

1) A mill in a textile plant uses the belt-and-pulley arrangement shown to transmit power. When  $t = 0$  an electric motor is turning pulley  $A$  with an angular velocity of  $\omega_A = 5 \text{ rad/s}$ . If this pulley is subjected to an acceleration  $\alpha_A = 0.25\theta^3 + 0.5 \text{ rad/s}^2$ , determine the angular velocity of pulley  $B$  after  $B$  turns 6 revolutions. The hub at  $D$  is rigidly connected to pulley  $C$  and turns with it.

2) The  $10 \text{ lb}$  collar  $B$  is at rest, and when it is in the position shown the spring is unstretched. Another  $1 \text{ lb}$  collar  $A$  is traveling at an initial speed  $v_{A1}$  when it strikes collar  $B$ , causing  $B$  to slide  $4 \text{ ft}$  on the smooth rod before momentarily stopping. Determine the velocity of  $A$  before and after impact. The coefficient of restitution between  $A$  and  $B$  is  $e = 0.5$ . Clearly label your coordinate system(s).

3) The crank  $OA$  revolves clockwise with a constant angular velocity of  $10 \text{ rad/s}$  within a limited arc of its motion. For the position  $\theta = 30^\circ$  determine the angular velocity and angular acceleration of the slotted link  $CB$ . Clearly label your coordinate system(s).
