning angle  $20^\circ$

ShowArc

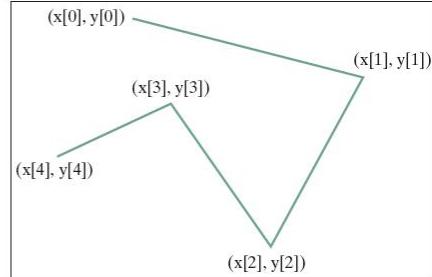

Run

24

# Polygon and Polyline

(a) Polygon

(b) Polyline

25

## Polygon

javafx.scene.shape.Polygon
+Polygon()
+Polygon(double... points)
+getPoints(): ObservableList<Double>

The `getter` and `setter` methods for property values and a `getter` for property `itself` are provided in the class, but omitted in the UML diagram for brevity.

Creates an empty polygon.

Creates a polygon with the given points.

Returns a list of double values as x- and y-coordinates of the points.

ShowPolygon

Run

26

# The Color Class

javafx.scene.paint.Color	
-red: double	The red value of this Color (between 0.0 and 1.0).
-green: double	The green value of this Color (between 0.0 and 1.0).
-blue: double	The blue value of this Color (between 0.0 and 1.0).
-opacity: double	The opacity of this Color (between 0.0 and 1.0).
+Color(r: double, g: double, b: double, opacity: double)	Creates a Color with the specified red, green, blue, and opacity values.
+brighter(): Color	Creates a Color that is a brighter version of this Color.
+darker(): Color	Creates a Color that is a darker version of this Color.
+color(r: double, g: double, b: double): Color	Creates an opaque Color with the specified red, green, and blue values.
+color(r: double, g: double, b: double, opacity: double): Color	Creates a Color with the specified red, green, blue, and opacity values.
+rgb(r: int, g: int, b: int): Color	Creates a Color with the specified red, green, and blue values in the range from 0 to 255.
+rgb(r: int, g: int, b: int, opacity: double): Color	Creates a Color with the specified red, green, and blue values in the range from 0 to 255 and a given opacity.

The getter methods for property values are provided in the class, but omitted in the UML diagram for brevity.

27

# The Font Class

javafx.scene.text.Font	
-size: double	The size of this font.
-name: String	The name of this font.
-family: String	The family of this font.
+Font(size: double)	Creates a Font with the specified size.
+Font(name: String, size: double)	Creates a Font with the specified full font name and size.
+font(name: String, size: double)	Creates a Font with the specified name and size.
+font(name: String, w: FontWeight, size: double)	Creates a Font with the specified name, weight, and size.
+font(name: String, w: FontWeight, p: FontPosture, size: double)	Creates a Font with the specified name, weight, posture, and size.
+getFamilies(): List<String>	Returns a list of font family names.
+getFontNames(): List<String>	Returns a list of full font names including family and weight.

The getter methods for property values are provided in the class, but omitted in the UML diagram for brevity.

FontDemo

Run

28

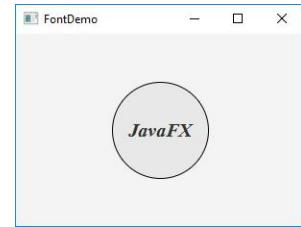

```

import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.layout.*;
import javafx.scene.paint.Color;
import javafx.scene.shape.Circle;
import javafx.scene.text.*;
import javafx.scene.control.*;
import javafx.stage.Stage;

public class FontDemo extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a pane to hold the circle
        Pane pane = new StackPane();

        // Create a circle and set its properties
        Circle circle = new Circle();
        circle.setRadius(50);
        circle.setStroke(Color.BLACK);
        circle.setFill(new Color(0.5, 0.5, 0.5, 0.1));
        pane.getChildren().add(circle); // Add circle to the pane
    }
}

