## Boolean Algebra and Logic Gates

Aziz Qaroush

## Basic Definitions

* Boolean Algebra defined with a set of elements, a set of operators and a number of axioms (البديهيات) or postulates (المسلمات).
A set if a collection of objects having a common property

| $x, y$ | Elements |
| :--- | :--- |
| $x \in S$ | $x$ is an element of set $S$ |
| $y \notin S$ | $y$ is not an element of set $S$ |
| $a * b=c$ | * Binary operator and <br> result $c$ of operation on |
| $a, b, c \in S$ | a and $b$ is an element of <br> set $S$ |

## Basic Definitions

1. Closure: A set $S$ is closed with respect to a binary operator if, for every pair of elements of $S$, the binary operator specifies a rule for obtaining a unique element of $S$.
2. Associative law: $\left(x^{*} y\right)^{*} z=x^{*}\left(y^{*} z\right)$ for all $z, y, z \in S$.
3. Commutative law: $x^{\star} y=y^{*} x$
4. Identity Element: $e^{*} x=x^{*} e=x$
5. Inverse: A set $S$ having the identity element $e$ with respect to binary operator * is said to have an inverse whenever, for every $x € S$, there exists an element $y$ such that $x^{*} y=e$
6. Distributive law: If * and . are binary operators on $S$, *is said to be distributive over. whenever $x^{*}(y \cdot z)=\left(x^{*} y\right) .\left(x^{*} z\right)$

## Axiomatic Definition of Boolean Algebra

Boolean algebra is an algebraic structure defined by a set of elements, $B$, together with binary operators (+) and (.)

1. (a) The structure is closed with respect to +
(b) The structure is closed with respect to .
2. (a) The element 0 is an identity element with respect to + (b) The element 1 is an identity element with respect to .
3. (a) The structure is commutative with respect to +
(b) The structure is commutative with respect to .
4. (a) The operator . is distributive over +
(b) The operator + is distributive over .
5. For every element $x \in B$, there exists an element $x^{\prime} Є B$ called the complement of $x$ such that
(a) $x+x^{\prime}=1$ and
(b) $x \cdot x^{\prime}=0$
6. There exist at least two elements $x, y \in B$ such that $x \neq y$

## Two-valued Boolean Algebra

Defined on a set of two elements $B=\{0,1\}$

| $x$ | $y$ | $x . y$ | $x$ | $y$ | $x+y$ | $X$ | $x^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 0 | 1 | 0 | 0 | 1 | 1 |  |  |
| 1 | 0 | 0 | 1 | 0 | 1 | 1 | 0 |
| 1 | 1 | 1 | 1 | 1 | 1 |  |  |

## Two-valued Boolean Algebra

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | 0 |
| 1 | 1 | 1 |

| $\mathbf{y + z}$ | $\mathbf{x .}(\mathbf{y}+\mathbf{z})$ |  | $\mathbf{x . y}$ | $\mathbf{x . z}$ | (x.y)+(x.z) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 |  | 0 | 0 | 0 |
| 1 | 0 |  | 0 | 0 | 0 |
| 1 | 0 |  | 0 | 0 | 0 |
| 1 | 0 |  | 0 | 0 | 0 |
| 0 | 0 |  | 0 | 0 | 0 |
| 1 | 1 |  | 0 | 1 | 1 |
| 1 | 1 |  | 1 | 0 | 1 |
| 1 | 1 |  | 1 | 1 | 1 |

## Duality Principle

* The dual of a Boolean expression can be obtained by:
$\triangleleft$ Interchanging AND ( $\cdot$ ) and OR (+) operators
$\triangleleft$ Interchanging 0's and 1's
* Example: the dual of $x\left(y+z^{\prime}\right)$ is $x+y z^{\prime}$
$\checkmark$ The complement operator does not change
* The properties of Boolean algebra appear in dual pairs
$\diamond$ If a property is proven to be true then its dual is also true

|  | Property | Dual Property |
| :--- | :---: | :---: |
| Identity | $x+0=x$ | $x \cdot 1=x$ |
| Complement | $x+x^{\prime}=1$ | $x \cdot x^{\prime}=0$ |
| Distributive | $x(y+z)=x y+x z$ | $x+y z=(x+y)(x+z)$ |

