
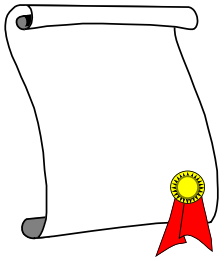
SNORT

Topics

- Background
  - What is Snort?
- Using Snort
- Snort Architecture
- Third-Party Enhancements

Background – Policy



- Successful intrusion detection depends on policy and management as much as technology
  - Security Policy (defining what is acceptable and what is being defended) is the first step
  - Notification
    - Who, how fast?
  - Response Coordination

Intro to Snort

- What is Snort?
  - Snort is a multi-mode packet analysis tool
    - Sniffer
    - Packet Logger
    - Forensic Data Analysis tool
    - Network Intrusion Detection System
- Where did it come from?
  - Developed out of the evolving need to perform network traffic analysis in both real-time and for forensic post processing

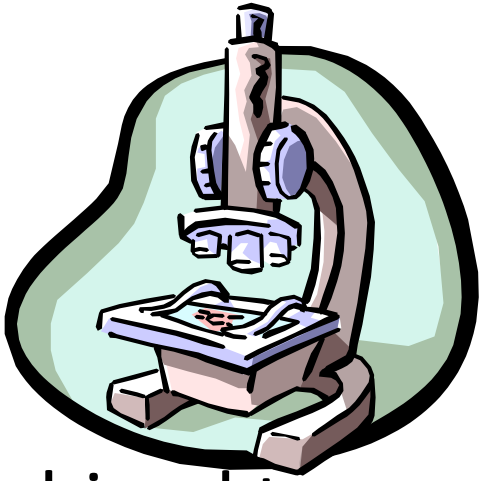
Snort “Metrics”

- Portable (Linux, Windows, MacOS X, Solaris, BSD, IRIX, Tru64, HP-UX, etc)
- Fast (High probability of detection for a given attack on 100Mbps networks)
- Configurable (Easy rules language, many reporting/logging options
- Free (GPL/Open Source Software)

Snort Design

- Packet sniffing “lightweight” network intrusion detection system
- Libpcap-based sniffing interface
- Rules-based detection engine
- Plug-in system allows endless flexibility

Detection Engine

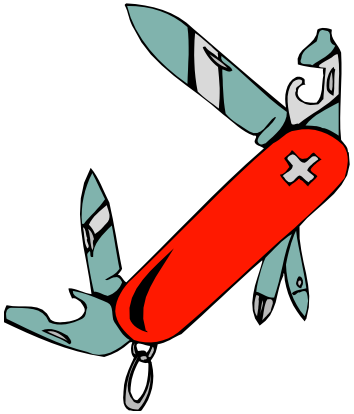


- Rules form “signatures”
- Modular detection elements are combined to form these signatures
- Wide range of detection capabilities
  - Stealth scans, OS fingerprinting, buffer overflows, back doors, CGI exploits, etc.
- Rules system is very flexible, and creation of new rules is relatively simple

Plug-Ins

- Preprocessor
  - Packets are examined/manipulated before being handed to the detection engine
- Detection
  - Perform single, simple tests on a single aspect/field of the packet
- Output
  - Report results from the other plug-ins

Using Snort



- Three main operational modes
  - Sniffer Mode
  - Packet Logger Mode
  - NIDS Mode
  - (Forensic Data Analysis Mode)
- Operational modes are configured via command line switches
  - Snort automatically tries to go into NIDS mode if no command line switches are given, looks for snort.conf configuration file in /etc

Using Snort – Sniffer Mode

- Works much like tcpdump
- Decodes packets and dumps them to stdout
- BPF filtering interface available to shape displayed network traffic

What Do The Packet Dumps Look Like?

```
=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+

00 0D 0A 0D 00                                   .....

=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+
```

