

# Chapter Two: Discrete-Time Signals and System

## Introduction:-

- **Signals**:- can be defined as:
  1. A flow of information.
  2. a function of independent variable such as time (e.g: speech signal), position (e.g: image), etc.

## • Examples of signals:-

- **Speech**: 1-Dimension signal as a function of time,  $s(t)$ .
- **Grey-scale image**: 2-Dimension signal as a function of space  $(x, y)$
- **Video**: 3-Dimension signal as a function of space and time  $\{r(x, y, t), g(x, y, t), b(x, y, t)\}$

## • Types of signals:

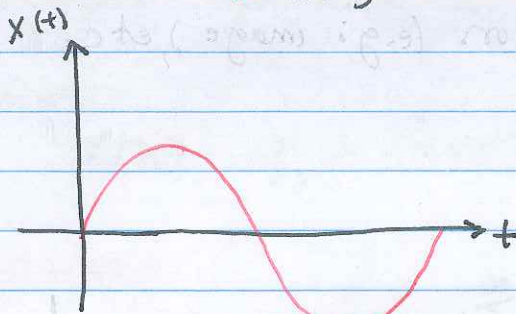

- The independent variable may be either continuous or discrete
  - \* Continuous-time signal
  - \* Discrete-time signals: are defined at discrete times and represented as a sequences of numbers.

The signal amplitude may be either continuous or discrete

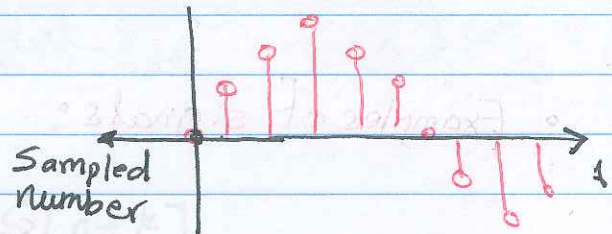

\* Analog Signals: both time and amplitude are continuous.

\* Analog Signals: both time and amplitude are continuous.

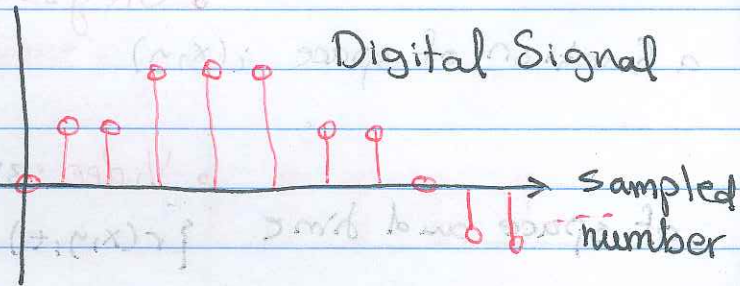

\* Digital Signals: both are discrete.

Analog Signal

Discrete-time Signal

Digital Signal

## • Digital Signal Processing:

• Modifying and analyzing information with computers - so being measured as sequence of numbers.

• Representation, transformation and manipulation of signals and information they contain.

## • Typical DSP System Components

Analog to Digital Converter  
(ADC)

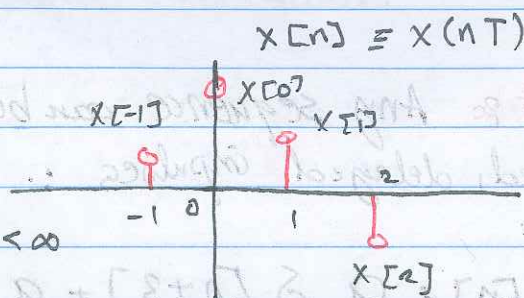

Digital to Analog Converter  
(DAC)

### • Discrete Signals:

$$x[n] = x(nT) \quad -\infty < n < \infty$$

where  $n$  is an integer

$T$  is called the sampling Period.

### • Sequence Operations:

• The product and sum of two sequences  $x[n]$  and  $y[n]$ : Sampled-by-Sampled production and sum, respectively.

• Multiplication of a sequence  $x[n]$  by a number  
multiplication of each sample value.

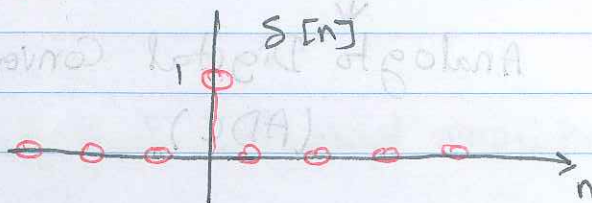

• Delay or shift of a sequence  $x[n]$

$$y[n] = x[n - n_0] \quad \text{where } n_0 \text{ is an integer.}$$

• Basic Sequences :

\* Unit Sample Sequence (Discrete-time impulse)

$$\delta[n] = \begin{cases} 1 & n = 0 \\ 0 & n \neq 0 \end{cases}$$

Note that  $\delta$  Any sequence can be represented as a sum of scaled, delayed impulses  $\therefore$

For example:

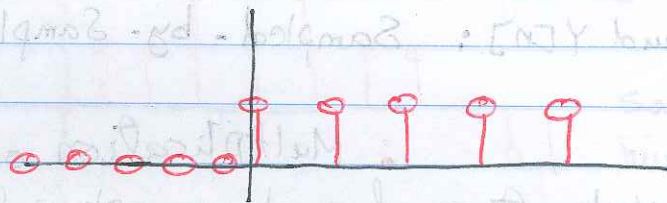

$$x[n] = a_{-3} \delta[n+3] + a_{-2} \delta[n+2] + \dots + a_3 \delta[n-3]$$

More generally:

$$x[n] = \sum_{k=-\infty}^{\infty} x[k] \delta[n-k]$$

\* Unit Step Sequence:

$$u[n] = \begin{cases} 1 & n \geq 0 \\ 0 & n < 0 \end{cases}$$

Also, it can be written in terms of impulse sequences:

$$u[n] = \delta[n] + \delta[n-1] + \delta[n-2] + \dots$$

or

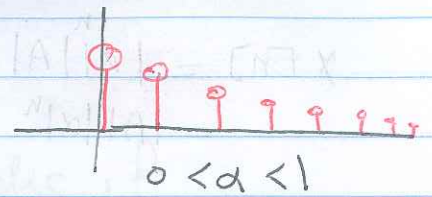

$$u[n] = \sum_{k=-\infty}^{\infty} u[k] \delta[n-k] = \sum_{k=0}^{\infty} \delta[n-k]$$

Conversely,

$$\delta[n] = u[n] - u[n-1]$$

## • Exponential Sequences :

$$x[n] = A \alpha^n$$

It can be noted :-

\* If  $A$  and  $\alpha$  are real numbers, the sequence is real.

\* If  $0 < \alpha < 1$  and  $A$  is positive, the sequence values are positive and decrease with increasing  $n$ .

\* If  $-1 < \alpha < 0$ , the sequence values alternate in sign, but again decrease in magnitude with increasing  $n$ .

\* If  $|\alpha| > 1$ , the sequence values increase with increasing  $n$ .

\* An exponential sequence that is zero for  $n < 0$  can be expressed as:

$$x[n] = \begin{cases} A \alpha^n & n \geq 0 \\ 0 & n < 0 \end{cases}$$

$$x[n] = A \alpha^n u[n]$$

## • Sinusoidal Sequences

$$x[n] = A \cos(\omega n + \phi), \text{ for all } n \text{ --- (*)}$$

with  $A$  and  $\phi$  are real constants.