## Basic Theorems

## Table 2.1

Postulates and Theorems of Boolean Algebra

| Postulate 2 | (a) | $x+0=x$ | (b) | $x \cdot 1=x$ |
| :--- | :--- | ---: | :--- | ---: |
| Postulate 5 | (a) | $x+x^{\prime}=1$ | (b) | $x \cdot x^{\prime}=0$ |
| Theorem 1 | (a) | $x+x=x$ | (b) | $x \cdot x=x$ |
| Theorem 2 | (a) | $x+1=1$ | (b) | $x \cdot 0=0$ |
| Theorem 3, involution | $\left(x^{\prime}\right)^{\prime}$ | $=x$ |  |  |
| Postulate 3, commutative | (a) | $x+y=y+x$ | (b) | $x y=y x$ |
| Theorem 4, associative | (a) $x+(y+z)=(x+y)+z$ | (b) | $x(y z)=(x y) z$ |  |
| Postulate 4, distributive | (a) | $x(y+z)=x y+x z$ | (b) $x+y z=(x+y)(x+z)$ |  |
| Theorem 5, DeMorgan | (a) | $(x+y)^{\prime}=x^{\prime} y^{\prime}$ | (b) | $(x y)^{\prime}=x^{\prime}+y^{\prime}$ |
| Theorem 6, absorption | (a) | $x+x y$ | $=x$ | (b) $x(x+y)=x$ |

## Theorem 1(a)

$x+x=x$
$x+x=(x+x) \cdot 1$
but
$1=x+x^{\prime}$
thus
$x+x=(x+x)\left(x+x^{\prime}\right)$
Distributing + over . gives in general $x+(x y)=x+x y=(x+x)(x+y)$
$x+x=(x+x)\left(x+x^{\prime}\right)=x+x x^{\prime}$
$=x+0$
$=x$

## Theorem 1(b)

$$
\begin{aligned}
x \cdot x & =x \\
x \cdot x & =x x+0 \\
& =x x+x x^{\prime} \\
& =x\left(x+x^{\prime}\right) \\
& =x \cdot 1 \\
& =x
\end{aligned}
$$

It can be proved by duality of Theorem 1(a)

## Theorem 2(a)

$$
\begin{aligned}
x+1 & =1 \\
x+1 & =1 \cdot(x+1) \\
& =\left(x+x^{\prime}\right)(x+1) \\
& =x+x^{\prime} \cdot 1 \\
& =x+x^{\prime} \\
& =1
\end{aligned}
$$

## Theorem 2(b)

$$
x \cdot 0=0
$$

By duality of Theorem 2(a)

## Theorem 3

$$
\begin{aligned}
& \quad\left(x^{\prime}\right)^{\prime}=x \\
& x+x^{\prime}=1 \quad \text { and } \quad x \cdot x^{\prime}=0
\end{aligned}
$$

Both equations define the complement
The complement of $x^{\prime}$ is $x$ and is also $\left(x^{\prime}\right)^{\prime}$
Since the complement is unique $\left(x^{\prime}\right)^{\prime}=x$

## Theorem 6(a) Absorption

$$
\begin{aligned}
x+x y & =x \\
x+x y & =x \cdot 1+x y \\
& =x(1+y) \\
& =x(y+1) \\
& =x \cdot 1 \\
& =x
\end{aligned}
$$

## Theorem 6(b) Absorption

$$
x(x+y)=x
$$

By duality of Theorem 6(a)

## Theorem 6(a) Absorption

Proof by truth table

| $x$ | $y$ |
| :---: | :---: |
| 0 | 0 |
| 0 | 1 |
| 1 | 0 |
| 1 | 1 |

| $x y$ | $x+x y$ |
| :---: | :---: |
| 0 | 0 |
| 0 | 0 |
| 0 | 1 |
| 1 | 1 |

## DeMorgan's Theorem

$*(x+y)^{\prime}=x^{\prime} y^{\prime}$
$*(x y)^{\prime}=x^{\prime}+y^{\prime}$

## Can be verified

Using a Truth Table

| X | y | $\mathrm{X}^{\prime}$ | $y^{\prime}$ | x+y | $(x+y)^{\prime}$ | $x^{\prime} y^{\prime}$ | $x$ y | (x y $)^{\prime}$ | $x^{\prime}+y^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 1 | 1 |
| 0 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 |
| 1 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |

* Generalized DeMorgan's Theorem:
$\ddot{*}\left(x_{1}+x_{2}+\cdots+x_{n}\right)^{\prime}=x_{1}^{\prime} \cdot x_{2}^{\prime} \cdot \cdots \cdot x_{n}^{\prime}$
* $\left(x_{1} \cdot x_{2} \cdots \cdots x_{n}\right)^{\prime}=x_{1}^{\prime}+x_{2}^{\prime}+\cdots+x_{n}^{\prime}$

## Boolean Functions

* Boolean functions are described by expressions that consist of:
$\triangleleft$ Boolean variables, such as: $x, y$, etc.
$\diamond$ Boolean constants: 0 and 1
২ Boolean operators: AND (•), OR (+), NOT (')
$\diamond$ Parentheses, which can be nested
* Example: $f=x\left(y+w^{\prime} z\right)$
$\triangleleft$ The dot operator is implicit and need not be written
* Operator precedence: to avoid ambiguity in expressions
$\diamond$ Expressions within parentheses should be evaluated first
$\diamond$ The NOT (') operator should be evaluated second
$\triangleleft$ The AND (•) operator should be evaluated third
$\diamond$ The OR (+) operator should be evaluated last

