# CHAPTER FOUR: INTERPRETATION OF PRESCRIPTIONS AND MEDICATION ORDERS

## Objectives

- Demonstrate an understanding of the format and components of a typical prescription.
- Demonstrate an understanding of the format and components of a typical institutional medication order.
- Interpret correctly standard abbreviations and symbols used on prescriptions and medication orders.
- patient adherence calculations

- By definition, a *prescription* is an order for medication issued by a physician, dentist, or other properly licensed medical practitioner.
- A prescription designates a specific medication and dosage to be prepared by a pharmacist and administered to a particular patient.

## Components of a typical prescription

- (1) Prescriber information and signature
- (2) Patient information
- (3) Date prescription was written
- (4) symbol (the Superscription), meaning "take thou,"
- "you take," or "recipe" Rx
- (5) Medication prescribed (the Inscription)
- (6) Dispensing instructions to the pharmacist (the Subscription)
- (7) Directions to the patient (the Signa)
- (8) Special instructions. It is important to note that for any Medicaid or Medicare prescription and according to individual state laws, a handwritten language by the prescriber, such as "Brand necessary," may be required to disallow generic substitution.

(1)	John M. Brown, M.D. 100 Main Street Libertyville, Maryland Phone 123-4567	
(2)	Name Mary Smith Date Jan 9, 20yy  Address 123 Broad Street	(3)
(4) (5)	R Lipitor 10 mg	
(6) (7)	Tabs No. 30 Sig: tab í every day	
(8)	Refill 6_ times Label: Yes  V No  Generic if available: Yes No	
	JM Brown, M.D.  DEA No. 1234563 State License No. 65432	(1)

 In hospitals and other institutions, the forms are somewhat different and are referred to as *medication orders*. A typical medication order sheet is shown in Figure 4.2.

CITY HOSPIT Athens, GA 3	0600	PATIENT NAMI ADDRESS: CITY, STATE: AGE/SEX: PHYSICIAN: HOSP.NO: SERVICE: ROOM:	E: Thompson, Linda 2345 Oak Circle Athens, GA 35 Female J. Hardmer 900612345 Medicine 220 East	
DATE TIME			<u> </u>	
02/01/yy	1200	1. Propranolol 40 mg po QID		
		2. Furosemide 20 mg po q AM		
		3. Flurazepam 30 mg at HS prn sleep		
		4. D-5-W + 20 mEq kcl/L at 84 mL/hr		
	Hardmer, MD			

Unless "No substitution permitted" is clearly written after the order, a generic or therapeutic equivalent drug may be dispensed according to the Formulary policies of this hospital.

FIGURE 4.2 Typical hospital medication order sheet.

- A prescription or medication order for an infant, child, or an elderly person may also include the age, weight, and/or body surface area (BSA) of the patient
- An example of a prescription written for a pediatric patient is shown in Figure 4.3. This information
- is sometimes necessary in calculating the appropriate medication dosage.