This result can be obtained as follow

(5)

If we assume  $a = |\alpha| e^{j\omega_0}$  and  $A = |A| e^{j\phi}$

$$\begin{aligned}x[n] &= |a|^n |A| e^{j\omega_0 n + j\phi} \\ &= |A| |\alpha|^n e^{j(\omega_0 n + \phi)}\end{aligned}$$

By using Euler's Equation

$$x[n] = |A| |\alpha|^n \left[ \cos(\omega_0 n + \phi) + j \sin(\omega_0 n + \phi) \right]$$

By taking real part then

$$\begin{aligned}x[n] &= \operatorname{Re} \{ x[n] \} \\ &= |A| |\alpha|^n \cos(\omega_0 n + \phi)\end{aligned}$$

and if we assume  $|\alpha| = 1$  then we obtain the same result expressed in (\*)

$$x[n] = |A| \cos(\omega_0 n + \phi)$$

### • Periodic & a Periodic Signals :-

In the discrete-time case, a periodic sequence is defined as:

$$x[n] = x[n+N], \text{ for all } n$$

where the period  $N$  is necessary to be an integer.

For sinusoid,

$$A \cos(\omega_0 n + \phi) = A \cos(\omega_0 n + \omega_0 N + \phi)$$

which requires that  $\omega_0 N = 2\pi k$  or  $N = 2\pi k / \omega_0$

where  $k$  is an integer.

Note that:

- The signal should be periodic, if

$$\frac{N}{k} = \frac{2\pi}{\omega_0} \Rightarrow \text{rational number.}$$

otherwise

$$\frac{N}{k} : \text{irrational number}$$

$\Rightarrow$  The signal will be a periodic signal

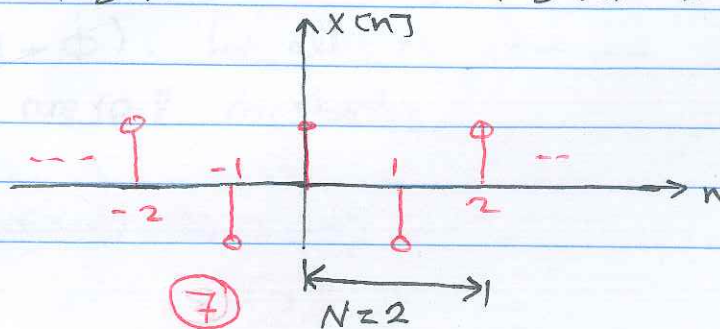

Take care:  $N$  and  $k$  should be integer numbers.

Example: Consider the following signal

$$x[n] = \sum_{k=-\infty}^{\infty} (-1)^k \delta(n-k), \text{ check, if } x[n] \text{ is periodic or not?}$$

Ans: 
$$x[n] = \sum_{k=-\infty}^{\infty} (-1)^k \delta(n-k)$$

$$= \dots + \delta(n+2) - \delta(n+1) + \delta(0) - \delta(n-1) + \delta(n-2) + \dots$$

**Example:** Consider the following signal

$$x[n] = A \sin(\omega_0 n + \Phi)$$

check if  $x[n]$  is periodic or not?

**Ans:** If  $x[n]$  is periodic with fundamental period  $N$  then

$$\omega_0 N = 2\pi k, \quad k = 1, 2, 3, \dots$$

$$\frac{N}{k} = \frac{2\pi}{\omega_0} \text{ should be rational number}$$

If  $\frac{N}{k}$  is irrational number then  $x[n]$  is a periodic.

• Rational Number  $\left(\frac{N}{k}, \text{ where } q \neq 0\right)$

Rational Number  $\left(\frac{N}{k}\right)$  could be —

- Finite fractional part  
e.g.,  $\frac{1}{2} = 0.5$
- Infinite fractional part  
which is cyclic  
e.g.,  $\frac{1}{3} = 0.333$

OR: ratio of two integer is always rational.

**Examples on irrational number:**

$$\pi, \sqrt{2}, \frac{1}{\sqrt{2}}$$

**Example:** Check the periodicity of each signal, In case of periodic signal, specify the values of  $k$ , and  $N$ .

1.  $x[n] = 3 \cos(0.2\pi n)$

**Ans:**

$$x[n] = 3 \cos(0.2\pi n)$$

where  $\omega_0 = 0.2\pi$

$$\Rightarrow \frac{N}{K} = \frac{2\pi}{\omega_0} = \frac{2\pi}{0.2\pi} = \frac{10}{1} \Rightarrow \text{rational number}$$

where  $N = 10$  and  $K = 1 \Rightarrow$  periodic @  $N = 10$  and

2.  $x[n] = 5 \sin(0.3\pi n)$

**Ans:**

$$x[n] = 5 \sin(0.3\pi n)$$

where  $\omega_0 = 0.3\pi$

$$\Rightarrow \frac{N}{K} = \frac{2\pi}{0.3\pi} = \frac{20}{3} \Rightarrow \text{rational number}$$

periodic @  $N = 20$  and  $K = 3$

**Note:**

- If we assume  $K = 1 \Rightarrow N = \frac{20}{30}$  (Not integer number)

- If we assume  $K = 2, \Rightarrow N = \frac{40}{3}$  (Not integer number)

- If we assume  $K = 3, \Rightarrow N = 20$  ( $K$  and  $N$  are integer)

Remember: For periodic signal  $K$  and  $N$  should be integer Numbers.

3.  $x[n] = 4 \cos(0.5n)$

Ans:

$$x[n] = 4 \cos(0.5n) \quad \frac{2\pi}{\omega} = \frac{2\pi}{0.5} = \frac{N}{K}$$

where  $\omega_0 = 0.5$

$$\Rightarrow \frac{N}{K} = \frac{2\pi}{\omega_0} = \frac{2\pi}{0.5} = 4\pi \Rightarrow \text{irrational number}$$

$\Rightarrow x[n]$  is a periodic signal.

4.  $x[n] = 8 \sin\left(\frac{\pi}{\sqrt{2}}n\right)$

Ans:

w/  $x[n] = 8 \sin\left(\frac{\pi}{\sqrt{2}}n\right)$

where  $\omega_0 = \frac{\pi}{\sqrt{2}}$

$$\Rightarrow \frac{N}{K} = \frac{2\pi}{\omega_0} = \frac{2\pi}{\pi/\sqrt{2}} = 2\sqrt{2} \Rightarrow \text{irrational number}$$

$\Rightarrow x[n]$  is a periodic signal.

5.  $x[n] = 10 e^{-j1.1\pi n}$

Ans:-

$$x[n] = 10 e^{-j1.1\pi n}$$

where  $x[n]$  can be written in form

$$x[n] = A e^{-j\omega_0 n}$$

$$\Rightarrow \omega_0 = 1.1 \pi$$

$$\frac{N}{K} = \frac{2\pi}{\omega_0} = \frac{2\pi}{1.1\pi} = \frac{20}{11}$$

The signal  $x[n]$  will be periodic signal when  $k=11$  and  $N=20$ .

$$x[n] = 10 e^{-j1.1\pi(n-1)}$$

Ans:

$$x[n] = 10 e^{-j1.1\pi(n-1)}$$

$$= 10 e^{-j1.1\pi n} e^{j1.1\pi}$$

where

$$e^{j1.1\pi} = \cos(1.1\pi) + j \sin(1.1\pi)$$

$$\omega_0 = 1.1\pi$$

$\Rightarrow$

$$\frac{N}{K} = \frac{2\pi}{1.1\pi} = \frac{20}{11} \Rightarrow \text{rational number}$$

$x[n]$  is periodic signal  $\omega$   $N=20$  and  $k=11$

7.  $x[n] = 10 e^{-j1.1\pi(n-1)} u(n-1)$

Ans:

$$x[n] = 10 e^{-j1.1\pi(n-1)} u(n-1)$$

$$= \begin{cases} 10 e^{-j1.1\pi(n-1)} & n \geq 1 \\ 0 & n < 1 \end{cases}$$

→

$x[n]$  is a periodic signal.

• Periodicity of Composite Signal:

$$x[n] = x_1[n] + x_2[n] + x_3[n] + \dots + x_k[n]$$

where the fundamental period for each signal is

$N_1, N_2, N_3, \dots, N_k$ , respectively.