## Truth Table

* A truth table can represent a Boolean function
* List all possible combinations of 0's and 1's assigned to variables
* If $n$ variables then $2^{n}$ rows

Table 2.2
Truth Tables for $F_{1}$ and $F_{2}$

$$
\begin{aligned}
& F_{1}=x+y^{\prime} z \\
& F_{2}=x^{\prime} y^{\prime} z+x^{\prime} y z+x y^{\prime}
\end{aligned}
$$

| $\boldsymbol{x}$ | $\boldsymbol{y}$ | $\boldsymbol{z}$ | $\boldsymbol{F}_{\mathbf{1}}$ | $\boldsymbol{F}_{\mathbf{2}}$ |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 | 1 |
| 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 1 | 0 | 1 |
| 1 | 0 | 0 | 1 | 1 |
| 1 | 0 | 1 | 1 | 1 |
| 1 | 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 1 | 0 |

## Boolean functions

Transform the algebraic equation of $F_{1}$ to a circuit diagram using logic gates

FIGURE 2.1 Gate implementation of $F_{1}=x+y^{\prime} z$

## Boolean functions

Transform the algebraic equation of $F_{2}$ to a circuit diagram using logic gates

(a) $F_{2}=x^{\prime} y^{\prime} z+x^{\prime} y z+x y^{\prime}$

## Algebraic manipulation (معالجة)

Literal: A single variable within a term that may be complemented or not.

Use Boolean Algebra to simplify Boolean functions to produce simpler circuits (minimum number of literals)

Example $1 \quad x\left(x^{\prime}+y\right)=x x^{\prime}+x y=0+x y=x y$
Example $2 x+x^{\prime} y=\left(x+x^{\prime}\right)(x+y)=1(x+y)$

$$
=x+y
$$

Example $3 \quad(x+y)\left(x+y^{\prime}\right)=x+x y+x y^{\prime}+y y^{\prime}$

$$
=x\left(1+y+y^{\prime}\right)+0=x
$$

Example $5(x+y)\left(x^{\prime}+z\right)(y+z)$

$$
=(x+y)\left(x^{\prime}+z\right)
$$

By duality of Consensus Theorem

## Consensus Theorem

Prove that: $x y+x^{\prime} z+y z=x y+x^{\prime} z$ (consensus theorem)

* Proof: $x y+x^{\prime} z+y z$

$$
\begin{array}{ll}
=x y+x^{\prime} z+1 \cdot y z & \\
=x y+x^{\prime} z+\left(x+x^{\prime}\right) y z & \\
=x y+x^{\prime} z+x y z+x^{\prime} y z & \\
=x y+x y z+x^{\prime} z+x^{\prime} y z & \\
=x y \cdot 1+x y z+x^{\prime} z \cdot 1+x^{\prime} z y & \\
=x y=x y \cdot 1, x^{\prime} y z=x^{\prime} z y \\
=x y(1+z)+x^{\prime} z(1+y) & \\
=x y \cdot 1+x^{\prime} z \cdot 1 & \\
=x y+x^{\prime} z & \\
=x y \cdot 1=x y, \quad x^{\prime} z \cdot 1=x^{\prime} z
\end{array}
$$

## Boolean functions

Compare the two implementations

FIGURE 2.2 Implementation of Boolean function $F_{2}$ with gates

## Complementing Boolean Functions

*What is the complement of $f=x^{\prime} y z^{\prime}+x y^{\prime} z^{\prime}$ ?

* Use DeMorgan's Theorem:
$\triangleleft$ Complement each variable and constant
$\diamond$ Interchange AND and OR operators
* So, what is the complement of $f=x^{\prime} y z^{\prime}+x y^{\prime} z^{\prime}$ ?

Answer: $f^{\prime}=\left(x+y^{\prime}+z\right)\left(x^{\prime}+y+z\right)$

* Example 2: Complement $g=\left(a^{\prime}+b c\right) d^{\prime}+e$

Answer: $g^{\prime}=\left(a\left(b^{\prime}+c^{\prime}\right)+d\right) e^{\prime}$

## Complement of a function

Find the complement of the following functions

$$
\begin{aligned}
F_{1}^{\prime} & =\left(x^{\prime} y z^{\prime}+x^{\prime} y^{\prime} z\right)^{\prime} \\
& =\left(x^{\prime} y z^{\prime}\right)^{\prime}\left(x^{\prime} y^{\prime} z\right)^{\prime} \\
& =\left(x+y^{\prime}+z\right)\left(x+y+z^{\prime}\right) \\
F_{2}^{\prime} & =\left[x\left(y^{\prime} z^{\prime}+y z\right)\right]^{\prime} \\
& =x^{\prime}+\left(y^{\prime} z^{\prime}+y z\right)^{\prime} \\
& =x^{\prime}+\left(y^{\prime} z^{\prime}\right)^{\prime}(y z)^{\prime} \\
& =x^{\prime}+(y+z)\left(y^{\prime}+z^{\prime}\right) \\
& =x^{\prime}+\boldsymbol{y z}+y^{\prime} \mathbf{z}
\end{aligned}
$$

