Problem Solving Program Design in

JERI R. HANLY | ELLIOT B. KOFFMAN

Repetition and Loop Statements

Chapter 5

Repetition and Loop

- **loop** a control structure that repeats a group of steps in a program.
- There are 3 types of loops in C
 - \circ while
 - \circ for
 - **do-while**

Chapter 5

• Repetition in Programs

Loop Kinds

Kind	When Used	C Implementation Structures
Counting loop	We can determine before loop execution exactly how many loop repetitions will be needed to solve the problem.	while for
Sentinel-controlled loop	Input of a list of data of any length ended by a special value	while, for
Endfile-controlled loop	Input of a single list of data of any length from a data file	while, for
Input validation loop	Repeated interactive input of a data value until a value within the valid range is entered	do-while
General conditional loop	Repeated processing of data until a desired condition is met	while, for

Controlling Loop

- loop repetition condition: the condition that controls loop repetition.
 While(count<10)
- **Counter-controlled loop** : a loop whose required number of iterations can be determined before loop execution begins.
 - o For(i=0;i<10;i++)</pre>
- Event controlled loops: stop when special value is encountered. (E.g., exit loop when input value is "E", or stop a loop when input is -1).
 While(X != -1)
- **Result controlled loops:** continues until a test determines that the desired result is reached (e.g., numerical approximations)
- **infinite loop** a loop that executes forever

While Loop

```
Set loop control variable to an initial value of 0 .
while loop control variable < final value
Loop Body
                                                                             while(condition)
 Increase loop control variable by 1.
                                                                             Conditional code:
                                                                         Condition
         count star = 0;
         n = 10;
                                                                     If condition
                                                                       is true
         while (count star < n)</pre>
                                                                                If Condition
                                                                                 is false
                                                                         Conditional
                                                                          Code
              printf("*");
              count star++;
```

Write a program to print the first 100 positive integers.
 #include<stdio.h>
 int main() {

```
int counter = 1;
```

```
while( counter <= 100) {</pre>
```

```
printf(``%d\n", counter);
```

```
counter = counter + 1; //don't forget
```

```
return 0;
```

• Write a program to find and print the average of **n** values, where **n** is entered by the user.

```
# include <stdio. h>
int main ()
1{ int i=0, n;
 double sum=0.0, x;
 printf ("Please, enter number of values to read: ");
 scanf ("%d", &n); // don't forget to initialize i before entering loop
 while (i < n)
 £
 printf (" Please, enter value: ");
 scanf ("%lf", &x); // Reading a double
 sum + = x;
 i++; // don't forget to increment i (update statement to stop the condition)
 }
 if (n)
 printf (" Average of %d values = %0.3f \n ", n, sum/n);
 else
 printf ("No values were entered !");
 return 0;
```

Write a program that reads 10 grades and compute their average.

```
int main() {
  int counter = 0, grade, total = 0;
  float average;
 while( counter < 10 ) {</pre>
    printf("Please enter a grade");
    scanf("%d", &grade);
    total = total + grade;
    counter = counter + 1;
  }
  average = total / counter;
 printf("The average is %f\n", average);
  return 0;
```

}

Write a program that reads **n** grades and compute their average. When -1 is entered, stop.

```
int main() {
  int counter = 0, grade, total = 0;
 float average;
 printf("Please enter a grade");
  scanf("%d", &grade);
 while (grade != -1) {
    total = total + grade;
    counter = counter + 1;
   printf("Please enter a grade");
  scanf("%d", &grade);
  }
  average = total / counter;
 printf("The average is %f\n", average);
 return 0;
```

Write a program to calculate the sum of a set of values (we don't know their count). When 0 is entered this means that program should stop receiving data, and print the sum.

```
lint main() {
  int sum = 0, x;
  printf ("Please enter a value or 0 to stop");
  scanf("%d", &x);
  while( x != 0) { //when zero is entered, stop the program
  sum = sum + x;
  printf ("Please enter a value or 0 to stop");
    scanf("%d", &x);
  }
  if( sum ) //or if( sum != 0 )
  printf("The sum is %d ", sum);
  else
    printf("Zero! No values were entered");
  return 0;
```

Write a program to calculate the sum of a set of values (we don't know their count). When the sum exceeds 1000 this means that program should stop receiving data, and print the number of values were entered.

```
int main ()
int sum=0, count=0,x;
printf (" Please, enter value ");
scanf ("%d", &x); // Reading integer
while ( sum <= 1000) // Exit when the sum more than 1000
 { count++;// increment count
 sum + = x; // add the value to sum
printf (" Please, enter next value ");
 scanf ("%d", &x); // Reading integer
printf ("Number of value %d ", count);
return 0;
```

}

Write a program to print the number of passes and the number of failures in a set of n students. The user should enter -1 to stop.

```
int main() {
   int countPasses = 0, countFails;
   int x;
   printf("Please enter a value or -1 to stop");
    scanf("%d", &x);
   while (x != -1) { //when -1 is entered, stop the program
        if(x >= 60)
            countPasses = countPasses + 1;
        else
            countFails = countFails + 1;
        printf("Please enter a value or -1 to stop");
        scanf("%d", &x);
   printf ("Number of passes is %d and number of failures is %d", countPasses, countFails);
    return 0;
```

Write a program to compute the factorial of a given number n.