→

where  $N = \text{LCM}(N_1, N_2, N_3, \dots, N_k)$

If we assume  $k=1 \Rightarrow N = \frac{N_1}{\text{gcd}(N_1)}$  (Not integer)

If we assume  $k=2 \Rightarrow N = \frac{N_1 N_2}{\text{gcd}(N_1, N_2)}$  (Not integer)

If we assume  $k=3 \Rightarrow N = \frac{N_1 N_2 N_3}{\text{gcd}(N_1, N_2, N_3)}$  (Not integer)

**Example:** Check the periodicity of each signal. In case of periodic signal, specify the values of  $k_1$  and  $N$

1.  $x[n] = 4 \cos(0.2\pi n) - 3 \sin(0.3\pi n) + 5 \cos(0.4\pi n)$

**Ans:**  $x[n+N] \stackrel{?}{=} x[n]$

$0.2\pi N_1 = 2\pi k_1$

$\frac{N_1}{k_1} = \frac{2}{0.2} = \frac{20}{2} = \frac{10}{1} \Rightarrow N_1 = 10$  and  $k_1 = 1$

$0.3\pi N_2 = 2\pi k_2$

$\frac{N_2}{k_2} = \frac{2}{0.3} = \frac{20}{3} \Rightarrow N_2 = 20$  and  $k_2 = 3$

and

$0.4\pi N_3 = 2\pi k_3$

$\frac{N_3}{k_3} = \frac{2}{0.4} = \frac{20}{4} = \frac{5}{1} \Rightarrow N_3 = 5$  and  $k_3 = 1$

$N = \text{LCM}(10, 20, 5) = 20$

2.

$x[n] = 3 \sin\left(\frac{\pi}{4}n\right) + 5 \cos\left(\frac{\pi}{3}n\right) - 7 \sin\left(\frac{\pi}{2}n\right)$

$\frac{\pi}{4} N_1 = 2\pi k_1 \Rightarrow \frac{N_1}{k_1} = \frac{8}{1} \Rightarrow N_1 = 8$  and  $k_1 = 1$

$\frac{\pi}{3} N_2 = 2\pi k_2 \Rightarrow \frac{N_2}{k_2} = \frac{6}{1} \Rightarrow N_2 = 6$  and  $k_2 = 1$

Example: Check the periodicity of each signal and specify the values of  $k_1$  and  $k_2$  for which the signal is periodic.

$$\frac{2\pi}{3} N_3 = 2\pi k_3 \Rightarrow N_3 = 4 \text{ and } k_3 = 1$$

$$N = \text{LCM}(8, 6, 4) = 24$$

$$3. \Rightarrow X[n] = 2 \cos(\sqrt{2} \pi n) + 5 \sin 2\sqrt{2} \pi n$$

$$\sqrt{2} \pi N_1 = 2\pi k_1$$

$$2\sqrt{2} \pi N_2 = 2\pi k_2$$

$$\frac{N_1}{k_1} = \frac{1}{\sqrt{2}} \text{ "irrational number"}$$

$$\frac{N_2}{k_2} = \frac{1}{\sqrt{2}}$$

irrational number  
aperiodic signal

$\Rightarrow$  A periodic signal

$$4. X[n] = 10 \cos 0.1 \pi n - 6 \cos 0.9 \pi n + 5 \sin 0.7 \pi n$$

$$0.1 \pi N_1 = 2\pi k_1$$

$$0.9 \pi N_2 = 2\pi k_2$$

$$0.7 \pi N_3 = 2\pi k_3$$

$$\frac{N_1}{k_1} = \frac{2}{0.1} = 20$$

$$\frac{N_2}{k_2} = \frac{2}{0.9} = \frac{20}{9}$$

$$\frac{N_3}{k_3} = \frac{2\pi}{0.7}$$

periodic

periodic

"irrational number"  
a periodic

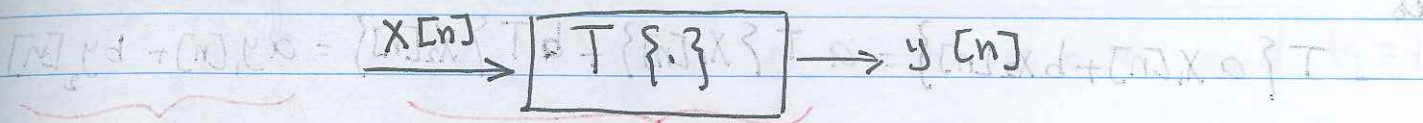

$$X[n] = 10 \cos \left( \frac{n\pi}{10} \right) - 6 \cos \left( \frac{9n\pi}{10} \right) + 5 \sin \left( \frac{7n\pi}{10} \right)$$

$\Rightarrow$  A periodic signal

## Discrete-time Systems

A transformation or operator that maps input into output can be expressed as

$$y[n] = T\{x[n]\}$$

### • Examples on Discrete-time Systems

The ideal delay system

$$y[n] = x[n - n_d] \quad -\infty < n < \infty$$

- A memoryless system

$$y[n] = (x[n])^2 \quad -\infty < n < \infty$$

### • Properties of Discrete-time Systems

#### 1. Linear and Non-Linear System

A system is linear if and only if the following properties are achieved:

Ⓐ additivity property

$$T\{x_1[n] + x_2[n]\} = T\{x_1[n]\} + T\{x_2[n]\} = y_1[n] + y_2[n]$$

## ⑤ Scaling Property Discrete-time systems

$$T\{ax[n]\} = a T\{x[n]\} = ay[n]$$

where  $a$  is an arbitrary constant

In other words, scaling and additivity should be achieved as

$$T\{ax_1[n] + bx_2[n]\} = a T\{x_1[n]\} + b T\{x_2[n]\} = ay_1[n] + by_2[n]$$
$$c T\{x_3[n]\} = cy_3[n]$$

**Example:** Consider the following accumulator system which is defined by the following input-output equation

$$y[n] = \sum_{k=-\infty}^n x[k]$$

check the linearity of the system

**Ans:**  $d_1 y_1[n] = \sum_{k=-\infty}^n d_1 x_1[k]$

$$d_2 y_2[n] = \sum_{k=-\infty}^n d_2 x_2[k]$$

$$d_1 y_1[n] + d_2 y_2[n] = \sum_{k=-\infty}^n [d_1 x_1[k] + d_2 x_2[k]]$$

$$d_3 y_3[n]$$

$$d_3 x_3[k]$$

⇒ The system is linear

**Example:-** Consider the system defined by

$$w[n] = \log_{10}(|x[n]|)$$

check the linearity of the system.

**Ans:**

$$d_1 w_1[n] = \log_{10}(|d_1 x_1[n]|)$$

$$d_2 w_2[n] = \log_{10}(|d_2 x_2[n]|)$$

$$d_1 w_1[n] + d_2 w_2[n] = \log_{10}(|d_1 x_1[n]|) + \log_{10}(|d_2 x_2[n]|)$$

$$= d_3 w_3[n]$$

$$\neq \log_{10}(|d_3 x_3[n]|)$$

$$= \log_{10}(|d_1 x_1[n] + d_2 x_2[n]|)$$

The system is Non-linear.

## 2. Time-invariant Systems

• For which a time shift or delay of the input sequence causes a corresponding shift in the output sequence

**Example:** Consider the compressor system which is defined by the relation

$$y[n] = x[Mn] \quad -\infty < n < \infty$$

check if the system is time-invariant or time-variant

**Ans:**

$$y_1[n-n_0] = x_1[M[n-n_0]] \quad \text{"time shift"}$$

$$y_2[n-n_0] = x_2[Mn-n_0] \quad \text{"Delay of the input sequence"}$$

Since  $y_1[n-n_0] \neq y_2[n-n_0]$   
 $\Rightarrow$  The system is time-variant

**Example:** Consider accumulator system which is defined by

$$y[n] = \sum_{k=-\infty}^n x[k]$$

check if the system is time-invariant or time-variant

**Ans:**

$$y_1[n-n_0] = \sum_{k=-\infty}^{n-n_0} x_1[k] \quad \text{"Time shift"}$$

$$y_2[n-n_0] = \sum_{k=-\infty}^{n-n_0} x_2[k] \quad \text{"Delay of the input sequence"}$$

$\Rightarrow y_1[n-n_0] = y_2[n-n_0] \Rightarrow$  The system is time invariant.