```

29

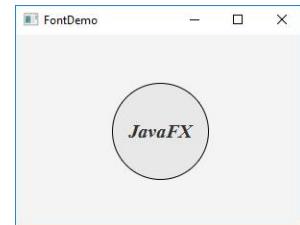

```

// Create a label and set its properties
Label label = new Label("JavaFX");
label.setFont(Font.font("Times New Roman",
    FontWeight.BOLD, FontPosture.ITALIC, 20));
pane.getChildren().add(label);

// Create a scene and place it in the stage
Scene scene = new Scene(pane,300,200);
primaryStage.setTitle('FontDemo'); // Set the stage title
primaryStage.setScene(scene); // Place the scene in the stage
primaryStage.show(); // Display the stage
}

public static void main(String[] args) {
    launch(args);
}
}

```

30

# Text

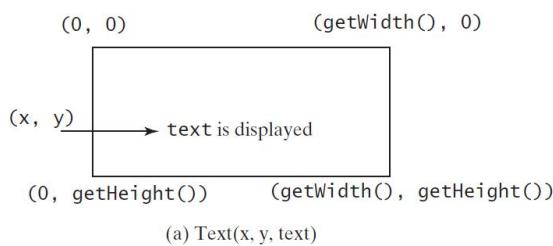

```
javafx.scene.text.Text  
-text: StringProperty  
-x: DoubleProperty  
-y: DoubleProperty  
-underline: BooleanProperty  
-strikethrough: BooleanProperty  
-font: ObjectProperty<Font>  
  
+Text()  
+Text(text: String)  
+Text(x: double, y: double,  
      text: String)
```

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

Defines the text to be displayed.  
Defines the x-coordinate of text (default 0).  
Defines the y-coordinate of text (default 0).  
Defines if each line has an underline below it (default `false`).  
Defines if each line has a line through it (default `false`).  
Defines the font for the text.  
  
Creates an empty Text.  
Creates a Text with the specified text.  
Creates a Text with the specified x-, y-coordinates and text.

31

## Text Example

(a) `Text(x, y, text)`

(b) *Three Text objects are displayed*

ShowText Run

32

```

import javafx.application.Application;
import javafx.scene.Scene;
import javafx.scene.layout.Pane;
import javafx.scene.paint.Color;
import javafx.geometry.Insets;
import javafx.stage.Stage;
import javafx.scene.text.Text;
import javafx.scene.text.Font;
import javafx.scene.text.FontWeight;
import javafx.scene.text.FontPosture;
import javafx.scene.text.FontWeight;
import javafx.scene.text.FontPosture;

public class ShowText extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a pane to hold the texts
        Pane pane = new Pane();
        pane.setPadding(new Insets(5, 5, 5, 5));
        Text text1 = new Text(20, 20, 'Programming is fun');
        text1.setFont(Font.font('Courier', FontWeight.BOLD,
            FontPosture.ITALIC, 15));
        pane.getChildren().add(text1);
    }
}

```

33

```

Text text2 = new Text(60, 60, 'Programming is fun\nDisplay text');
pane.getChildren().add(text2);

Text text3 = new Text(10, 100, 'Programming is fun\nDisplay text');
text3.setFill(Color.RED);
text3.setUnderline(true);
text3.setStrikethrough(true);
pane.getChildren().add(text3);

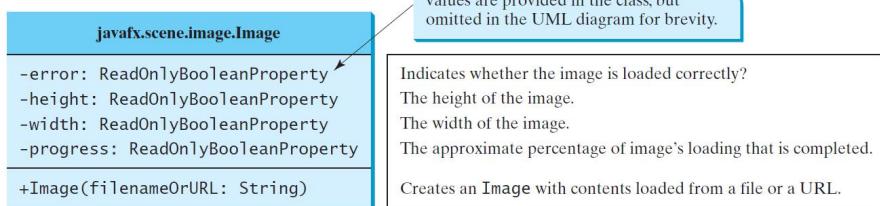

// Create a scene and place it in the stage
Scene scene = new Scene(pane);
primaryStage.setTitle('ShowText'); // Set the stage title
primaryStage.setScene(scene); // Place the scene in the stage
primaryStage.show(); // Display the stage
}

public static void main(String[] args) {
    launch(args);
}
}