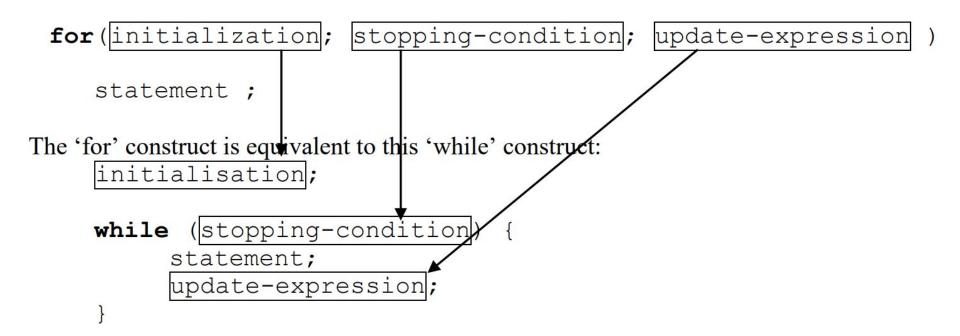

```
int main() {
    int factorial = 1, counter = 1, x;
    printf("Please enter a number");
    scanf("%d", &x);
    while( counter <= x ) {</pre>
        factorial = factorial * counter;
        counter = counter + 1;
    printf("The factorial of %d is %d", x, factorial);
    return 0;
```

}

Write a program to check if an input number is prime or not.

```
int main() {
    int isPrime = 1, counter = 2, x;
    printf("Please enter a number");
    scanf("%d", &x);
    while( counter < x ) { //when -lis entered, stop the program</pre>
        if( x % counter == 0)
             isPrime = 0;
                                       Note the if scope
        counter++;
    if ( isPrime == 1 )
        printf("The number %d is a prime number\n");
    else
        printf ("The number %d is NOT a prime number\n");
    return 0;
```

For Loop

For Loop

```
for(expr1; expr2; expr3)
   body
Normal forms are:
for(i = 0; i < 10; i++) {...}
for(i = n-1; i >= 0; i--) {...}
```

For Loop

7

	14
<pre>#include <stdio.h></stdio.h></pre>	21
<pre>#include <stdlib.h></stdlib.h></pre>	28
	35
<pre>int main()</pre>	42
	49
int i;	56
	63
<pre>for (i=1;i<=100;i++)</pre>	70
if (1%7==0)	77
<pre>printf("%d\n",i);</pre>	84
return 0;	91
}	98

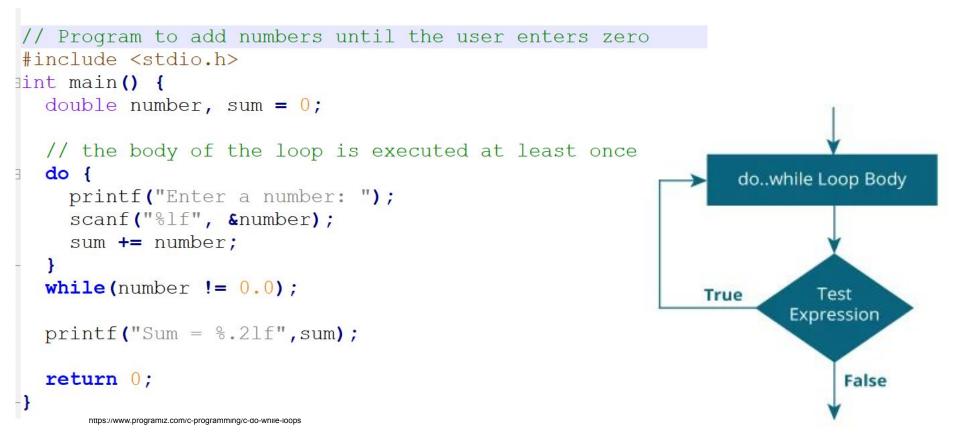

For Loop Example

}

Write a program to compute the factorial of a given number **n**.

```
int main(){
    int factorial = 1, counter, x;
    printf("Please enter a number");
    scanf("%d", &x);
    for( counter = 1; counter <= x; counter++ ) {</pre>
        factorial = factorial * counter;
    }
```

printf("The factorial of %d is %d", x, factorial);
return 0;

Chapter 5

• Logical and relational operators

Relational & Equality Operators

Operator	Meaning	Туре
<	Less than	Relational
<=	Less than or equal	Relational
>	Greater than	Relational
>=	Greater than or equal	Relational
==	Equals	Equality
!=	Not equal	Equality

Logical Operators

Operator	Meaning
8.8	And
I	Or
	Negation (not)