### 3. Causal and Non-Causal System

- The system will be causal if the output sequence value at the index  $n=n_0$  depends only on the input sequence values for  $n \leq n_0$

**Example:** The following system

$$y[n] = x[n-n_d] \quad -\infty < n < \infty$$

will be

- causal for  $n_d \geq 0$

- non-causal for  $n_d < 0$

**Example:** Consider the forward difference system defined by the relationship

$$y[n] = x[n+1] - x[n]$$

check if the system is causal or non-causal

**Ans:** To check if the system is causal or non-causal.

Assume  $n=1$

$$\Rightarrow y[1] = x[2] - x[1]$$

↑
↑
↑  
 output value      Future      present

$\Rightarrow$  The system is non-causal

**Example:** Consider the backward difference system, defined as

$$y[n] = x[n] - x[n-1]$$

check if the system is causal or non-causal

**Ans:** To check if the system is causal or non-causal.

Assume  $n=1$

$$\Rightarrow y[1] = x[1] - x[0]$$

↑
↑
↑  
 output value      present      past

$\Rightarrow$  causal system

## 4. Stability

- A system is stable in the bounded-input, bounded output (BIBO) sense if and only if every bounded input sequence produces a bounded output sequence.

• The input  $x[n]$  is bounded if there exists a fixed positive finite value  $B_x$  such that

$$|x[n]| \leq B_x < \infty \quad \text{for all } n$$

• stability requires that, for every bounded input, there exist a fixed positive finite value  $B_y$  such as

$$|y[n]| \leq B_y < \infty \quad \text{for all } n$$

**Example:** Check the stability of the following systems

1.  $y[n] = (x[n])^2$

**Ans:**

$$|y[n]| = |x[n]|^2 \leq B_x^2 < \infty$$

$\Rightarrow$  BIBO  $\Rightarrow$  The system is stable

2.  $y[n] = \log(x[n])$

**Ans:**

The system is unstable since  $y[n] = -\infty$  when  $x[n] = 0$ .

3.  $y[n] = \sum_{k=-\infty}^n u[k]$

There is no finite choice for  $B_y$  such that  $(n+1) \leq B_y < \infty$  for all  $n$ ;

thus the system is unstable.

$$[n]x \sum^n = [n]x T \quad \cdot 1$$

**Example:** For each of the systems, determine whether the system is  
 (1) stable, (2) causal, (3) linear, (4) time invariant, and  
 (5) memoryless

a.  $T(x[n]) = g[n]x[n]$  with  $g[n]$  is given.

1. The system will be stable if  $|g[n]| < \infty$  since  $|x[n]| \leq M < \infty$

2. The system is causal since the system depends on the present value of  $n$ .

3.

3. The system is linear, because:

$$d_1 y_1[n] = d_1 g[n] x_1[n] \quad \cdot 1$$

$$d_2 y_2[n] = d_2 g[n] x_2[n] \quad \cdot 1$$

$$(d_1 y_1[n] + d_2 y_2[n]) = g[n] (d_1 x_1[n] + d_2 x_2[n]) \quad \cdot 1$$

$$d_3 y_3[n] = g[n] d_3 x_3[n] \quad \cdot 1$$

⇒ The system is linear

4. The system is time variant, because:

$$T[x[n-n_0]] = g[n] x[n-n_0]$$

$$\neq y[n-n_0] = g[n-n_0] x[n-n_0] \quad \cdot 2$$

5. The system is Memoryless because

$y[n] = T(x[n])$  depends only on the  $n^{\text{th}}$  value of  $x$ .

b.  $T(x[n]) = \sum_{k=n_0}^n x[k]$

Thus the system is unstable.

1. The system will be unstable when for each of the roots of the characteristic equation.

$$|T(x[n])| \leq \sum_{k=n_0}^n |x[k]| \leq |n-n_0| M \rightarrow \infty \text{ when } n \rightarrow \infty$$

2. The system will be non-causal in case of  $n > n_0$ .

3. The system is linear since

$$d_1 y_1[n] = \sum_{k=n_0}^n \alpha_1 x_1[k]$$

$$d_2 T[x_2[n]] = \sum_{k=n_0}^n d_2 x_2[k]$$

$$d_1 T[x_1[n]] + d_2 T[x_2[n]] = \sum_{k=n_0}^n (d_1 x_1[k] + d_2 x_2[k])$$

$$d_3 T[x_3[n]]$$

$$d_3 x_3[n]$$

4. The system is time-variant since

$$T[x[n-n_0]] = \sum_{k=n_0}^n x[k-n_0] = \sum_{k=0}^{n-n_0} x[k]$$

$$\neq y[n-n_0] = \sum_{k=n_0}^{n-n_0} x[k]$$

5. The system is Memory since it depends on the past value  $n > n_0$ .

$$C. T[x[n]] = \sum_{k=n-n_0}^{n+n_0} x[k]$$

$$T(x[n]) = (x[n])^T$$

1. The system is stable since  $|T[x[n]]| \leq |x[n-n_0]| + |x[n+n_0]| < \infty$   
BIBO.

2. The system is Non-causal since it depends on the future values of  $x[n]$

3. The system is linear since

$$\alpha_1 T(x_1[n]) = \sum_{k=n-n_0}^{n+n_0} \alpha_1 x_1[k]$$

$$T(\alpha_2 x_2[n]) = \sum_{k=n-n_0}^{n+n_0} \alpha_2 x_2[k]$$

$$T(\alpha_1 x_1[n] + \alpha_2 x_2[n]) = \sum_{k=n-n_0}^{n+n_0} (\alpha_1 x_1[k] + \alpha_2 x_2[k])$$

$$T(\alpha_3 x_3[n]) = \sum_{k=n-n_0}^{n+n_0} \alpha_3 x_3[k]$$

4. The system is Time-invariant since

$$T(x[n-n_0]) = \sum_{k=n-n_0}^{n+n_0} x[k-n_0]$$

$$\sum_{k=n-2n_0}^{n} x[k] = y[n-n_0]$$

5. The system is memory since it depends on different values of  $x[n]$ .

D.  $T(x[n]) = x[n-n_0]$

1. The system is stable since  $|T(x[n])| \leq |x[n-n_0]| \leq M < \infty$

2. The system will be causal if  $n_0 \geq 0$ , otherwise it is non-causal

3. The system is linear since

$$T(\alpha_1 x_1[n]) = \alpha_1 x_1[n-n_0]$$

$$T(\alpha_2 x_2[n]) = \alpha_2 x_2[n-n_0]$$

$$T(\alpha_1 x_1[n] + \alpha_2 x_2[n]) = \alpha_1 x_1[n-n_0] + \alpha_2 x_2[n-n_0]$$

$$T(\alpha_3 x_3[n]) = \alpha_3 x_3[n-n_0]$$

4. The system is Time-invariant since

$$T(x[n-nd]) = x[n-nd-n_0] = y[n-nd]$$

5. The system will be memoryless only if  $n_0 = 0$ , otherwise the system is memory.

E.  $T(x[n]) = e^{x[n]}$

1. The system is stable since  $|T(x[n])| = |e^{x[n]}| \leq e^M < \infty$

2. The system is causal.

3. The system is non-linear since

$$T(\alpha_1 x_1[n]) = e^{\alpha_1 x_1[n]}$$

$$\text{and } T(\alpha_2 x_2[n]) = e^{\alpha_2 x_2[n]}$$

$$\Rightarrow T(\alpha_1 x_1[n] + \alpha_2 x_2[n]) = e^{\alpha_1 x_1[n]} + e^{\alpha_2 x_2[n]} \neq e^{\alpha_1 x_1[n] + \alpha_2 x_2[n]}$$