```

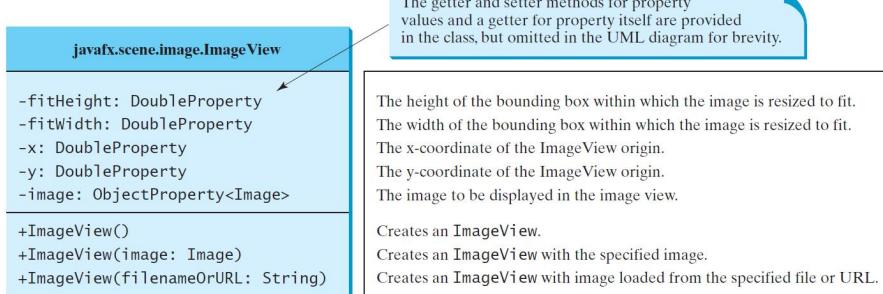

34

# The Image Class

35

# The ImageView Class

ShowImage

Run

36

# BorderPane

```
javafx.scene.layout.BorderPane  
-top: ObjectProperty<Node>  
-right: ObjectProperty<Node>  
-bottom: ObjectProperty<Node>  
-left: ObjectProperty<Node>  
-center: ObjectProperty<Node>  
  
+BorderPane()  
+setAlignment(child: Node, pos:  
Pos)
```

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

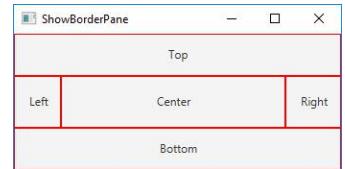

The node placed in the top region (default: null).  
The node placed in the right region (default: null).  
The node placed in the bottom region (default: null).  
The node placed in the left region (default: null).  
The node placed in the center region (default: null).  
  
Creates a BorderPane.  
Sets the alignment of the node in the BorderPane.

ShowBorderPane

Run

37

```
public class ShowBorderPane extends Application {  
    @Override // Override the start method in the Application class  
    public void start(Stage primaryStage) {  
        // Create a border pane  
        BorderPane pane = new BorderPane();  
  
        // Place nodes in the pane  
        pane.setTop(new CustomPane('Top'));  
        pane.setRight(new CustomPane('Right'));  
        pane.setBottom(new CustomPane('Bottom'));  
        pane.setLeft(new CustomPane('Left'));  
        pane.setCenter(new CustomPane('Center'));  
  
        // Create a scene and place it in the stage  
        Scene scene = new Scene(pane);  
        primaryStage.setTitle('ShowBorderPane'); // Set the  
        primaryStage.setScene(scene);  
        primaryStage.show();  
    }  
    public static void main(String[] args) {  
        launch(args);  
    }  
}
```

```
//Define a custom pane to hold a label in the center of the  
pane  
class CustomPane extends StackPane {  
    public CustomPane(String title) {  
        getChildren().add(new Label(title));  
        setStyle('-fx-border-color: red');  
        setPadding(new Insets(11.5, 12.5, 13.5, 14.5));  
    }  
}
```

38

# GridPane

```
javafx.scene.layout.GridPane  
-alignment: ObjectProperty<Pos>  
-gridLinesVisible:  
    BooleanProperty  
-hgap: DoubleProperty  
-vgap: DoubleProperty  
  
+GridPane()  
+add(child: Node, columnIndex: int, rowIndex: int): void  
+addColumn(columnIndex: int, children: Node...): void  
+addRow(rowIndex: int, children: Node...): void  
+getRowIndex(child: Node): int  
+setRowIndex(child: Node, columnIndex: int): void  
+setRowIndex(child: Node, rowIndex: int): void  
+setHalignment(child: Node, value: HPos): void  
+setValignment(child: Node, value: VPos): void
```

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

The overall alignment of the content in this pane (default: Pos.LEFT). Is the grid line visible? (default: false)

The horizontal gap between the nodes (default: 0). The vertical gap between the nodes (default: 0).

Creates a GridPane.

Adds a node to the specified column and row.

Adds multiple nodes to the specified column.

Adds multiple nodes to the specified row.

Returns the column index for the specified node.

Sets a node to a new column. This method repositions the node.

Returns the row index for the specified node.

Sets a node to a new row. This method repositions the node.

Sets the horizontal alignment for the child in the cell.

Sets the vertical alignment for the child in the cell.