## Complement of a function

Find the complement of the following functions by taking their duals and complementing each literal

$$
F_{1}=x^{\prime} y z^{\prime}+x^{\prime} y^{\prime} z
$$

The dual

$$
\left(x^{\prime}+y+z^{\prime}\right)\left(x^{\prime}+y^{\prime}+z\right)
$$

Complement each literal $\left(x+y^{\prime}+z\right)\left(x+y+z^{\prime}\right)=F_{1}^{\prime}$

$$
F_{2}=x\left(y^{\prime} z^{\prime}+y z\right)
$$

The dual

$$
x+\left(y^{\prime}+z^{\prime}\right)(y+z)
$$

Complement each literal $\quad x^{\prime}+(y+z)\left(y^{\prime}+z^{\prime}\right)=F_{2}^{\prime}$

## Simplification Example

- Example: Show that the following equality holds

$$
\overline{\mathbf{A}(\overline{\mathbf{B}} \overline{\mathbf{C}}+\mathbf{B C})}=\overline{\mathbf{A}}+(\mathbf{B}+\mathbf{C})(\overline{\mathbf{B}}+\overline{\mathbf{C}})
$$

- Simplification

$$
\begin{aligned}
\overline{\mathbf{A}(\overline{\mathbf{B}} \overline{\mathbf{C}}+\mathbf{B C})} & =\overline{\mathbf{A}}+(\overline{\mathbf{B} \overline{\mathbf{C}}+\mathbf{B C})} \\
& =\overline{\mathbf{A}}+(\overline{\mathbf{B} \overline{\mathbf{C}}})(\overline{\mathbf{B C}}) \\
& =\overline{\mathbf{A}}+(\mathbf{B}+\mathbf{C})(\overline{\mathbf{B}}+\overline{\mathbf{C}})
\end{aligned}
$$

## Simplification Example

## Example

Simplify the following function

$$
\text { i. } \mathbf{G}=\overline{((\overline{A+\bar{B}+C}) \cdot(\overline{A B}+\bar{C} \bar{D})+\overline{A C D})}
$$

Solution:

$$
\begin{aligned}
G & =\overline{((\overline{A+\bar{B}+C}) \cdot(\overline{A B}+\bar{C} \bar{D})+\overline{A C D}}) \\
& =((A+\bar{B}+C)+(A B \cdot(C+D))) \cdot A C D \\
& =(A+\bar{B}+C) \cdot A C D+(A B \cdot(C+D)) \cdot A C D \\
& =(A C D+A C D \bar{B})+(A C D B+A C D B) \\
& =A C D+A C D B \\
& =A C D
\end{aligned}
$$

## Canonical Forms

* Minterms and Maxterms
* Sum-of-Minterm (SOM) Canonical Form
* Product-of-Maxterm (POM) Canonical Form
* Representation of Complements of Functions
* Conversions between Representations

## Combinational Circuit

$\star$ A combinational circuit is a block of logic gates having:
$n$ inputs: $x_{1}, x_{2}, \ldots, x_{n}$ $m$ outputs: $f_{1}, f_{2}, \ldots, f_{m}$

* Each output is a function of the input variables
* Each output is determined from present combination of inputs
* Combination circuit performs operation specified by logic gates

## Example of a Simple Combinational Circuit

* The above circuit has:
$\diamond$ Three inputs: $x, y$, and $z$
$\diamond$ Two outputs: $f$ and $g$
$*$ What are the logic expressions of $f$ and $g$ ?
* Answer: $\quad f=x y+z^{\prime}$

$$
g=x y+y z
$$

## From Truth Tables to Gate Implementation

* Given the truth table of a Boolean function $f$, how do we implement the truth table using logic gates?

## Truth Table

| $x$ | $y$ | $z$ | $f$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 |  | 0 |
| 0 | 0 | 1 |  | 0 |
| 0 | 1 | 0 |  | 1 |
| 0 | 1 | 1 |  | 1 |
| 1 | 0 | 0 |  | 0 |
| 1 | 0 | 1 | 1 |  |
| 1 | 1 | 0 | 0 |  |
| 1 | 1 | 1 | 1 |  |

What is the logic expression of $f$ ?
What is the gate implementation of $f$ ?