Packet Logger Mode

- Gee, it sure would be nice if I could save those packets to disk…
- Multi-mode packet logging options available
  - Flat ASCII, tcpdump, XML, database, etc available
- Log all data and post-process to look for anomalous activity

NIDS Mode

- Wide variety of rules available for signature engine (~1300 as of June 2001, grow to ~2900 at May 2005, now ~6000 rules)
- Multiple detection modes available via rules and plug-ins
  - Rules/signature
  - Statistical anomaly
  - Protocol verification

Snort Rules

Snort Rules

- Snort rules are extremely flexible and are easy to modify
- Sample rule to detect SubSeven trojan:

```
alert tcp $EXTERNAL_NET 27374 -> $HOME_NET any (msg:"BACKDOOR
   subseven 22"; flags: A+; content: "|0d0a5b52504c5d3030320d0a|";
   reference:arachnids,485; reference:url,www.hackfix.org/subseven/;
   sid:103; classtype:misc-activity; rev:4;)
```

- Elements before parentheses comprise ‘rule header’
- Elements in parentheses are ‘rule options’

Snort Rules

```
alert tcp $EXTERNAL_NET 27374 -> $HOME_NET any (msg:"BACKDOOR
   subseven 22"; flags: A+; content:
   "|0d0a5b52504c5d3030320d0a|"; reference:arachnids,485;
   reference:url,www.hackfix.org/subseven/; sid:103;
   classtype:misc-activity; rev:4;)
```

- **alert** action to take; also **log, pass, activate, dynamic**
- **tcp** protocol; also **udp, icmp, ip**
- **$EXTERNAL_NET** source address; this is a variable – specific IP is ok
- **27374** source port; also **any**, negation (**!21**), range (**1:1024**)
- **->** direction; best not to change this, although **<>** is allowed
- **$HOME_NET** destination address; this is also a variable here
- **any** destination port

Snort Rules

```
alert tcp $EXTERNAL_NET 27374 -> $HOME_NET any (msg:"BACKDOOR
   subseven 22"; flags: A+; content:
   "|0d0a5b52504c5d3030320d0a|"; reference:arachnids,485;
   reference:url,www.hackfix.org/subseven/; sid:103;
   classtype:misc-activity; rev:4;)
```

- **`msg:"BACKDOOR subseven 22";`** message to appear in logs
- **`flags: A+;`** tcp flags; many options, like `SA, SA+, !R`
- **`content: "|0d0…0a|";`** binary data to check in packet; content without | (pipe) characters do simple content matches
- **`reference…;`** where to go to look for background on this rule
- **`sid:103;`** rule identifier
- **`classtype: misc-activity;`** rule type; many others
- **`rev:4;`** rule revision number
- other rule options possible, like **`offset, depth, nocase`**

Snort Rules

- bad-traffic.rules exploit.rules scan.rules
- finger.rules ftp.rules telnet.rules
- smtp.rules rpc.rules rservices.rules
- dos.rules ddos.rules dns.rules
- tftp.rules web-cgi.rules web-coldfusion.rules
- web-frontpage.rules web-iis.rules web-misc.rules
- web-attacks.rules sql.rules x11.rules
- icmp.rules netbios.rules misc.rules
- backdoor.rules shellcode.rules policy.rules
- porn.rules info.rules icmp-info.rules
- virus.rules local.rules attack-responses.rules

Snort Rules

- Rules which actually caught intrusions
  - **`alert tcp $EXTERNAL_NET any -> $SQL_SERVERS 1433 (msg:"MS-SQL xp_cmdshell - program execution"; content: "x|00|p|00|_|00|c|00|m|00|d|00|s|00|h|00|e|00|l|00|l|00| "; nocase; flags:A+; classtype:attempted-user; sid:687; rev:3;)`** caught compromise of Microsoft SQL Server
  - **`alert tcp $EXTERNAL_NET any -> $HTTP_SERVERS 80 (msg:"WEB-IIS cmd.exe access"; flags: A+; content:"cmd.exe"; nocase; classtype:web-application-attack; sid:1002; rev:2;)`** caught Code Red infection
  - **`alert tcp $EXTERNAL_NET any -> $HOME_NET 21 (msg:"INFO FTP \"MKD / \" possible warez site"; flags: A+; content:"MKD / "; nocase; depth: 6; classtype:misc-activity; sid:554; rev:3;)`** caught anonymous ftp server