4. The system is Time-invariant since

$$T(x[n-n_0]) = e^{x[n-n_0]} = y[n-n_0]$$

5. The system is memoryless since it depends only on the present value of  $x[n]$ .

F.  $T(x[n]) = ax[n] + b$

1. The system is stable since  $|T(x[n])| = |ax[n] + b|$   
 where  $a$ , and  $b$  are finite values.

2. The system is causal.

3. The system is non-linear

4. The system is time-invariant

5. The system is memoryless.

G.  $T(x[n]) = x[-n]$

1. The system is stable since  $|T(x[n])| = |x[-n]| \leq M < \infty$

2. The system will be non-causal if  $n < 0$ , otherwise the system is causal

3. The system is linear  $y = (T(x_1) + T(x_2))$

4. The system is time-variant since  $T(x[n-n_0]) \neq y[n-n_0]$

$$T(x[n-n_0]) = x[-n-n_0] \neq y[n-n_0] = x[-n+n_0]$$

5. The system is Memory for all values  $n$  except  $n=0$ .

H.  $T(x[n]) = x[n] + 3u[n+1]$

1. The system is stable since

$$|T(x[n])| = |x[n] + 3u[n+1]| \leq M + 3 \text{ for } n \geq -1$$

$$\text{and } |T(x[n])| \leq M \text{ for } n < -1$$

2. The system is causal

3. The system is non linear

4. The system is Time-variant since

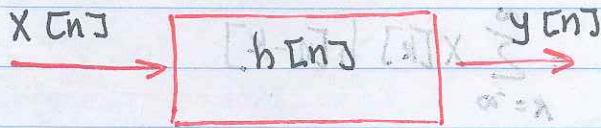

$$T(x[n-n_0]) = x[n-n_0] + 3u[n+1]$$

$$\neq y[n-n_0] = x[n-n_0] + 3u[n-n_0+1]$$

5. The system is Memoryless.

• Linear Time-Invariant Systems

For LTI system shown below

The output signal  $y[n]$  can be expressed as:

$$y[n] = x[n] * h[n]$$

where

\* represents convolution operation

⇒

$$y[n] = x[n] * h[n]$$

$$= \sum_{k=-\infty}^{\infty} x[k] h[n-k]$$

or

$$y[n] = \sum_{k=-\infty}^{\infty} x[n-k] h[k]$$

Example:- Consider LTI system with impulse response

$$h[n] = u[n] - u[n-N]$$

$$= \begin{cases} 1 & 0 \leq n \leq N-1 \\ 0 & \text{o.w.} \end{cases}$$

and the input signal is given by

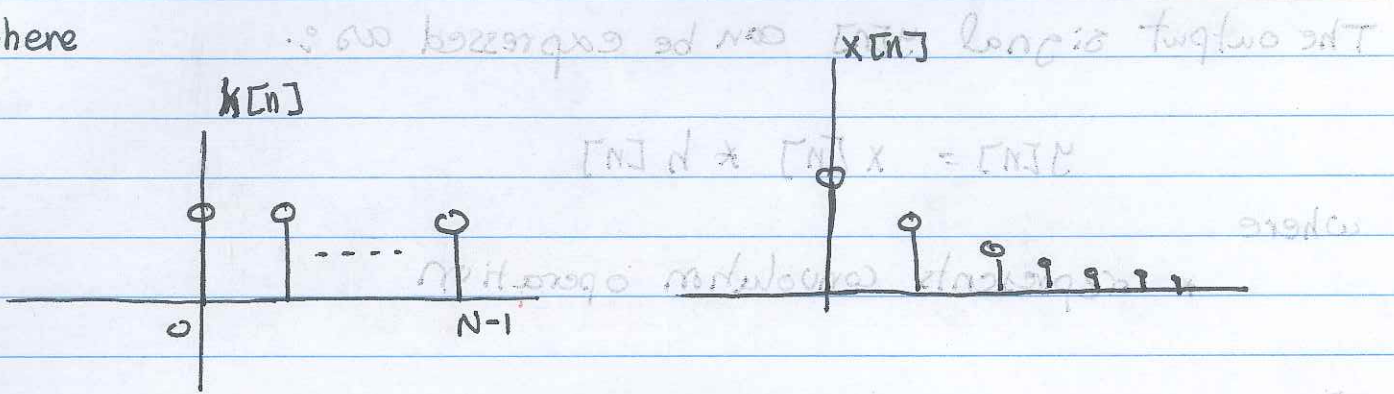

$$x[n] = a^n u[n]; \quad 0 < a < 1$$

Ans:- For LTI system *Linear Time-Invariant Systems*

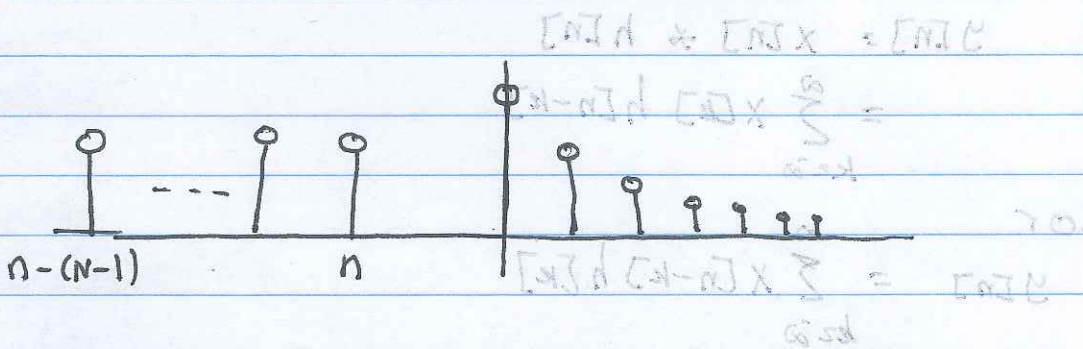

For LTI system  $y[n] = x[n] * h[n]$

$$y[n] = \sum_{k=-\infty}^{\infty} x[k] h[n-k]$$

where

⇒

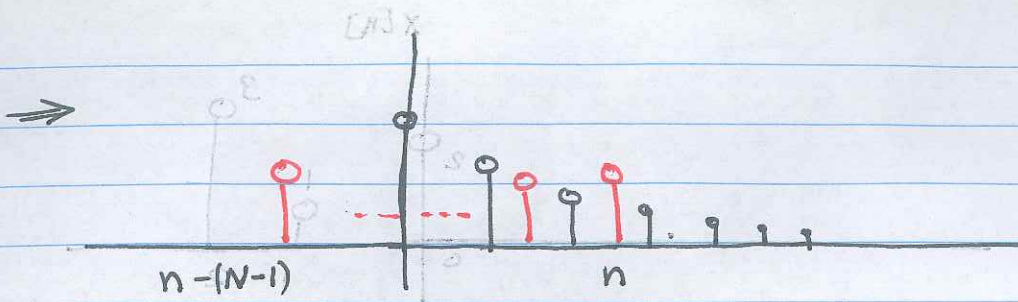

when  $n < 0$

$$y[n] = 0$$

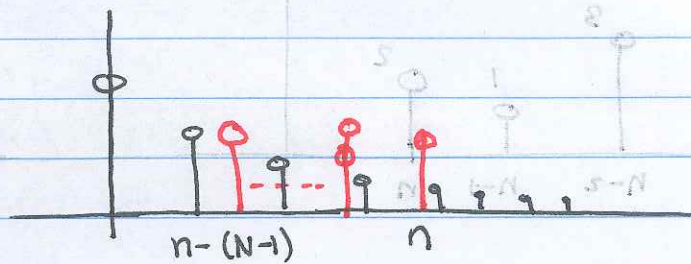

when  $0 \leq n \leq N-1$ , and by using the general formula of the closed form expression of the sum, where,