To answer these questions, we need to define Minterms and Maxterms

## Minterms and Maxterms

* Minterms are AND terms with every variable present in either true or complement form
* Maxterms are OR terms with every variable present in either true or complement form

Minterms and Maxterms for 2 variables $x$ and $y$

| $\mathbf{x}$ | $\mathbf{y}$ | index | Minterm | Maxterm |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | $m_{0}=x^{\prime} y^{\prime}$ | $M_{0}=x+y$ |
| 0 | 1 | 1 | $m_{1}=x^{\prime} y$ | $M_{1}=x+y^{\prime}$ |
| 1 | 0 | 2 | $m_{2}=x y^{\prime}$ | $M_{2}=x^{\prime}+y$ |
| 1 | 1 | 3 | $m_{3}=x y$ | $M_{3}=x^{\prime}+y^{\prime}$ |

* For $n$ variables, there are $2^{n}$ Minterms and Maxterms

## Minterms and Maxterms for 3 Variables

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | index | Minterm | Maxterm |
| :---: | :---: | :---: | :---: | :--- | :--- |
| 0 | 0 | 0 | 0 | $m_{0}=x^{\prime} y^{\prime} z^{\prime}$ | $M_{0}=x+y+z$ |
| 0 | 0 | 1 | 1 | $m_{1}=x^{\prime} y^{\prime} z$ | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 2 | $m_{2}=x^{\prime} y z^{\prime}$ | $M_{2}=x+y^{\prime}+z$ |
| 0 | 1 | 1 | 3 | $m_{3}=x^{\prime} y z$ | $M_{3}=x+y^{\prime}+z^{\prime}$ |
| 1 | 0 | 0 | 4 | $m_{4}=x y^{\prime} z^{\prime}$ | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 5 | $m_{5}=x y^{\prime} z$ | $M_{5}=x^{\prime}+y+z^{\prime}$ |
| 1 | 1 | 0 | 6 | $m_{6}=x y z^{\prime}$ | $M_{6}=x^{\prime}+y^{\prime}+z$ |
| 1 | 1 | 1 | 7 | $m_{7}=x y z$ | $M_{7}=x^{\prime}+y^{\prime}+z^{\prime}$ |

Maxterm $M_{i}$ is the complement of Minterm $m_{i}$

$$
M_{i}=m_{i}^{\prime} \text { and } m_{i}=M_{i}^{\prime}
$$

## Purpose of the Index

* Minterms and Maxterms are designated with an index
* The index for the Minterm or Maxterm, expressed as a binary number, is used to determine whether the variable is shown in the true or complemented form
* For Minterms:
$\diamond$ '1' means the variable is Not Complemented
$\triangleleft$ ' 0 ' means the variable is Complemented
* For Maxterms:
$\checkmark$ ' 0 ' means the variable is Not Complemented
$\diamond$ ' 1 ' means the variable is Complemented

## Sum-Of-Minterms (SOM) Canonical Form

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $z$ | $\mathbf{f}$ | Minterm |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 |  |
| 0 | 0 | 1 | 0 |  |
| 0 | 1 | 0 | 1 | $m_{2}=x^{\prime} y z^{\prime}$ |
| 0 | 1 | 1 | 1 | $m_{3}=x^{\prime} y z$ |
| 1 | 0 | 0 | 0 |  |
| 1 | 0 | 1 | 1 | $m_{5}=x y^{\prime} z$ |
| 1 | 1 | 0 | 0 |  |
| 1 | 1 | 1 | 1 | $m_{7}=x y z$ |

## Sum of Minterm entries

 that evaluate to ' 1 'Focus on the ' 1 ' entries

$$
f=m_{2}+m_{3}+m_{5}+m_{7}
$$

$$
f=\sum(2,3,5,7)
$$

$$
f=x^{\prime} y z^{\prime}+x^{\prime} y z+x y^{\prime} z+x y z
$$

## Examples of Sum-Of-Minterms

* $f(a, b, c, d)=\sum(2,3,6,10,11)$
* $f(a, b, c, d)=m_{2}+m_{3}+m_{6}+m_{10}+m_{11}$
$\& f(a, b, c, d)=a^{\prime} b^{\prime} c d^{\prime}+a^{\prime} b^{\prime} c d+a^{\prime} b c d^{\prime}+a b^{\prime} c d^{\prime}+a b^{\prime} c d$
* $g(a, b, c, d)=\sum(0,1,12,15)$
$g(a, b, c, d)=m_{0}+m_{1}+m_{12}+m_{15}$
* $g(a, b, c, d)=a^{\prime} b^{\prime} c^{\prime} d^{\prime}+a^{\prime} b^{\prime} c^{\prime} d+a b c^{\prime} d^{\prime}+a b c d$

## Product-Of-Maxterms (POM) Canonical Form

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | Maxterm |
| :--- | :--- | :--- | :--- | :---: |
| 0 | 0 | 0 | 0 | $M_{0}=x+y+z$ |
| 0 | 0 | 1 | 0 | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 1 |  |
| 0 | 1 | 1 | 1 |  |
| 1 | 0 | 0 | 0 | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 1 |  |
| 1 | 1 | 0 | 0 | $M_{6}=x^{\prime}+y^{\prime}+z$ |
| 1 | 1 | 1 | 1 |  |