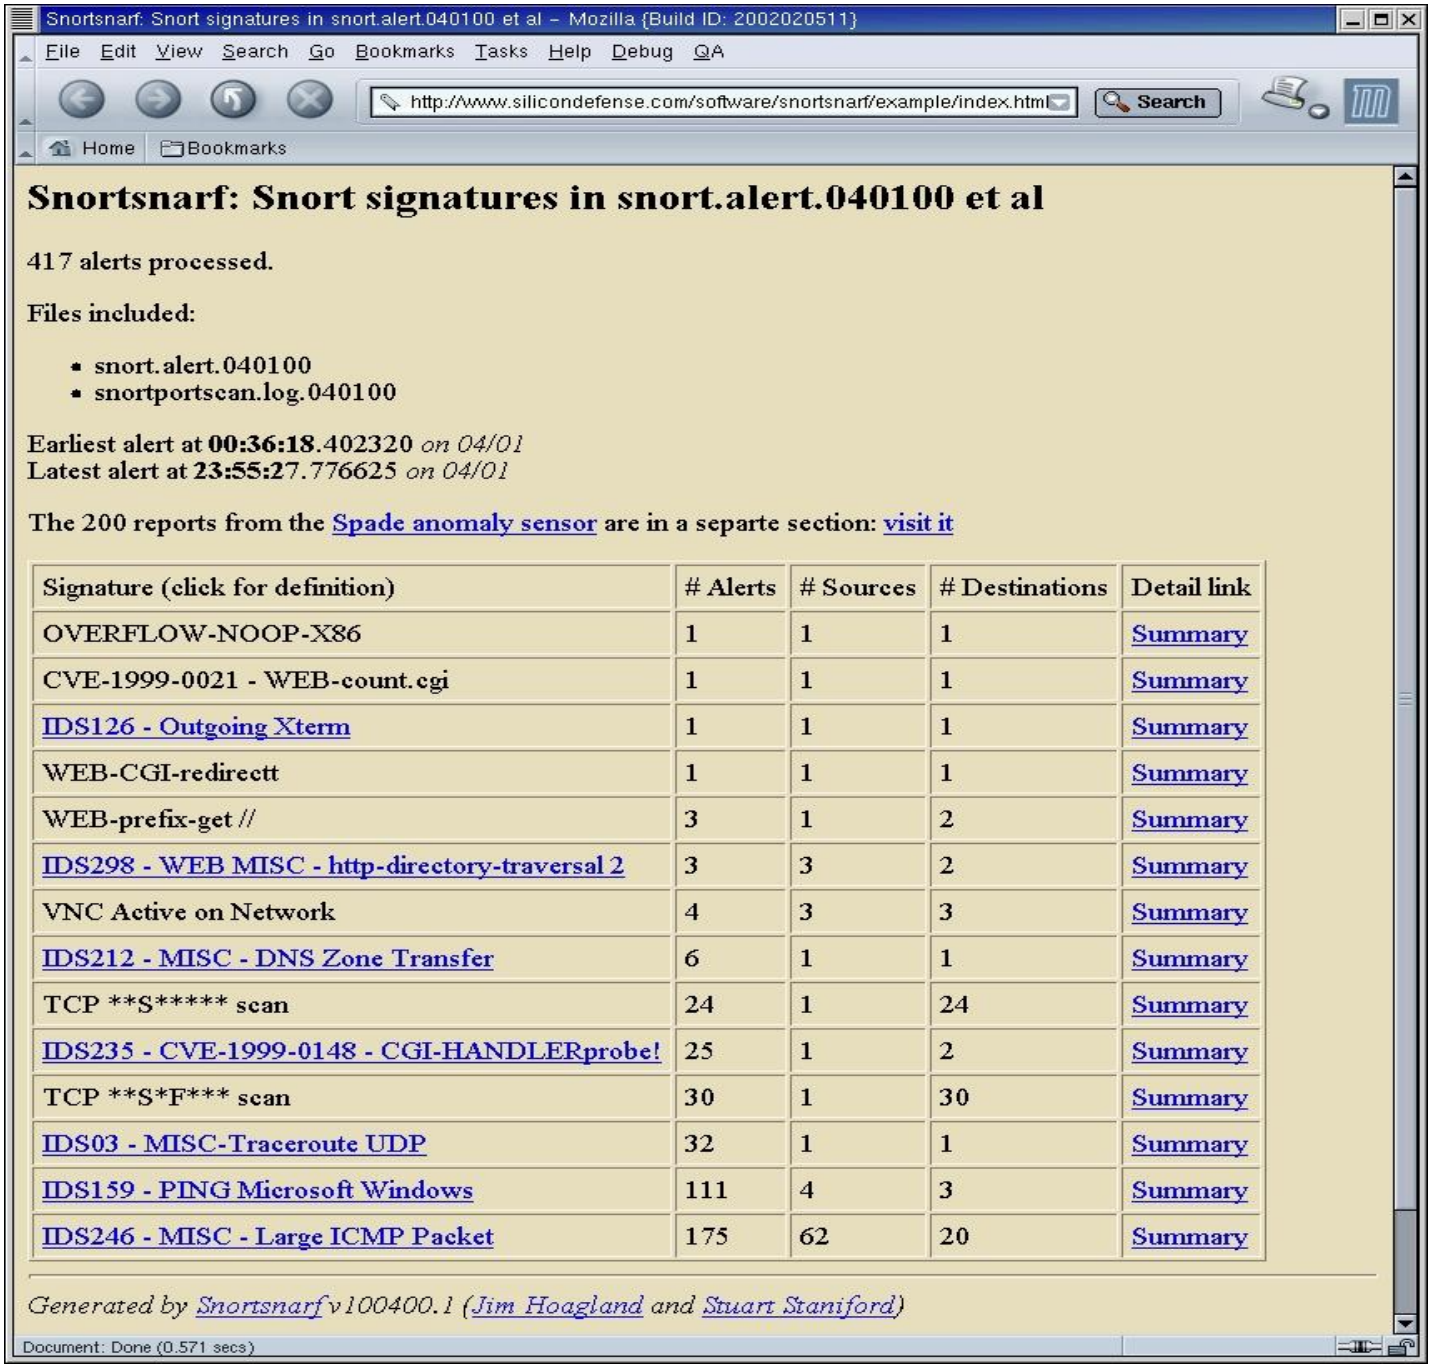
Third-Party Enhancements

SnortSnarf

- http://www.snort.org/dl/contrib/data_analysis/snortsnarf/
- SnortSnarf is a Perl program to take files of alerts from the Snort to produce HTML reports
- Output intended for diagnostic inspection
- Used to have commercial support from SiliconDefense



Snortsnarf: Snort signatures in snort.alert.040100 et al

417 alerts processed.

Files included:

- **snort.alert.040100**
- **snortportscan.log.040100**

Earliest alert at 00:36:18.402320 *on 04/01*
Latest alert at 23:55:27.776625 *on 04/01*

Conclusion

- Snort is a powerful tool, but maximizing its usefulness requires a trained operator
- Becoming proficient with network intrusion detection takes 12 months; “expert” 24-36?
- Snort is considered a very good NIDS when compared to most commercial systems
- Managed network security providers should collect enough information to make decisions without calling clients to ask what happened