$$\sum_{k=N_1}^{N_2} a^k = \frac{a^{N_1} - a^{N_2+1}}{1-a} \quad N_2 \geq N_1$$

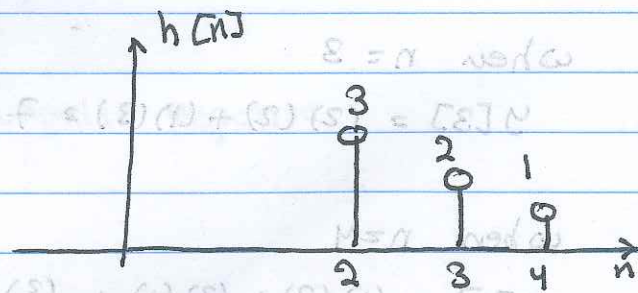

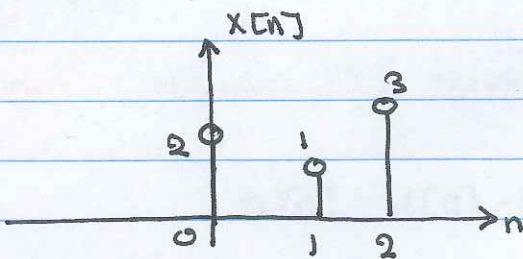

$$y[n] = \sum_{k=0}^{n} a^k = \frac{1 - a^{n+1}}{1 - a} \quad 0 \leq n \leq N-1$$

when  $n > N-1$

$$y[n] = \sum_{k=n-(N-1)}^n a^k = \frac{a^{n-N+1} - a^{n+1}}{1 - a} \quad n > N-1$$

**Example:** Consider LTI system in which  $x[n]$  (and  $h[n]$ ) shown below

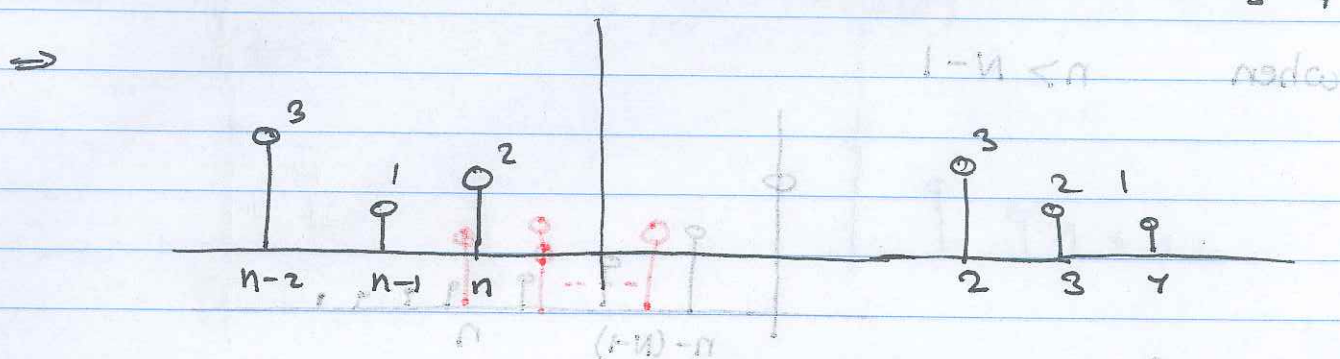

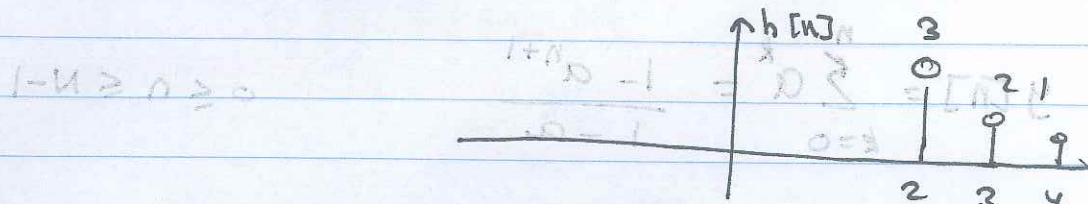

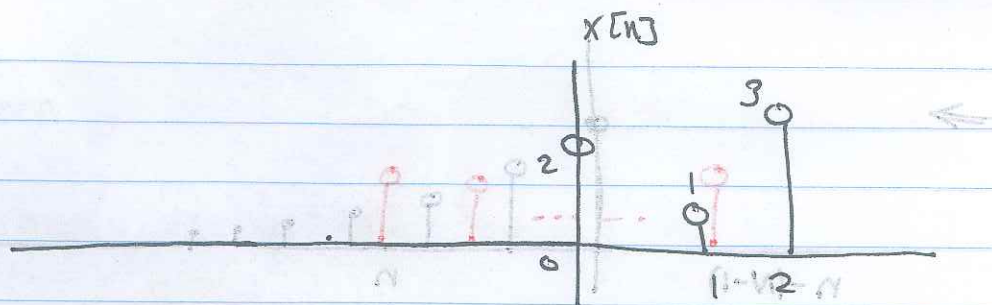

Find  $y[n]$ .

when the input signal is given by  $F = (5)(2) + (1)(1) = [27]C$

Ans:

Method 1:-

when  $n < 2$   
 $y[n] = 0$

when  $n = 2$

$y[2] = (2)(3) = 6$

when  $n = 3$

$y[3] = (2)(2) + (1)(3) = 7$

when  $n = 4$

$y[4] = (1)(2) + (2)(1) + (3)(3) = 13$

when  $n = 5$

$y[5] = (1)(1) + (3)(2) = 7$

when  $n = 6 \Rightarrow y[6] = (3)(1) = 3$

when  $n=7$  the impulse response  $y[n]$  is 0. For  $n=0$  the impulse response  $y[n]$  is 0. For  $n=1$  the impulse response  $y[n]$  is 0. For  $n=2$  the impulse response  $y[n]$  is 0. For  $n=3$  the impulse response  $y[n]$  is 0. For  $n=4$  the impulse response  $y[n]$  is 0. For  $n=5$  the impulse response  $y[n]$  is 0. For  $n=6$  the impulse response  $y[n]$  is 0. For  $n=7$  the impulse response  $y[n]$  is 0. For  $n=8$  the impulse response  $y[n]$  is 0. For  $n=9$  the impulse response  $y[n]$  is 0. For  $n=10$  the impulse response  $y[n]$  is 0. For  $n=11$  the impulse response  $y[n]$  is 0. For  $n=12$  the impulse response  $y[n]$  is 0. For  $n=13$  the impulse response  $y[n]$  is 0. For  $n=14$  the impulse response  $y[n]$  is 0. For  $n=15$  the impulse response  $y[n]$  is 0. For  $n=16$  the impulse response  $y[n]$  is 0. For  $n=17$  the impulse response  $y[n]$  is 0. For  $n=18$  the impulse response  $y[n]$  is 0. For  $n=19$  the impulse response  $y[n]$  is 0. For  $n=20$  the impulse response  $y[n]$  is 0. For  $n=21$  the impulse response  $y[n]$  is 0. For  $n=22$  the impulse response  $y[n]$  is 0. For  $n=23$  the impulse response  $y[n]$  is 0. For  $n=24$  the impulse response  $y[n]$  is 0. For  $n=25$  the impulse response  $y[n]$  is 0. For  $n=26$  the impulse response  $y[n]$  is 0. For  $n=27$  the impulse response  $y[n]$  is 0. For  $n=28$  the impulse response  $y[n]$  is 0. For  $n=29$  the impulse response  $y[n]$  is 0. For  $n=30$  the impulse response  $y[n]$  is 0. For  $n=31$  the impulse response  $y[n]$  is 0. For  $n=32$  the impulse response  $y[n]$  is 0. For  $n=33$  the impulse response  $y[n]$  is 0. For  $n=34$  the impulse response  $y[n]$  is 0. For  $n=35$  the impulse response  $y[n]$  is 0. For  $n=36$  the impulse response  $y[n]$  is 0. For  $n=37$  the impulse response  $y[n]$  is 0. For  $n=38$  the impulse response  $y[n]$  is 0. For  $n=39$  the impulse response  $y[n]$  is 0. For  $n=40$  the impulse response  $y[n]$  is 0. For  $n=41$  the impulse response  $y[n]$  is 0. For  $n=42$  the impulse response  $y[n]$  is 0. For  $n=43$  the impulse response  $y[n]$  is 0. For  $n=44$  the impulse response  $y[n]$  is 0. For  $n=45$  the impulse response  $y[n]$  is 0. For  $n=46$  the impulse response  $y[n]$  is 0. For  $n=47$  the impulse response  $y[n]$  is 0. For  $n=48$  the impulse response  $y[n]$  is 0. For  $n=49$  the impulse response  $y[n]$  is 0. For  $n=50$  the impulse response  $y[n]$  is 0. For  $n=51$  the impulse response  $y[n]$  is 0. For  $n=52$  the impulse response  $y[n]$  is 0. For  $n=53$  the impulse response  $y[n]$  is 0. For  $n=54$  the impulse response  $y[n]$  is 0. For  $n=55$  the impulse response  $y[n]$  is 0. For  $n=56$  the impulse response  $y[n]$  is 0. For  $n=57$  the impulse response  $y[n]$  is 0. For  $n=58$  the impulse response  $y[n]$  is 0. For  $n=59$  the impulse response  $y[n]$  is 0. For  $n=60$  the impulse response  $y[n]$  is 0. For  $n=61$  the impulse response  $y[n]$  is 0. For  $n=62$  the impulse response  $y[n]$  is 0. For  $n=63$  the impulse response  $y[n]$  is 0. For  $n=64$  the impulse response  $y[n]$  is 0. For  $n=65$  the impulse response  $y[n]$  is 0. For  $n=66$  the impulse response  $y[n]$  is 0. For  $n=67$  the impulse response  $y[n]$  is 0. For  $n=68$  the impulse response  $y[n]$  is 0. For  $n=69$  the impulse response  $y[n]$  is 0. For  $n=70$  the impulse response  $y[n]$  is 0. For  $n=71$  the impulse response  $y[n]$  is 0. For  $n=72$  the impulse response  $y[n]$  is 0. For  $n=73$  the impulse response  $y[n]$  is 0. For  $n=74$  the impulse response  $y[n]$  is 0. For  $n=75$  the impulse response  $y[n]$  is 0. For  $n=76$  the impulse response  $y[n]$  is 0. For  $n=77$  the impulse response  $y[n]$  is 0. For  $n=78$  the impulse response  $y[n]$  is 0. For  $n=79$  the impulse response  $y[n]$  is 0. For  $n=80$  the impulse response  $y[n]$  is 0. For  $n=81$  the impulse response  $y[n]$  is 0. For  $n=82$  the impulse response  $y[n]$  is 0. For  $n=83$  the impulse response  $y[n]$  is 0. For  $n=84$  the impulse response  $y[n]$  is 0. For  $n=85$  the impulse response  $y[n]$  is 0. For  $n=86$  the impulse response  $y[n]$  is 0. For  $n=87$  the impulse response  $y[n]$  is 0. For  $n=88$  the impulse response  $y[n]$  is 0. For  $n=89$  the impulse response  $y[n]$  is 0. For  $n=90$  the impulse response  $y[n]$  is 0. For  $n=91$  the impulse response  $y[n]$  is 0. For  $n=92$  the impulse response  $y[n]$  is 0. For  $n=93$  the impulse response  $y[n]$  is 0. For  $n=94$  the impulse response  $y[n]$  is 0. For  $n=95$  the impulse response  $y[n]$  is 0. For  $n=96$  the impulse response  $y[n]$  is 0. For  $n=97$  the impulse response  $y[n]$  is 0. For  $n=98$  the impulse response  $y[n]$  is 0. For  $n=99$  the impulse response  $y[n]$  is 0. For  $n=100$  the impulse response  $y[n]$  is 0.

n	0	1	2	3	4
$x[n]$	$x[0]$	$x[1]$	$x[2]$	0	0
$h[n]$	0	0	$h[2]$	$h[3]$	$h[4]$
	0	0	$h[2]x[0]$	$h[3]x[0]$	$h[4]x[0]$
	0	0	0	$h[3]x[1]$	$h[4]x[1]$
	0	0	0	0	$h[4]x[2]$
$\Sigma$	0	0	6	7	3

**Exercise:** An LTI System has the impulse response  $h[n] = a^n u[n]$  with  $|a| < 1$ . The input to the system is  $x[n] = B^n (u[n] - u[n-5])$  with no restriction on the value of B.

- a. Find the general closed-form equation for the system output  $y[n]$ .
- b. Evaluate  $y[n]$  at  $n=0, 2$ , and  $10$  for  $a=0.6$  and  $B=0.8$ .
- c. Create stem plots of  $x[n]$ ,  $h[n]$ , and  $y[n]$  over the time range  $0 \leq n \leq 10$  for  $a=0.6$  and  $B=0.8$ .
- d. Repeat Part (c) for  $a=0.6$  and  $B=-0.8$

**Example:** An LTI system has the impulse response  $h[n] = \{1, \underline{2}, 0, -3\}$ ; the underline locates the  $n=0$  value. For each input sequence below, find the output sequence  $y[n] = x[n] * h[n]$  expressed both as a list (underline the  $n=0$  value) and as a stem plot.

a.  $x_1[n] = \delta[n]$

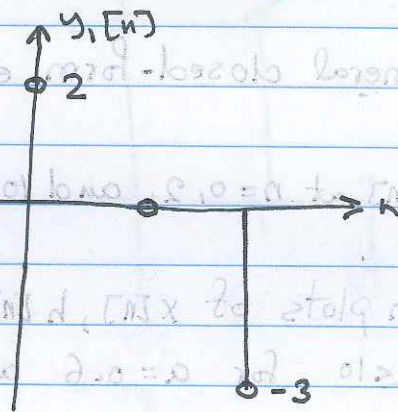

b.  $x_2[n] = \delta[n+1] + \delta[n-2]$

c.  $x_3[n] = \{1, 1, 1\}$

d.  $x_4[n] = \{2, 1, \underline{-1}, -2, -3\}$

**Ans:**

a.  $y_1[n] = x_1[n] * h[n] = \delta[n] * h[n] = h[n] = \{1, \underline{2}, 0, -3\}$

b.  $y_2[n] = x_2[n] * h[n] = (\delta[n+1] + \delta[n-2]) * h[n] = h[n+1] + h[n-2]$

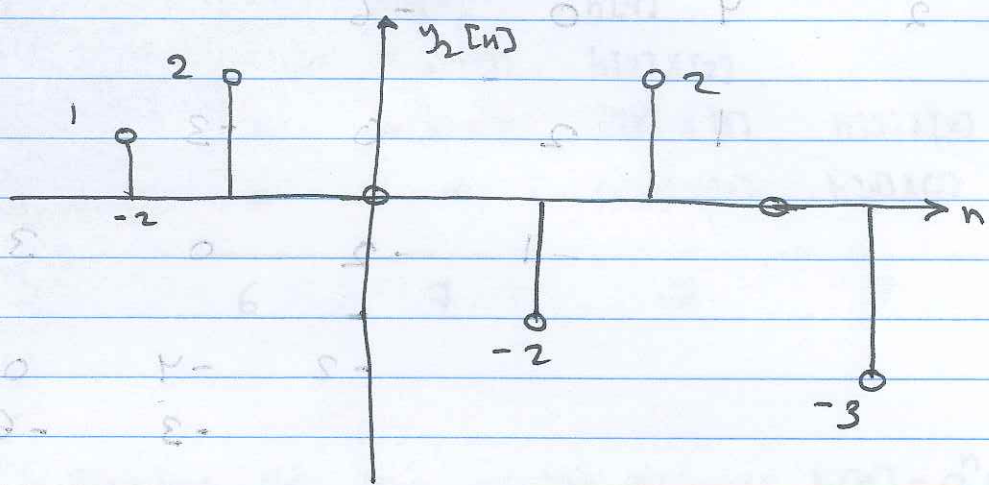

$$h[n] \quad \quad \quad 1 \quad \quad \quad \underline{2} \quad [n] \times [n-3] = [n] \times -3$$

$$h[n+1] \quad \quad \quad 1 \quad \quad \quad \underline{2} \quad \quad \quad \underline{0} \quad \quad \quad 0 \quad 0 \quad 0$$

$$h[n-2] \quad \quad \quad 0 \quad 0 \quad \underline{0} \quad \quad \quad 1 \quad \quad \quad 2 \quad 0 \quad -3$$

$$h[n+1] + h[n-2] \quad \quad \quad 1 \quad 2 \quad \underline{0} \quad \quad \quad -2 \quad \quad \quad 2 \quad 0 \quad -3$$