## Product of Maxterm entries that evaluate to ' 0 '

Focus on the ' 0 ' entries

$$
f=M_{0} \cdot M_{1} \cdot M_{4} \cdot M_{6}
$$

$$
f=\prod(0,1,4,6)
$$

$$
f=(x+y+z)\left(x+y+z^{\prime}\right)\left(x^{\prime}+y+z\right)\left(x^{\prime}+y^{\prime}+z\right)
$$

## Examples of Product-Of-Maxterms

* $f(a, b, c, d)=\Pi(1,3,11)$
$* f(a, b, c, d)=M_{1} \cdot M_{3} \cdot M_{11}$
* $f(a, b, c, d)=\left(a+b+c+d^{\prime}\right)\left(a+b+c^{\prime}+d^{\prime}\right)\left(a^{\prime}+b+c^{\prime}+d^{\prime}\right)$
$g(a, b, c, d)=\Pi(0,5,13)$
* $g(a, b, c, d)=M_{0} \cdot M_{5} \cdot M_{13}$
$f(a, b, c, d)=(a+b+c+d)\left(a+b^{\prime}+c+d^{\prime}\right)\left(a^{\prime}+b^{\prime}+c+d^{\prime}\right)$

## Conversions between Canonical Forms

* The same Boolean function $f$ can be expressed in two ways:
$\diamond$ Sum-of-Minterms $\quad f=m_{0}+m_{2}+m_{3}+m_{5}+m_{7}=\sum(0,2,3,5,7)$
$\diamond$ Product-of-Maxterms $f=M_{1} \cdot M_{4} \cdot M_{6}=\Pi(1,4,6)$

## Truth Table

$\left.$| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | Minterms | Maxterms |
| :--- | :--- | :--- | :--- | :---: | :---: |
| 0 | 0 | 0 | 1 | $m_{0}=x^{\prime} y^{\prime} z^{\prime}$ |  |
| 0 | 0 | 1 | 0 |  | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 1 | $m_{2}=x^{\prime} y z^{\prime}$ |  |
| 0 | 1 | 1 | 1 | $m_{3}=x^{\prime} y z$ |  |
| 1 | 0 | 0 | 0 |  | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 1 | $m_{5}=x y^{\prime} z$ |  |
| 1 | 1 | 0 | 0 |  | $M_{6}=x^{\prime}+y^{\prime}+z$ | | To convert from one canonical |
| :---: |
| form to another, interchange |
| the symbols $\sum$ and $\Pi$ and list |
| those numbers missing from | \right\rvert\, | the original form. |
| :---: |

$\begin{array}{lllll}1 & 1 & 1 & 1\end{array} m_{7}=x y z$

## Function Complement

Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | $\mathbf{f}^{\prime}$ |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 0 | 1 |
| 0 | 1 | 0 | 1 | 0 |
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 | 0 |
| 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 1 | 1 | 0 |

Given a Boolean function $f$

$$
f(x, y, z)=\sum(0,2,3,5,7)=\prod(1,4,6)
$$

Then, the complement $f^{\prime}$ of function $f$

$$
f^{\prime}(x, y, z)=\prod(0,2,3,5,7)=\sum(1,4,6)
$$

The complement of a function expressed by a Sum of Minterms is the Product of Maxterms with the same indices. Interchange the symbols
$\Sigma$ and $\Pi$, but keep the same list of indices.

## Algebraic Conversion to Sum-of-Minterms

- Expand all terms first to explicitly list all minterms
- AND any term missing a variable $v$ with $(v+v)^{-}$
- Example 1: $f=x+x y^{-}$
(2 variables)

$$
\begin{aligned}
& f=x(y+y) 7 x y^{-} \\
& f=x y+x y \mp x y^{-} \\
& \mathrm{f}=\mathrm{m}_{3}+\mathrm{m}_{2}+\mathrm{m}_{0}=\sum(0,2,3)
\end{aligned}
$$

- Example 2: $g=a+b \bar{c}$ (3 variables)
$g=a(b+b)(c+c) \overline{+}(a+a) b \bar{c}$
$g=a b c+a b c \overline{+} a b \bar{c}+a b \bar{c} \overline{+} a b \bar{c}+a \bar{b} \bar{c}$
$g=a \bar{b} \bar{c}+a b \bar{c} \overline{+} a b \bar{c}+a b c \overline{+} a b c$
$g=\mathrm{m}_{1}+\mathrm{m}_{4}+\mathrm{m}_{5}+\mathrm{m}_{6}+\mathrm{m}_{7}=\sum(1,4,5,6,7)$