                              State License No. 65432
```

- It is important to recognize two broad categories of prescriptions:
- (1) those written for a single component or prefabricated product and *not requiring compounding* or admixture by
- the pharmacist, and
- (2) those written for more than a single component and requiring compounding

## extemporaneous compounding

- The extemporaneous compounding of prescriptions is an activity for which pharmacists are uniquely qualified by virtue of their education, training, and experience.
- By definition, pharmacy compounding involves the
  - mixing,
  - assembling,
  - packaging, and
  - labeling of
- a medication on receipt of a prescription order for a specific patient.

John M. Brown, M.D. 100 Main Street Libertyville, Maryland Phone 123-4567

Use as directed. Discard after 60 days. Refill \_O\_times Label: Yes \_√\_ No \_\_\_\_ Generic if available: Yes \_\_\_\_ No \_\_\_ JM Brown, M.D. DEA No. CB1234563 State License No. 65432

**FIGURE 4.5** Example of a prescription requiring compounding.

## e-prescribing/e-prescriptions

- In the inpatient or outpatient setting, a medication order, for a patient is entered into an automated data entry system as a personal computer (PC) or a handheld
- device loaded with *e-prescribing* software and sent to a pharmacy as an *e-prescription*.
- When received, a pharmacist immediately reduces the order to a hard copy and/or stores it as a computer
- file.

- Among the advantages cited for e-prescriptions over traditional paper prescriptions are:
  - Reduced errors due to prescription legibility;
  - concurrent software screens for drug interactions;
  - reduced incidence of altered or forged prescriptions;
  - · efficiency for both prescriber and pharmacist; and,
  - convenience to the patient, whose prescription would likely be ready for pick-up upon arrival at the pharmacy

#### Range of Prescription and Medication Order Calculations

- calculations of the following:
  - Doses: including the quantity of a prescribed dose, the total number of doses prescribed, and the number of days the prescribed medication will last.
  - Adherence: the patient's or caregiver's Adherence in meeting the prescribed directions for dosing. Drug concentration: the quantity of an active therapeutic ingredient to use to achieve the desired drug concentration.
  - Rate of drug administration: the quantity of drug administered per unit of time to meet prescribed dosing schedule
  - Compounding: the quantities of active and inactive components to use in the extemporaneous preparation of a pharmaceutical product, including the use of stock solutions and/or prefabricated dosage units in the process.
  - Chemical-physical factors: including calculations to make solutions isotonic, iso-osmotic, equimolar, or buffered.
  - Pharmacoeconomics: including medication costs, cost-benefit analysis, cost-effectiveness analysis, alternative treatment plans, and medication pricing.

 The quantities of ingredients to be used almost always are expressed in SI metric units of weight and measurement.

#### Examples of prescriptions written in SI metric units:

$\mathbf{R}$	Acetylsalicylic Acid	4 g
	Phenacetin	0.8 g
	Codeine Sulfate	0.5 g
	Mix and make capsules no. 20	
	Sig. One capsule every 4 hours.	

## Prescription and Medication Order Accuracy

- It is pharmacists responsibility that each medication should be:
  - therapeutically appropriate for the patient;
  - prescribed at the correct dose;
  - dispensed in the correct strength and dosage form;
  - correctly labeled with complete instructions for the patient or caregiver; and
  - for the patient in a hospital or other health care facility, each medication must be administered
  - > to the correct patient, at the correct time, and by the correct rate and route of administration.

### Use of Roman Numerals on Prescriptions

SS	=	1/2	L or l	=	50
l, i, or j	=	1	C or c	=	100
V or v	=	5	D or d	=	500
X or x	=	10	M or m	=	1000

- 1. A letter repeated once or more, repeats its value (e.g., xx 20; xxx 30).
- 2. One or more letters placed after a letter of greater value increases the value of the greater letter (e.g., vi 6; xij 12; lx 60).
- 3. A letter placed before a letter of greater value decreases the value of the greater letter (e.g., iv
- 4; xl 40).
- When Roman numerals are used, the tradition of placing the numerals after the term or
- symbol generally is followed (e.g., capsules no. xxiv; fluidounces xij).

## Use of Abbreviations and Symbols

#### TABLE 4.2 SELECTED ABBREVIATIONS, ACRONYMS, AND SYMBOLS USED IN PRESCRIPTIONS AND MEDICATION ORDERS<sup>a,b</sup>

#### Recommendations to decrease errors

- A whole number should be shown without a decimal point and without a terminal zero (e.g., express 4 milligrams as 4 mg and not as 4.0 mg).
- A quantity smaller than one should be shown with a zero preceding the decimal point (e.g., express two tenths of a milligram as 0.2 mg and not as 0.2 mg).
- Leave a space between a number and the unit (e.g., 10 mg and not 10 mg).
- Use whole numbers when possible and not equivalent decimal fractions (e.g., use 100 mg and not 0.1 g).
- Use the full names of drugs and not abbreviations (e.g., use phenobarbital and not PB).
- Use USP designations for units of measure (e.g., for grams, use g and not Gm or gms; for milligrams, use mg and not mgs or mgm).
- Spell out "units" (e.g., use 100 units and not 100 u or 100 U since an illegible U may be misread as a zero, resulting in a 10-fold error, i.e., 1000). The abbreviation I.U., which stands for "International Units," should also be spelled out so it is not interpreted as I.V., meaning "intravenous."