ShowGridPane

Run

39

```
import javafx.application.Application;  
import javafx.geometry.HPos;  
import javafx.geometry.Insets;  
import javafx.geometry.Pos;  
import javafx.scene.Scene;  
import javafx.scene.control.Button;  
import javafx.scene.control.Label;  
import javafx.scene.control.TextField;  
import javafx.scene.layout.GridPane;  
import javafx.stage.Stage;
```

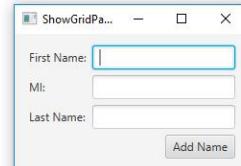

```
public class ShowGridPane extends Application {
```

@Override // Override the start method in the Application class

```
public void start(Stage primaryStage) {
```

// Create a pane and set its properties

```
GridPane pane = new GridPane();  
pane.setAlignment(Pos.CENTER);  
pane.setPadding(new Insets(11.5, 12.5, 13.5, 14.5));  
pane.setHgap(5.5);  
pane.setVgap(5.5);
```

40

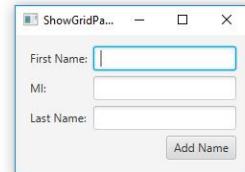

```

// Place nodes in the pane
pane.add(new Label("First Name:"), 0, 0);
pane.add(new TextField(), 1, 0);
pane.add(new Label("MI:"), 0, 1);
pane.add(new TextField(), 1, 1);
pane.add(new Label("Last Name:"), 0, 2);
pane.add(new TextField(), 1, 2);
Button btAdd = new Button("Add Name");
pane.add(btAdd, 1, 3);
GridPane.setAlignment(btAdd, HPos.RIGHT);

// Create a scene and place it in the stage
Scene scene = new Scene(pane);
primaryStage.setTitle("ShowGridPane"); // Set the stage title
primaryStage.setScene(scene); // Place the scene in the stage
primaryStage.show(); // Display the stage
}

public static void main(String[] args) {
    launch(args);
}

```

41

## FlowPane

**javafx.scene.layout.FlowPane**

-alignment: ObjectProperty<Pos>	The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.
-orientation: ObjectProperty<Orientation>	The overall alignment of the content in this pane (default: Pos.LEFT). The orientation in this pane (default: Orientation.HORIZONTAL).
-hgap: DoubleProperty	The horizontal gap between the nodes (default: 0).
-vgap: DoubleProperty	The vertical gap between the nodes (default: 0).
+FlowPane()	Creates a default FlowPane.
+FlowPane(hgap: double, vgap: double)	Creates a FlowPane with a specified horizontal and vertical gap.
+FlowPane(orientation: ObjectProperty<Orientation>)	Creates a FlowPane with a specified orientation.
+FlowPane(orientation: ObjectProperty<Orientation>, hgap: double, vgap: double)	Creates a FlowPane with a specified orientation, horizontal gap and vertical gap.

MultipleStageDemo Run

42

```

FlowPane pane = new FlowPane();
pane.setPadding(new Insets(11, 12, 13, 14));
pane.setHgap(5);
pane.setVgap(5);

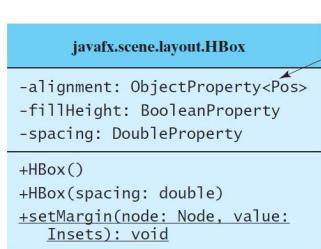

// Place nodes in the pane
pane.getChildren().addAll(new Label("First Name:"),
    new TextField(), new Label("MI:"));
TextField tfMi = new TextField();
tfMi.setPrefColumnCount(1);
pane.getChildren().addAll(tfMi, new Label("Last Name:"),
    new TextField());

// Create a scene and place it in the stage
Scene scene = new Scene(pane, 200, 250);
primaryStage.setTitle("ShowFlowPane"); // Set the stage title
primaryStage.setScene(scene); // Place the scene in the stage
primaryStage.show(); // Display the stage

```

43

## HBox

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

The overall alignment of the children in the box (default: Pos.TOP\_LEFT). Is resizable children fill the full height of the box (default: true). The horizontal gap between two nodes (default: 0).

Creates a default HBox.  
Creates an HBox with the specified horizontal gap between nodes.  
Sets the margin for the node in the pane.