## Algebraic Conversion to Product-of-Maxterms

- Expand all terms first to explicitly list all maxterms
- OR any term missing a variable $v$ with $v \cdot \bar{v}$
- Example 1: $f=x+\bar{x} \bar{y}$
(2 variables)
Apply $2^{\text {nd }}$ distributive law:

$$
f=(x+\bar{x})(x+\bar{y})=1 \cdot(x+\bar{y})=(x+\bar{y})=\mathrm{M}_{1}
$$

- Example 2: $g=a \bar{c}+b c+\bar{a} \bar{b}$
(3 variables)

$$
\begin{array}{ll}
g=(a \bar{c}+b c+\bar{a})(a \bar{c}+b c+\bar{b}) & \text { (distributive) } \\
g=(\bar{c}+b c+\bar{a})(a \bar{c}+c+\bar{b}) & (x+\bar{x} y=x+y) \\
g=(\bar{c}+b+\bar{a})(a+c+\bar{b}) & (x+\bar{x} y=x+y) \\
g=(\bar{a}+b+\bar{c})(a+\bar{b}+c)=\mathrm{M}_{5} \cdot \mathrm{M}_{2}=\prod(2,5)
\end{array}
$$

## Summary of Minterms and Maxterms

* There are $2^{n}$ Minterms and Maxterms for Boolean functions with $n$ variables, indexed from 0 to $2^{n}-1$
* Minterms correspond to the 1 -entries of the function
* Maxterms correspond to the 0 -entries of the function
* Any Boolean function can be expressed as a Sum-of-Minterms and as a Product-of-Maxterms
* For a Boolean function, given the list of Minterm indices one can determine the list of Maxterms indices (and vice versa)
* The complement of a Sum-of-Minterms is a Product-of-Maxterms with the same indices (and vice versa)

## Sum-of-Products and Products-of-Sums

* Canonical forms contain a larger number of literals
$\triangleleft$ Because the Minterms (and Maxterms) must contain, by definition, all the variables either complemented or not
* Another way to express Boolean functions is in standard form
* Two standard forms: Sum-of-Products and Product-of -Sums
* Sum of Products (SOP)
$\diamond$ Boolean expression is the ORing (sum) of AND terms (products)
$\diamond$ Examples: $f_{1}=x y^{\prime}+x z \quad f_{2}=y+x y^{\prime} z$
* Products of Sums (POS)
$\diamond$ Boolean expression is the ANDing (product) of OR terms (sums)
$\diamond$ Examples: $f_{3}=(x+z)\left(x^{\prime}+y^{\prime}\right) \quad f_{4}=x\left(x^{\prime}+y^{\prime}+z\right)$

## Standard Forms

* Sum of Products (SOP)

## Standard Forms

* Product of Sums (POS)

$$
\begin{aligned}
& \bar{F}=\bar{A} \bar{B} \bar{C}+\bar{A} B \bar{C}+\bar{A} B C+A B \bar{C} \\
& \\
& \bar{F}=\bar{A} \bar{C}(\bar{B}+B)+\bar{A} B(\bar{C}+\bar{C}+C)+B \bar{C}(\bar{A}+\bar{C}(\bar{A}+A) \\
& \overline{\bar{F}}=\overline{\bar{A} \bar{C}+\bar{A} B+B \bar{C}} \\
& F=(A+C)(A+\bar{B})(\bar{B}+C)
\end{aligned}
$$

## Two-Level Gate Implementation

$f_{1}=x y^{\prime}+x z$

$f_{2}=y+x y^{\prime} z$

$f_{3}=(x+z)\left(x^{\prime}+y^{\prime}\right)$

OR-AND
$f_{4}=x\left(x^{\prime}+y^{\prime}+z\right)$

## Two-Level vs. Three-Level Implementation

* $h=a b+c d+c e$ (6 literals) is a sum-of-products
* $h$ may also be written as: $h=a b+c(d+e)$ (5 literals)
* However, $h=a b+c(d+e)$ is a non-standard form
$\diamond h=a b+c(d+e)$ is not a sum-of-products nor a product-of-sums

2-level implementation

$$
h=a b+c d+c e
$$

3-level implementation

$$
h=a b+c(d+e)
$$

## Additional Logic Gates and Symbols

* Why?
$\diamond$ Low cost implementation
$\diamond$ Useful in implementing Boolean functions
* Factors to be weighed in considering the construction of other types of logic gates are
$\diamond$ The feasibility and economy of producing the gate with physical components,
$\triangleleft$ The possibility of extending the gate to more than two inputs,
$\diamond$ The basic properties of the binary operator, such as commutativity and associativity,
$\diamond$ The ability of the gate to implement Boolean functions alone or in conjunction with other gates.

