

Lab11. Shell Scripts (III)- Programming (Looping Constructs)

INSTRUCTOR :MURAD NJOUM

Objectives

After completing this lab, the student should be able to:

- Include programming looping constructs in shell scripts.
- Understand and use the **while, until, and for loops** constructs.
- Learn how to make for loops more efficient by using command outputs as lists.

There are different loop constructs that may be used in shell scripts which include:

while loops

until loops

for loops

Each has its own useful features that make it useful in certain situations.

While Loop

```
while condition
do
statement(s)
done
```

example:

```
vi listarguments
while [ $# -ne 0 ]
do
echo $1
shift
done
:wq
```

Run the above script as follows:
listarguments a hello 7 x
Check the output.

Output:

```
a
hello
7
x
```

Last Delete

```
if [ $# -ne 1 ]
then
  echo Usage:delete filename
  exit 1
else
  if [ -f $1 ]
  then
    rm $1 # $1 exists and is a file name
    echo File $1 has been deleted
    exit 0
  elif [ -d $1 ]
  then rm -r $1 # $1 exists and is directory
    echo Directory $1 has been deleted
    exit 0
  else
    echo $1: No Such file or directory
    exit 2
  fi
fi
```

Execute the Scripts:

Rewrite the delete script we wrote in the last lab such that it works as follows:

delete file1 wrong dir1 file2

File file1 is deleted

wrong: No such file or directory

Directory dir1 is deleted

File file2 is deleted

```
#!/bin/bash
if [ $# -eq 0 ]
then
echo "No argument was entered"
exit 1
fi
while [ $# -ne 0 ]
do

if [ -f $1 ]
then
rm $1 # $1 exists and is a file name
echo File $1 has been deleted

elif [ -d $1 ]
then rm -r $1 # $1 exists and is directory
echo Directory $1 has been deleted
```

```
else
echo $1: No Such file or
directory

fi
shift
done
```

Sometimes the loop will stop executing based on the user input, as follows:

Cont.. *vi findahmad*

```
echo Enter name
read name
while [ "$name" != "ahmad" ]
do
echo $name: wrong name. Try again.
echo Enter name
read name
done
:wq
```

Question

Now modify the **checkusername** script from the previous lab such that it is called checkusernames instead and works as follows:

```
checkusernames
Enter user name to check or word "enough" to stop
u1112345
Enter user name to check or word "enough" to stop
u11
Enter user name to check or word "enough" to stop
u1123456
Enter user name to check or word "enough" to stop

u1112345 = Salem Hamdi
u11 = No such user name
u1123456 = Sabah Khaled
enough
```

```
echo Enter user name to check or word "enough" to stop
read name
while [ "$name" != "enough" ]
do
y=$(grep ^$name /etc/passwd |cut -d : -f1)
if [ "$name" = "$y" ]
then
x=$(grep ^$name /etc/passwd |cut -d : -f5|tr '_' ' ')
echo $name = $x
else
echo No such user name
fi
echo Enter user name to check or word "enough" to stop
read name
done
```

What is the problem
with this script??

What about, two
user name :mnjoum
njoum??

Break and Continue Statements

The programmer can use **break** and **continue** statements inside shell script loops which mean the same as they do in the **C language**:

break - exit the loop immediately.

continue – stop running the current cycle but go back and check the condition.

In addition they can use **break** and **continue** followed by a number to specify how many loop levels they want them to work for. For example:

break 2

Will exit out of two nested loops if they exist.

```
#!/bin/bash
#breaking a loop
num=0
while [ $num -lt 10 ]
do
  (( num ++ ))
  if [ $num -eq 5 ]
  then
    echo "break done"
    break
  fi

  echo $num
done
echo Loop is complete
```

```
#!/bin/bash
#continue a loop
num=0
while [ $num -lt 10 ]
do
  (( num ++ ))
  if [ $num -eq 5 ]
  then
    echo "continue done"
    Continue
  fi

  echo $num
done
echo Loop is complete
```

until loop

The until loop is similar to the while loop, but stops when the condition becomes true.

```
until false
```

```
do
```

```
statements
```

```
done
```

Modify the above two programs such that they use the until construct instead of the while construct and try them out.

Did they work? _____.

```
until [ "$name" = "enough" ]
```

```
until [ $# -eq 0 ]
```

For loop

In shell scripts, the for loop is very powerful and useful. The general structure of the for loop is as follows:

```
for item in list of items
do
statement(s)
done
```

What makes a for loop powerful is the different ways a list of items may be specified. Let us start with a simple example:

vi names

```
for name in ahmad hamdan subha khaled
do
echo $name
done
```

:wq

Run the script names. It should display the names given in the list

```
#!/bin/bash
for name in $*
do
echo $name
done
```

Rewrite the delete script we wrote at the beginning of this lab such that it uses a for loop instead of a while loop. Did it work? _____.

Welcome
Friends

```
if [ $# -eq 0 ]
then
echo no arguments was entered
exit 1
fi
for i in $*
do
if [ -f $i ]
then
rm $i # $1 exists and is a file
name
echo File $i has been deleted
elif [ -d $i ]
then rm -r $i # $1 exists and is
directory
echo Directory $i has been
deleted
else
echo $i: No Such file or directory
fi
done
```

Using a for loop, write a script called *comp311* that lists the full names of all the users that are registered in the comp311 course.

Answer:

```
for i in $(grep comp311 /etc/passwd|cut -d : -f5)
do
echo $i
done
```

Now rewrite the script *comp311* such that it will display only the names of the users that are currently logged in to the system. (hint: use the output of the who command)

Answer:

```
for login in $(who|tr -s ' '|cut -d ' ' -f1)
do
name=$(grep $login /etc/passwd |cut -d : -f5)
echo $name
done
```

The for loop can also be applied to a directory of files as follows:

```
vi myfiles
for file in * → or $(ls)
do
echo $file
done
```

Write a script called ***filetypes*** that uses a for loop to type the name and type (file, dir, or unknown) for each file in a given directory as follows:

Assume that I use the script in the following way:

filetypes /etc

then the script should display the names of all the files under directory /etc and the type of each of those files:

```
#!/bin/bash
for file in $1/*
do

---

if [ -f $file ]
then
echo $file : is File type
elif [ -d $file ]
then
echo $file :is Directory type
else
echo $file : is Unknown type
fi
done
```

The **which** command displays the directory in the PATH that contains the command. Try it as follows:

which ls

What is the result? /bin/ls .

Write a script called *mywhich* that simulates the which command. You are not allowed to use the which command in your script.

(hint: use the for loop and the sed command)

```
#!/bin/bash
for list in $(echo $PATH|sed "s:/:/g" )
# solve another way
do
if [ -f $list /$1 ]
then
echo $list /$1
exit 0
fi
done
echo $1= No such command
```

```
#!/bin/bash
for i in $(echo $PATH|sed "s/:// /g" )
# solve another way
do
if [ -f $i/$1 ]
then
    echo $i/$1
exit 0
fi
done
echo $1= No such command
```