- Certain abbreviations that could be mistaken for other abbreviations should be written out (e.g., write "right eye" or "left eye" rather than use o.d. or o.l., and spell out "right ear" and "left ear" rather than use a.d. or a.l.).

- Spell out "every day" rather than use q.d.; "every other day," rather than q.o.d; and "four times a day," rather than q.i.d to avoid misinterpretation.
- Avoid using d for "day" or "dose" because of the profound difference between terms, as in mg/kg/day versus mg/kg/dose.
- Integrate capital or "tall man" letters to distinguish between "look alike" drug names, such as AggreSTAT and AggreNOX; hydrOXYZINE and hydrALAZINE; and DIGoxin and DESoxyn.
- Amplify the prescriber's directions on the prescription label when needed for clarity (e.g., use "Swallow one (1) capsule with water in the morning" rather than "one cap in a.m.").

#### Examples of prescription directions to the pharmacist:

- (a) M. ft. ung.

  Mix and make an ointment.
- (b) Ft. sup. no xii Make 12 suppositories.
- (c) M. ft. cap. d.t.d. no. xxiv Mix and make capsules. Give 24 such doses.

#### Examples of prescription directions to the patient:

- (a) Caps. i. q.i.d. p.c. et h.s.

  Take one (1) capsule four (4) times a day after each meal and at bedtime.
- (b) gtt. ii rt.eye every a.m.
  Instill two (2) drops in the right eye every morning.
- (c) tab. ii stat tab. 1 q. 6 h. × 7 d. Take two (2) tablets immediately, then take one (1) tablet every 6 hours for 7 days.

**CASE IN POINT 4.1:** A pharmacist received the following prescription, which requires the correct interpretation of abbreviations prior to engaging in calculations, compounding, labeling, and dispensing.

Ŗ

Lisinopril

Hydrochlorothiazide aa. 10 mg

Calcium Phosphate 40 mg

Lactose q.s. ad 300 mg

M.ft. cap. i D.T.D. # 30

Sig: cap. i AM a.c.

- (a) How many milligrams each of lisinopril and hydrochlorothiazide are required to fill the prescription?
- (b) What is the weight of lactose required?
- (c) Translate the label directions to the patient.

#### Case in Point 4.1

- (a) Since aa. means "of each," 10 mg lisinopril and 10 mg hydrochlorothiazide are needed for each capsule. And since D.T.D. means "give of such doses," 30 capsules are to be prepared. Thus,
  - 10 mg lisinopril × 30 (capsules) = 300 mg lisinopril and
  - 10 mg hydrochlorothiazide × 30 (capsules) = 300 mg hydrochlorothiazide are needed to fill the prescription.
- (b) Since q.s. ad means "a sufficient quantity to make," the total in each capsule is 300 mg. The amount of lactose per capsule would equal 300 mg less the quantity of the other ingredients (10 mg + 10 mg + 40 mg), or 240 mg. Thus,
  - 240 mg lactose/capsule × 30 (capsules) = 7200 mg = 7.2 g lactose.
- (c) Take one (1) capsule in the morning before breakfast.

#### Examples:

R Hydrochlorothiazide
No. XC

50 mg

Sig. i q AM for HBP

If the prescription was filled initially on April 15, on about what date should the patient return to have the prescription refilled?

Answer: 90 tablets, taken 1 per day, should last 90 days, or approximately 3 months, and the patient should return to the pharmacy on or shortly before July 15 of the same year.

Penicillin V Potassium Oral Solution
Disp.\_\_\_\_mL
Sig. 5 mL q 6h ATC × 10 d

125 mg/5 mL

How many milliliters of medicine should be dispensed?

Answer: 5 mL times 4 (doses per day) equals 20 mL times 10 (days) equals 200 mL.

A pharmacist may calculate a patient's percent compliance rate as follows:

% Compliance rate = 
$$\frac{\text{Number of days supply of medication}}{\text{Number of days since last Rx refill}} \times 100$$

#### Example:

What is the percent compliance rate if a patient received a 30-day supply of medicine and returned in 45 days for a refill?

% Compliance rate = 
$$\frac{30 \text{ days}}{45 \text{ days}} \times 100 = 66.6\%$$
, answer.

In determining the patient's actual (rather than apparent) compliance rate, it is important to determine if the patient had available and used extra days' dosage from some previous filling of the prescription.

## Presentation by students

- Medication Scheduling,
- Medication Adherence,
- Errors and Omissions

#### Homework

- Interpret each of the following Subscriptions (directions to the pharmacist) taken from prescriptions:
  - (a) Disp. supp. rect. no. xii
  - (b) M. ft. iso. sol. Disp. 120 mL.
  - (c) M. et div. in pulv. no. xl
  - (d) DTD vi. Non rep.
  - (e) M. et ft. ung. Disp. 10 g
  - (f) M. et ft. caps. DTD xlviii
  - (g) M. et ft. susp. 1 g/tbsp. Disp. 60 mL.
  - (h) Ft. cap. #1. DTD no.xxxvi N.R.
  - (i) M. et ft. pulv. DTD #C
  - (j) M. et ft. I.V. inj.
  - (k) Label: hydrocortisone, 20 mg tabs.

- Interpret each of the following Signas (directions to the patient) taken from prescriptions:
  - (a) Gtt. ii each eye q. 4 h. p.r.n. pain.
  - (b) Tbsp. i in  $\frac{1}{3}$  gl. aq. q. 6 h.
  - (c) Appl. a.m. & p.m. for pain prn.
  - (d) Gtt. iv right ear m. & n.
  - (e) Tsp. i ex aq. q. 4 or 5 h. p.r.n. pain.
  - (f) Appl. ung. left eye ad lib.

- (g) Caps i c aq. h.s. N.R.
- (h) Gtt. v each ear 3 × d. s.o.s.
- Tab. i sublingually, rep. p.r.n.
- (j) Instill gtt. ii each eye of neonate.
- (k) Dil. c̄ = vol. aq. and use as gargle q. 5 h.
- Cap. ii 1 h. prior to departure, then cap. i after 12 h.
- (m) Tab i p.r.n. SOB
- (n) Tab i qAM HBP
- (o) Tab ii q 6h ATC UTI
- (p) 3ii 4×d p.c. & h.s.
- (q) 3ss a.c. t.i.d.
- (r) Add crushed tablet to pet's food s.i.d.
