

Working with Files

Computer Science Department

Files vs. File Variables

A file variable is a data structure in the C program which represents the file

- Temporary exists only when program runs
- There is a struct called FILE in <stdio.h>
- Details of the struct are private to the standard C I/O library routines

V-2

What's in stdio.h?

Prototypes for I/O functions.

Definitions of useful #define constants Example: EOF for End of File

Definition of *FILE struct* to represent information about open files.

<u>File variables</u> in C programs are **pointers** to a FILE *struct*.

FILE *myfile;

V-

Opening A File

"Opening" a file: making a connection between the operating system (file name) and the C program (file variable)

Files must be opened before they can be used

/-4

Opening A File

To open a disk file in C:

```
library function fopen
specify "r" (read, input) or "w" (write, output)
NB String "r", not char 'r'!
```

Files stdin/stdout (used by scanf/printf) are automatically opened & connected to the keyboard and display

V-5

File Open Example

```
/*usually done only once in a program*/
/*usually done near beginning of program*/
FILE *infilep, *outfilep; /*file variables*/
char ch;

/* Open input and output files */
infilep = fopen ("Student_Data.txt", "r");
outfilep = fopen ("New_Student_Data.txt", "w");
```

3

File I/O: fscanf and fprintf

Once a file has been opened...

use *fscanf* and *fprintf* to read or write data from/to the file

Use the file variable returned by *fopen* to identify the file to be read/written

File must already be open before *fscanf* or *fprintf* is used!

V-7

File I/O: fscanf and fprintf

```
fscanf: works just like scanf, but 1st parameter is a file variable
```

```
fscanf (filepi, "%...", &var, ...);
```

fprintf: works just *printf*, but 1st parameter is a file variable

```
fprintf (filepo, "%...", var, ...);
```

V-8

Files - Summary

```
    Declare a file pointer variable
```

```
FILE *ftp_in , /* pointer to input file */FILE *ftp_out; /* pointer to output file */
```

The calls to function fopen

```
- ftp_in = fopen("distance.dat", "r");
- ftp_out = fopen("distance.out", "w");
```

· Use of the functions

```
- fscanf(ftp_in, "%lf", &miles);
```

- fprintf(ftp_out, "The distance in miles is %.2f. \n", miles);
- End of use
 - fclose(ftp_in);
 - fclose(ftp_out);

Files (Examples)

- 1. Write a program to read <u>two</u> integers from a file (input.txt), find the **sum** of them and save the result into another file (output.txt).
- 2. Repeat the above example, but print the result on the screen instead of saving the result of the file.

```
Files (Example 1 solution)
                                                  input.txt - Notepad
#include <stdio.h>
                                                  File Edit Format View Help
int main()
                                                  5 4
    FILE *fpt_in, *fpt_out;
    int num1, num2;
    int sum;
    fpt in = fopen ("input.txt", "r");
    fpt out = fopen ("output.txt", "w");
    fscanf (fpt in, "%d%d", &num1, &num2);
    sum=num1+num2;
    fprintf(fpt out, "The result is %d", sum);
    fclose(fpt_in);
                                                   a output.txt - Notepad
    fclose(fpt out);
    return 0;
                                                   The result is 9
```

```
Files (Example 2 solution)
int main()
                                                 ji input.txt - Notepad
                                                 File Edit Format View Help
                                                 5 4
    FILE *fpt in;
    int num1, num2;
    int sum;
    fpt in = fopen ("input.txt", "r");
    fscanf (fpt in, "%d%d", &num1, &num2);
    sum=num1+num2;
    printf("The result is %d", sum);
    fclose(fpt in);
                                 The result is 9
    return 0;
                                 Process returned 0 (0x0) execution time: 0.009 s
                                 Press any key to continue.
```

End-file-Controlled Loops

End-file-Controlled Loops

Repetition statement is very similar to the sentinel controlled loop that uses the status value returned by the scanning function to control repetition rather than using the values scanned.

- 1. Get the first *data value* and save *input status*
- 2. while *input status* does not indicate that end of file has been reached
 - 3. Process data value
 - 4. Get next data value and save input status

The loop repetition condition: input_status != EOF

input_status = scanf("%d%d%lf", &part_id, &num_avail, &cost);

scanf function returns as its value the number of data items scanned.

Here 3

EXAMPLE: Write a C program that reads the integers stored in a text file #include <stdio.h> int main() ₽ (int m = 0, n, k = 0; FILE *fptr; fptr = fopen("c:\\Code\\numbers.dat", "r"); if (fptr != NULL) printf("\nFile numbers.dat is opened successfully."); printf("\nContents of file numbers.dat:"); m = fscanf(fptr, "%d", &n); while (m != EOF) printf("%d ", n); m = fscanf(fptr, "%d", &n); printf("\n"); k = fclose(fptr); if(k == -1)printf("\nFile-closing failed"); if(k == 0) printf("\nFile is closed successfully."); printf("\nFile-opening failed"); return(0);
