ENCS539: NLP Information Retrieval and Web Search, Quiz2, October 26, 2021

## Student Name:

$\qquad$ Student Number: $\qquad$
Question 1: Consider the following small part of a positional index with the format:
word: doc\#: <position, position,...>; doc\#: <position,...>. Example:
good: 2: <6>; 3: <2,12>; 4: <9,17>
Means: word "Good" occurs in document 2 at position 6 , in document 3 at locations 2 and 12 and in document 4 at locations 9 and 17.

Black: 1: <1>; 2: <6>; $3:<2,15>; 4:<9>$.
Sheep: $3:<4,11>; 4:<3>; \quad 7:<14,89>$.
Fish: 1: <2>; 2: <12, 16,21>; 3: <13>; 5: <21,25>.
The /d operator, with the format: word1 /d word2 finds occurrences of word1 at a distance at most $d>=1$ words on either side of word2. Thus, $d=1$ demands that word1 is adjacent to word2.
a. Give the set of documents that satisfy the query: Black /2 Fish.
\{D1,D3\}
b. For which values of $\mathbf{d}$ the query: Black /d Sheep returns the set of documents $\{D 3\}$ as the answer.
$\mathrm{d}=\{2,3,4,5\}$ [greater than or equal 2 but less than 6 . At $\mathrm{d}=6$ document 4 comes in and the set is no more \{D1,D3\}.

Question2: Find the Levinshtein distance between words "F1F2L3F3F4" and "L1L2L3L4" using the table below (or equivalent). Please mark all needed squares. $L_{i}$ is the $i^{t h}$ letter of your last name, $F_{j}$ is the $j^{\text {th }}$ letter of your first name. Example:name is "adnan yahya" $\rightarrow$ F1=' $a^{\prime} F 2=^{\prime} d^{\prime} \mathrm{L} 3={ }^{\prime} h^{\prime}$ F3='n' F4='a' so word='adhna' and L1='y' L2= 'a' L3= 'h' L4='y'and word2='yahy'

|  | - | F1 $=$ | F2 $=$ | L3= | F3= | F4= |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| - |  |  |  |  |  |  |
| L1 $=$ |  |  |  |  |  |  |
| L2 $=$ |  |  |  |  |  |  |
| L3 $=$ |  |  |  |  |  |  |
| L4 $=$ |  |  |  |  |  |  |

Test your case at the following link: http://www.let.rug.nl/~kleiweg/lev/
Compute the Jackard Similarity between "researcher" and "saercher" using letter Bi-grams (2-grams). Don't worry about spaces before/after.
"researcher"=\{re,es,se,ea,ar,rc,ch,he,er\}; "saercher"=\{sa,ae,er,rc,ch,he,er\}: size of "researcher"=9, different in "saercher" $=2$. Total: 11; Common /total=4/11=0.36