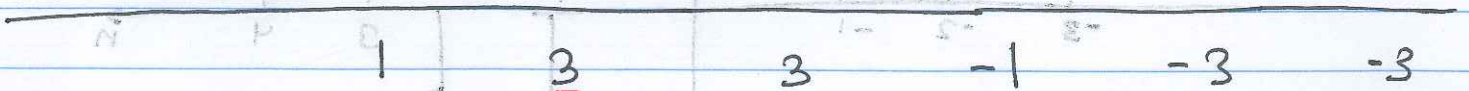

c.  $y_3[n] = x_3[n] * h[n]$

$$= h[n] + h[n-1] + h[n-2]$$

$$h[n] \quad \quad \quad 1 \quad \quad \quad \underline{2} \quad \quad \quad 0 \quad \quad \quad -3$$

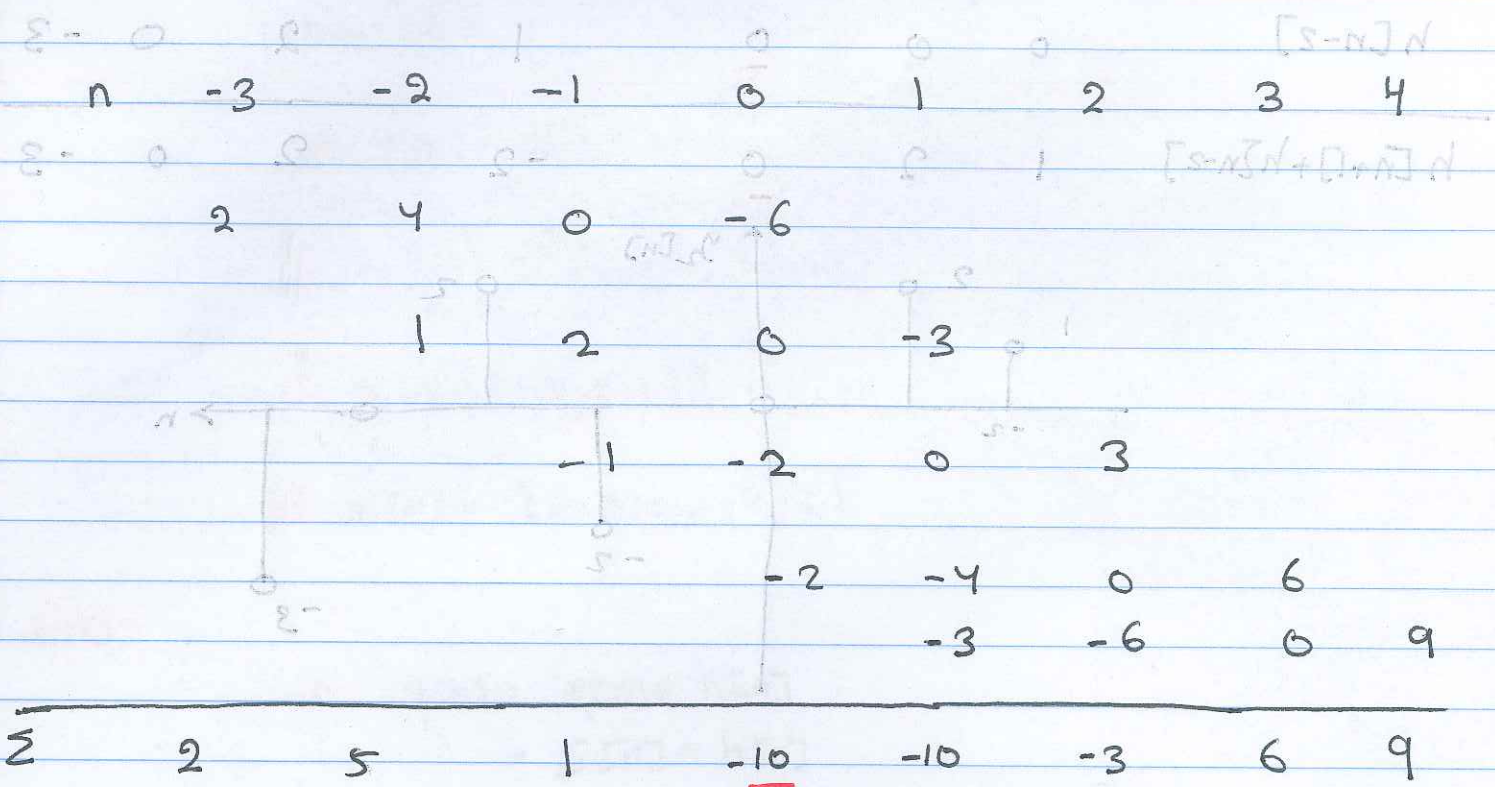

$$h[n-1] \quad \quad \quad \quad \quad 1 \quad \quad \quad 2 \quad \quad \quad 0 \quad \quad \quad -3$$

$$h[n-2] \quad \quad \quad \quad \quad \quad \quad 1 \quad \quad \quad 2 \quad \quad \quad 0 \quad \quad \quad -3$$

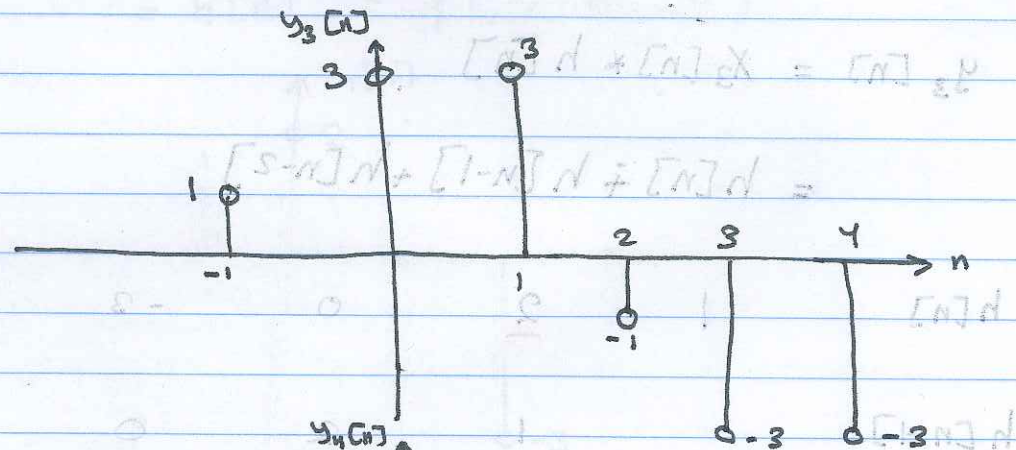

d.  $y_4[n] = x_4[n] * h[n]$

$= 2h[n+2] + h[n+1] - h[n] - 2h[n-1] - 3h[n-2]$

c.

d.