Operator Precedence

Operator	Precedence
!, +, -, & (unary operators)	Highest
*, /, %	
+, -	
<, <=, >, >=	
==, !=	
&&	
Ι	
=	Lowest

Logical Operators

```
float x=3.0, y=4.0, z=2.0;
int flag = 0;
//What is the value after applying the following expression:
!flag !0 is 1 (true)
x + y / z <= 3.5 5.0 <= 3.5 is 0 (false)
!flag || (y + z >= x -z ) 1 || 1 is 1 (true)
!(flag||(y + z >= x -z )) !(0 || 1) is 0 (false)
```

Logical Operators

int a = 5, b = 5, c = 10, result;

result = (a == b) & (c > b);printf("(a == b) & (c > b) is $d \ln, result$;

result = (a == b) & (c < b);printf("(a == b) && (c < b) is d n", result);

result = (a == b) || (c < b);printf("(a == b) || (c < b) is $d \ln$, result);

result = (a printf("(a

result = !(a != b);printf("!(a != b) is %d \n", result);

printf("!(a == b) is %d \n", result);

https://www.programiz.com/c-programming/c-operators

result = !(a == b);

Assignment Shorthands

Simple Assignment Operators	Compound Assignment Operators
x = x + 1;	x += 1;
x= x -1;	x -= 1;
x = x * y;	x *= y;
x= x / y;	x /= y;
n = n % (x+1);	n %= x+1;

++x : Pre-increment x
a = ++x * b;
x = x + 1;
a = x * b;

x++ : Post-increment x
a = x++ * b;
a = x * b;
x = x + 1;

--x : Pre-decrement x
 a = --x * b;
 x = x - 1;
 a = x * b;

x-- : Post-decrement x
a = x-- * b;
a = x * b;
x = x - 1;

Q

• Find x,y,z ?

int x=2,y=3,z=0;

z += --x * y++;

Result : x=1 , y=4, and z = 3

• Find x,y,z ?

int x=2,y=3,z=4;

z *= ++x * y++;

Result : x=3 , y=4, and z = 36

- Find a,b,c ?
 - int a=4,b=3,c=20;

c /= ++a;

Result : a=5 , b=3, and c = 4

int i = 1; while (i < 5) printf ("%d " , i++);

- What is the output?
 - 1234
- What is the final value of **i** ?

• i=5

• Write a program to find x^y

```
//Write a program to find x^y
                                              //Write a program to find x^y
#include <stdio.h>
                                              #include <stdio.h>
int main()
                                              int main()
    int x,y;
                                                    int x,y;
     int Resultpow=1;
                                                    int Resultpow=1;
    printf("Enter x and y ");
                                                    printf("Enter x and y ");
     scanf("%d%d",&x,&y);
                                                    scanf("%d%d",&x,&y);
    while(y>=1)
                                                    while (y - - > = 1)
        Resultpow*=x;
                                                    Ł
                                                        Resultpow*=x;
         V--;
    printf("The result is : %d", Resultpow);
                                                    printf("The result is : %d", Resultpow);
   return 0;
                                                  return 0;
```

```
Write a program to find n!
int main()
     int n;
     int Result=1;
     printf("Enter n value ");
     scanf("%d",&n);
     while(n>=1)
         Result*=n;
         n--;
     printf("The result is : %d",Result);
    return 0;
```

Break and Continue

- The break and continue statements are used to alter the flow of control.
- The 'break' statement: terminates a loop under some special condition
- The 'continue' statement: skips a section of the loop body in an iteration.
- The 'break' statement in a 'switch', 'while', 'do-while' or 'for' structure causes immediate exit from the structure

Break and Continue

```
What would be displayed by the following program?
 int main()
      int i;
      i=0;
      while (i++<10)
         printf("%d\n",i);
          if(i==5)
              break;
     return 0;
```

Ahmed Sabbah – Birzeit University – COMP133 – Second Semester 2021/2022

 printf("\n");
                                             *****
                                             ******
                                             *******
 return 0;
```

• What would be displayed by the following program?

```
int main()
B
 int n, c, k = 2, j;
 printf("Enter number of rows\n");
 scanf("%d",&n);
 for ( j = 1 ; j <= n ; j++ ){</pre>
 for ( c = 1 ; c \le 2*n-k ; c++)
 printf(" ");
 k = k + 2;
 for (c = 1; c <= j; c++)
 printf("* ");
 printf("\n");
 return 0;
```

End Of File

```
int grade 1, grade 2, grade 3;
float avg;
int res;
FILE * fpt input;
fpt input=fopen("grades.txt","r");
res=fscanf(fpt input, "%d%d%d", &grade 1, &grade 2, &grade 3);
while (res!=EOF)
    avg=(grade 1+grade 2+grade 3)/3.0;
    printf("Average= %0.2f\n",avg);
    res=fscanf(fpt input, "%d%d%d", &grade 1, &grade 2, &grade 3);
```

```
fclose(fpt_input);
```

Thank You.