## Additional Logic Gates and Symbols

3-state gate

## NAND Gate

* The NAND gate has the following symbol and truth table * NAND represents NOT AND
* The small bubble circle represents the invert function

NAND gate

| $\mathbf{x}$ | $\mathbf{y}$ | NAND |
| :---: | :---: | :---: |
| 0 | 0 | 1 |
| 0 | 1 | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 0 |

* NAND gate is implemented efficiently in CMOS technology
$\diamond$ In terms of chip area and speed

## NOR Gate

$\star$ The NOR gate has the following symbol and truth table * NOR represents NOT OR

* The small bubble circle represents the invert function

NOR gate

| $\mathbf{x}$ | $\mathbf{y}$ | NOR |
| :---: | :---: | :---: |
| $\mathbf{0}$ | 0 | 1 |
| $\mathbf{0}$ | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 0 |

* NOR gate is implemented efficiently in CMOS technology $\diamond$ In terms of chip area and speed

## Non-Associative NAND / NOR Operations

* Unlike AND, NAND operation is NOT associative
( $x$ NAND $y$ ) NAND $z \neq x$ NAND ( $y$ NAND $z$ )
( $x$ NAND $y$ ) NAND $z=\left((x y)^{\prime} z\right)^{\prime}=\left(\left(x^{\prime}+y^{\prime}\right) z\right)^{\prime}=x y+z^{\prime}$
$x$ NAND $(y$ NAND $z)=\left(x(y z)^{\prime}\right)^{\prime}=\left(x\left(y^{\prime}+z^{\prime}\right)\right)^{\prime}=x^{\prime}+y z$
* Unlike OR, NOR operation is NOT associative
( $x$ NOR $y$ ) NOR $z \neq x$ NOR ( $y$ NOR $z$ )
$(x \operatorname{NOR} y) \operatorname{NOR} z=\left((x+y)^{\prime}+z\right)^{\prime}=\left(\left(x^{\prime} y^{\prime}\right)+z\right)^{\prime}=(x+y) z^{\prime}$
$x \operatorname{NOR}(y \operatorname{NOR} z)=\left(x+(y+z)^{\prime}\right)^{\prime}=\left(x+\left(y^{\prime} z^{\prime}\right)\right)^{\prime}=x^{\prime}(y+z)$

## Extension to multiple inputs

Demonstrating the nonassociativity of the NOR operator: $\quad\left(x \downarrow_{y}\right) \downarrow_{z \neq x} \downarrow(y \downarrow z)$

## Multiple-Input NAND / NOR Gates

NAND/NOR gates can have multiple inputs, similar to AND/OR gates

2-input NAND gate

2-input NOR gate

3-input NAND gate

3-input NOR gate

4-input NAND gate

4-input NOR gate

Note: a 3-input NAND is a single gate, NOT a combination of two 2-input gates. The same can be said about other multiple-input NAND/NOR gates.

## Extension to multiple inputs

Multiple-input and cascaded NOR and NAND gates

(a) 3-input NOR gate

(b) 3-input NAND gate

(c) Cascaded NAND gates

## Exclusive OR / Exclusive NOR

* Exclusive OR (XOR) is an important Boolean operation used extensively in logic circuits
* Exclusive NOR (XNOR) is the complement of XOR

| $x$ | y | XOR |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| 0 |  | 1 |
| 1 |  | 1 |
| 1 |  | 0 |

## XOR / XNOR Functions

* The XOR function is: $x \oplus y=x y^{\prime}+x^{\prime} y$
* The XNOR function is: $(x \oplus y)^{\prime}=x y+x^{\prime} y^{\prime}$
* XOR and XNOR gates are complex
$\triangleleft$ Can be implemented as a true gate, or by
$\triangleleft$ Interconnecting other gate types
* XOR and XNOR gates do not exist for more than two inputs
$\diamond$ For 3 inputs, use two XOR gates
$\diamond$ The cost of a 3-input XOR gate is greater than the cost of two XOR gates
* Uses for XOR and XNOR gates include:

ヶ Adders, subtractors, multipliers, counters, incrementers, decrementers
$\triangleleft$ Parity generators and checkers

## Extension to multiple inputs

Three-input exclusive-OR gate

(a) Using 2-input gates

(b) 3-input gate

| $x$ | $y$ | $z$ | $F$ |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |

(c) Truth table

## Positive and Negative Logic

* Choosing the high-level $H$ to represent logic 1 defines a positive logic system
* Choosing the low-level $L$ to represent logic 1 defines a negative logic system.
* It is up to the user to decide on a positive or negative logic polarity.

Signal assignment and logic polarity

## Positive and Negative Logic

* The conversion from positive logic to negative logic and vice versa is essentially an operation that changes 1's to 0's and 0's to 1 's in both the inputs and the output of a gate.
* Since this operation produces the dual of a function, the change of all terminals from one

| $x$ | $y$ | $z$ |
| :--- | :--- | :--- |
| $L$ | $L$ | $L$ |
| $L$ | $H$ | $L$ |
| $H$ | $L$ | $L$ |
| $H$ | $H$ | $H$ |

(a) Truth table with $H$ and $L$

(d) Positive logic AND gate

| $x$ | $y$ | $z$ |  |
| :---: | :---: | :---: | :---: |
| 1 | 1 | 1 |  |
| 1 | 0 | 1 |  |
| 0 | 1 | 1 |  |
| 0 | 0 | 0 |  |
| (e) Truth table for |  |  |  |
| negative logic |  |  |  |

(f) Negative logic OR gate