44

# VBox

```
javafx.scene.layout.VBox
-alignment: ObjectProperty<Pos>
-fillWidth: BooleanProperty
-spacing: DoubleProperty
+VBox()
+VBox(spacing: double)
+setMargin(node: Node, value: Insets): void
```

The getter and setter methods for property values and a getter for property itself are provided in the class, but omitted in the UML diagram for brevity.

The overall alignment of the children in the box (default: Pos.TOP\_LEFT).  
Is resizable children fill the full width of the box (default: true).  
The vertical gap between two nodes (default: 0).  
Creates a default VBox.  
Creates a VBox with the specified horizontal gap between nodes.  
Sets the margin for the node in the pane.

ShowHBoxVBox Run

45

```
public class ShowHBoxVBox extends Application {
    @Override // Override the start method in the Application class
    public void start(Stage primaryStage) {
        // Create a border pane
        BorderPane pane = new BorderPane();
        private HBox getHBox() {
            HBox hBox = new HBox(15);
            hBox.setPadding(new Insets(15, 15, 15, 15));
            hBox.setStyle("-fx-background-color: gold");
            hBox.getChildren().add(new Button("Computer Science"));
            hBox.getChildren().add(new Button("Chemistry"));
            ImageView imageView = new ImageView(new Image("image/us.gif"));
            hBox.getChildren().add(imageView);
            return hBox;
        }
        // Place nodes in the pane
        pane.setTop(getHBox());
        pane.setLeft(getVBox());
        Scene scene = new Scene(pane);
        primaryStage.setTitle("ShowHBoxVBox"); // Set the stage title
        primaryStage.setScene(scene); // Place the scene in the stage
        primaryStage.show(); // Display the stage
    }
}
```

46

```

private VBox getVBox() {
    VBox vBox = new VBox(15);
    vBox.setPadding(new Insets(15, 5, 5, 5));
    vBox.getChildren().add(new Label("Courses"));

    Label[] courses = {new Label("CSCI 1301"), new Label("CSCI 1302"),
        new Label("CSCI 2410"), new Label("CSCI 3720")};

    for (Label course: courses) {
        vBox.setMargin(course, new Insets(0, 0, 0, 15));
        vBox.getChildren().add(course);
    }

    return vBox;
}

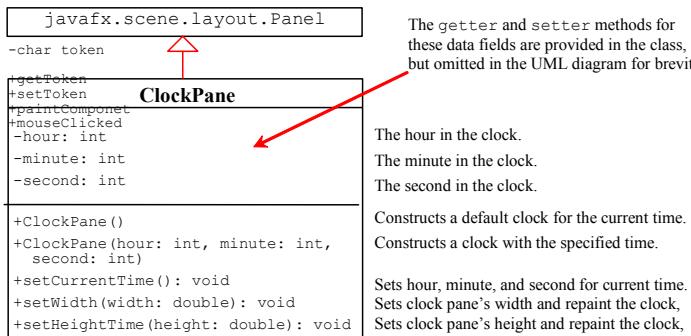

public static void main(String[] args) {
    launch(args);
}

```

47

## Case Study: The ClockPane Class

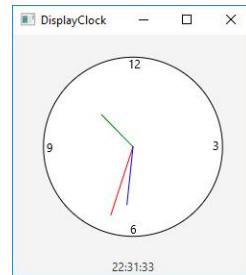

This case study develops a class that displays a clock on a pane.

ClockPane

48

## Use the ClockPane Class

DisplayClock

Run

49

There is a problem with the default installation of Eclipse and getting JavaFX to run. Here's the fix

When you create a JavaFX project, right-click on the project (under the Package Explorer in Eclipse), and select “Properties”

In the window that appears, click on “Java Build Path” on the left side, then “Add External JARs” on the right from \_ Libraries tab

Navigate to: C:\Program Files (x86)\Java\jre1.8.0\_111\lib\ext  
Double-click on **jfxrt.jar**, which should now appear at the top of your build path

Click on the “Order and Export” tab

50

Click on **jfxrt.jar** to highlight it

Then click the button labeled “Top” to move it to the top of  
the list

Click “OK”
